DRAFT REPORT FOR PUBLIC REVIEW

Rock River/Pierce Lake Watershed HUC 0709000501

TMDL and Watershed-based Implementation Plan

Prepared for Illinois EPA

September 2023

CDM Smith

Table of Contents

Executive Summary ES-1

Section 1 Goals and Objectives for the Rock River/Pierce Lake Watershed 1-1
1.1 Total Maximum Daily Load Overview 1-1
1.2 Total Maximum Daily Load Goals and Objectives 1-2
1.3 Report Overview 1-5

Section 2 Rock River/Pierce Lake Watershed Description 2-1
2.1 Location 2-1
2.2 Topography 2-1
2.3 Land Use 2-1
2.3.1 Subbasin Land Use 2-3
2.4 Soils 2-7
2.4.1 Soil Characteristics 2-8
2.5 Population 2-11
2.6 Climate and Streamflow 2-11
2.6.1 Climate 2-11
2.6.2 Streamflow 2-11

Section 3 Rock River/Pierce Lake Watershed Public Participation 3-1

Section 4 Rock River/Pierce Lake Watershed Water Quality Standards 4-1
4.1 Illinois Water Quality Standards 4-1
4.2 Designated Uses 4-1
4.2.1 General Use 4-1
4.3 Water Quality Criteria 4-2

Section 5 Rock River/Pierce Lake Watershed Data and Potential Pollutant Sources 5-1
5.1 Water Quality Data 5-1
5.1.1 Stream Water Quality Data 5-1
5.1.1.1 Fecal Coliform 5-3
5.1.1.2 Arsenic 5-4
5.1.1.3 pH 5-5
5.1.1.4 Zinc 5-6
5.1.2 Pierce Lake Water Quality Data 5-7
5.1.2.1 Total Phosphorus in Pierce Lake 5-8
5.2 Lake Characteristics 5-9
5.3 Point Sources 5-11
5.4 Nonpoint Sources 5-13
5.4.1 Crop Information 5-13
5.4.2 Animal Operations 5-14
5.4.3 Septic Systems 5-16
5.4.4 Internal Phosphorus Loading in Lakes 5-16
5.5 Watershed Studies and Other Watershed Information 5-16

Section 6 Approach to Developing Total Maximum Daily Loads and Identifying Data Needs 6-1
6.1 Additional Data Needs for Total Maximum Daily Load Development in the Rock River/ Pierce Lake Watershed 6-1
6.2 Approaches for Developing Total Maximum Daily Loads for Stream Segments 6-2
6.3 Approach for Developing Total Maximum Daily Load for Pierce Lake 6-2

Section 7 Methodology Development for Load Reduction Calculations in the Rock River/Pierce Lake Watershed 7-1
7.1 Methodology Overview 7-1
7.1.1 Load Duration Curve Overview 7-1
7.1.2 Simplified Lake Assessment Model (SLAM) Overview 7-1
7.2 Methodology Development – Load Duration Curves 7-2
7.2.1 Watershed Delineation and Flow Estimation 7-2
7.2.2 Fecal Coliform Load Duration Curves 7-4
7.3 Methodology Development – Simplified Lake Assessment Model 7-8
7.3.1 Pierce Lake Model Construction 7-9
7.3.1.1 Model Segmentation 7-9
7.3.1.2 Lake Hydraulics 7-9
7.3.1.3 Watershed Parameters 7-11
7.3.1.4 Lake Nutrient Parameters 7-11
7.3.1.5 Sediment Layer Parameters 7-11
7.3.1.6 Pierce Lake Model Calibration 7-12

Section 8 Total Maximum Daily Loads for the Rock River/Pierce Lake Watershed 8-1
8.1 Total Maximum Daily Load Endpoints for the Rock River/Pierce Lake Watershed 8-1
8.2 Pollutant Sources and Linkages 8-1
8.3 Total Maximum Daily Load Allocation 8-2
8.3.1 Fecal Coliform Total Maximum Daily Loads 8-3
8.3.1.1 Loading Capacity 8-3
8.3.1.2 Seasonal Variation 8-4
8.3.1.3 Waste Load Allocation 8-4
8.3.1.4 Margin of Safety 8-7
8.3.1.5 Reserve Capacity 8-7
8.3.1.6 Load Allocation and Total Maximum Daily Load Summary 8-7
8.3.2 Total Phosphorus Total Maximum Daily Load for Pierce Lake 8-10
8.3.2.1 Loading Capacity 8-10
8.3.2.2 Seasonal Variation 8-10
8.3.2.3 Waste Load Allocation 8-11
8.3.2.4 Margin of Safety 8-11
8.3.4.5 Reserve Capacity 8-11
8.3.4.6 Load Allocation and Total Maximum Daily Load Summary 8-11

Section 9 Watershed-Based Implementation Plan for the Rock River/Pierce Lake Watershed 9-1
9.1 Implementation Overview 9-1
9.2 Adaptive Management 9-1
9.3 Best Management Practice Recommendations 9-2

9.3.1 Recommendations for Fecal Coliform Reduction 9-2
9.3.1.1 Point Sources of Fecal Coliform 9-3
9.3.1.2 Nonpoint Sources of Fecal Coliform 9-3
9.3.2 Recommendations for Total Phosphorus Reduction 9-18
9.4 Costing Estimates and Funding Opportunities 9-23
9.4.1 Best Management Practice Cost Estimates 9-23
9.4.2 Project Funding 9-24
9.4.2.1 State-Level Funding 9-25
9.4.2.2 Federal Funding 9-26
9.4.3 Planning Level Cost Estimates for Implementation Measures 9-33
9.5 Watershed-Specific Priority Areas and Projects 9-34
9.6 Information and Education 9-35
9.7 Milestones and Success Criteria 9-37
9.8 Plan Monitoring and Schedule 9-37
9.8.1 Monitoring Plan 9-37
9.8.2 Implementation Schedule 9-38

Executive Summary

A total maximum daily load (TMDL) is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA develops a list, known as the 303(d) list, of water bodies not meeting water quality standards every 2 years, which is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. In accordance with U.S. Environmental Protection Agency (EPA) guidance, the report assigns all waters of the state to one of five categories; 303(d)-listed water bodies make up category five in the Integrated Report.

Water bodies listed as impaired in the 2018 Integrated Water Quality Report and 303(d) List[1] were originally targeted for TMDL development in 2019. A Stage 1 TMDL report was initiated for the Rock River/Pierce Lake watershed based on the 2018 303(d) list. Stage 1 of TMDL development reviews and documents the physical characteristics of a watershed as well as available historical data in comparison to applicable water quality standards. **Table ES-1** contains information on the 2018 impaired water bodies that were investigated for this report:

Table ES-1 Impaired Water Bodies in the Rock River/Pierce Lake Watershed (2018 303(d) List)

Segment ID	Segment Name	Potential Cause of Impairment	Impaired Use	Potential Source(s) of Impairment (as identified by the 2018 303(d) list)
IL_PR-01	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
IL_PR-99	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers

Segment ID	Segment Name	Potential Cause of Impairment	Impaired Use	Potential Source(s) of Impairment (as identified by the 2018 303(d) list)
IL_RPC	Pierce Lake	Total Phosphorus (TP)	Aesthetic Quality	Internal Nutrient Recycling, On-Site Treatment Systems, Waterfowl, Crop Production (Crop Land or Dry Land), Runoff from Forest/Grassland/Parkland

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[2] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for pH, zinc, and arsenic from the 2020/2022 303(d) list. Appendix C-4 of the Integrated Report[3] provides information for segments and causes that were removed from the 2018 303(d) list. The appendix notes that there were no standard violations in the new data for the 2020 assessment cycle for pH and zinc and that new data allowed for delisting of arsenic as a legacy cause. Because of these delistings, TMDL development did not continue for these parameters in Keith Creek beyond Stage 1. The remaining impairments shown in Table ES-1 have not changed during the most recent listing cycle and TMDL development is documented in this report.

Section 1

Goals and Objectives for the Rock River/Pierce Lake Watershed

1.1 Total Maximum Daily Load Overview

A total maximum daily load (TMDL) is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Every 2 years, Illinois EPA develops a list known as the 303(d) list of water bodies that do not meet water quality standards. The list is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. In accordance with Illinois EPA guidance, the report assigns all waters of the state to one of five categories. The 303(d)-listed water bodies make up category five in the integrated report.

In general, a TMDL is a quantitative assessment of water quality impairments, contributing potential sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a water body.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters
- Where attainable, achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water

Water quality standards consist of three elements:

- Designated beneficial use or uses of a water body or segment of a water body
- Water quality criteria necessary to protect the use or uses of that particular water body
- Antidegradation policy

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a

narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 Total Maximum Daily Load Goals and Objectives

Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

Water bodies listed as impaired in the 2018 Integrated Water Quality Report and 303(d) List[4] were originally targeted for Stage 1 TMDL development in 2019. Illinois EPA uses the U.S. Geologic Survey (USGS) 10-digit hydrologic unit code (HUC) to group subbasins into TMDL watersheds. This report addresses Stages 1 and 3 TMDL development for the Rock River/Pierce Lake watershed (HUC 0709000501). Stage 2 was not performed as data collection was not necessary to support Stage 3 work. The data gathered and presented during Stage 1 (Sections 1 through 6 of this document) were used to calculate TMDLs in the watershed.

Following this process, TMDL goals and objectives for the Rock River/Pierce Lake watershed included developing TMDLs for impaired water bodies within the watershed, describing the necessary elements of the TMDL, developing a watershed-based implementation plan (WBP) to attain water quality goals, and gaining public acceptance of the process. The impaired water body segments in the Rock River/Pierce Lake watershed are:

- Keith Creek (IL_PR-01 and IL_PR-99)
- North Fork Kent Creek (IL_PSB-01)
- South Fork Kent Creek (IL_PSA)
- North Kinnikinnick Creek (IL_PU)
- South Kinnikinnick Creek (IL_PT)
- Spring Creek – North (IL_PZZG)
- Pierce Lake (IL_RPC)

The impaired water body segments are shown on **Figure 1-1**. There are seven impaired stream segments and one impaired lake within the Rock River/Pierce Lake watershed addressed in this report. **Table 1-1** lists the water body segment, potential cause of impairment, use description, and potential sources of impairment for the water body as listed in 2018.

Figure 1-1: Rock River/Pierce Lake Watershed
HUC 0709000501

Table 1-1 Impaired Water Bodies in the Rock River/Pierce Lake Watershed (2018 303(d) List)

Segment ID	Segment Name	Potential Cause of Impairment	Impaired Use	Potential Source(s) of Impairment (as identified by the 2018 303(d) list)
IL_PR-01	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
IL_PR-99	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
		Arsenic[1]	Aquatic Life	Channelization, Urban Runoff/Storm Sewers, Contaminated Sediments
		pH[1]	Aquatic Life	Channelization, Urban Runoff/Storm Sewers
		Zinc[1]	Aquatic Life	Channelization, Urban Runoff/Storm Sewers, Contaminated Sediments
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PSA	South Fork Kent Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PU	North Kinnikinnick Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PT	South Kinnikinnick Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PZZG	Spring Creek – North	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_RPC	Pierce Lake	Total Phosphorus (TP)	Aesthetic Quality	Internal Nutrient Recycling, On-Site Treatment Systems, Waterfowl, Crop Production (Crop Land or Dry Land), Runoff from Forest/Grassland/Parkland

Note:

1 **These parameters were included on the 2018 303(d) list when this TMDL report was initiated. The parameters have since been removed from the 2020/2022 303(d) list.**

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[5] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for pH, zinc, and arsenic from the 2020/2022 303(d) list. Because of these delistings, TMDL development did not continue for these parameters in Keith Creek beyond Stage 1 (Sections 1 through 6 of this report). The remaining impairments shown in Table 1-1 have not changed during the most recent listing cycle.

The TMDLs for the segments listed above will specify the following elements:

- Loading capacity (LC), or the maximum amount of pollutant loading a water body can receive without violating water quality standards
- Waste load allocation (WLA), or the portion of the TMDL allocated to existing or future point sources
- Load allocation (LA), or the portion of the TMDL allocated to existing or future nonpoint sources and natural background

5 Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

- Margin of safety (MOS), or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- Reserve capacity (RC), or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\mathbf{TMDL = LC = \Sigma WLA + \Sigma LA + MOS + RC}$$

TMDLs also consider the seasonal variability of pollutant loads so that applicable water quality standards are met during all seasons of the year. Also, reasonable assurance that TMDLs will be achieved is described in the WBP. The WBP for the Rock River/Pierce Lake watershed describes how water quality standards and goals will be met and attained. The WBP includes recommendations for implementing best management practices (BMPs), cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completion of implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Rock River/Pierce Lake Watershed Description** describes the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Rock River/Pierce Lake Watershed Public Participation** discusses public participation activities that will occur throughout TMDL development.
- **Section 4 Rock River/Pierce Lake Watershed Water Quality Standards** defines the water quality standards and water quality guidelines for the impaired water bodies.
- **Section 5 Rock River/Pierce Lake Watershed Data and Potential Pollutant Sources** presents the available water quality data needed to develop TMDLs, discusses the characteristics of the impaired stream segments in the watershed, and describes the point and nonpoint sources with the potential to contribute to the watershed load.
- **Section 6 Approach to Developing Total Maximum Daily Loads and Identifying Data Needs** makes recommendations for the models and analysis that are needed for TMDL development and suggests segments for Stage 2 data collection.
- **Section 8 Total Maximum Daily Loads for the Rock River/Pierce Lake Watershed** provides the results of the water quality modeling and analyses for the impaired segments within the watershed.
- **Section 9 Watershed-Based Implementation Plan for the Rock River/Pierce Lake Watershed** includes recommendations for implementation actions, point source monitoring, management measures, and BMPs that can be used to address water quality issues in the watershed.

This page intentionally left blank.

Section 2

Rock River/Pierce Lake Watershed Description

2.1 Location

The Rock River/Pierce Lake watershed (HUC 0709000501 shown on **Figure 1-1**) is in north central Illinois and drains approximately 149,300 acres[6], roughly 139,100 acres of which drain land within Illinois. The remaining 10,200 acres drain areas within Wisconsin. In Illinois, approximately 107,000 acres (71.7 percent of the total watershed) lie in Winnebago County and 32,100 acres (21.5 percent of the total watershed) lie in Boone County. The scope of this report is largely limited to the Illinois portion of the watershed, and the impaired water bodies addressed are all in Illinois.

2.2 Topography

Topography is an important factor in watershed management because stream types, precipitation, and soil types can vary dramatically by elevation. Elevation data are available from USGS[7] for each 1:24,000 topographic quadrangle in the United States. Elevation data for the Rock River/Pierce Lake watershed were obtained by overlaying USGS grid data onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed.

Elevation in the Rock River/Pierce Lake watershed ranges from approximately 1,000 feet above sea level in the north central portion of the watershed to 670 feet above sea level near the confluence of Keith Creek and the Rock River.

2.3 Land Use

Land use data for the Rock River/Pierce Lake watershed were extracted from the U.S. Department of Agriculture's (USDA's) National Agriculture Statistics Service (NASS) 2018 Cropland Data Layer (CDL).[8] The CDL is a raster-based, georeferenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities and to produce digital, crop-specific, categorized georeferenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2018 and includes 33 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters.

DRAFT

CDM Smith

Figure 2-1: Rock River/Pierce Lake Watershed Elevation

Land use characteristics of the watershed were determined by overlaying the Illinois Statewide 2018 CDL data layers onto the GIS-delineated watershed. **Table 2-1** contains the main categories of land uses in the Rock River/Pierce Lake watershed, based on the 2018 CDL land cover categories. The table also includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed. **Appendix A** contains a table of all land uses in the watershed.

Table 2-1 Land Cover in the Rock River/Pierce Lake Watershed

Land Cover Category	Acres	Percentage[1]
Corn	34,695	23.2%
Developed/Low Intensity	24,538	16.4%
Soybeans	22,030	14.7%
Deciduous Forest	16,110	10.8%
Developed/Open Space	14,494	9.7%
Developed/Med Intensity	9,777	6.5%
Grass/Pasture	9,453	6.3%
Background	8,908	6.0%
Developed/High Intensity	3,239	2.2%
Open Water	1,528	1.0%
Shrubland	1,379	0.9%
Alfalfa	914	0.6%
Winter Wheat	676	0.5%
Herbaceous Wetlands	595	0.4%
All Others	1,058	0.7%
Total	**149,394**	**100%**

Note:
[1] Percentages have been rounded to the nearest tenth.

The land cover data reveal that 58,315 acres, representing 39 percent of the total watershed area, are dedicated to agricultural activities. Corn and soybean make up 97.3 percent of the agricultural land use within the watershed. Forests and woodlands cover 11.7 percent of the watershed (17,489 acres), and grasslands or pastures cover 6.3 percent (9,453 acres). Approximately 35 percent of the watershed area (52,048 acres) is developed, urbanized land. The remaining watershed area is wetland or open water.

2.3.1 Subbasin Land Use

The subbasin areas draining to each impaired segment within the Rock River/Pierce Lake watershed were further delineated through GIS. Land cover data were then intersected with the subbasin boundaries to determine the land uses contributing runoff to each impaired water body, as shown in **Table 2-2** through **Table 2-9**. Each table includes data on all lands upgradient of an impaired segment, including areas that may contribute to other impaired segments upgradient.

2.4 Soils

Soils data are available through the Natural Resources Conservation Service (NRCS) Soil Survey Geographic (SSURGO) database.[9] For SSURGO data, field mapping methods using national standards are used to construct the soil maps. Mapping scales generally range from 1:12,000 to 1:63,360, making SSURGO the most detailed level of soil mapping done by NRCS.

Attributes of the spatial coverage can be linked to the SSURGO database, which provides information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups and the K-factor of the Universal Soil Loss Equation. This section discusses the soil characteristics of the Rock River/Pierce Lake watershed.

[9] NRCS SSURGO. https://www.nrcs.usda.gov/resources/data-and-reports/soil-survey-geographic-database-ssurgo

2.4.1 Soil Characteristics

Appendix B contains a table of the SSURGO soil series for the Rock River/Pierce Lake watershed. A total of 162 soil types exist in the watershed. The most common type, Griswold loam (6 to 12 percent slopes), covers 8 percent of the watershed. The second and third most common types, Comfrey loam (0 to 2 percent slopes) and Flagler sandy loam (0 to 2 percent slopes), respectively, each cover 4 percent of the watershed. All other soil types each represent less than 4 percent of the total watershed area. The table in **Appendix B** also contains the area, dominant hydrologic soil group, and K-factor range. The two characteristics are described in more detail below.

Figure 2-3 shows the hydrologic soils groups found within the Rock River/Pierce Lake watershed. Hydrologic soil groups are used to estimate runoff from precipitation. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

While hydrologic soil groups A, B, C, D, A/D, and B/D are all found within the Rock River/Pierce Lake watershed, group B soils are the most common type, representing about 61 percent of the watershed. Groups A/D and B/D are dual hydrologic soil group. Dual hydrologic soil groups can be adequately drained. The first letter applies to the drained condition and the second letter to the undrained condition. For the purpose of hydrologic soil grouping, adequately drained means that the seasonal high-water table is kept at 24 inches below the surface.[10]

A commonly used soil attribute is the K-factor, which is a measure of soil erodibility and quantifies the relative susceptibility of soil to sheet and rill erosion. Values of K range from 0.02 to 0.69, from least erodible to most erodible, respectively, and are influenced by elements including texture, organic matter content, structure, and saturated hydraulic conductivity.[11] The distribution of K-factor values in the Rock River/Pierce Lake watershed range from 0.20 to 0.47 (**Figure 2-4**).

DRAFT

CDM Smith

Figure 2-4: Rock River/Pierce Lake Watershed K-Factor

2.5 Population

The Census TIGER/Line data[12] from the U.S. Census Bureau were reviewed along with shapefiles of census blocks[13] for the entire state of Illinois. All census blocks that have geographic center points (centroids) within the watershed were selected and tallied to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Given that the optimal size of a census block group is 1,500 people, and 178 block group centroids are within the watershed, it is estimated that approximately 267,000 people reside in the Rock River/Pierce Lake watershed. The major municipalities in the watershed are shown in **Figure 1-1**. The largest urban development in the watershed is the City of Rockford, which lies partially within the watershed and has an estimated population of approximately 147,651 according to the 2018 census.[14]

2.6 Climate and Streamflow

2.6.1 Climate

Northern Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly temperature and precipitation data from Greater Rockford Airport in Illinois (station USW00094822), approximately 3.5 miles south of the watershed, were extracted from the National Centers for Environmental Information database for 1951 through 2019.[15] This station was selected because of its proximity to the watershed and completeness of its dataset.

Table 2-10 contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is approximately 37 inches. Summer months are historically the wettest months while January and February are the driest.

2.6.2 Streamflow

Analysis of the Rock River/Pierce Lake watershed requires an understanding of flow throughout the drainage area. There are three active USGS stream gages[16] throughout the watershed that may be used to estimate stream flows for all impaired segments (**Figure 2-5**). **Table 2-11** summarizes the station information.

DRAFT

CDM Smith

Figure 2-5: Rock River/Pierce Lake Watershed Active USGS Gages

Table 2-11 USGS Stream Gages

Gage Number	Name	Period of Record
USGS 05437641	Rock River at Auburn St. in Rockford[1]	2002–2020
USGS 05437610	Rock River at Latham Park, IL[1]	2002–2020
USGS 05437500	Rock River at Rockton, IL	1903–2020

Note:
[1] Gaging station data includes gage height measurements only; no discharge values were reported.

Data from these gages can be used to estimate flow values for each impaired stream segment within the Rock River/Pierce Lake watershed for purposes of TMDL development. Estimates of flow values for impaired segments are corrected for each segment's watershed size using the drainage area ratio method represented by the following equation:

$$Q_{gaged}\left(\frac{Area_{ungaged}}{Area_{gaged}}\right) = Q_{ungaged}$$

Where,

Q_{gaged} = Streamflow of the gaged basin

$Q_{ungaged}$ = Streamflow of the ungaged basin

$Area_{gaged}$ = Area of the gaged basin

$Area_{ungaged}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Section 3

Rock River/Pierce Lake Watershed Public Participation

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet recommended TMDLs and WBPs. It is important to involve the public as early in the process as possible to achieve maximum cooperation and counter concerns regarding the purpose of the process and the regulatory authority to implement any recommendations.

Illinois EPA and CDM Smith held a virtual public meeting on June 30, 2021, to present Stage 1 of TMDL development (Sections 1 through 6 of this report). An additional public meeting will be held at the completion of Stage 3 (Sections 7 through 9 of this report). Comments received through the public meeting process are included in **Appendix D**. This section will be updated following the final public meeting.

This page intentionally left blank.

Section 4

Rock River/Pierce Lake Watershed Water Quality Standards

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the designated uses of the state's waterways. In Illinois, the Illinois Pollution Control Board (IPCB) is responsible for setting the water quality standards. Illinois is required to update water quality standards every 3 years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA in conjunction with EPA. New standards are then developed or revised during the 3-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to the IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards.[17]

4.2 Designated Uses

The waters of Illinois are classified by designated uses, which include General Use, Public and Food Processing Water Supplies, Lake Michigan Basin, and Secondary Contact and Indigenous Aquatic Life Use.[18] The General Use designation applies to the impairments within the Rock River/Pierce Lake watershed.

4.2.1 General Use

The General Use classification is defined by the IPCB as standards that "are intended to protect aquatic life, wildlife, agricultural, primary contact, secondary contact, and most industrial uses." They are also intended to "ensure the aesthetic quality of the state's aquatic environment and to protect human health from disease or other harmful effects that could occur from ingesting aquatic organisms taken from surface waters of the state."[19] Primary contact uses are protected for all General Use waters whose physical configuration permits such use.

4.3 Water Quality Criteria

According to the 2018 and 2020/2022 Illinois EPA Integrated Report[20], aquatic life use assessments in streams are typically based on the interpretation of biological information, physicochemical water data, and physical habitat. The primary biological measures used are the Fish Index of Biotic Integrity, the Macroinvertebrate Index of Biotic Integrity, and the Macroinvertebrate Biotic Index. Physical habitat information used in assessments includes quantitative or qualitative measures of stream-bottom composition and qualitative descriptors of channel and riparian conditions. Physicochemical water data used include measures of conventional parameters (e.g., dissolved oxygen [DO], pH, and temperature), priority pollutants, nonpriority pollutants, and other pollutants.

Table 4-1 and **Table 4-2** present the numeric water quality standards of the potential causes of impairment for both lakes and streams in the Rock River/Pierce Lake watershed based on the 2018 303(d) list.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of Lake Impairments in the Rock River/Pierce Lake Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
TP	mg/L	0.05[1]	302.205

Note:

[1] The standard applies to inland lakes and reservoirs (greater than 20 acres) and in any stream at the point where it enters any such lake or reservoir.

mg/L = milligrams per liter

Table 4-2 Summary of Numeric Water Quality Standards for Potential Causes of Stream Impairments in the Rock River/Pierce Lake Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Arsenic**	µg/L	*Trivalent, dissolved:* Acute = 360 × 1.0* = 360 Chronic = 190 × 1.0* = 190	302.208(e)
pH**	Standard units (SU)	6.5–9.0	302.204
Total Fecal Coliform	Count per 100 mL	*May through October* 200(1), 400(2)	302.209
Zinc*	µg/L	*Dissolved:* Acute = $e^{A+B\ln(H)} \times 0.978$* where A = 0.9035 and B = 0.8473 Chronic = $e^{A+B\ln(H)} \times 0.986$* where A = -0.4456 and B = 0.8473	302.208(e)

Notes:

(1) The geometric mean based on a minimum of five samples collected over not more than a 30-day period.

(2) The standard shall not be exceeded by more than 10 percent of the samples collected during any 30-day period.

** These parameters have been delisted from the 303(d) list in the 2020/2022 Integrated Water Quality Report.

* Conversion factor multiplier for dissolved metals

H = hardness; µg/L – micrograms per liter

Section 5

Rock River/Pierce Lake Watershed Data and Potential Pollutant Sources

To further characterize the Rock River/Pierce Lake watershed, a wide range of data were collected and reviewed. Water quality data for streams and lakes, and information on potential point and nonpoint sources within the watershed were compiled from a variety of data sources. This information is discussed further in this section.

5.1 Water Quality Data

Illinois EPA monitoring programs that contribute data to the assessment of streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program.[21] Data from numerous historical water quality stations within the Rock River/Pierce Lake watershed were located and reviewed for this report (**Figure 5-1**). These water quality data were primarily provided by Illinois EPA. Stations RPC-1, RPC-2, and RPC-3 on Pierce Lake are part of the Illinois EPA Ambient Lakes Program and were sampled multiple times a year in 2001, 2004, 2011, and 2016. Stations on the impaired stream segments are part of Illinois EPA's Intensive Basin Survey Program, which monitors stations on a 5-year cycle. Additional information on Illinois EPA's monitoring programs can be found in the Water Monitoring Strategy report.[22]

The impaired water body segments in the Rock River/Pierce Lake watershed were presented in Section 1. **Table 1-1** provides impairment information for each segment. Recent and historical data are included in this section and document historical trends and observations. The subsections address both stream and lake impairments, discussing data for the impaired stream segments in the Rock River/Pierce Lake watershed followed by data for the impaired lake in the watershed. Data are summarized by impairment and discussed in relation to the relevant Illinois water quality standard. The data summaries include all available date ranges of data.

5.1.1 Stream Water Quality Data

Seven impaired stream segments exist within the Rock River/Pierce Lake watershed (Keith Creek segments IL_PR-01 and IL_PR-99, North Fork Kent Creek segment IL_PSB-01, South Fork Kent Creek segment IL_PSA, North Fork Kinnikinnick Creek segment IL_PU, South Fork Kinnikinnick Creek segment IL_PT, and Spring Creek – North segment IL_PZZG). Data summaries are presented for the 2018 parameters of concern for stream impairments in this watershed: pH, zinc, arsenic, and fecal coliform. Historical water quality data for the impaired segments of the Rock River/Pierce Lake watershed are provided in **Appendix C**.

DRAFT

CDM Smith

Figure 5-1: Rock River/Pierce Lake Watershed Water Quality Stations

5.1.1.1 Fecal Coliform

All seven of the impaired stream segments (IL_PR-01, IL_PR-99, IL_PSB-01, IL_PSA, IL_PU, IL_PT, and IL_PZZG) are listed for impairment of the primary contact recreation use caused by elevated fecal coliform concentrations. **Table 5-1** summarizes historical fecal coliform data for this segment. The general use water quality standard for fecal coliform states that the standard of 200 colony forming units (cfu) per 100 milliliters (mL) shall not be exceeded by the geometric mean of at least five samples, nor can 10 percent of the samples collected exceed 400 cfu per 100 mL in protected waters, except as provided in 35 Ill. Adm. Code 302.209(b). Samples must have been collected over a 30-day period or less during May through October. Samples collected between September and October 2019 exceeded the current standard at all locations as shown **Figure 5-2**. **Figure 5-2** shows single sample results compared to statistics-based standards.

Table 5-1 Existing Fecal Coliform Data for Impaired Stream Segments

Stream Segment Name and ID	Period of Record and Number of Data Points[1]	Geometric Mean of All Results (cfu/100 mL)	Maximum Result (cfu/100 mL)	Minimum Result (cfu/100 mL)	Number of Exceedances of the 200 cfu/100 mL Standard[1]	Number of Exceedances of the 400 cfu/100 mL Standard[1]
Keith Creek Segment IL_PR-01	2019; 5	1,500	11,200	602	5	5
Keith Creek Segment IL_PR-99[2]	2019; 5	856	1,870	450	5	5
North Fork Kent Creek Segment IL_PSB-01	2019; 5	645	4,610	72	5	5
South Fork Kent Creek Segment IL_PSA	2019; 5	943	6,490	134	4	3
North Kinnikinnick Segment IL_PU	2019; 5	915	2,480	295	5	4
South Kinnikinnick Segment IL_PT	2019; 5	322	631	189	4	2
Spring Creek – North Segment IL_PZZG	2019; 5	413	1,720	108	4	3

Notes:

1 Samples were collected May through October.

2 Samples were collected at station PR-02.

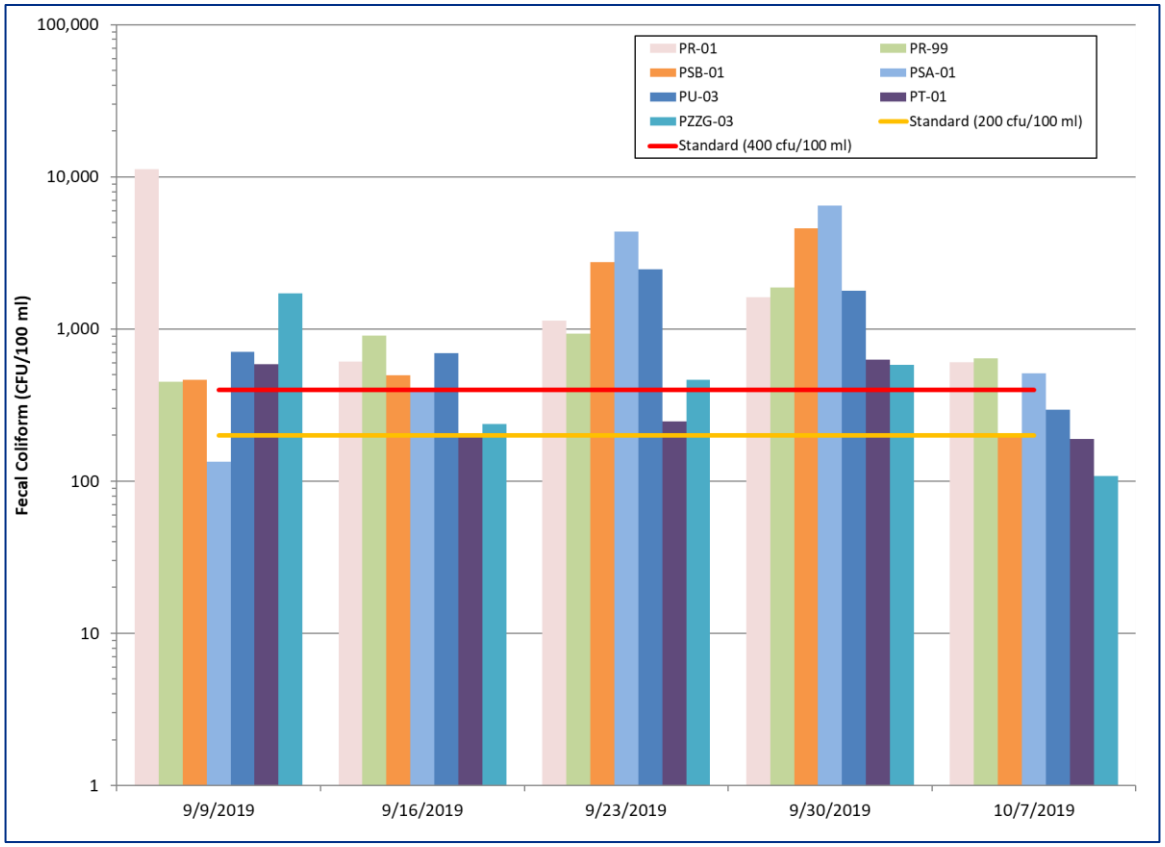

Figure 5-2 Fecal Coliform in Impaired Stream Segments in the Rock River/Pierce Lake Watershed

5.1.1.2 Arsenic

Keith Creek segment IL_PR-99 was listed in 2018 for impairment of the aquatic life use because of elevated arsenic concentrations. **Table 5-2** summarizes, and **Figure 5-3** presents historical arsenic data for this segment. The general use water quality standard for arsenic consists of acute and chronic thresholds. Sampling results for dissolved arsenic at this location are reported as nondetect; therefore, the detection limit value for each sample was applied for the purpose of calculation. However, no results exceeded the acute or chronic water quality standards.

Table 5-2 Existing Arsenic Data for Keith Creek Segment IL_PR-99

Impaired Stream Segment Name and ID	Period of Record and Number of Data Points	Mean Result (µg/L)	Maximum Result (µg/L)	Minimum Result (µg/L)	Number of Acute Exceedances	Number of Chronic Exceedances
Keith Creek Segment IL_PR-99	2008, 2013; 6	3.05[1]	4.45[1]	1.65[1]	0	0

Note:

[1] All dissolved arsenic sample results were reported as nondetect; therefore, the detection limit value was applied for the purpose of calculation.

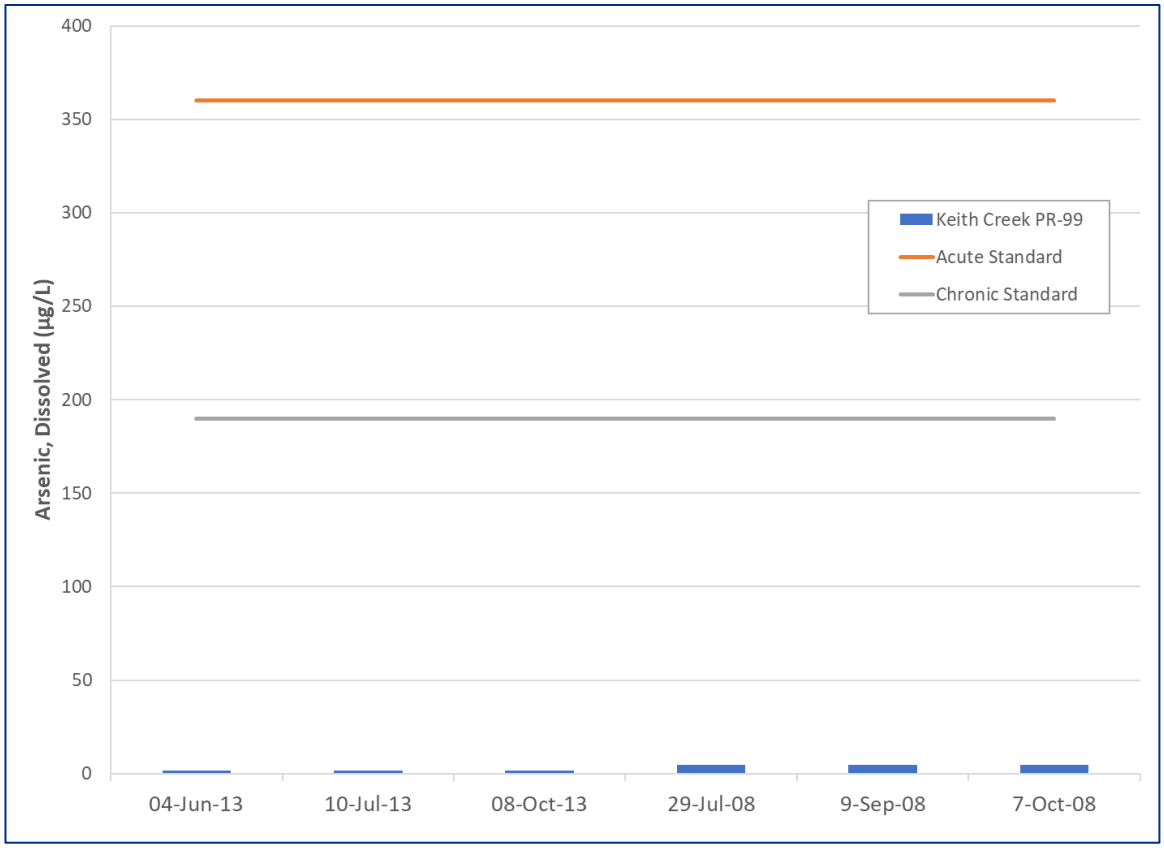

Figure 5-3 Arsenic in Impaired Stream Segment IL_PR-99 of Keith Creek

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[23] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for arsenic from the 2020/2022 303(d) list. Because of the delisting, TMDL development for arsenic in Keith Creek did not continue beyond Stage 1.

5.1.1.3 pH

Keith Creek segment IL_PR-99 was also listed in 2018 for impairment of the aquatic life use because of pH. **Table 5-3** summarizes, and **Figure 5-4** presents historical pH data for this segment. A sample result is considered an exceedance if it is below 6.5 or above 9.0 SU at any time. Only three samples were available for review on this segment. The samples were from 2013 and none of the results were outside the allowable pH range.

Table 5-3 Existing pH Data for Keith Creek Segment IL_PR-99

Impaired Stream Segment Name & ID	Period of Record and Number of Data Points	Mean Result (SU)	Maximum Result (SU)	Minimum Result (SU)	Number of Exceedances
Keith Creek Segment IL_PR-99	2013; 3	8.04	8.34	7.84	0

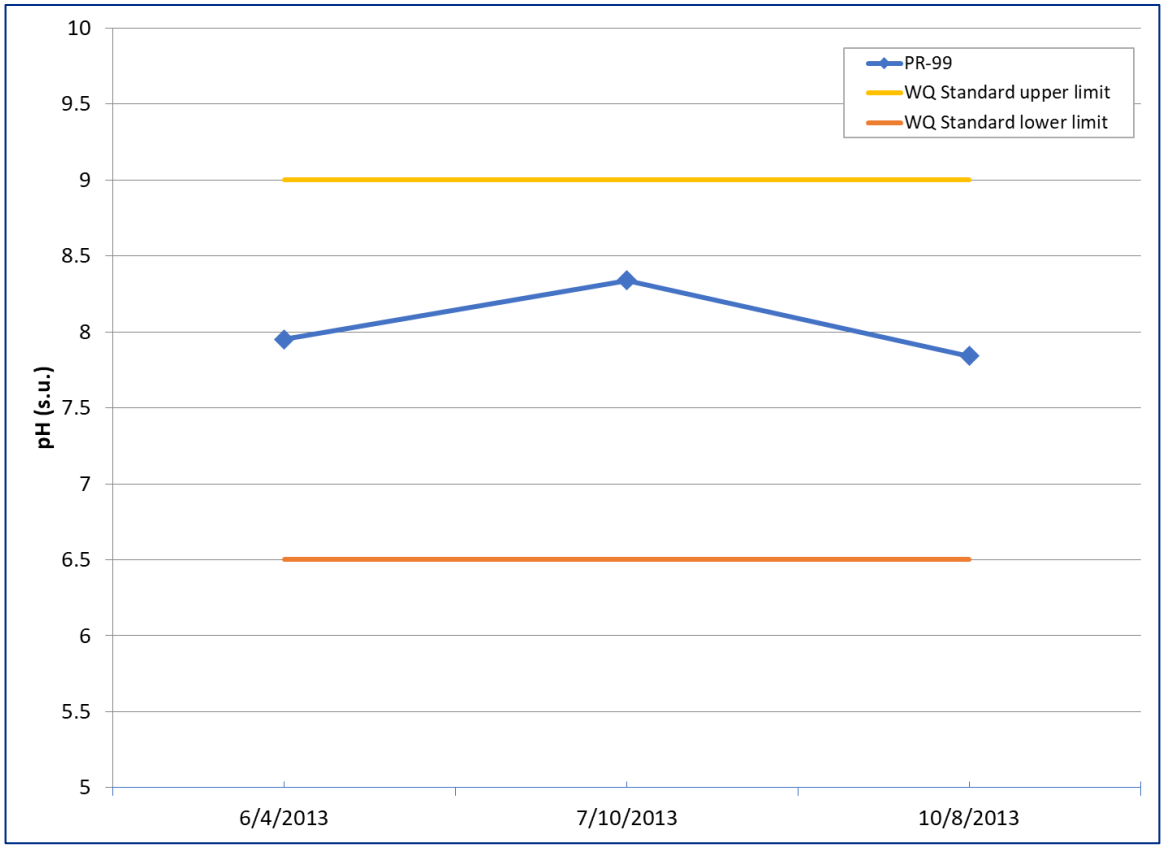

Figure 5-4 pH in Impaired Stream Segment IL_PR-99 of Keith Creek

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[24] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for pH from the 2020/2022 303(d) list. Because of the delisting, TMDL development for pH in Keith Creek did not continue beyond Stage 1.

5.1.1.4 Zinc

Keith Creek segment IL_PR-99 was listed for impairment of aquatic life use because of elevated dissolved zinc concentrations in 2018. **Table 5-4** summarizes historical zinc data for this segment. Both the acute and chronic general use water quality standards for dissolved zinc are calculated standards that vary with the total hardness of the sampled water. The data presented in **Table 5-4** reflect single sample results from the segment compared to the hardness-dependent standard. No exceedances were noted in the dataset for Keith Creek. Three of the six sample results indicate zinc concentrations were below the detection limit of the analytical method employed. For nondetect results, method detection limits were applied. **Figure 5-5** shows the dissolved zinc measurements collected over time on the segment.

[24] Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

Table 5-4 Existing Zinc Data for Keith Creek Segment IL_PR-99

Illinois Water Quality Standard (µg/L)	Period of Record and Number of Data Points	Mean Result (µg/L)	Maximum Result (µg/L)	Minimum Result (µg/L)	Number of Acute Exceedances	Number of Chronic Exceedances
Varies[1]	2008, 2013; 6	2.9[2]	8.8	<0.35[2]	0[2]	0[2]

Notes:

1 The standards are hardness dependent.

2 Method detection limits were applied for nondetect results (half of the samples).

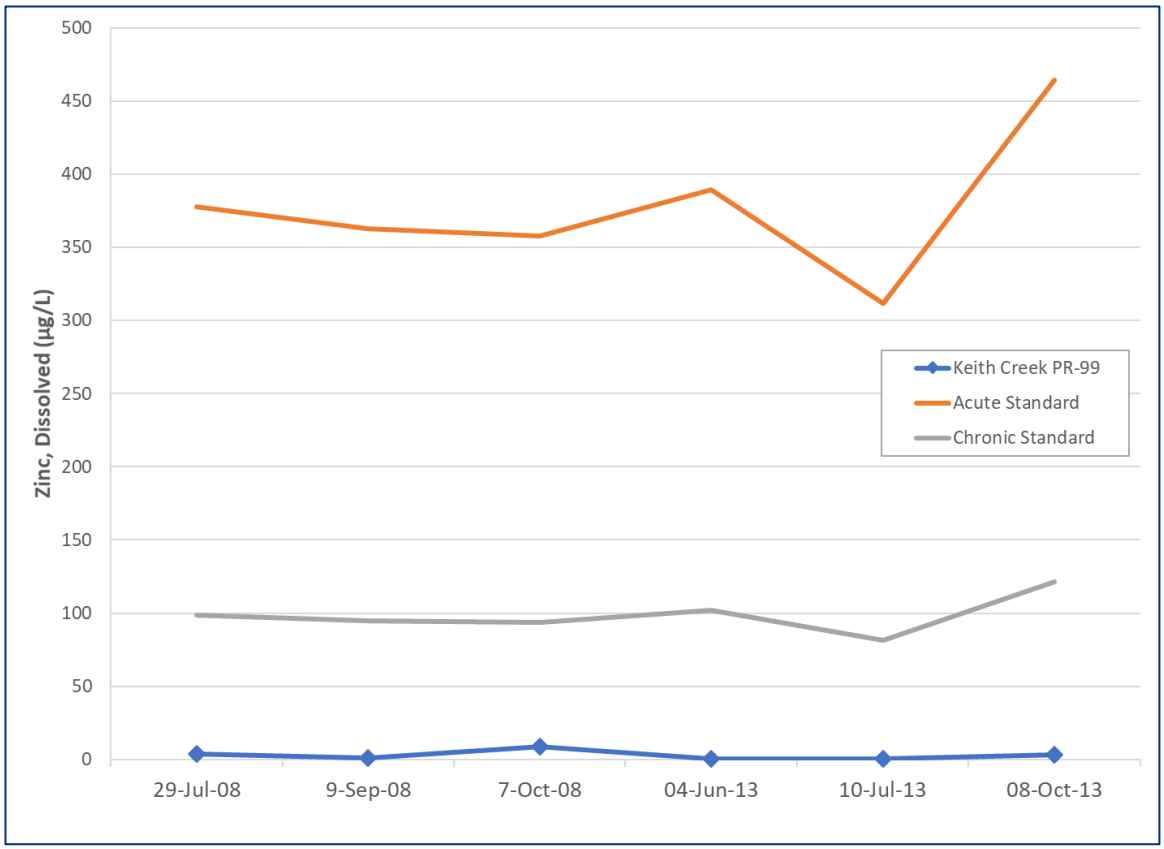

Figure 5-5 Dissolved Zinc in Impaired Stream Segment IL_PR-99 of Keith Creek

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[25] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for zinc from the 2020/2022 303(d) list. Because of the delisting, TMDL development for zinc in Keith Creek did not continue beyond Stage 1.

5.1.2 Pierce Lake Water Quality Data

Pierce Lake is listed for impairment of aesthetic quality use due to elevated TP concentrations. Data are available from three separate water quality monitoring locations within Pierce Lake. The data associated with the impairments in Pierce Lake is presented in **Table 5-5**.

[25] Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

Table 5-5 Data Related to Impairment at Pierce Lake

Pierce Lake Segment IL_RPC; Sample Locations RPC-1, RPC-2, RPC-3		
RPC-1	**Period of Record**	**Number of Samples**
TP	1998, 2001, 2004, 2011, 2016	40

RPC-3		
TP	1998, 2001, 2004, 2011, 2016	19
Dissolved Phosphorus	2001, 2004, 2011, 2016	17
Phosphorus in Bottom Deposits	2001, 2011	2

5.1.2.1 Total Phosphorus in Pierce Lake

The applicable water quality standard for TP in Pierce Lake is 0.05 mg/L. Compliance with the TP standard is assessed using samples collected at a 1-foot depth from the lake surface. The number of samples, count of exceedances, and average TP concentrations at a 1-foot depth for each year of data at each monitoring location in Pierce Lake are summarized in **Table 5-6** and shown on **Figure 5-6**. Based on the dataset, TP concentrations collected at a 1-foot depth in Pierce Lake are consistently above the 0.05 mg/L water quality standard. Annual average phosphorus concentrations at all sampling stations decreased from 2011 to 2016. However, annual average phosphorus data from sampling station RPC-3 are consistently above the 0.05 mg/L water quality standard.

Table 5-6 Total Phosphorus at a 1-Foot[1] Depth in Pierce Lake (IL_RPC)

Station ID	Period of Record and Number of Data Points	Mean Result (mg/L)	Maximum Result (mg/L)	Minimum Result (mg/L)	Number of Exceedances
RPC-1	2001, 2004, 2011, 2016; 13	0.094	0.584	0.026	5
RPC-2	2001, 2004, 2011, 2016; 17	0.053	0.115	0.01	7
RPC-3	2001, 2004, 2011, 2016; 17	0.069	0.128	0.029	12

Note:

[1] Excludes samples from 1998 and 1999 that did not specify the collection depth.

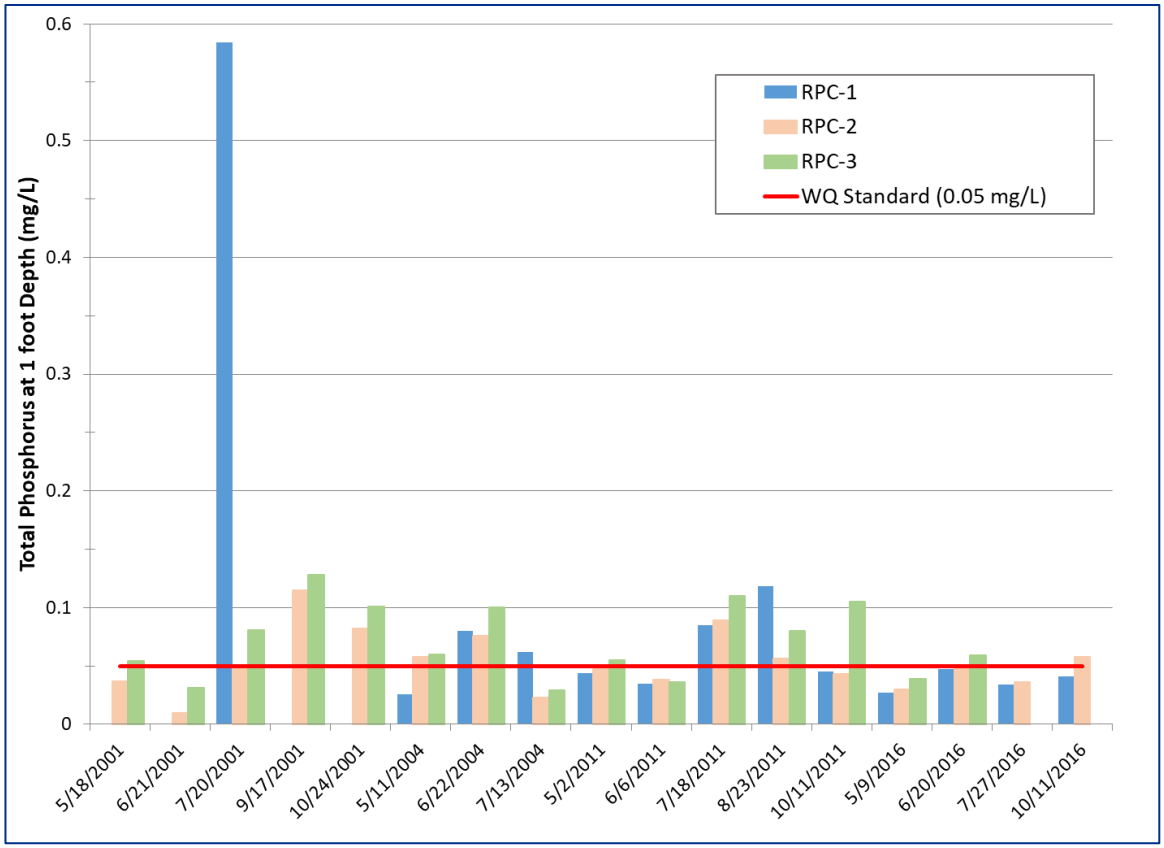

Figure 5-6 Total Phosphorus in Pierce Lake

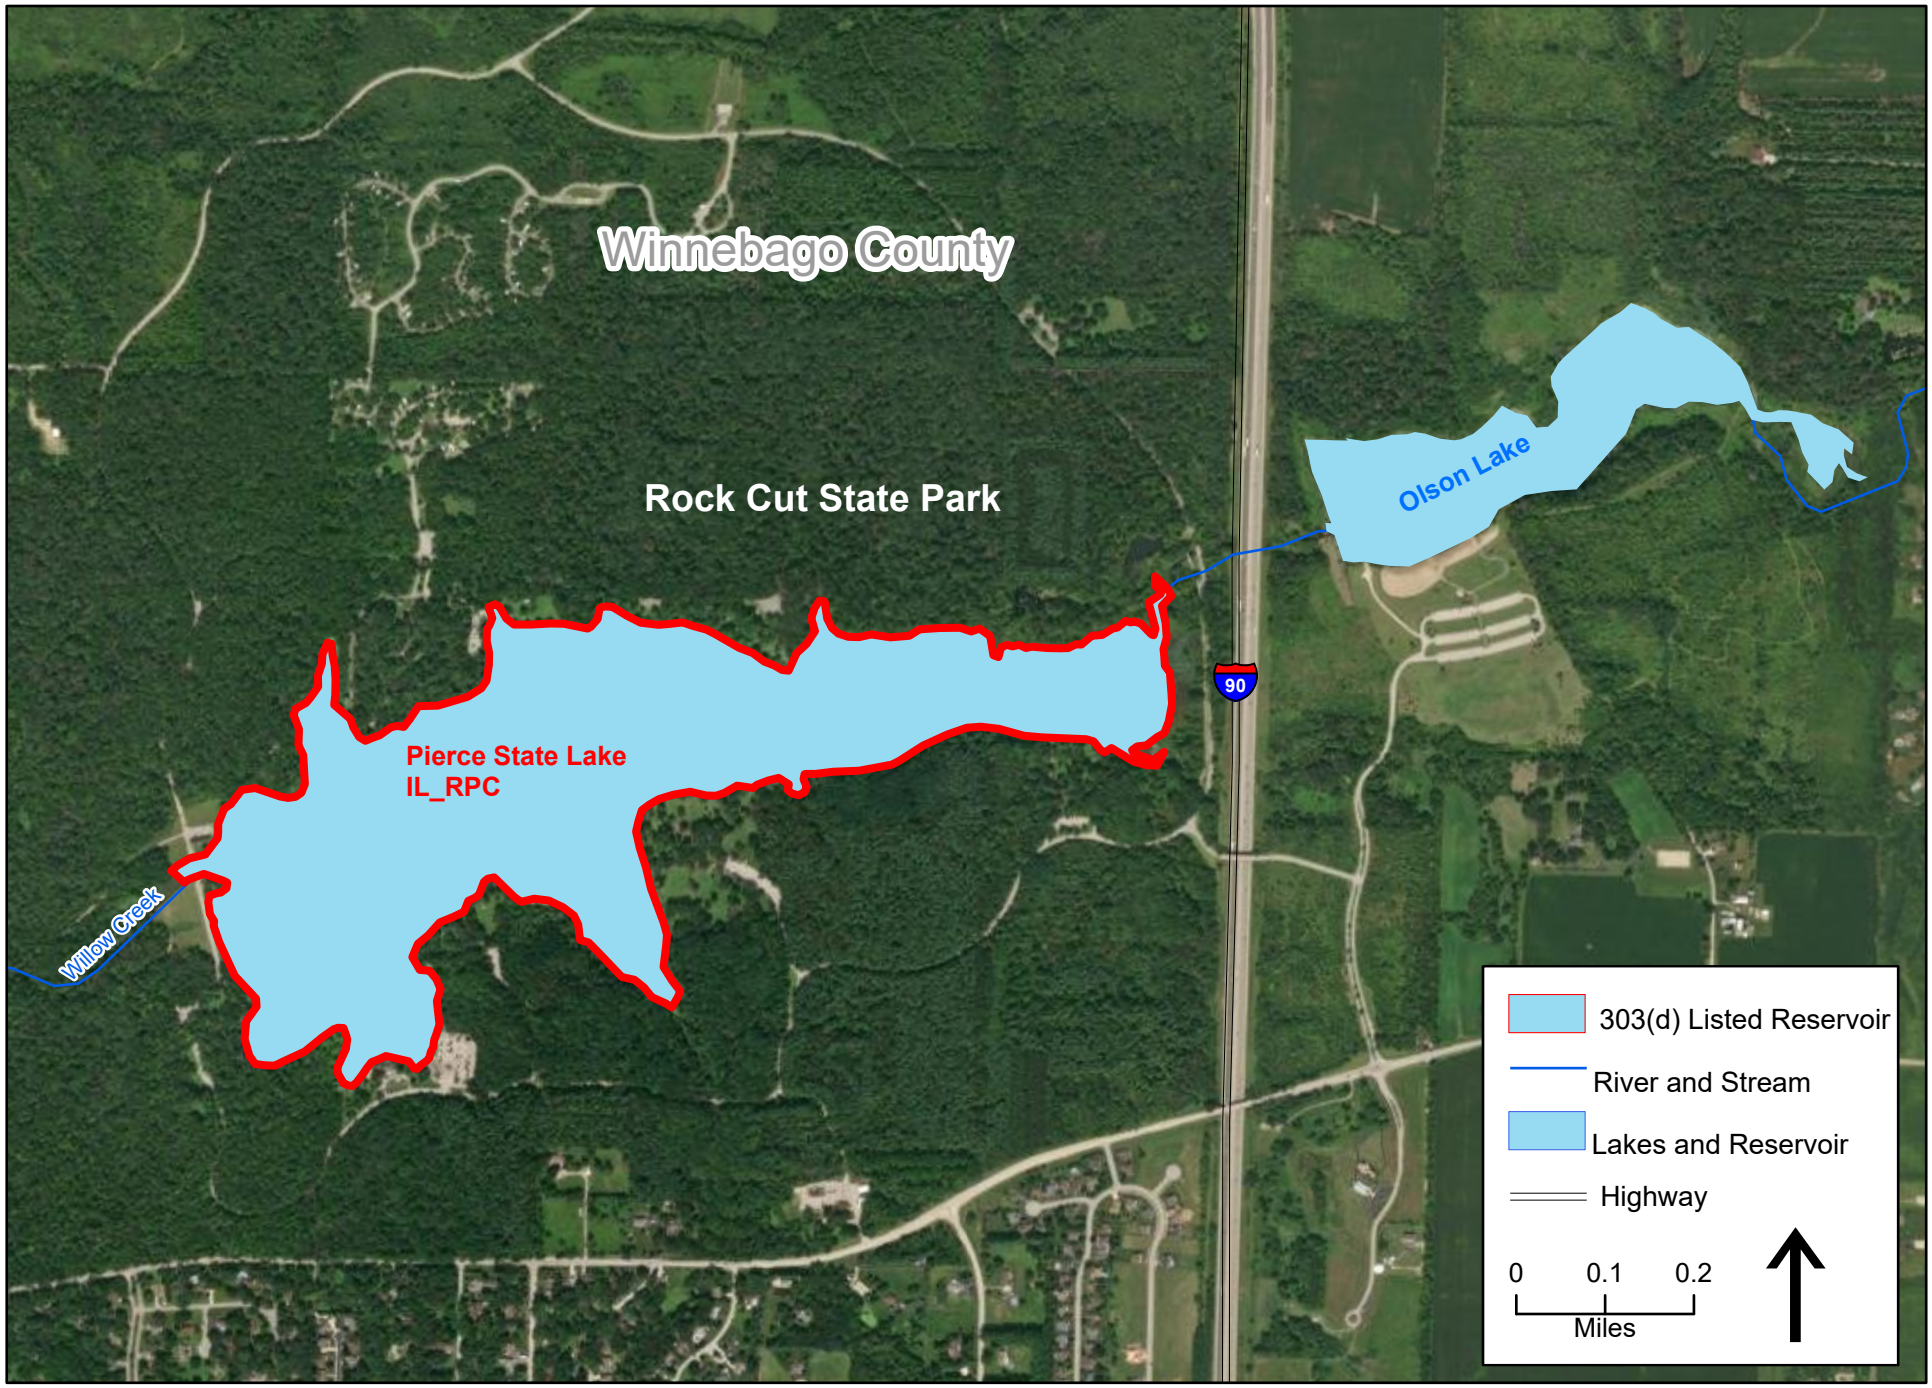
5.2 Lake Characteristics

Pierce Lake is in Winnebago County, approximately 7 miles northeast of Rockford, Illinois. Pierce Lake is fed by Willow Creek, a tributary of the Rock River. As groundwater is the sole source of water supply for Rockford, the city does not use Pierce Lake as a source for its drinking water.

Pierce Lake has a surface area of 157 acres and a reported maximum depth of 36 feet. The overland watershed draining into Pierce Lake is approximately 8,150 acres. The lake is in a park setting and is adjacent to campgrounds and just downstream of Olson Lake (**Figure 5-7**). The areas immediately adjacent to the lake are primarily grass and forest land. Further to the south, west, and northwest of the lake there is low- and medium-density development; the other surrounding areas are primarily farmland. The lake is used for boating and fishing.



DRAFT

CDM Smith

Figure 5-7: Pierce Lake

5.3 Point Sources

Table 5-7 contains permit information for permitted dischargers in the watershed. **Figure 5-8** shows the locations of each facility. Not all facilities within the watershed discharge upstream of impaired segments. In general, facilities discharging treated domestic wastewater have the potential to affect pathogen, metals, and nutrient concentrations in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain metals, nutrients, and/or pathogens. National Pollutant Discharge Elimination System (NPDES) facilities with permit limits are required to submit discharge monitoring reports to Illinois EPA and report effluent flows and concentrations.

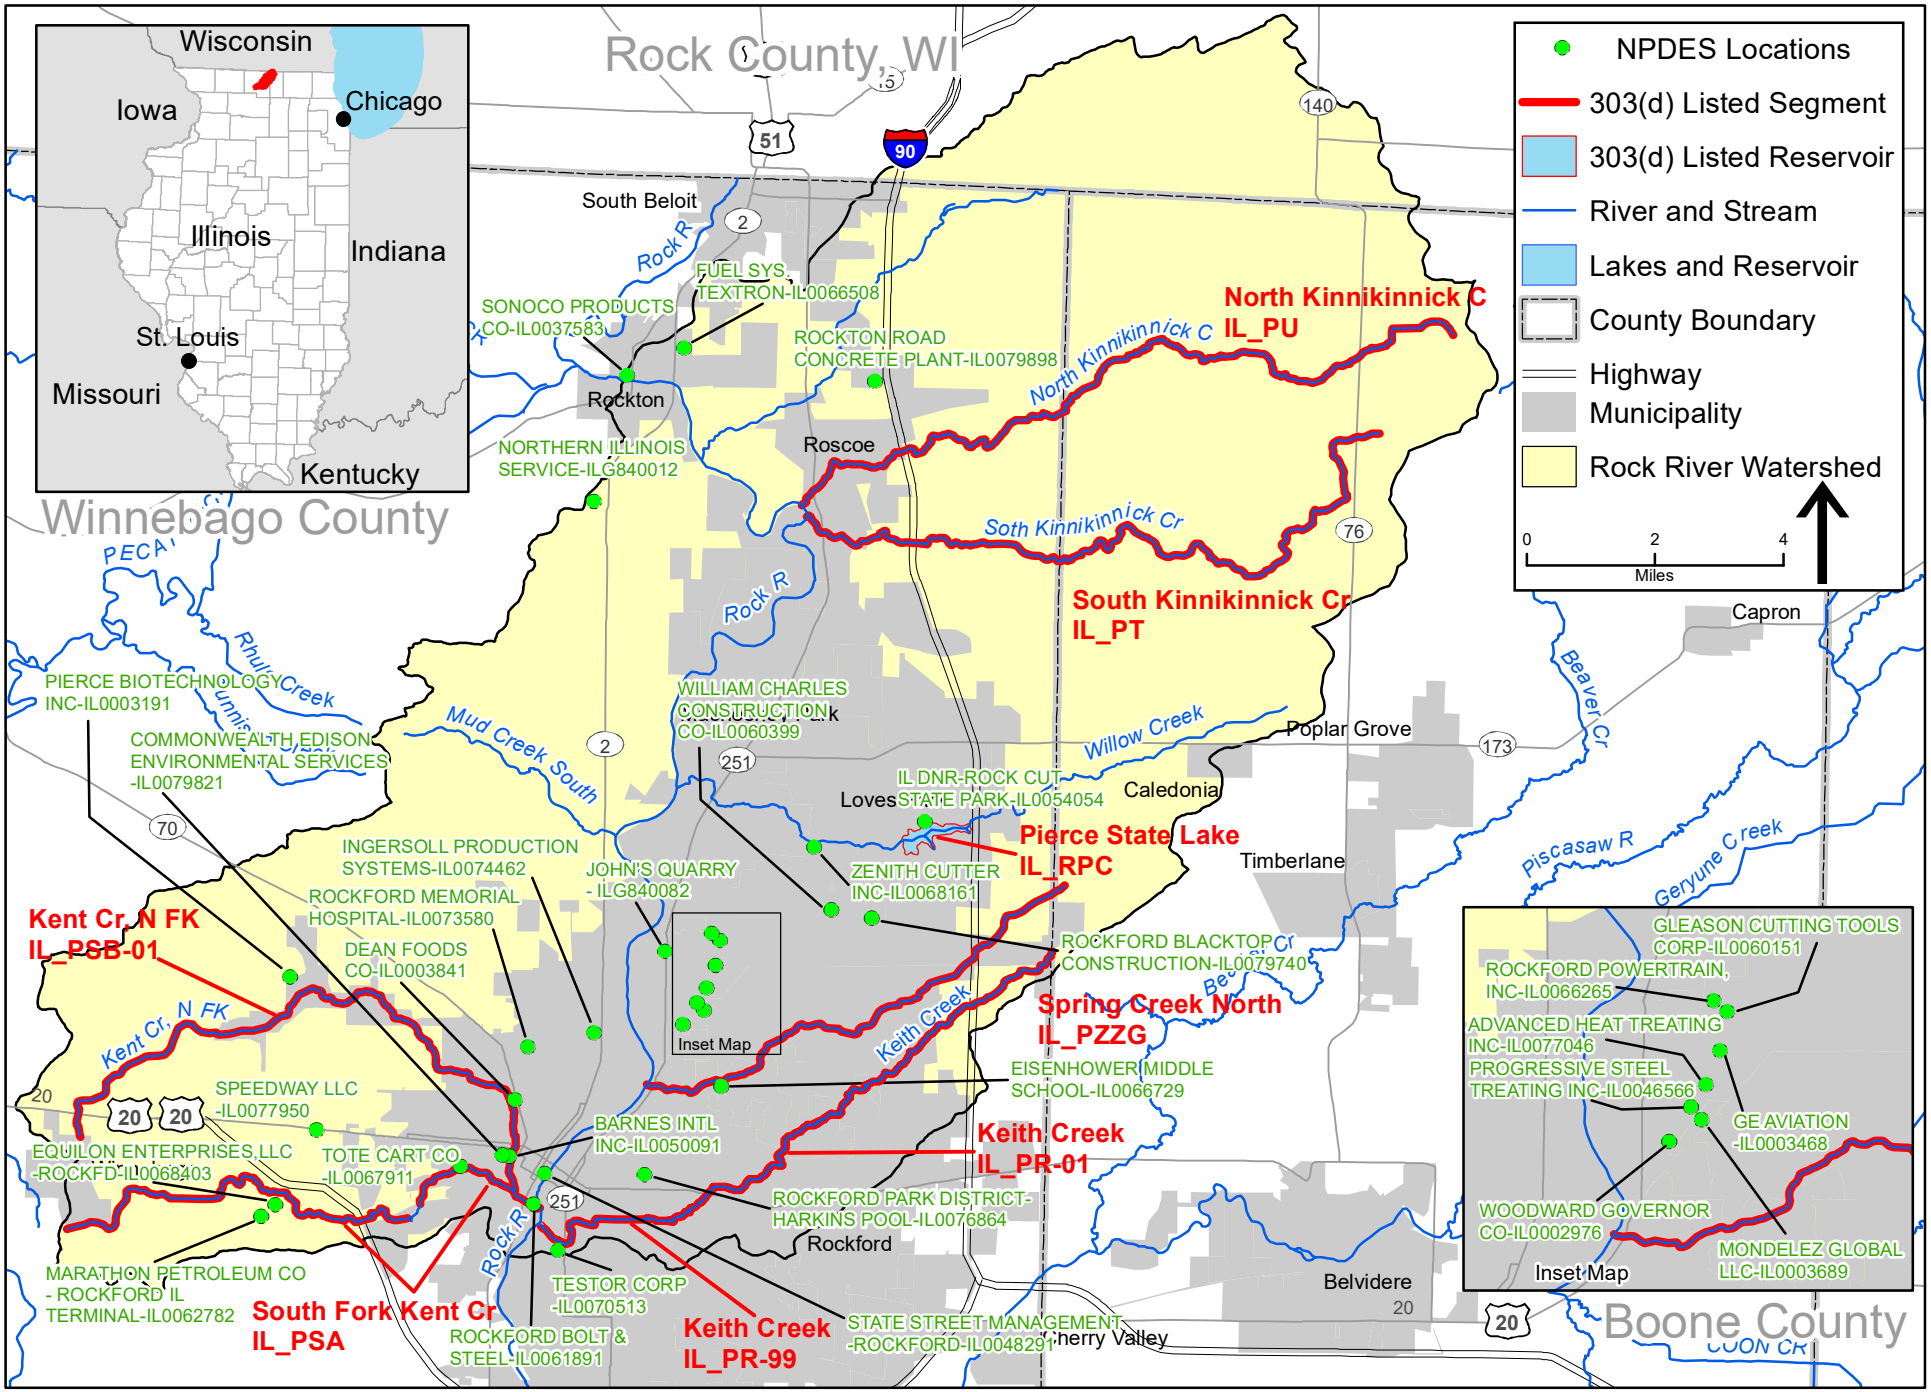
[2] Value represents the total DAF from outfalls 001 through 006.

[3] Permit terminated in 2021.



DRAFT

CDM Smith

Figure 5-8: Rock River/Pierce Lake Watershed NPDES Discharge Locations

Municipal separate storm sewer (MS4) permits within the watershed exist for the areas of Loves Park, Rockford Township, Roscoe Township, and Winnebago County. **Table 5-8** shows the acreage in each subbasin covered by each municipality's MS4 permit. MS4 discharges have the potential to impact impaired segments within the watershed and storm sewers/urban runoff were listed as potential sources of fecal coliform on the 303(d) list. Urban runoff through MS4 systems can contribute fecal coliform from urban animal and pet waste, illicit sewer connections and overflows.

Table 5-8 Subbasin Acres Covered by MS4 Permits in the Rock River/Pierce Lake Watershed

Subbasin	Loves Park	Rockford Township	Winnebago County	Roscoe Township
	ILR400379	ILR400118	ILR400505	ILR400120

North Kinnikinnick Creek Segment IL_PU				1,094
Spring Creek Segment IL_PZZG	629	2,278		

5.4 Nonpoint Sources

There are many potential nonpoint sources of pollutant loading to the impaired segments in the Rock River/Pierce Lake watershed. This section will discuss site-specific cropping practices, animal operations, and area septic systems. Data were collected through communications with the local NRCS, Illinois Soil and Water Conservation Districts (SWCDs), and public health departments.

5.4.1 Crop Information

Approximately 39 percent of the land within the Rock River/Pierce Lake watershed is dedicated to agriculture. Because a portion of the watershed is under cultivation, soil loss from fields is likely a source of sediment and any pollutant attached to the sediment such as nutrients, pathogens, and, potentially, naturally occurring metals. Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. The percentage of each tillage practice for corn, soybeans, and small grains by county are generated from County Transect Surveys by the Illinois Department of Agriculture (IDA).[26] Data from 2015 and 2018 surveys are presented in **Table 5-9** through **Table 5-10** for Boone and Winnebago Counties, respectively. Although Rock County in Wisconsin does not have an IDA Transect Survey, the USDA 2017 Census of Agriculture for Wisconsin indicates that of the 302,797 acres of total crop land in Rock County, 39.6 percent used no till practices in 2017 (compared to 25.5 percent in 2012); 31.7 percent used reduced till practices in 2017 (compared

[26] IDA. 2018. Illinois Soil Conservation Transect Surveys. https://agr.illinois.gov/resources/landwater/illinois-soil-conservation-transect-survey-reports.html

to 36.4 percent in 2012); and 17.0 percent used intensive till practices in 2017 (compared to 26.3 percent in 2012).

Table 5-9 Tillage Practices in Boone County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	44.6%	62.5%	4.7%	10.8%	81.8%	NA
Reduced Till	22.5%	18.7%	24.0%	17.6%	0.0%	NA
Mulch Till	27.9%	15.1%	34.5%	46.6%	0.0%	NA
No Till	5.0%	3.6%	36.8%	25.0%	18.2%	NA

Note: NA – not available (or zero survey data points); however, the 2017 survey indicates that only no till practices were applied for small grain.

Table 5-10 Tillage Practices in Winnebago County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	10.8%	9.6%	1.8%	0.8%	0.0%	0.0%
Reduced Till	39.6%	27.2%	15.9%	10.0%	11.1%	40.0%
Mulch Till	24.3%	29.5%	27.4%	36.4%	88.9%	20.0%
No Till	25.3%	33.7%	54.9%	52.8%	0.0%	40.0%

According to the County Transect Survey Summary Report,[27] fields planted conventionally leave less than 15 percent of the soil surfaced covered with crop residue after planting, while mulch till leaves at least 30 percent of the residue from the previous crop remaining on the soil surface after being tilled and planted. Reduced till falls between conventional and mulch (greater than 15 percent but less than 30 percent), and no till practices leave the soil virtually undisturbed from harvest through planting. Residue is important because it shields the ground from the eroding effects of rain and helps retain moisture for crops.

Information on field drain tile practices was also sought as field drain tiles can influence the timing and amounts of water delivered to area streams and reservoirs and can deliver dissolved nutrients from fields to receiving waters. Local NRCS offices reported that they currently do not keep records on which farms use tile drainage.

5.4.2 Animal Operations

Information on commercial animal operations is available from the NASS. Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals have the potential to increase erosion and contribute nutrients and pathogens through manure. Although watershed-specific data are not available, countywide data for Boone, Rock, and Winnebago

[27] IDA. 2018. Illinois Soil Conservation Transect Survey Reports. https://agr.illinois.gov/content/dam/soi/en/web/agr/resources/landwater/documents/2018-transect-survey-summary-report.pdf

Counties are presented in **Table 5-11** through **Table 5-13**, respectively. Data from 2012 and 2017 have been published on the USDA website.[28,29]

Table 5-11 Boone County, Illinois Animal Population (2012 and 2017 Census of Agriculture)

Livestock Type	2012	2017	Percent Change
Cattle and Calves	5,603	7,040	25.6%
Beef	521	1,141	119.0%
Dairy	1,920	2,424	26.3%
Hogs and Pigs	7,431	6,025	-18.9%
Poultry[1]	1,542[2]	3,277	112.5%
Sheep and Lambs	443	467	5.4%
Horses and Ponies	735	677	-7.9%

Notes:

[1] Poultry census data are inclusive of broilers, layers, pullets, roosters, and turkeys.

[2] No data are available for pullets, broilers, or turkeys; therefore, the percent change may not be accurate.

Table 5-12 Rock County, Wisconsin Animal Population (2012 and 2017 Census of Agriculture)

Livestock Type	2012	2017	Percent Change
Cattle and Calves	45,897	55,784	21.5%
Beef	3,149	4,267	35.5%
Dairy	17,432	19,182	10.0%
Hogs and Pigs	12,884	18,176	41.1%
Poultry[1]	9,272	5,129	-44.7%
Sheep and Lambs	2,878	3,311	15.0%
Horses and Ponies	2,309	1,610	-30.3%

Note:

[1] Poultry census data are inclusive of broilers, layers, pullets, roosters, and turkeys.

Table 5-13 Winnebago County, Illinois Animal Population (2012 and 2017 Census of Agriculture)

Livestock Type	2012	2017	Percent Change
Cattle and Calves	11,556	12,333	6.7%
Beef	1,375	1,730	25.8%
Dairy	2,392	2,700	12.9%
Hogs and Pigs	4,807	3,550	-26.1%
Poultry[1]	4,339	3,036	-30.0%
Sheep and Lambs	512	588	14.8%
Horses and Ponies	1,241	871	-29.8%

Note:

[1] Poultry census data are inclusive of broilers, layers, pullets, roosters, and turkeys.

Table 5-11 through **Table 5-13** show significant cattle, hog, and pig populations within the watershed counties. No concentrated animal feeding operations (CAFOs) were listed for Boone or

[28] NASS. 2019. 2017 Census of Agriculture, Illinois State and County Data. https://www.nass.usda.gov/Publications/AgCensus/2017/Full_Report/Volume_1, Chapter_2_County_Level/Illinois/

[29] NASS. 2014. 2012 Census of Agriculture, Illinois State and County Data. https://agcensus.library.cornell.edu/census_parts/2012-illinois/

Winnebago Counties under the general NPDES permit for CAFOs in Illinois (NPDES Permit No. ILA01),[30] and there are no documented CAFOs within the watershed.

5.4.3 Septic Systems

Most households in rural areas of Illinois that are not connected to municipal sewers make use of on-site sewage disposal systems or septic systems. There are several types of septic systems, but the most common is composed of a septic tank draining to a septic field, where nutrient removal occurs. The degree of nutrient removal is limited by local soils and the extent of system upkeep and maintenance. Across the United States, septic systems have been found to be a significant source of phosphorus pollution.

Information on the extent of sewered and nonsewered municipalities in the Rock River/Pierce Lake watershed was obtained from the county health departments. The Boone County Health Department in Illinois was contacted and a response regarding properties with private septic systems is pending. Additionally, the Winnebago County Health Department in Illinois stated that it does not have a method for geographically searching for septic systems and provided countywide private septic system installations for 2015 to 2018. Health department officials in Rock County, Wisconsin, stated that other than areas within the City of Beloit, properties within the watershed area in Rock County likely rely on private septic systems with a nearly one-to-one relationship between houses and private septic systems. Rock County, however, represents only a small portion of the watershed area.

5.4.4 Internal Phosphorus Loading in Lakes

An additional potential nonpoint source of pollutants for Pierce Lake is in-lake sediments. Nutrients can be bound to soils and as soils erode throughout the drainage area, they accumulate at the bottom of receiving lakes. Internal phosphorus loading can occur when the water above the sediments becomes anoxic, causing the release of phosphorus from the sediment in a form that is available for plant uptake. The addition of bioavailable phosphorus in the water column stimulates more plant growth and die-off, which may perpetuate or create anoxic conditions and enhance the subsequent release of phosphorus into the water. Internal phosphorus loading can also occur in shallow lakes through release from sediments by the physical mixing and reintroduction of sediments into the water column as a result of wave action, winds, boating activity, and other means.

5.5 Watershed Studies and Other Watershed Information

Previous efforts completed within the watershed are listed below. Reports have been reviewed and incorporated into Stage 3 where appropriate and relevant.

1996 – ISWS Miscellaneous Publication 174, *Rock River Basin: Historical Background, Illinois EPA Targeted Watersheds, and Resource-Rich Areas*, April 1996 – The report notes that in 1971, the Wisconsin Department of Natural Resources' Environmental Protection Division indicated that streams within the Wisconsin portion of the Rock River basin receive organic wastes from treated sewage and industrial wastes. In 1994, ISWS reported decreasing nitrate-nitrogen levels in the

[30] Illinois EPA. 2009. NPDES Permit No. ILA01. https://epa.illinois.gov/content/dam/soi/en/web/epa/documents/water/permits/cafo/general-npdes-permit.pdf

basin, which may be because of improved agricultural practices and reduced septic tank use by lakefront communities.[31]

2002 – The Rockford Park District, through a grant from Illinois Department of Natural Resources (IDNR) Conservation 2000 Program, performed an assessment of the morphology, hydrology, aquatic biota, and community use potential of the North Fork of Kent Creek. A copy of the report was provided to Illinois EPA during the Stage 1 public meeting.

2006 – *Illinois EPA Rock River Basin Assessment*, March 2006 – The report identified the phosphorus impairment in Pierce Lake, although none of the other impaired stream segments were identified in the report. Illinois EPA determined that the Rock River and associated tributaries in Winnebago County do not support the designated water uses of swimming and fish consumption. Grant funds were awarded to the City of Rockford to supplement a joint project between the city, Illinois EPA, the Rock River Water Reclamation District, and other Winnebago County communities. The project began in 2003.[32]

2008 – Baetis Environmental performed a watershed modeling study for South Kinnikinnick Creek and North Fork Kent Creek for the Winnebago County Forest Preserve District. The study was funded through a grant from IDNR under the Conservation 2000 Program. The grant was administered on behalf of the Upper Rock River Ecosystem Partnership. A copy of the draft report was provided to Illinois EPA during the Stage 1 public meeting.

2019 – Olson Ecological Solutions' *South Fork Kent Creek Watershed Resource Inventory*, December 2019 – The report identifies the fecal coliform impairment for South Fork Kent Creek. Olson Ecological Solutions performed an evaluation of riparian buffer conditions, erosion rates, and channelization throughout the South Fork Kent Creek subwatershed. Surveys were performed in late October and early November 2019 along approximately 22,000 feet of stream segments for South Fork Kent Creek and its tributaries. About 57 percent of the surveyed segments were found to have poor riparian conditions, 42 percent good condition, and 3 percent fair condition. Streambank erosion was also noted for surveyed stream segments. Mapping and modeling efforts identified low-intensity developed areas as a significant source for bacteria pollutants in the subwatershed.[33]

Section 6

Approach to Developing Total Maximum Daily Loads and Identifying Data Needs

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass-balance, load duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches and therefore these are the analyses recommended for the Rock River/Pierce Lake watershed. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL. As discussed above, this link can be established through a variety of techniques. The remainder of this section recommends approaches for establishing these links for the constituents of concern in the Rock River/Pierce Lake watershed.

6.1 Additional Data Needs for Total Maximum Daily Load Development in the Rock River/Pierce Lake Watershed

Table 6-1 summarizes information regarding data availability for all impairments to be addressed by TMDLs in the Rock River/Pierce Lake watershed. The datasets for fecal coliform and/or phosphorus impairments on Keith Creek, North Fork Kent Creek, South Fork Kent Creek, North Kinnikinnick Creek, South Kinnikinnick Creek, Spring Creek – North, and in Pierce Lake are generally sufficient for basic TMDL calculations and model development. Additional data collection is not needed for impairment confirmation for the remaining parameters listed for Keith Creek (PR-99) because these parameters have been removed from the 2020/2022 303(d) list and TMDL development did not progress beyond Stage 1 investigations.

Table 6-1 Data Availability for Total Maximum Daily Load Development in the Rock River/Pierce Lake Watershed

Impaired Segment	Impairment Parameter	Period of Record	Data Count	Additional Data Needs
Keith Creek (IL_PR-01)	Fecal Coliform	2019	5	None
Keith Creek (IL_PR-99)	Fecal Coliform	2019	5	None
	Arsenic[1]	2008, 2013	6	**None – parameter removed from 2020/2022 303(d) list**
	pH[1]	2013	3	**None – parameter removed from 2020/2022 303(d) list**
	Zinc[1]	2008–2013	3	**None – parameter removed from 2020/2022 303(d) list**
North Fork Kent Creek (IL_PSB-01)	Fecal Coliform	1985, 2019	8	None
South Fork Kent Creek (IL_PSA-01)	Fecal Coliform	2019	5	None
North Kinnikinnick Creek (IL_PU-03)	Fecal Coliform	2019	5	None

Impaired Segment	Impairment Parameter	Period of Record	Data Count	Additional Data Needs
South Kinnikinnick Creek (IL_PT-01)	Fecal Coliform	2019	5	None
Spring Creek – North (IL_PZZG-03)	Fecal Coliform	2019	5	None
Pierce Lake (IL_RPC)	TP	1998–2004	43	None

Note:

[1] **These parameters were included on the 2018 303(d) list when this TMDL report was initiated. The parameters have since been removed from the 2020/2022 303(d) list.**

6.2 Approaches for Developing Total Maximum Daily Loads for Stream Segments

The recommended approach for developing TMDLs for fecal coliform in streams in the Rock River/Pierce Lake watershed is the load duration curve (LDC) method. The LDC methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a water body.

6.3 Approach for Developing Total Maximum Daily Load for Pierce Lake

Pierce Lake is listed for impairment of the aesthetic quality use because of elevated TP concentrations. The BATHTUB model[34] is typically recommended for TMDL development for lake and reservoir impairments such as those in Pierce Lake. The BATHTUB model performs steady-state water and nutrient balance calculations in a spatially segmented hydraulic network that accounts for advective and diffusive transport, and nutrient sedimentation. The model relies on empirical relationships to predict lake trophic conditions and subsequent DO conditions as functions of TP and nitrogen loads, residence time, and mean depth. Oxygen conditions in the model are simulated as meta- and hypolimnetic depletion rates, rather than explicit concentrations. Watershed loadings to the lakes will be estimated using event mean concentration data, precipitation data, and estimated flows within the watershed.

Another option for the TP TMDL for Pierce Lake is CDM Smith's Simplified Lake Analysis Model (SLAM). SLAM was developed specifically to address an identified need for a practical and low-cost water quality model focused on lake eutrophication that could be easily and simply applied in planning studies by a wide range of end-users. The model was originally developed as an enhanced version of the BATHTUB model and retains many of the core algorithms of that model.

SLAM calculates lake mass and flow balances on a daily time step assuming one or more well-mixed lake zones. Each zone follows the conceptual model, often referred to as a continuously stirred tank reactor, whereby complete and immediate mixing is assumed for each zone in both the vertical and horizontal directions. The model targets the key parameters important for eutrophic lakes: phytoplankton (as chlorophyll a), phosphorus (P), and nitrogen (N), and can be

[34] Walker, W.W. 1996. Software for Eutrophication Assessment and Prediction: FLUX, PROFILE, BATHTUB. http://www.wwwalker.net/bathtub/

easily modified to aid in assessment of unrelated conservative parameters such as total suspended solids (TSS).

SLAM also includes a state-of-the-art dynamic sediment nutrient flux module. This module calculates internal nutrient loads from the sediments to the water column as a function of shallow sediment nutrient dynamics and diffusive exchanges between sediment pore water and the overlying water column. Internal nutrient loads are a key component of many eutrophic lakes, particularly small and/or shallow lakes with large catchment areas. The inclusion of dynamic and rigorous sediment nutrient calculations within a practical planning level water quality model distinguishes SLAM from most other published lake water quality models and is a particularly appealing feature for this application.

Section 7

Methodology Development for Load Reduction Calculations in the Rock River/Pierce Lake Watershed

7.1 Methodology Overview

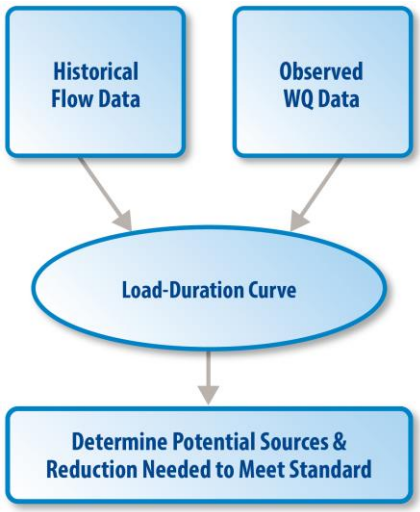
Table 7-1 contains information on the methodologies selected and used to develop TMDLs for impaired segments within the Rock River/Pierce Lake watershed.

Table 7-1 Methodologies Used to Develop Calculated Reduction Goals in the Rock River/Pierce Lake Watershed

Segment ID	Segment Name	Cause of Impairment	Methodology
IL_PR-99	Keith Creek	Fecal Coliform	LDC TMDL
IL_PR-01	Keith Creek	Fecal Coliform	LDC TMDL
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	LDC TMDL
IL_PSA-01	South Fork Kent Creek	Fecal Coliform	LDC TMDL
IL_PU-03	North Kinnikinnick Creek	Fecal Coliform	LDC TMDL
IL_PT-01	South Kinnikinnick Creek	Fecal Coliform	LDC TMDL
IL_PZZG-03	Spring Creek – North	Fecal Coliform	LDC TMDL
IL_RPC	Pierce Lake	TP	SLAM TMDL

7.1.1 Load Duration Curve Overview

A LC analysis was performed for fecal coliform in the impaired segments through the development of LDCs. An LDC is developed to show a graphical representation of the maximum load of a pollutant that a stream segment can assimilate over a range of flow scenarios while still meeting the instream water quality standard. As discussed in Section 4 of this report, assessment of fecal coliform data against the water quality standard is based on the geometric mean of a minimum of five samples collected in a 30-day period. Because of limited data, and as a conservative measure, individual sample values are shown on the LC curves and used to calculate the load reductions needed.



7.1.2 Simplified Lake Assessment Model (SLAM) Overview

Historically, the BATHTUB model has been a commonly used tool for simplified assessments of nutrient (TP, ammonia) and nutrient-related impairments (chlorophyll a, pH, DO) in lakes. However, the BATHTUB model may not be the most efficient approach to developing this type of TMDL as it does not provide explicit modeling of the major lake and sediment interactions that

are important drivers of nutrient issues in Pierce Lake. The BATHTUB model also relies on a dated platform that is less user friendly than other options and is primarily setup to model nutrient fate and transport on an annual basis. While annual time step models have their place, they can often miss important seasonal dynamics that drive lake water quality.

As an alternative to BATHTUB, CDM Smith's SLAM software was used to develop the TMDL for the TP impairment in Pierce Lake. SLAM calculates lake mass and flow balances on a daily time step, assuming one or more well-mixed lake zones. Each zone follows the conceptual model often referred to as a ”continuously stirred tank reactor", whereby complete and immediate mixing is assumed for each zone in both the vertical and horizontal directions. This assumption makes the model well suited for Pierce Lake, which is generally well-mixed and can justifiably be divided into a limited number of small zones.

SLAM also includes a state-of-the-art dynamic sediment nutrient flux module. This module calculates internal nutrient loads from the sediments to the water column as a function of shallow sediment nutrient dynamics and diffusive exchanges between sediment pore water and the overlying water column. Internal nutrient loads are a key component of many eutrophic lakes, particularly small and/or shallow lakes with large catchment areas, as is the case with Pierce Lake.

7.2 Methodology Development – Load Duration Curves

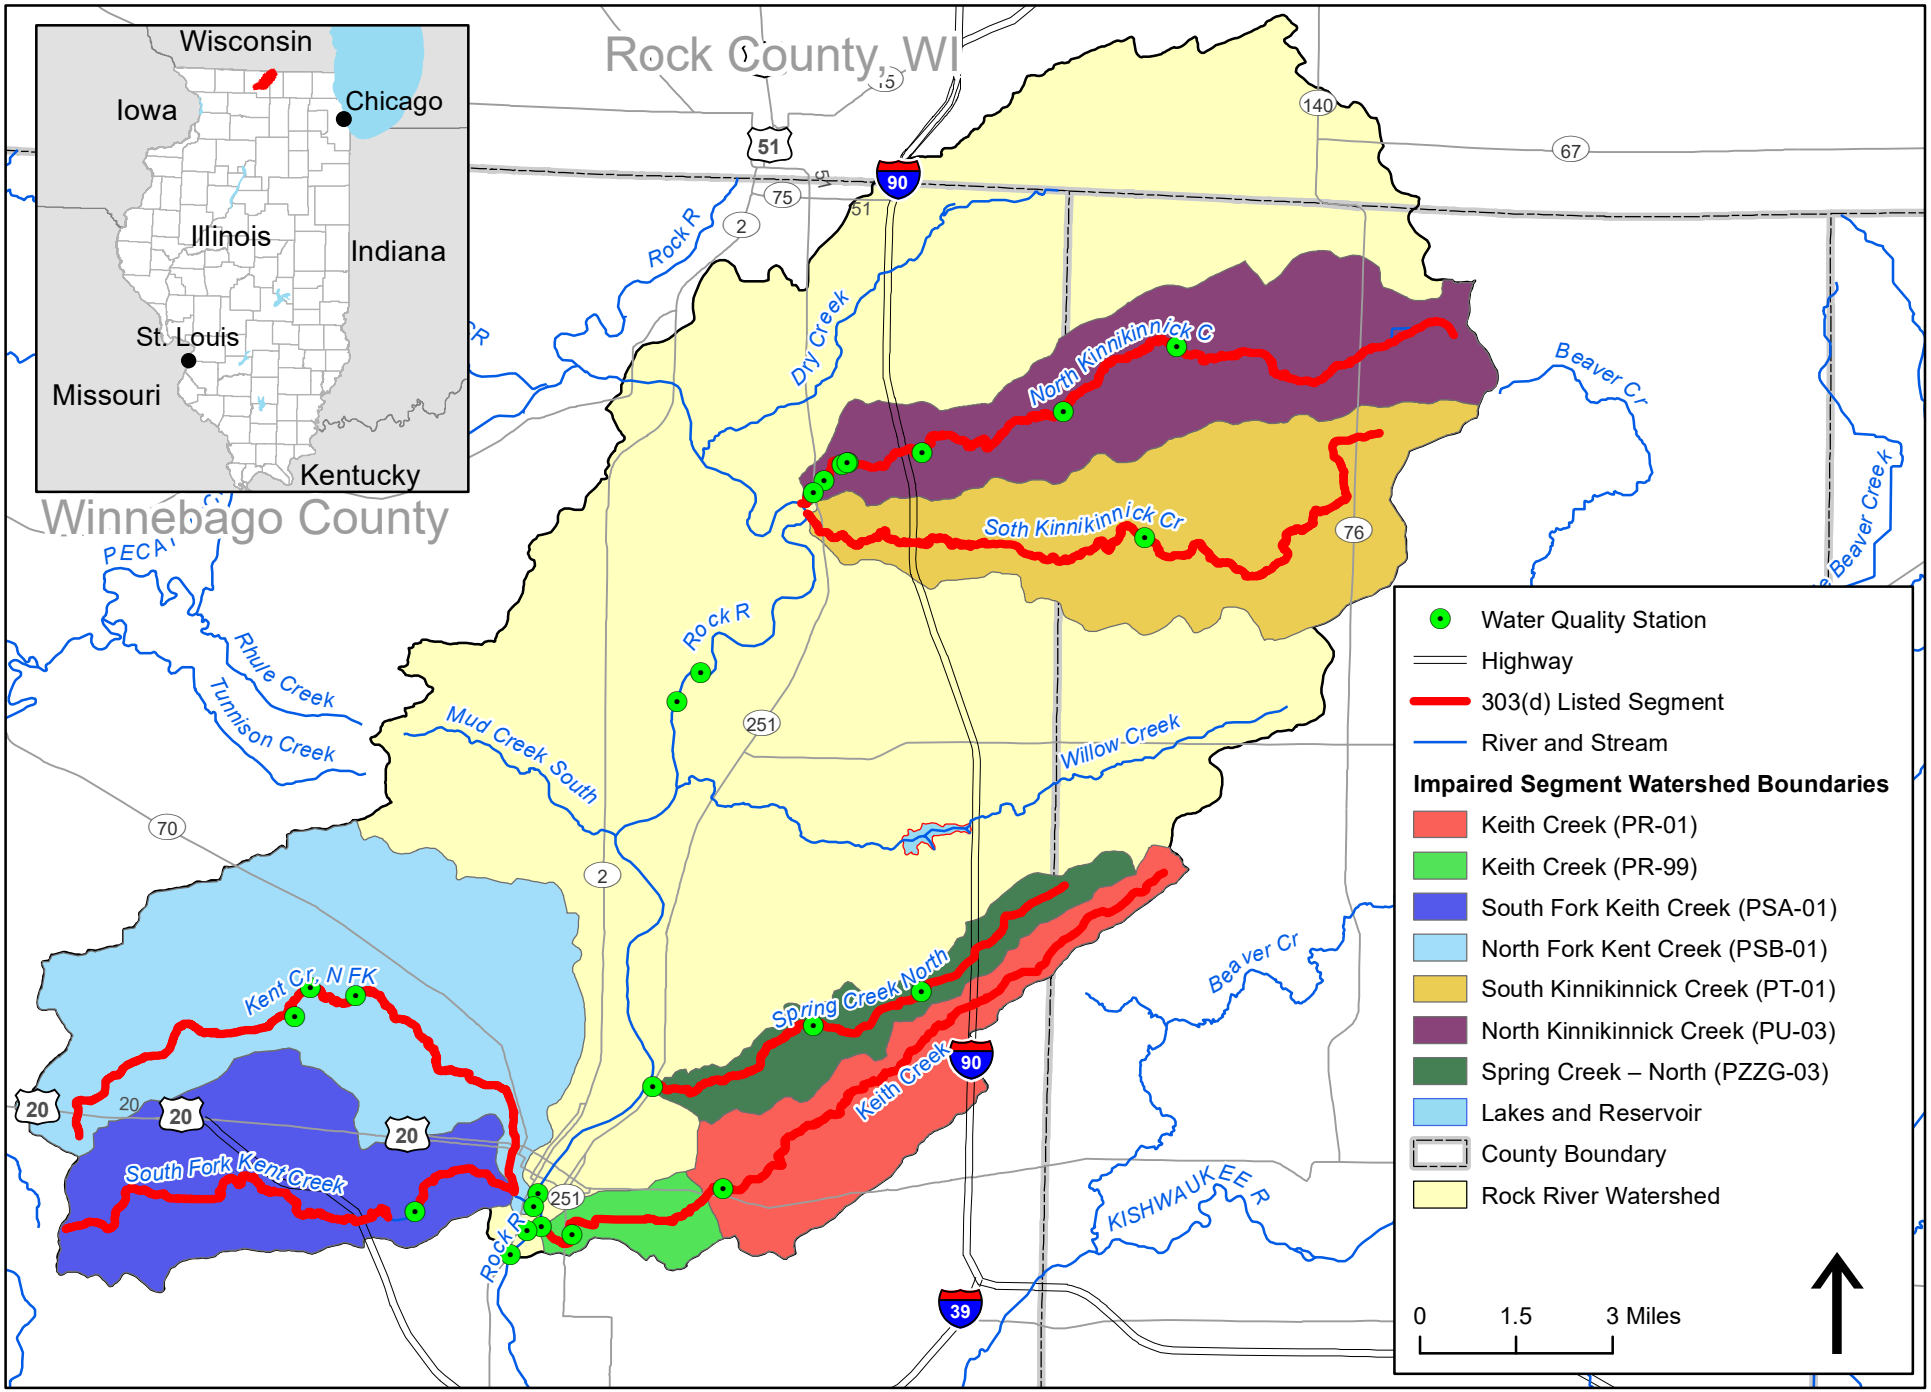
LDCs are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. This approach was used to characterize the current loading of fecal coliform for the impaired segments within the Rock River/Pierce Lake watershed.

7.2.1 Watershed Delineation and Flow Estimation

Watersheds contributing directly to the impaired stream segments at the data collection stations were delineated with GIS analyses through use of elevation data, as discussed in Section 2.2. The watershed delineations result in the following estimates of directly contributing subbasin areas used for each impaired segment’s LDC development:

- Keith Creek IL_PR-99: 13.8 square miles
- Keith Creek IL_PR-01: 11.3 square miles
- North Fork Kent Creek IL_PSB-01: 30.4 square miles
- South Fork Kent Creek IL_PSA-01: 15.7 square miles
- North Kinnikinnick Creek IL_PU-03: 20.2 square miles
- South Kinnikinnick Creek IL_PT-01: 21.2 square miles
- Spring Creek – North IL_PZZG-03: 6.4 square miles

Figure 7-1 shows the location of the water quality stations on each segment and the boundaries of the GIS-delineated watersheds.



DRAFT

Figure 7-1: Watershed Boundaries and Water Quality Sampling Locations for Impaired Stream Segments within the Rock River/Pierce Lake Watershed

CDM Smith

Flow data corresponding to each water quality sample is needed to create an LDC. As discussed in Section 2.6.2, there were three active USGS stream gages in the Rock River/Pierce Lake watershed. However, all three of the active gages in the watershed are on the mainstem of the Rock River and have very large contributing areas (greater than 6,000 square miles), whereas the impaired basins within the watershed have much smaller drainage areas (less than 50 square miles). More accurate subbasin flows were estimated using a surrogate gage in a nearby subbasin with a similar drainage area (78 square miles) and land use characteristics as the impaired segments. The South Branch Kishwaukee River at Dekalb, Illinois gage (05437500) was used as the surrogate gage to estimate stream flows for the impaired stream segments within the Rock River/Pierce Lake watershed using the drainage area ratio method.

Data downloaded through USGS for the surrogate gage from 1990 to 2021 were adjusted to account for point source influences in the watershed upstream of the gaging station. Average daily flows from all NPDES permitted facilities upstream of the surrogate USGS gage were subtracted from the gaged flow prior to flow per unit area calculations. The resulting estimates account for flows associated with precipitation and overland runoff only. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Rock River/Pierce Lake watershed were then added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment. Spreadsheets used for the area ratio flow calculations are provided in **Appendix E**.

7.2.2 Fecal Coliform Load Duration Curves

The general use water quality standard for fecal coliform states that the standard of 200 cfu/100 mL shall not be exceeded by the geometric mean of at least five sample results, nor can 10 percent of the samples collected exceed 400 cfu/100 mL in protected waters, except as provided in 35 Illinois Administrative Code 302.209(b). Fecal coliform concentration data for the Rock River/Pierce Lake impaired segments obtained during TMDL development were paired with the corresponding flows for the sampling dates and plotted against the LDC, representing the most restrictive instream standard of 200 cfu/100 ml.

Figure 7-2 through **Figure 7-8** show the 200 cfu/100 ml LDC for the impaired segments within the watershed as a solid blue line, and the observed pollutant loads as points on the graph. **Appendix E** contains the spreadsheets used for the calculation of fecal coliform LDCs for impaired segments within the Rock River/Pierce Lake watershed.

7.3 Methodology Development – Simplified Lake Assessment Model

SLAM relies on the following primary categories of inputs:

- Model segmentation: number of geographically distinct segments of a lake to be modeled, flow direction, and an estimate of longitudinal dispersion between segments.
- Lake morphology and hydraulics: surface area, average and maximum depth, volume, inflows, mixing lengths, thermal stratification.
- Watershed inflows: dynamic or steady loads and flows to the lake from the draining watershed.
- In-lake nutrients dynamics: initial water column concentrations, particulate phosphorus nutrient settling velocities, dissolved nutrient uptake rates, and settled nutrient burial fractions. Note that seasonality factors may be included to account for expected variations in settling velocity and nutrient uptake.
- Sediment layer dynamics: sediment characteristics and kinetic rates used for calculating nutrient fluxes.

Input parameters specific to the Pierce Lake model are described in the section that follows. Model documentation can be found in **Appendix F**.

7.3.1 Pierce Lake Model Construction

A numerical model of Pierce Lake phosphorus dynamics was constructed, using SLAM, to quantify a TMDL for the lake. The constructed model simulates a recent 11-year period (2010 to 2020) with a daily time step. The model was roughly calibrated using site-specific data and subsequently applied to calculate a total load reduction required to achieve the TMDL target. The TMDL target for TP in Pierce Lake is 0.05 mg/L.

7.3.1.1 Model Segmentation

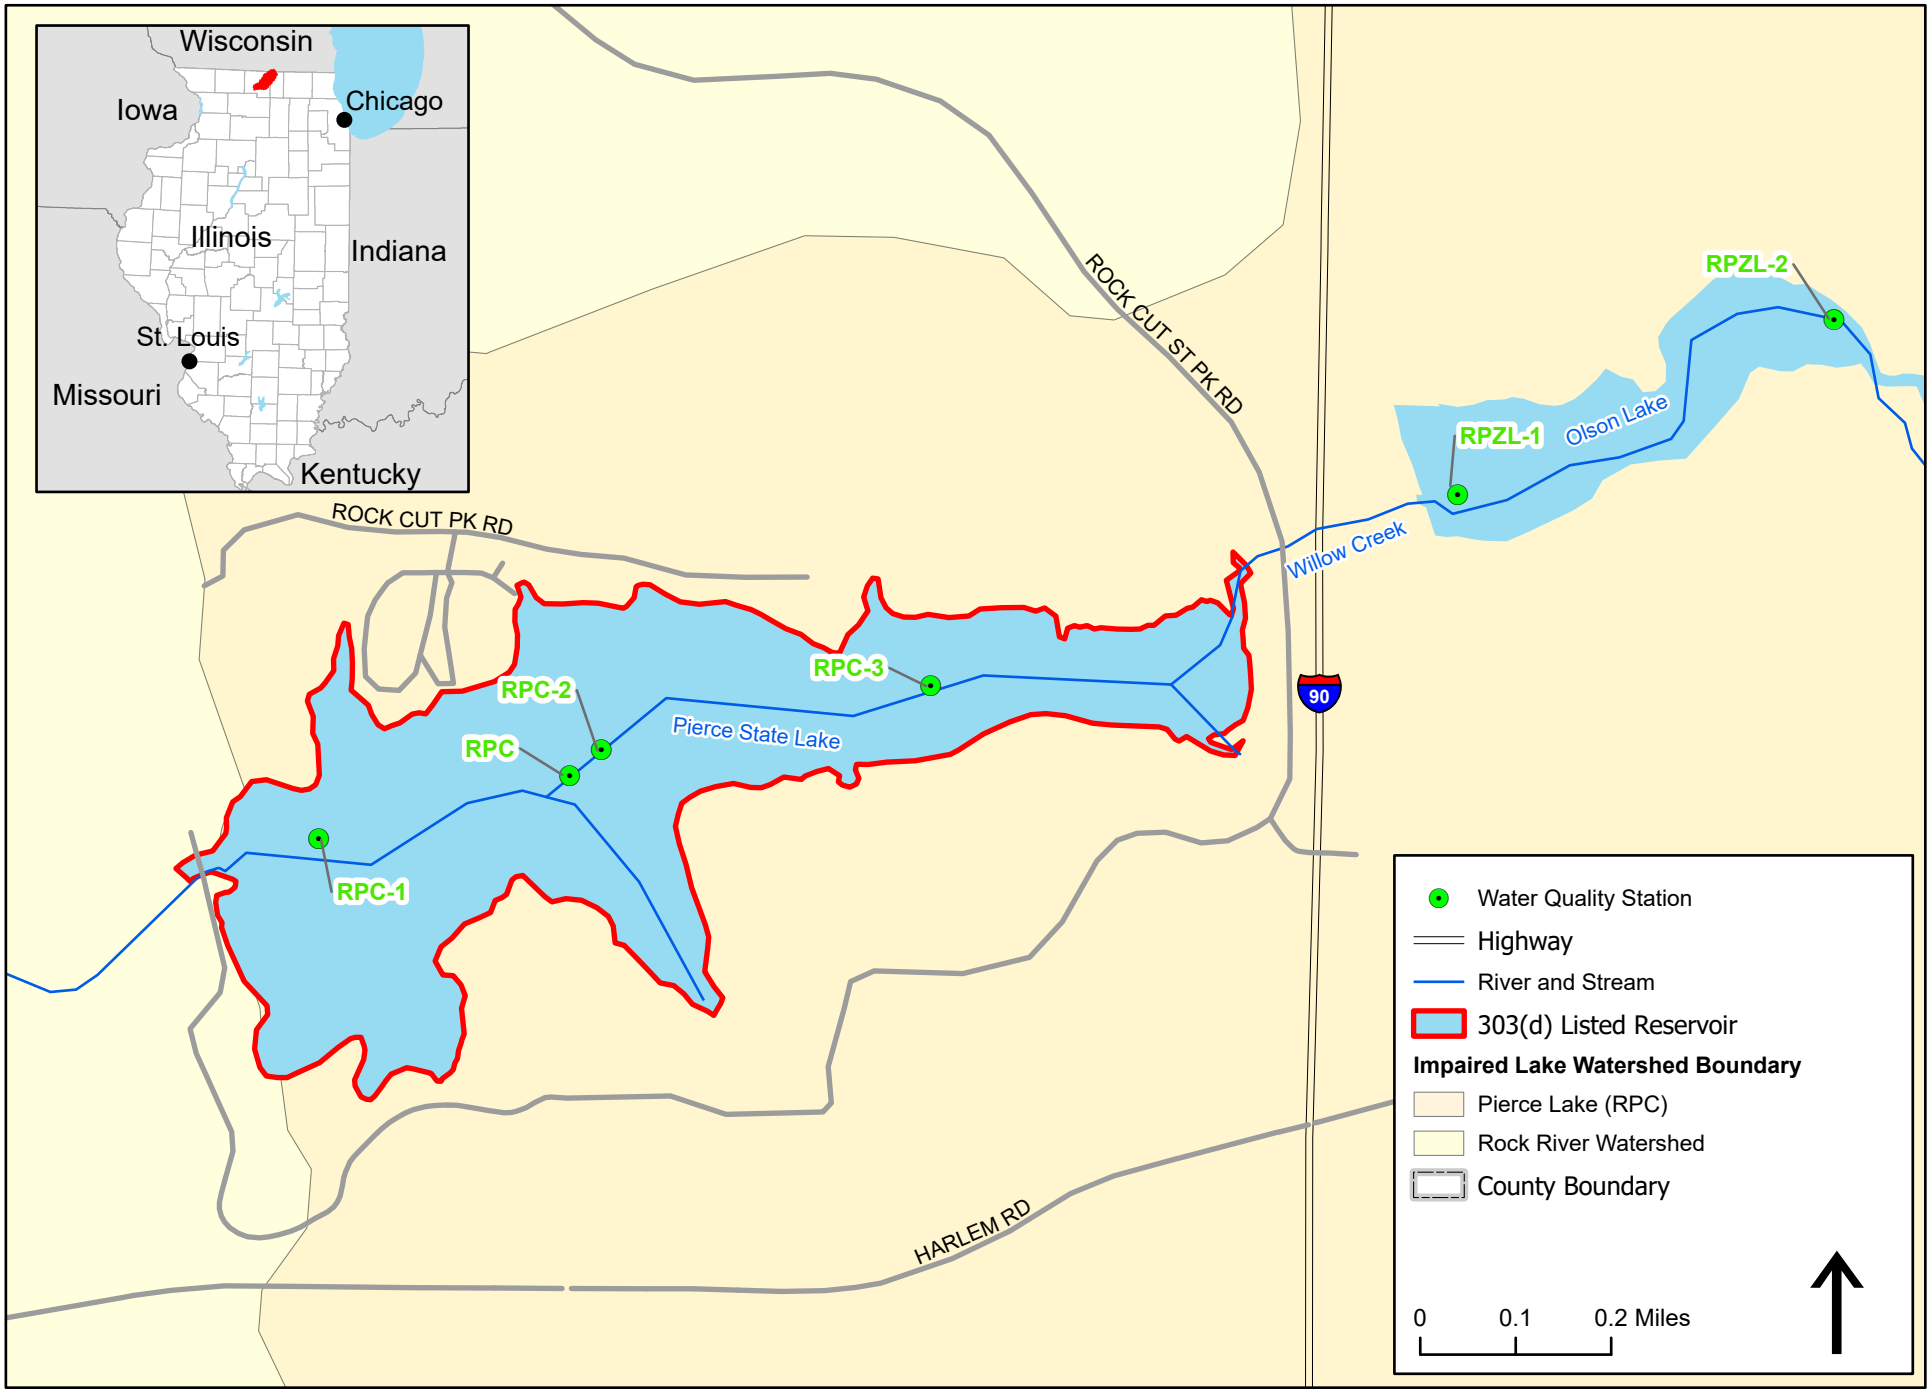
Pierce Lake was simulated with a single well-mixed zone. Although well-mixed laterally, water quality observations suggest seasonal stratification in the lake. Therefore, seasonal stratification was prescribed in the model, occurring from May through September. An assumed hypolimnion depth of 30 percent of the total lake depth was prescribed for this period, based on the limited available water quality data measured at depth.

The sampling locations and watershed boundary are shown on **Figure 7-9.**

7.3.1.2 Lake Hydraulics

Lake hydraulics are defined in SLAM via either internal calculation or user prescription. Data needs for internal calculations of lake hydraulics are somewhat greater as the model performs dynamic water balance calculations of lake volumes at each time step based on user-defined or calculated inflows, outflows, and evaporative losses. Corresponding lake depths, surface areas, and releases are calculated as a function of user-defined bathymetry tables. For the prescribed hydraulics option, users specify monthly variable lake volumes, areas, and depths. Hydraulics are assumed static within a month, and lake outflows are set equal to total lake inflows at each time step. Evaporative losses are not explicitly included in the calculations but rather should be implicitly reflected in the prescribed volumes.

Due to low data availability and the limited fluctuation of water levels of Pierce Lake in a typical year, the prescribed hydraulics option was used for this analysis, with an assumption of steady lake hydraulics. Prescribed lake hydraulics are summarized in **Table 7-2**.



DRAFT

Figure 7-9: Watershed Boundaries and Water Quality Sampling Locations for Pierce Lake (RPC)

Table 7-2 Pierce Lake (IL_RPC) Lake Hydraulics Data

Segment	Surface Area (acres)	Volume (acre-feet)	Average Depth (feet)
IL_RPC	162	2,025	12.5

7.3.1.3 Watershed Parameters

Watershed loadings to the lake were estimated using limited measured data and a surrogate flow gage. Willow Creek phosphorus data from two sampling events in 2017 were used to quantify lake inflow quality. The Willow Creek sampling location (RPZL-1) is just above its discharge to Pierce Lake. Based on this small data set, a steady inflow concentration of 0.15 mg/L was prescribed in the model. Lake inflows were estimated from a regional continuous flow gage using the area ratio method described in Section 7.2.1. The steady concentration was combined with the daily time series of estimated lake inflows for the 11-year simulation period to construct a daily time series of lake phosphorus loads for the model.

In addition to watershed inflow loads, direct depositions of phosphorus to the lake, both wet (precipitation) and dry (atmospheric), were explicitly included in the model. Literature-based model default values for both a steady dry deposition rate (pounds per acre per day) and rainwater concentration (mg/L) were used in combination with site-specific reported daily precipitation rates for the lake to generate daily direct deposition phosphorus loads in the model.

The inclusion of point source phosphorus loads into SLAM was not applicable as there are no NPDES permitted discharges in the Pierce Lake subbasin.

7.3.1.4 Lake Nutrient Parameters

Lake nutrient parameters support the simulation of lake water column nutrient dynamics and include nutrient uptake kinetic and settling rates and lake water quality initial conditions. Uptake kinetics are defined by first order rate constants, applied to dissolved nutrients only. These rate constants represent the transformation of dissolved nutrient into organic particulate fraction via phytoplankton uptake.

Model default nutrient parameter values were adjusted slightly as part of the model calibration exercise described in Section 7.3.1.6. All rates were held within reasonable recommended ranges, as supported by literature.

7.3.1.5 Sediment Layer Parameters

SLAM allows for the calculation of dynamic sediment nutrient fluxes, quantifying the movement of phosphorus from the shallow sediments to the water column or vice versa. Key user-input parameters for this calculation include lake shallow sediment physical characteristics and first order adsorption and desorption/mineralization rate constants. These rate constants can vary seasonally according to user-prescribed levels of sediment anoxia. For the Pierce Lake model, rate constants were adjusted slightly from model default values as part of the calibration exercise described below.

7.3.1.6 Pierce Lake Model Calibration

Historical water quality data for Pierce Lake were used to guide model parameterization and confirm the model's ability to simulate current lake water quality. The historical data set is limited to a small number of samples collected at varying depths from May through October in 2011 and 2016 only. Consequently, the model calibration should be considered coarse. Additional data collection could be used to strengthen the calibration in the future.

The primary calibration parameters in this exercise were the water column dissolved phosphorus uptake rate constant, the seasonally varying particulate phosphorus settling velocity, and the sediment phosphorus desorption rate constant. Lake stratification conditions were prescribed based on observed temperature vertical profiles in the lake during the sampling periods.

Results of the calibration exercise are shown in **Figures 7-10** through **Figure 7-12**. An adequate match between observed and predicted in-lake phosphorus values was achieved in both the epilimnion and the hypolimnion. The modeled partitioning between particulate and dissolved phosphorus in the water column also agrees well with measured data (not shown). Last, modeled sediment phosphorus flux rates (milligrams per square meter per day) fall well within the expected plausible ranges for eutrophic lakes. These results, considered in total, lend significant support to the predictive ability of the model. **Appendix F** contains additional information regarding the model setup and inputs.

Section 8

Total Maximum Daily Loads for the Rock River/Pierce Lake Watershed

8.1 Total Maximum Daily Load Endpoints for the Rock River/Pierce Lake Watershed

The TMDL endpoints for impairments in the Rock River/Pierce Lake watershed are summarized in **Table 8-1**. Parameters with numeric water quality standards are assessed via the TMDL process and the TMDL endpoints directly correlate to the lowest applicable water quality standard established for a given parameter.

Table 8-1 Total Maximum Daily Load Endpoints for the Rock River/Pierce Lake Watershed

Segment Name/ID	Potential Cause of Impairment	Designated Use	Assessment Type	TMDL/Modeling Endpoint
Keith Creek (IL_PR-99)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
Keith Creek (IL_PR-01)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
North Fork Kent Creek (IL_PSB-01)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
South Fork Kent Creek (IL_PSA-01)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
North Kinnikinnick Creek (IL_PU-03)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
South Kinnikinnick Creek (IL_PT-01)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
Spring Creek – North (IL_PZZG-03)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
Pierce Lake (IL_RPC)	TP	Aesthetic Quality	TMDL	0.05 mg/L

Note:

[1] Geometric mean based on a minimum of five samples taken over a 30-day period between May and October.

8.2 Pollutant Sources and Linkages

Potential fecal coliform sources for the impaired segments in the Rock River/Pierce Lake watershed include on-site treatment systems, agricultural runoff, and urban sewers. Sources of TP in Pierce Lake include nonpoint sources and internal nutrient cycling as described in Section 5. The sources identified for each parameter of concern as described in the 2018 Integrated Report, are presented in **Table 8-2**.

Table 8-2 Sources of Pollutants in the Rock River/Pierce Lake Watershed

Segment ID	Segment Name	Cause of Impairment	Source(s) of Pollutants in the Rock River/Pierce Lake Watershed
IL_PR-99	Keith Creek	Fecal Coliform	Urban runoff/storm sewers
IL_PR-01	Keith Creek	Fecal Coliform	Urban runoff/storm sewers
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	Source unknown
IL_PSA-01	South Fork Kent Creek	Fecal Coliform	Source unknown
IL_PU-03	North Kinnikinnick Creek	Fecal Coliform	Source unknown
IL_PT-01	South Kinnikinnick Creek	Fecal Coliform	Source unknown
IL_PZZG-03	Spring Creek – North	Fecal Coliform	Source unknown
IL_RPC	Pierce Lake	TP	Internal nutrient recycling, septic systems, waterfowl, crop production (crop land or dry land), runoff from forest/grassland/parkland

Table 8-3 shows the example source area/hydrologic condition considerations developed by EPA that may impact nutrient and fecal coliform levels in water. Based on the available fecal coliform data and LDC analyses, fecal coliform concentrations exceeding water quality standards occur across flow conditions, with data being limited to the Dry and High Flow categories. This suggests that stormwater runoff, riparian areas, and, potentially, on-site wastewater systems are the primary contributors to fecal coliform loads in the watershed.

Table 8-3 Example Source Area/Hydrologic Condition Considerations (EPA 2007)

Contributing Source Area	Duration Curve Zone				
	High Flow	Moist	Mid-Range	Dry	Low Flow
Point Source				M	H
On-Site Wastewater System			H	M	
Riparian Areas		H	H	H	
Stormwater: Impervious Areas		H	H	H	
Combined Sewer Overflows	H	H	H		
Stormwater: Upland	H	H	M		
Bank Erosion	H	M			

Note: potential relative importance of source area to contribute loads under given hydrologic conditions (H: High, M: Medium).

8.3 Total Maximum Daily Load Allocation

As explained in Section 1, the TMDLs for impaired segments in the Rock River/Pierce Lake watershed will address the following equation:

$$TMDL = LC = \Sigma WLA + \Sigma LA + MOS + RC$$

where: LC = Loading capacity – the maximum amount of pollutant loading a water body can receive without violating water quality standards

WLA = Waste load allocation – the portion of the TMDL allocated to existing or future point sources

LA = Load allocation – the portion of the TMDL allocated to existing or future nonpoint sources and natural background

MOS = Margin of safety – an additional load reduction term to account for the uncertainty associated with the relationship between pollutant loads and receiving water quality

RC = Reserve capacity – the portion of the load explicitly set aside for future population growth and additional development in the watershed

Each of these elements will be discussed in this section as well as consideration of seasonal variation in the TMDL calculation.

8.3.1 Fecal Coliform Total Maximum Daily Loads

The LCs of impaired stream segments are equal to the number of fecal coliform forming units assimilated by the streams per day while still meeting the general use water quality standard. The general use water quality standard for fecal coliform was presented in **Table 8-1** and was used as the basis for calculating target loads of fecal coliform that can be generated using LDC analysis, as discussed in Section 7.

8.3.1.1 Loading Capacity

The fecal coliform LC for each impaired segment according to flow is presented in **Table 8-4**.

Table 8-4 Fecal Coliform Loading Capacity (million colonies/day) in the Rock River/Pierce Lake Watershed

Zone	Flow Exceedance Range	Keith Creek IL_PR-99	Keith Creek IL_PR-01	North Fork Kent Creek IL_PSB-01	South Fork Kent Creek IL_PSA-01	North Kinnikinnick Creek IL_PU-03	South Kinnikinnick Creek IL_PT-01	Spring Creek – North IL_PZZG-03
High Flow	0–10%	234,544	192,108	513,261	266,070	342,566	359,611	108,747
Moist	10–20%	106,373	87,127	234,522	121,248	155,365	163,095	49,991
	20–30%	68,009	55,704	149,943	77,258	99,332	104,274	31,694
	30–40%	47,347	38,922	104,252	53,731	68,895	72,323	21,992
Mid-Range	40–50%	33,133	27,138	73,601	37,716	48,392	50,800	15,362
Dry	50–60%	20,926	17,140	46,780	23,877	30,564	32,084	9,702
	60–70%	10,550	8,641	23,983	12,113	15,409	16,176	4,851
	70–80%	5,484	4,492	12,872	6,369	8,010	8,409	2,476
	80–90%	2,354	1,928	5,975	2,820	3,438	3,609	1,049
Low Flow	90-100%	349	286	1,569	547	509	535	141

8.3.1.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. The fecal coliform water quality target was applied to the full range of expected flows; therefore, the LC represents conditions throughout the year as well as during the applicable period for the seasonal water quality standard for fecal coliform (May through October).

8.3.1.3 Waste Load Allocation

WLAs generally are applied to individually permitted facilities and MS4 discharges that may exist in the watershed, as described in the paragraphs that follow.

Individual NPDES Permitted Facilities

There are currently no individual permitted point sources within the Rock River/Pierce Lake watershed with reasonable potential to discharge fecal coliform to or immediately upstream of impaired segments. While there are several individually permitted discharges in the watershed, none of those that potentially influence impaired segments are required to monitor or report fecal coliform concentrations because of the nature of the facility operations and effluent quality assessments performed as part of the NPDES permitting process. No WLA for individual point source discharges are included in the TMDL calculations.

MS4 Discharges

MS4s represent runoff from municipal areas with permitted separate stormwater sewer systems. Several permitted MS4s exist within the watershed that potentially discharge urban runoff to impaired segments. MS4 permits for each permittee cover varying proportions of the subbasin area contributing loads to the impaired segments. MS4s are regulated discharges and therefore, are allocated through WLAs, rather than LAs. WLAs for MS4s are calculated by first determining the total area within an MS4-permitted municipality's boundaries that lies within the target watershed using GIS analyses and geographic data for municipal boundaries.

As MS4 discharges are not regularly assigned effluent limits as part of the NPDES permitting process and discharge at highly variable flow rates in response to high runoff events, WLA allocations for MS4s are based on existing load estimates rather than being calculated based on water quality standards. The proportion of total MS4 area to total watershed area was calculated for each municipality in the watershed. This proportion was then used to migrate loads from previously calculated LAs for overland runoff to WLAs for MS4 areas in each flow category. This process effectively transfers MS4 load allocations for overland runoff from non-regulated sources described as LAs to the WLA for regulated sources of fecal coliform. As MS4 allocations are tied to overland runoff in urban areas, they are therefore related to higher flow conditions in the stream. As a result, the WLAs for MS4s are only applied to the upper 50 percent of flow categories (mid-range to high flows). The total MS4 load allocations for fecal coliform are applied to the proportion of each municipality within the impaired reach's subbasin are shown in **Table 8-5** through **Table 8-11.**

Table 8-5 Fecal Coliform WLAs (million colonies/day) for MS4 Areas in the Keith Creek Segment IL_PR-01 Subbasin

Municipality	NPDES ID	MS4 Area in Basin (acres)	High Flow	Moist			Mid-Range	Total per MS4

8.3.1.4 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings), or a combination of both. The MOS incorporated into the fecal coliform TMDL analyses is implicit as the analyses used the more conservative 200 cfu/100 mL standard and did not consider die-off of bacteria, which is likely occurring in the system but is unquantified.

8.3.1.5 Reserve Capacity

A portion of each of the fecal coliform TMDL's LC may be set as a RC to allow for future population growth and development. As the municipal wastewater facilities treating this area do not discharge to the impaired segments, significant future growth potentially impacting the fecal coliform loads to the impaired segments is not anticipated in the area and no RC was included in the calculations.

8.3.1.6 Load Allocation and Total Maximum Daily Load Summary

Tables 8-13 through **Table 8-19** summarize the fecal coliform TMDLs for the impaired segments in the Rock River/Pierce Lake watershed.

Table 8-13 Fecal Coliform Total Maximum Daily Load for Keith Creek (IL_PR-99)

8.3.2 Total Phosphorus Total Maximum Daily Load for Pierce Lake

8.3.2.1 Loading Capacity

The LC of Pierce Lake represents the pounds of TP that can be allowed as input to the lake per day and still meet the applicable water quality standard. The water quality standard for TP is 0.05 mg/L, to be met at all times. The allowable loads of TP that can be generated in the watershed and still maintain water quality standards were determined using SLAM, as discussed in Section 7. To calculate the LC, the current watershed TP loads into the lake, as quantified by the calibrated model of current conditions, were iteratively reduced until the water quality standard was met.

8.3.2.2 Seasonal Variation

Seasonal variation is accounted for in the TP TMDL through the development of the model and all calculations of load being for an annual basis. Modeling on an annual basis takes into account the

seasonal effects each lake will undergo during a given year. Since the pollutant source can be expected to contribute loadings in different quantities during different periods (e.g., various agricultural processes occurring at different times of the year combined with seasonal changes in precipitation result in different runoff characteristics at different times of the year), the loadings for this TMDL are focused on average annual loads converted to daily loads, rather than specifying different loadings by season. Pierce Lake will experience critical conditions pertaining to phosphorus concentrations every year, primarily during fall destratification (or overturn) (as modeled). Because a continuous daily simulation for an extended multi-year period was performed to calculate the Pierce Lake TMDL, the critical condition for the lake is accounted for within the analysis.

8.3.2.3 Waste Load Allocation

There are no NPDES permitted facilities in the Pierce Lake watershed, therefore, a WLA was not included in the TMDL calculation for this TMDL.

8.3.2.4 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions), explicit (expressed in the TMDL as a portion of the loadings), or a combination of both. The MOS for the Pierce Lake TMDL is explicit. An explicit MOS of 10 percent was included to account for the lack of site-specific data available within the subbasin.

8.3.4.5 Reserve Capacity

A portion of a TMDL's LC may be set as an RC to allow for future population growth and development potentially leading to increased pollutant loads in the future. In the case of this TMDL for TP, an explicit RC was not included in the TMDL calculations because of the lack of projected population growth in the area.

8.3.4.6 Load Allocation and Total Maximum Daily Load Summary

The TP TMDL developed for Pierce Lake is provided in **Table 8-20**. A total reduction of approximately 53.5 percent of existing watershed TP loads will result in compliance with the applicable water quality standard of 0.05 mg/L TP throughout the year and with the requisite MOS in Pierce Lake. As modeled, this reduction in watershed (external) loads will ultimately result in a similar reduction in lake internal loads of approximately 53.5 percent. Internal loads will naturally decrease as external loads are decreased and sediment phosphorus replenishment is reduced.

Table 8-20 Total Maximum Daily Load Summary for Pierce Lake

Source	LC (lb/day)	LA (lb/day)	MOS (lb/day, 10% of LC)	Current Load (lb/day)	Percent Reduction Needed
Internal	4.0	4.0	0.4	8.5	53.5%[1]
External	4.9	4.4	0.5	10.9	53.5%
Total	8.9	8.4	0.9	19.4	53.5%

Notes:

[1] Internal loads will ultimately be reduced as a consequence of targeted external load reductions.

lb/day – pounds per day

Section 9

Watershed-Based Implementation Plan for the Rock River/Pierce Lake Watershed

9.1 Implementation Overview

The goal of this watershed plan is to identify BMPs to be implemented in the Rock River/Pierce Lake watershed. The BMPs will provide reasonable assurance that impaired waters in the watershed will meet water quality goals developed to ensure water bodies are able to support designated uses.

EPA has identified nine minimum elements that a watershed plan for impaired waters is expected to include. The nine elements are defined in **Table 9-1** along with additional information about where each element is addressed in this report.

Table 9-1 EPA's Nine Elements of a Watershed-Based Implementation Plan for Impaired Waters

Element	Element Description	Report Section
1	Identify causes and sources of pollution that will need to be controlled to achieve pollutant load reduction requirements estimated within the watershed plan.	Sections 5 and 8
2	Estimate pollutant load reductions expected as a result of implementation of management measures described in element 3.	Sections 8 and 9
3	Describe the nonpoint source BMPs that will need to be implemented to achieve load reductions estimates and identify the critical areas where measures need to be implemented.	Section 9.3
4	Estimate the level of technical assistance, associated costs, potential funding sources and parties that will be relied upon to implement the prescribed measures.	Section 9.4
5	Include a public information/education component designed to change social behavior.	Section 9.6
6	Develop an implementation schedule for the plan.	Section 9.7
7	Develop a description of interim, measurable milestones.	Section 9.7
8	Identify indicators that can be used to determine whether pollutant loading reductions are being achieved over time.	Section 9.8
9	Develop a monitoring component to evaluate the effectiveness of the implementation efforts over time.	Section 9.8

9.2 Adaptive Management

Watershed planning is an iterative and adaptive process that requires continuous monitoring and evaluation of success criteria to help improve results as lessons are learned throughout implementation. This adaptive management approach is recommended for the implementation of management practices designed to meet the load reduction targets developed for the Rock River/Pierce Lake watershed. Adaptive management conforms to the EPA guidelines outlined in **Table 9-1** as it is a systematic process for continually improving management policies and practices through learning from the outcomes of operational programs. Some defining characteristics of an adaptive management approach include:

- Acknowledgment of uncertainty about what policy or practice is "best" for the particular management issue
- Thoughtful selection of the policies or practices to be applied (the assessment and design stages of the cycle)
- Careful implementation of a plan of action designed to reveal the critical knowledge that is currently lacking
- Monitoring of key response indicators
- Analysis of the management outcomes in consideration of the original objectives and incorporation of the results into future decisions

Implementation actions, management measures, available assistance programs, and recommended continued monitoring are all discussed throughout the remainder of this section to assist in development of an adaptive management program. The recommended nonpoint source BMPs are voluntary based on landowner preferences.

9.3 Best Management Practice Recommendations

Implementation actions, management measures, and/or BMPs are used to control the generation or distribution of pollutants within a watershed. BMPs are either structural, such as wetlands, sediment basins, fencing, and filter strips; or managerial, such as conservation tillage practices, nutrient management plans (NMPs), and crop rotation. Both structural and managerial BMPs require effective management to be successful in reducing pollutant loading to water resources.[35]

It is typically most effective to install a combination of nonpoint source controls and BMPs or a BMP system. A BMP system is a combination of two or more individual BMPs that are used to control pollutants from a single critical source. If the watershed has more than one identified pollutant, but the transport mechanism is the same, then a BMP system that establishes controls for the transport mechanism can be employed.

9.3.1 Recommendations for Fecal Coliform Reduction

Inputs of fecal coliform primarily originate from overland runoff associated with precipitation events. Fecal coliform contributions from failed on-site wastewater treatment (septic) systems can also be a source, especially if they are concentrated in a small area. Fecal coliform can be bound to soil particles and enter streams from erosion. The impact from fecal coliform discharged by nonpoint sources is typically intermittent and is most often associated with stormwater runoff that carries things like animal waste, fertilizers, or other pathogenic sources. Sedimentation can impact the physical attributes of the stream and act as a transport mechanism for fecal coliform contamination.

[35] Osmond, D.L., D.L.K. Hoag, A.E. Luloff, D.W. Meals, and K. Neas. 2015. "Farmers' Use of Nutrient Management: Lessons from Watershed Case Studies." *Journal of Environmental Quality*. DOI http://dx.doi.org/10.2134/jeq2014.02.0091

Table 9-2 lists all the stream segments currently impaired for fecal coliform according to the 2018 EPA 303(d) list of impaired waters. Impaired stream segments are listed from upstream to downstream segment.

Table 9-2 Rock River/Pierce Lake Watershed Streams Impaired for Fecal Coliform on the EPA 303(d) List from Upstream to Downstream Segment

Impaired Stream Segment	Segment ID	Segment Length (miles)
Keith Creek	IL_PR-99	3.34
Keith Creek	IL_PR-01	10.43
North Fork Kent Creek	IL_PSB-01	12.13
South Fork Kent Creek	IL_PSA	9.6
North Kinnikinnick Creek	IL_PU	15.28
South Kinnikinnick Creek	IL_PT	14.43
Spring Creek – North	IL_PZZG	8.68

As presented in previous sections, possible external sources of fecal coliform in the Rock River/Pierce Lake watershed include agricultural activity (cropping practices and animal operations), municipal and industrial point sources, and/or urban runoff and storm sewer discharges. To achieve a reduction of fecal coliform for the Rock River/Pierce Lake watershed, management measures can be implemented to address a range of potential sources.

9.3.1.1 Point Sources of Fecal Coliform

There are currently no permitted point sources within the Rock River/Pierce Lake watershed with reasonable potential to discharge fecal coliform to or immediately upstream of impaired segments. While there are several individually permitted discharges in the watershed, none of the dischargers potentially influencing impaired segments are required to monitor or report fecal coliform concentrations due to the nature of the facility operations and effluent quality assessments performed as part of the NPDES permitting process.

A number of municipalities and townships within the watershed have MS4s. MS4s represent runoff from municipal areas with permitted separate stormwater sewer systems. Several permitted MS4s exist within the watershed that potentially discharge urban runoff to impaired segments. MS4 permits for each permittee cover varying proportions of the subbasin area contributing loads to the impaired segments. WLAs for the MS4 areas are discussed in Section 8; BMPs for the MS4 areas are discussed along with non-MS4 stormwater and urban runoff in the following section.

9.3.1.2 Nonpoint Sources of Fecal Coliform

There are many potential nonpoint sources of fecal coliform within the Rock River/Pierce Lake watershed. This section presents information on watershed cropping practices, animal operations, urban runoff, and storm sewer discharges. Because fecal coliform can enter waterways through surface runoff and erosion of contaminated soils, sediment management and erosion control BMPs on a watershed scale can help reduce fecal coliform loading to impaired stream segments. Data were collected where available through communications with the local NRCS, Illinois SWCDs, and public health departments.

BMPs that could be used for treatment of these nonpoint sources include:

- Conservation tillage practices
- Filter strips and riparian buffers
- Farming/soil retention practices
- Wetlands
- Water and Sediment Control Basins (WASCOBs)
- Streambank Protection
- Faulty Private Septic Systems
- Animal waste management
    - Stream crossings
    - Restrict livestock access to streams and tributaries
    - Pet waste
    - CAFO BMPs (40 Code of Federal Regulations [CFR] 412.4)
- Urban soil/erosion BMPs

Conservation Tillage Practices: Conservation tillage practices could help reduce sediment loads into impaired segments by reducing erosion of soils. **Table 9-3** shows the areas (acres) in each subbasin that are under cultivation, along with the percent of the corresponding watershed area which is cultivated. Note that the areas shown in the table below are for the impaired segment subbasins only, and do not include upstream subbasins to avoid double counting the acreage across the entire Rock River/Lake Pierce Watershed. Crop residuals or living vegetation cover on the soil surface protects against soil detachment from water and wind erosion.

Table 9-3 Cultivated Areas for the Rock River/Pierce Lake Watershed Subbasins

Impaired Stream Segment	Segment ID	Land Cover Area (acres)	Cultivated Area (acres)	Percent Cultivated
Keith Creek	IL_PR-99	8,854	999	11%
Keith Creek	IL_PR-01	7,251	999	14%
North Fork Kent Creek	IL_PSB-01	19,426	9,924	51%
South Fork Kent Creek	IL_PSA	10,039	4,078	41%
North Kinnikinnick Creek	IL_PU	12,936	7,155	55%
South Kinnikinnick Creek	IL_PT	13,583	7,943	58%
Spring Creek – North	IL_PZZG	4,109	954	23%

Conservation tillage practices are no till and reduced till. No till is the practice of limiting soil disturbance in order to manage the amount, orientation, and distribution of crop and plant

residue on the soil surface year around.[36] Reduced till is managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year round while limiting the soil-disturbing activities used to grow and harvest crops in systems where the field surface is tilled prior to planting.[37]

The no till practice consists only of an in-row soil tillage operation during the planting activities and a seed row/furrow closing device. No full-width tillage is performed from the time of harvest or termination of one cash crop to the time of harvest/termination of the next cash crop in the rotation regardless of the depth of the tillage operation. Limited tillage is allowed to close or level ruts from harvesting equipment; however, no more than 25 percent of the field may be tilled for this purpose.

As noted above, the reduced till practice consists of managing plant residue on the soil surface while limiting soil-disturbing activities. The practice includes tillage methods commonly referred to as mulch tillage or conservation tillage where the entire soil surface is disturbed by tillage operations such as chisel plowing, field cultivating, tandem disking, or vertical tillage. It also includes tillage/planting systems with few tillage operations (e.g., ridge till) but which do not meet the criteria for the no till practice as described above and in Illinois NRCS CPS 329.[38]

In both the no till and reduced till practices, removal of residue from the row area prior to or as part of the planting operation is acceptable. In the no till practice, however, the disturbed portion of the row width should not exceed one-third of the crop row width. In either practice, none of the residue should be burned. To reduce erosion to the targeted level, the current approved water and/or wind erosion prediction technology should be used to determine the amount of randomly distributed surface residue needed, the period of the year the residue needs to be present in the field, and the amount of surface soil disturbance allowed. All residues shall be uniformly distributed over the entire field. Residue should not be shredded after harvest because shredding makes it susceptible to movement by wind or water, and areas where the shredded residue accumulates may interfere with planting of the next crop.

If the no till BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 329.[39] If the reduced till BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 345.[40] To achieve TMDL load reductions, tillage practices already in place should be continued, and practices should be assessed and improved upon for all agricultural areas in the Rock River/Pierce Lake watershed subbasins.

Filter Strips: Filter strips can be used as a control to reduce both sediment and bacterial pollutant loads from runoff. Filter strips are strips or areas of permanent herbaceous vegetation situated between cropland, grazing land, or disturbed land and environmentally sensitive areas, such as waterways. The filter strips are permanently designated plantings to treat runoff and are not part of an adjacent cropland's rotation.

The filter strip vegetation may consist of a single species or a mixture of grasses, legumes, and/or other forbs that are appropriately adapted to the soil and climate, as well as to the farm chemicals used in the adjacent land. Approved seed listings are provided in the Illinois NRCS Conservation Practice Standard (CPS) 393.[41] Applicable maintenance shall be performed as needed to ensure the strips continue to function properly, including removal of state-listed noxious weeds, gully repair, removal of excess sediment, and reseeding. Overland flow entering the filter strip should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the filter strip. Harvesting of the filter strip vegetation, where appropriate, will help to encourage dense growth, maintain an upright growth habit, and remove contaminants such as nutrients and microbial pathogens. Prescribed burning may be used to manage and maintain the filter strip when an approved burn plan has been developed.

The installation of filter strips adjacent to the impaired stream segments, as well as any contributing tributaries, can result in considerable reduction of overland contributions of sediments, suspended solids, and fecal coliforms to an impaired water body. Filter strips implemented along impaired streams and their tributaries slow and filter runoff and provide bank stabilization thereby decreasing erosion and re-sedimentation; however, they should not be installed on unstable channel banks already eroding due to undercutting of the bank toe. When used in support of a riparian forest buffer, filter strips can also restore or maintain sheet flow.

The Illinois NRCS CPS 393 describes filter strip requirements based on land slope; the requirements are designed to achieve a minimum flow through time of 15 to 30 minutes at a one-half inch depth. **Table 9-4** provides a summary of the guidance for filter strip width, or flow length, as a function of slope.[42]

Table 9-4 Filter strip flow lengths based on land slope

Percent Slope	Filter Strip Flow Length (feet)	
	Minimum	Maximum
0.5 %	36	72
1.0 %	54	108
2.0 %	72	144
3.0 %	90	180
4.0 %	108	216
5.0 % or greater	117	234

[41] NRCS. 2017a. Conservation Practice Standard. Filter Strip. Code 393. https://efotg.sc.egov.usda.gov/api/CPSFile/5609/393_IL_CPS_Filter_Strip_2017

[42] NRCS. 2017a.

In conjunction with the available land use, topography, and soil information discussed in Section 2, mapping software was used to buffer impaired segments and their major tributaries to an appropriate and reasonable width to determine the total area found in the subbasin. Due to the wide range of soil types and slopes found throughout the watershed, the appropriate buffer widths estimated in GIS were based on the average slope of land within the maximum buffer areas of the impaired segment's major tributaries. These average slopes were then used to calculate approximate buffer distances based on the NRCS guidance using a best-fit equation to interpolate between the slope percentages to buffer width relationships provided in the NRCS guidance.

Not all land use types within the buffer areas are candidates for conversion to filter strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of developed residential or commercial lands is often not feasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips and will likely provide the greatest benefit to water quality once converted. Therefore, GIS software was used to extract the approximate acreage of agricultural lands surrounding potential tributaries and buffer areas of the impaired stream segments within the Rock River/Pierce Lake watershed. The calculated overall buffer areas and acreage of agricultural land within the buffer distances for the impaired segments and its tributaries are provided in **Table 9-5**. These data represent an approximation of the maximum acreage of land potentially available for conversion to filter strips. A more detailed assessment of a given property is necessary to determine the exact size and extent of convertible lands likely to provide the greatest benefit to surface water quality following conversion to filter strips.

Table 9-5 Average slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land within Buffers Potentially Suitable for Conversion to Filter Strips within the Rock River/Pierce Lake Watershed

Impaired Stream Segment	Segment ID	Avg Stream Slope (%)	Filter Strip Flow Length (ft)	Total Buffer Area (acres)	Agricultural Land in Buffer (acres)
Keith Creek	IL_PR-99	3	180	151	0.22
Keith Creek	IL_PR-01	3	180	446	63
North Fork Kent Creek	IL_PSB-01	2	144	412	101
South Fork Kent Creek	IL_PSA	4	216	481	104
North Kinnikinnick Creek	IL_PU	3	180	628	216
South Kinnikinnick Creek	IL_PT	4	216	724	248
Spring Creek – North	IL_PZZG	4	216	447	54

There is a total of approximately 786 acres of agricultural land within the various buffer distances of the impaired stream segments where filter strips could potentially be installed. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table 9-5**. **Figure 9-1** shows the buffered areas and agricultural lands suitable for conversion to filter strips within the watershed.

Figure 9-1: Rock River/Pierce Lake
Buffer Areas and Agricultural Lands Potentially Suitable for Conversion to Filter Strips

If this BMP is selected for use by a landowner, a separate plan should be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 393, including site preparation; seed, seeding rates, and mixtures; lime and fertilizer; seedbed preparation and seeding; and operation and maintenance.

Riparian Buffers: Similar to filter strips described above, riparian vegetation buffers enhance infiltration of runoff and subsequent trapping of nonpoint source pollutants such as fecal coliforms. The vegetation also serves to reinforce streambank soils, which helps minimize erosion. The primary difference between filter strips and riparian buffers are the types of vegetation plantings used within the buffer area. Riparian buffers leverage woody vegetation such as trees and shrubs. Grassland, forest, and agricultural areas within the appropriate buffer zones for each impaired stream segment within the Rock River/Pierce Lake watershed are shown in **Table 9-5**. There are 3,289 acres within the buffer area of impaired stream segments. Approximately 786 of those acres are classified as agricultural. Landowners should assess parcels adjacent to the stream channels and maintain or improve existing riparian areas or potentially convert cultivated lands.

Soil Retention: Soil retention practices could help reduce bacterial loads into the impaired stream segments by reducing erosion of soils. As indicated above, approximately 58,315 acres of the Rock River/Pierce Lake watershed are under cultivation, which accounts for about 39 percent of the watershed area. Farming practices in the watershed should be assessed to determine methods being used, where they can be improved upon, and what additional practices might be appropriate to reduce nutrient loads through soil retention.

Any farming/soil retention methods with the capability to reduce sediment and suspended solids entering impaired waterways also have the potential to reduce fecal coliform loads. In addition to conservation tillage and buffer strips (riparian or filter strips) as described above, other examples of soil retention methods may include:

- Field borders: A minimum 30-foot strip of permanent vegetation such as stiff-stemmed, upright grasses, grass/legumes, forbs, and/or shrubs established at the edge or around the perimeter of a cropland or grazing fields to reduce erosion from wind and water and protect soils and water quality.[43]

- Contour farming: Aligning ridges, furrows, and roughness formed by tillage, planting, and other operations to alter the velocity and/or direction of water flow to or around hillslopes in areas where crops are grown on sloping lands.[44]

- Conservation crop rotation: A planned sequence of at least two different crops grown on the same ground over a period of time (i.e., the rotation cycle), and applies to all cropland where at least one annually planted crop is included in the rotation. To recover excess nutrients from the soil profile and reduce water quality degradation, crops with quick germination and root system formation, a rooting depth sufficient to reach the nutrients

[43] NRCS. 2022a. Conservation Practice Standard. Field Borders. Code 386. https://efotg.sc.egov.usda.gov/api/CPSFile/35382/386_IL_CPS_Field_Border_2022

[44] NRCS. 2021a. Conservation Practice Standard. Contour Farming. Code 330. https://efotg.sc.egov.usda.gov/api/CPSFile/32990/330_IL_CPS_(Con)tour_Farming_2021

not removed by the previous crop, and nutrient requirements that readily utilize the excess nutrients should be used.

- Strip-cropping: A practice of growing planned rotations of erosion-resistant and erosion-susceptible crops or fallow in a systematic arrangement of approximately equal strips (two or more) across a field. Strip-cropping can reduce sheet, rill, and wind erosion as well as the transport of sediment and other water- and wind-borne contaminants. Strip-cropping can be applicable on steeper slopes but is less effective on slopes exceeding 12 percent.[45]

- Cover cropping: A cover crop consists of grasses, legumes, and forbs planted for seasonal vegetative cover that may either be established between successive production crops, or companion-planted or relay-planted into production crops. The cover crop should be established as soon as practical prior to or after harvest of the production crop and terminated as late as practical to maximize plant biomass production and nutrient uptake while allowing time to prepare the field for the next production crop.[46]

- Terracing: A soil conservation practice that may consist of an earthen embankment, channel, or combination of ridges and channels constructed across high gradient slopes that can prevent runoff of precipitation from causing serious erosion. Terraces reduce both the volume and velocity of water moving across the soil surface which reduces peak discharge rates by temporarily storing runoff and allowing associated sediment and other contaminants to settle out behind the terrace ridge rather than directly entering receiving waters.[47]

- Critical area planting: The establishment of permanent vegetation on sites that have or are expected to have high erosion rates, and/or on sites that have physical, chemical, or biological conditions that prevent the establishment of vegetation using normal practices.[48]

- Sediment basins: A basin formed by an embankment or excavation, or combination of these, with a constructed engineered outlet that captures and detains sediment-laden runoff or other debris for a sufficient length of time. Sediment basins act as the last line of defense for capturing sediment when erosion has already occurred and must have sediment storage capacity, detention storage, and temporary flood storage capacities. For maximum sediment retention, the basin should be designed so that the detention storage remains full of water between storm events. If site conditions, safety concerns, or local laws preclude a permanent pool of water, all or a portion of the detention and sediment storage may be designed to be dewatered between storm events.[49]

[49] NRCS. 2017. Conservation Practice Standard. Sediment Basin. Code 350. https://efotg.sc.egov.usda.gov/api/CPSFile/5539/350_IL_CPS_Sediment_Basin_2017

Wetlands: The use of wetlands as a structural control is applicable to fecal coliform reduction. To treat loads from agricultural runoff, such as from manure, wetlands could potentially be constructed at select locations where more focused runoff from fields occurs; e.g., downstream of a CAFO. Wetlands are effective BMPs for bacteria and sediment control because they:

- Prevent floods by temporarily storing water, allowing the water to evaporate or percolate into the ground.
- Filter sediment.
- Slow overland flow of water thereby reducing soil erosion and contaminant transport.

A properly designed and functioning wetland can provide very efficient treatment of pollutants, such as fecal coliform. Design of wetland systems is critical to the sustainable functionality of the system and should consider soils in the proposed location, hydraulic retention time, and space requirements. In general, soils classified as hydric are most suitable for wetland construction. Areas near waterways that are not currently classified as wetlands but have hydric soils present are typically strong candidates for potential wetland construction. Existing wetland areas may also be candidates for reconstruction or enhancement to improve their runoff filtration capacity. **Figure 9-2** highlights the areas along stream segments within the Rock River/Pierce Lake watershed that consist of hydric soils or wetlands which would be suitable for conversion or enhancement to help reduce nutrient loads into area waterways. These data layers are developed on a large-scale and on-site soil investigation and wetland delineation is typically necessary for verification of the suitability of a given area for wetland construction.

Constructed wetlands, which comprise the second or third stage of a nonpoint source treatment system, can be very effective at improving water quality. Studies have shown that artificial wetlands designed and constructed specifically to remove pollutants from surface water runoff have removal rates of greater than 90 percent for suspended solids.[50,51,52,53] Contaminant removal rates can be improved if sheet flow is maintained to the wetland and vegetation and substrate are monitored to ensure the wetland is operating optimally. Sediment or vegetation removal may be necessary if the wetland removal efficiency is lessened over time.[54] Guidelines for wetland design suggest a wetland to watershed ratio of 0.6 percent for nutrient and sediment removal from agricultural runoff is optimal.

DRAFT

CDM Smith

Figure 9-2: Rock River/Pierce Lake
Hydric Soils, Existing Wetlands, and Potential Wetland Construction

WASCOBs: WASCOBs are earth embankments or combination ridge and channel systems constructed across the slopes of minor watercourses to reduce watercourse and gully erosion. These basins act as water detention basins and trap sediments (and the pollutants bound to the sediment) prior to them reaching a receiving water. The WASCOB reduces gully erosion by controlling flow within the drainage area, and the basins may be installed singly or in series as part of a system. The practice applies to sites where the topography is generally irregular, runoff and sediment damage land and improvements, and watercourse or gully erosion is a problem. Adequate and stable outlets from the basin are required to convey runoff water to a point where it will not cause damage. Additionally, sheet and rill erosion should be controlled by other conservation practices; i.e., the WASCOB would be part of another conservation system that adequately addresses resource concerns both above and below the basin. However, if land ownership or physical conditions preclude treatment of the upper portion of a slope, a WASCOB may be used to separate the upper area from and permit treatment of the lower slope.

WASCOBS should, at a minimum, be designed to be large enough to control runoff from at least a 10-year, 24-hour storm using a combination of flood storage and discharge through the outlet. Additionally, the WASCOB must be designed to have the capacity to store at least the anticipated 10-year sediment accumulation. Otherwise, periodic sediment removal is required as part of the maintenance activities in order to maintain the required capacity. Locations are determined based on slopes, erosion areas, crop management, and soil survey data.

When using a WASCOB, a separate plan shall be prepared for each treatment unit which will use this practice. Local NRCS personnel can often provide information and advice for design and installation. Illinois NRCS CPS 638.[55] also provides additional information on the design and maintenance requirements for WASCOBs, as well as information on cropping activity recommendations and requirements around the basin. Maintenance includes reseeding or planting the basins in order to maintain vegetation, where specified, and periodically checking them, especially after large storms, to determine the need for embankment repairs or mechanical removal of excess sediment. Inlets and outlets should be cleaned regularly. Damaged components should be replaced promptly.

Streambank Protection: Treatments used to stabilize and protect banks of streams or constructed channels are discussed in Illinois NRCS CPS 580.[56] This practice can be used to help maintain the flow capacity of streams or channels, and to reduce the offsite or downstream effects of sediment resulting from bank erosion. Prior to implementation of the practice, an assessment of the unstable streambank sites should be conducted in sufficient detail to identify the causes contributing to the instability (e.g., livestock access, watershed alterations resulting in significant modifications of discharge or sediment production, and in channel modifications such as water level fluctuations and boat-generated waves). Protective treatments need to be compatible with the bank materials, water chemistry, channel hydraulics, and slope characteristics above and below the water line. Treatment area designs should provide for

[55] NRCS. 2018. Conservation Practice Standard. Water and Sediment Control Basin. Code 638. https://efotg.sc.egov.usda.gov/api/CPSFile/5838/638_IL_CPS_Water_and_Sediment_(Con)trol_Basin_2018

[56] NRCS. 2020. Conservation Practice Standard. Streambank and Shoreline Protection. Code 580. https://www.nrcs.usda.gov/sites/default/files/2022-10/Streambank_Shoreline_Protection_580_CPS_10_2020.pdf

protection of installed treatments from overbank flows resulting from upslope runoff and flood return flows, and from bank seepage.

Livestock traffic along treated streambanks should be limited to stable access points. All disturbed areas around protective treatments shall be protected from erosion through cultivation or selected vegetation suitable for the site conditions and intended purposes. Streambanks should be assessed to determine whether the causes of instability are local (e.g., poor soils, high water table in banks, alignment, obstructions deflecting flows into the bank, etc.) or systemic (e.g., aggradation due to increased sediment from the watershed, increased runoff due to urban development in the watershed, degradation due to channel modifications, etc.). Bank protection treatment should not be installed in channel systems undergoing rapid and extensive changes in bottom grade and/or alignment unless the treatment is designed to control or accommodate the changes. Bank treatment shall be constructed to a depth at or below the anticipated lowest depth of streambed scour. When appropriate, a buffer strip and/or diversion may be established at the top of the bank protection zone to help maintain and protect installed treatments; improve their function; and filter out sediments, nutrients, and pollutants from runoff. Some available approaches to potentially decrease nonpoint TSS and/or pollutant source loads, as well as help stabilize eroding banks include the following:

- Stone Toe Protection: Non-erodible materials are used to protect the eroding banks of tributary streams that discharge into the lake. Meandering bends found in the watershed could potentially be stabilized by placing the hard armor only on the toe of the bank. Stone toe protection is most commonly implemented using stone quarry stone that is sized to resist movement and is placed on the lower one-third of the bank in a windrow fashion.

- Rock Riffle Grade Control: Naturally stable stream systems typically have an alternating riffle-pool sequence that helps to dissipate stream energy. Riffle rock grade control places loose rock grade control structures at locations where natural riffles would occur to create and enhance the riffle-pool flow sequence of stable streams. By installing riffle rock in an incised channel, the riffles will raise the water surface elevation resulting in lower effective bank heights, which increases the bank stability by reducing the tractive force on the banks.

- Floodplain Excavation: Rather than raising the water level, Floodplain Excavation lowers the floodplain to create a more stable stream. Floodplain Excavation uses mechanical means to restore the floodplain by excavating and utilizing the soil that would eventually be eroded away and deposited in the stream.

- Rock chutes: Rock chutes are riprap lined water conveyance structures used to move water down a slope in a non-erosive manner. The main purpose of a rock chute is to reduce channel flow velocity by dissipating energy and to provide a stable grade at the outlet to prevent erosion.

Private Septic System Inspection and Maintenance Program: It is unclear to what extent businesses, residences, and other structures in the watershed are served by septic vs. municipal sewer systems. Most of businesses, residences, and other structures in the developed areas are expected to be served by a municipal sewer district; however, many households in rural areas of Illinois, as well as in some smaller townships, that are not connected to municipal sewers make

use of onsite sewage disposal systems, or septic systems. The degree of nutrient and pathogen removal in these systems is limited by soils and system upkeep and maintenance.

Failing or leaking septic systems can be a source of fecal coliform pollution. A program that actively manages functioning systems and addresses non-functioning systems could be implemented to reduce the potential phosphorus loads from septic systems in the watershed. The USEPA has developed guidance for managing septic systems, which includes assessing the functionality of systems, public health, and environmental risks.[57] It also introduces procedures for selecting and implementing a management plan.

To reduce the discharge of excessive amounts of contaminants from a faulty septic system, a scheduled maintenance plan that includes regular pumping and maintenance of the septic system should be followed. The majority of failures originate from excessive suspended solids, nutrients, and BOD loading to the septic system. Reduction of solids entering the tank can be achieved by limiting the use of garbage disposals.

Septic system management practices can extend the life, and maintain the efficiency, of a septic system. Water conservation practices, such as limiting daily water use or using low flow toilets and faucets, are the most effective methods to maintain a properly functioning septic system. Additionally, septic systems should not be used for the disposal of solids, such as cigarette butts, cat litter, cotton swabs, coffee grounds, disposable diapers, etc. Physical damage to the drain field can be prevented by:

- Maintaining a vegetative cover over the drain field to prevent erosion
- Avoiding construction over the system
- Protecting the area down slope of the system from excavation
- Landscape the area to divert surface flow away from the drain field (Johnson 1998)

The cost of each management measure is highly variable and site-specific data on septic systems and management practices do not exist for the watershed; therefore, homeowners with septic systems should contact their county health department for septic system management costs.

Current protocols for addressing failing septic systems should adhere to the Illinois Private Sewage Disposal Licensing Act and Code "to prevent the transmission of disease organisms, environmental contamination and nuisances resulting from improper handling, storage, transportation and disposal from private sewage disposal systems". Any new, replaced, or renovated system must be installed by a licensed contractor or the homeowner and permitted through the county health department. The department must receive both an application for permit and the appropriate fee from the contractor/homeowner. Once reviewed and approved, a permit is issued and an inspection of the system is conducted during and after construction. The county health department also investigates private sewage disposal system complaints.

[57] USEPA. 2023. Septic System Care and Maintenance. https://www.epa.gov/septic/septic-system-care-and-maintenance

A long-range solution to failing septic systems is connection to a municipal sanitary sewer system. Connection to a sanitary sewer line would reduce fecal coliform and phosphorus sources by replacing failing septic systems with municipal treatment and will allow communities to develop without further contribution of pollutants to impaired waterbodies. Costs for the installation are generally paid over a period of several years (average of 20 years) and help to avoid forcing homeowners to shoulder the entire initial cost of installing a new septic system. In addition, costs are sometimes shared between the community and the utility responsible for treating the wastewater generated from replacing the septic tanks. The planning process is involved and requires participation from townships, cities, counties, businesses, and citizens.

Animal Waste Management: Animal waste from domestic animals or livestock can also be a source of fecal coliform loads into impaired stream segments. A number of animal waste management techniques are helpful in reducing bacterial loads that enter waterways. Examples of effective animal waste management methods may include:

- Stream Crossings: A stream crossing is a stabilized area or structure constructed across a stream to provide a travel way for people, livestock, equipment, or vehicles. Use of established stream crossings can reduce streambank and streambed erosion, as well as improve water quality by reducing sediment, nutrient, organic, and inorganic loading downstream. This practice applies to all land uses where an intermittent or perennial watercourse exists and a ford, bridge, or culvert type crossing is needed.

  Stream crossings should in areas where the streambed is stable or can be stabilized, and preferably where the crossing can be installed perpendicular to the direction of stream flow. Each proposed crossing site should be evaluated for variations in stage and discharge, hydraulics, aquatic organism life stages, fluvial geomorphic impacts, sediment transport and flow continuity, groundwater conditions, and movement of woody and organic material. The crossing should then be designed to account for the known range of factors. Crossings should not be placed where the channel grade or alignment changes abruptly, excessive seepage or instability is evident, overfalls exist (evidence of incision and bed instability), where large tributaries enter the stream, within 300 feet of known spawning areas for listed species, or in wetland areas. The width of the crossing will depend upon its intended purpose.

- Restrict Livestock Access to Streams and Tributaries: Reduction of livestock access to streams is recommended to limit damage to streambanks and reduce bacterial loads entering the stream. Access of livestock and other animals to streams can increase bank erosion, trample filter strips and riparian buffers causing short circuiting of pollutant treatment, and introduce organic contaminants directly into the stream. Exclusion or restricting pet, livestock, and wildlife access to streams with fencing helps reduce pollutant loads. Fencing and alternate watering systems are effective ways to restrict livestock from streams; however, fencing emplacement is not always feasible from either a cost or animal management viewpoint. If used, fencing should be placed outside of the filter strips/riparian areas.

- Pet Waste Management: Domestic pet waste can contribute bacteria and nutrient loads to impaired streams or lakes through stormwater runoff that picks up and carries pet waste into storm sewers or discharge directly into waterways. Public outreach and education campaigns that encourage pet owners to pick up their dog's waste is a tool that can help reduce bacteria loading in impaired streams. Installing pet waste disposal systems and offering pet waste bags in residential areas or in parks or open spaces within bacteria impaired watersheds can also help reduce fecal coliform loads entering streams.

- CAFO BMPs (40 CFR 412.4): The proper management of waste from commercial animal operations within the watershed can help reduce bacteria loadings to area waterways. BMPs for the land application of manure and other process wastewater from such facilities are defined in 40 § CFR 412.4. Examples of applicable BMPs include using a setback, or specified distance from surface waters or their tributaries, where manure or other waste products are located or applied as well as using vegetated buffers or filter strips to help filter out or intercept contaminated runoff from animal facilities.

Urban Soil/Erosion BMPs: Table 9-6 summarizes the percentage of land that is developed or urban within each impaired stream segment's subbasin. In the developed/urban areas of the watershed, decreased infiltration and increased runoff rates associated with the prevalence of impervious surfaces and increased overland flow can contribute to high sediment and bacterial loads in the impaired stream segments. Most modern developments route runoff from impervious surfaces directly into storm sewers or paved channels which effectively convey the pollutants into receiving water bodies with little to no opportunity for infiltration or filtering. The storm sewers and lined channels then convey the runoff water downstream at a much faster rate than would normally occur in a natural, nonurbanized, setting.

Table 9-6 Urban and Developed Areas for the Rock River/Pierce Lake Watershed Subbasins

Impaired Stream Segment	Segment ID	Land Cover Area (acres)	Developed Area (acres)	Percent Developed
Keith Creek	IL_PR-99	8,854	7,090	80%
Keith Creek	IL_PR-01	7,251	5,499	76%
North Fork Kent Creek	IL_PSB-01	19,426	5,884	30%
South Fork Kent Creek	IL_PSA	10,039	3,837	38%
North Kinnikinnick Creek	IL_PU	12,936	2,157	17%
South Kinnikinnick Creek	IL_PT	13,583	1,739	13%
Spring Creek – North	IL_PZZG	4,109	2,948	72%

The long-term effects of urban development upon water bodies and wetlands primarily results in the elimination of vegetation and other natural materials. The typical consequences of these alterations include reduced shading and a resultant increase in water temperature, reduced capacity for pollutant filtering, and increased stream instability and erosion. The Association of Illinois SWCDs maintains and updates the Illinois Urban Manual, which is "intended for use as a technical reference by developers, planners, engineers, government officials and others involved in land use planning, building site development, and natural resource conservation in rural and

urban communities and developing areas."[58] Below is information on urban stormwater BMPs that can be used within the watershed. Detention basins, rock check dams and/or manufactured tri-dikes, and silt fences are BMPs employed to reduce surface runoff, particularly addressing the reduction of sediments and bacterial loads.

- Detention Basins: A dry detention basin is a vegetated basin designed to hold stormwater runoff, thus reducing peak stormwater flows and reducing flooding. Drainage areas for these basins are typically between 5 and 50 acres, and plans and specifications require the signature of a licensed professional engineer. Design components include basin inflow and outflow control structures, an emergency spillway, and basin planting. Practice standard 809 in the Urban Manual provides additional information.

- Rock Check Dam: A rock check dam is a small dam built across a grass swale or road ditch to slow stormwater flows, reduce erosion, trap sediment, and increase infiltration. The practice is limited to small, grassed swales or open channels that drain 10 acres or less. Practice standard 905 in the Urban Manual provides additional information on criteria, plans/specifications, and operations and maintenance.

- Manufactured tri-dikes: Also known as manufactured ditch checks (reference practice standard 814 in the Urban Manual), this practice involves installing a prefabricated temporary dam or flowthrough device (10 to 15 inches in height) across a swale or road ditch to slow water flow. Similar to a rock check dam, the purpose of manufactured ditch checks is to trap sediment, promote settling of suspended solids, reduce erosion, and promote infiltration. The practice is used where grading activity occurs in areas of concentrated flows with slopes less than 8 percent and flow velocities less than 8 cubic feet per second.

- Silt fence: A silt fence is a temporary barrier of filter fabric stretched between posts to cause sediment deposition from sheet flows from disturbed sites. Maximum drainage areas for overland flow to a silt fence should not exceed 0.5 acres per 100 feet of fence. Practice standard 920 of the Urban Manual provides additional information.

9.3.2 Recommendations for Total Phosphorus Reduction

Phosphorus loads in the Rock River/Pierce Lake watershed originate from both internal and external sources. As presented in previous sections, internal nutrient recycling may be a source of TP to the lake in addition to external sources such as septic systems, waterfowl, and agricultural activity.

Phosphorus is a nutrient critical to healthy ecosystems at low concentrations; however, overenrichment of phosphorus can result in aquatic ecosystem degradation when nitrogen is also available in sufficient quantities. Nutrient enrichment can result in rapid algal growth as available nutrients and carbon dioxide are consumed. This response can alter pH, decrease DO (which is critical to other aquatic biota), alter the diurnal DO pattern, and even create anoxic conditions. In

[58] Association of Illinois SWCDs. *Illinois Urban Manual*. https://illinoisurbanmanual.org/

addition, nutrient enrichment can reduce water clarity and light penetration and is aesthetically displeasing.

Inputs of phosphorus can originate from both point and nonpoint sources. Most of the phosphorus discharged by point sources is soluble and originates from anthropogenic sources. For example, effluents from municipal sewage treatment plants are often a contributor of phosphorous loads to area waterways. Contributions from failed on-site wastewater treatment (septic) systems can also be a significant source (nonpoint), especially if they are concentrated in a small area. Phosphorus from nonpoint sources is generally insoluble or particulate. Most of this phosphorus is bound tightly to soil particles and enters streams from erosion. The impact from phosphorus discharged by nonpoint sources is typically intermittent and is most often associated with stormwater runoff.

To achieve a reduction of TP for the Rock River/Pierce Lake watershed, management measures must primarily address loading through sediment and surface runoff controls. BMPs that could be used for treatment of these nonpoint sources include:

- Conservation tillage practices
- Filter strips and riparian buffers
- Farming/soil retention practices
- Wetlands
- WASCOBs
- Streambank Protection
- Septic Systems
- Animal waste management
    - Waterfowl
- Urban soil/erosion BMPs
- Nutrient management
- Phosphorus-based lawn fertilizer restrictions
- Shoreline protection
- In-lake management measures

Section 9.3.1.2 discusses conservation tillage, filter strips, riparian buffers, farming/soil retention, wetlands, WASCOBs, streambank protection, animal waste management and urban soil erosion BMPs, all of which are also applicable to reduction of phosphorus loads into Pierce Lake if applied upgradient of the waterbody. The paragraphs that follow provide detailed explanations for the remaining TP nonpoint source controls listed above.

Nutrient Management: Nutrient management programs could result in reduced nutrient loads to impaired segments within the Rock River/Pierce Lake Watershed and help improve DO levels. Crop management of nitrogen and phosphorus originating in the agricultural portions of the watershed can be accomplished through NMPs that focus on increasing the efficiency with which applied nutrients are used by crops, thereby reducing the amount available to be transported to both surface water and groundwater.

The overall goal of nutrient reduction from agriculture should be to increase the efficiency of nutrient use by balancing nutrient inputs in feed and fertilizer with outputs in crops and animal produce and to manage the concentration of nutrients in the soil. The four "Rs" of nutrient management are applying the right fertilizer source at the right rate at the right time and in the right place. It is not unusual for crops in fields or portions of fields to show nutrient deficiencies during periods of the growing season, even where an adequate NMP is followed. The fact that nutrients are applied does not necessarily mean they are available. Plants obtain most of their nutrients and water from the soil through their root system. Any factor that restricts root growth and activity has the potential to restrict nutrient availability and result in increased nutrient runoff.

Reducing nutrient loss in agricultural runoff may be brought about by source and transport control measures such as filter strips or grassed waterways. NMPs account for all inputs and outputs of nutrients to determine reductions. NMPs typically include the following measures:

- Review of aerial photography and soil maps.
- Regular soil testing to determine areas where adequate or excessive fertilization has taken place, monitor where nutrient buildup in soils occurs, and aid in determining fertilization maintenance requirements. Appropriate soils sampling and analysis techniques are described in the Illinois Agronomy Handbook.[59]
- Review of current and/or planned crop rotation practices.
- Establishment of yield goals and associated nutrient application rates, which can help minimize the potential for excessive buildup of phosphorus and reallocate phosphorus sources to fields or areas where the greatest agronomic benefits can be produced.
- Development of nutrient budgets with planned application rates, application methods, and timing and form of nutrient application.
- Identification of sensitive areas and restrictions on application when land is snow covered, frozen, or saturated.

Regional differences in phosphorus-supplying power are shown in Figure 8-4 of the Illinois Agronomy Handbook.[60] The differences were broadly defined primarily based on variability in parent material, degree of weathering, native vegetation, and natural drainages. For example,

---

[59] University of Illinois Urbana-Champaign. 2021. *Illinois Agronomy Handbook.* http://extension.cropsciences.illinois.edu/handbook/

[60] Fernandez, F.G., and R.G. Hoeft. Under Revision. "Managing Soil pH and Crop Nutrients." Chapter 8 in: *Illinois Agronomy Handbook.* chapter08.pdf (illinois.edu)

soils developed under forest cover appear to have more available subsoil phosphorus than those developed under grass. Soil test values are used to determine when buildup and maintenance of soil phosphorus is needed to supplement soils with low phosphorus-supplying power. Specific application amounts should be determined by periodic soil testing. Subsoil levels of phosphorus in the southern Illinois region may be rather high by soil test in some soils, but this is partially offset by conditions that restrict rooting.

Excessively high phosphorus soil test levels should not be maintained. While soil test procedures were designed to predict where phosphorus was needed, not to predict environmental problems, the likelihood of phosphorus loss increases with high phosphorus test levels. Environmental decisions regarding phosphorus applications should include such factors as distance from a significant lake or stream, infiltration rate, slope, and residue cover. One possible problem with using soil test values to predict environmental problems is in sample depth. Normally samples are collected to a 7-inch depth for predicting nutritional needs. For environmental purposes, it would often be better to collect the samples from a 1- or 2-inch depth, which is the depth that will influence phosphorus runoff. Another potential problem is variability in soil test levels within fields in relation to the dominant runoff and sediment-producing zones. Several fertilizer placement recommendations are described in the Illinois Agronomy Handbook. However, given the propensity of phosphorus to bind tightly to soil particles and subsequently enter streams through erosion, the deep fertilizer placement technique may be most appropriate in phosphorus impaired areas. Under the deep placement technique, the fertilizer is placed 4 to 8 inches deep into the soil rather than being spread near the surface.

Fertilizer Restrictions: Runoff from urban areas may include phosphorus-based fertilizers applied to residential lawns, golf courses, and other surfaces. If used too close to a receiving water body, phosphorus present in stormwater runoff will enter the water body. Illinois has a statute in place that governs the use of phosphorus-based fertilizers in urban areas—the Lawn Care Products Application and Notice Act (415 Illinois Compiled Statutes 65).[61] This act includes the following prohibitions for phosphorus-based fertilizers (see the act for limited exceptions):

- They shall not be applied to lawns unless it can be demonstrated by soil test that the lawn is lacking in phosphorus when compared against the standard established by the University of Illinois (see the act for exceptions).
- They shall not be applied to impervious surfaces.
- They shall not be applied within 3 feet of any water body if a spray, drop, or rotary spreader is used. If other equipment is used, the fertilizer may not be applied within 15 feet of a water body.
- They shall not be applied when the ground is frozen or saturated.
- Appropriate lawn markers for the application event and notifications to potentially affected adjacent properties are required.

[61] 415 ILCS 65. Environmental Safety. Lawn Care Products Application and Notice Act. https://www.ilga.gov/legislation/ilcs/ilcs3.asp?ActID=1597&ChapterID=36

Shoreline Protection: Treatments used to stabilize and protect shorelines of lakes, reservoirs, or estuaries are also discussed in Illinois NRCS CPS 580.[62] Factors that may be impacting Pierce Lake shoreline erosion include steep slopes of the original ground at the shoreline, saturation of the soils, wind- and boat-induced waves, or erosive soil types.

Riprap is human-placed rock or other material used to armor shoreline and/or shoreline structures against scour and water, wave, or ice erosion. Conventional placement of riprap blankets on the existing shorelines from a few feet above water level to a few feet below water level can help in reducing erosion to portions of the Pierce Lake shoreline. Other jurisdictions have installed a line of peaked stone riprap at a water depth of 1.5 feet (the edge of the riprap is about 5 to 10 feet from the edge of water) along lake shorelines. This method breaks the waves that would collide with the eroded bank. The riprap also accumulates soil that erodes from the bank, which in turn allows vegetation to establish in the quiescent zones between the riprap and the eroded shoreline. Another benefit of this method is that boats and barges construct the riprap from the water and the steep eroded shorelines are not disturbed by construction equipment. It can take years for the area between the riprap and the edge of the water to accumulate soil and to become fully vegetated.

Waterfowl: Waterfowl are a known contributor to phosphorus loads in lakes and reservoirs, primarily as a result of sizeable migratory and resident Canada geese populations. The lack of estimates of waterfowl in Pierce Lake made it difficult to account for phosphorus loads from this source explicitly; however, waterfowl and other wildlife uses in the watershed are accounted for implicitly by runoff coefficients developed for land uses.

In-Lake Phosphorus Loading: Modeling, described in Section 8, determined that internal loading of phosphorus is likely a significant contributor to overall watershed loads. A reduction of phosphorus from in-lake cycling through in-lake management strategies may be necessary for attainment of the TMDL load allocations. Internal phosphorus loading can occur when the water above the sediments becomes anoxic, causing the release of phosphorus from the sediment in a form that is available for plant uptake. The addition of bioavailable phosphorus in the water column stimulates more plant growth and die-off, which may perpetuate or create anoxic conditions and enhance the subsequent release of phosphorus into the water. Internal phosphorus loading can also occur in shallow lakes through release from sediments by the physical mixing and reintroduction of sediments into the water column as a result of wave action, winds, boating activity, and other means.

For lakes experiencing high rates of phosphorus input from bottom sediments, several management measures are available to control internal loading. Three BMP options for the control of internal loading include the installation of an aerator, the addition of aluminum, and dredging.

[62] NRCS. 2020. Streambank and Shoreline Protection. Code 580. https://www.nrcs.usda.gov/sites/default/files/2022-10/Streambank_Shoreline_Protection_580_CPS_10_2020.pdf

- Hypolimnetic (bottom water) aeration involves air release from an aerator that can be positioned at a selected depth or at multiple depths to increase oxygen transfer efficiencies in the water column and reduce internal loading by establishing aerobic conditions at the sediment-water interface.
- Phosphorus inactivation by aluminum addition (specifically aluminum sulfate or alum) to lakes is the most widely used technique to control internal phosphorus loading. Alum forms a polymer that binds phosphorus and organic matter. The aluminum hydroxide-phosphate complex (commonly called alum floc) is insoluble and settles to the bottom, carrying suspended and colloidal particles with it. Once on the sediment surface, alum floc inhibits phosphate diffusion from the sediment to the water.[63]
- Phosphorus release from the sediment is greatest from recently deposited layers. Dredging approximately 1 meter of recently deposited phosphorus–rich sediment can remove approximately 80 to 90 percent of the internally loaded phosphorus without the addition of potentially toxic compounds to the lake. Dredging may also contribute to reductions in internal phosphorus loading by increasing the depth of large portions of the water body, reducing the degree of reintroduction of sediments into the water column through physical mixing. However, dredging is typically more costly than other management options.

9.4 Costing Estimates and Funding Opportunities

This section provides an overview of the costing estimates and funding opportunity considerations that are important when evaluating the feasibility of implementing phosphorus- and fecal coliform-reducing BMPs within the Rock River/Pierce Lake watershed.

9.4.1 Best Management Practice Cost Estimates

Cost estimates for a number of suggested BMPs are available through the SWCD (**Table 9-7**). Cost information for additional BMPs not included in the table is discussed after the table.

Table 9-7 Fiscal Year 2023 NRCS BMP Cost Data[1]

Practice	Component	Units	Program	Average Cost
329	No Till/Strip Till	Acre	CSP	$2.27
340	Cover Crops	Acre	CSP	$18.49
342	Critical Area Planting	Acre	CSP	$134.88
362	Diversions	Foot	EQIP	$13.26
391	Riparian Forest Buffer	Acre	EQIP	$1,103.90
393	Filter Strip	Acre	EQIP	$459.48
410	Grade Stabilization Structures (drop structures, spillways, concrete block chute)	Square foot	CSP	$9.53
410	Grade Stabilization Structure (embankments, rip rap and concrete chutes)	Cubic yard	CSP	$20.13
412	Grassed Waterway Earthwork	Acre	CSP	$514.08
512	Pasture + Hayland Planting (applies to land not in pasture or hayland within the past 5 years)	Acre	CSP	$43.20
590	Nutrient Management	Acre	CSP	$4.65

[63] Cooke, G.D., Welch, E.B., Martin, A.B. et al. 1993. *Effectiveness of Al, Ca, and Fe salts for control of internal phosphorus loading in shallow and deep lakes*. Hydrobiologia 253, 323–335.

Practice	Component	Units	Program	Average Cost
600	Terrace	Foot	EQIP	$3.55
600	Terrace	Acre	EQIP	$1,122.04
638	WASCOB	Foot	EQIP	$3.89
638	WASCOB	Cubic yard	EQIP	$3.04
656	Constructed Wetland (plantings and earthwork)	Acre	EQIP	$8,054.13
657	Wetland Restoration	Acre	EQIP	$6,080.10
658	Wetland Creation	Acre	EQIP	$3,678.71
659	Wetland Enhancement	Acre	EQIP	$6,450.61

Note:

[1] NRCS. Payment Schedules – Illinois. https://www.nrcs.usda.gov/conservation-basics/conservation-state/illinois/payment-schedule.

Filter Strips and Riparian Buffers: Several types of filter strip practices are available, including areas for native herbaceous vegetation with or without fertility measures required and areas of introduced species, also with or without fertility measures required. Filter strip implementation that includes seedbed preparation and native seed application ranges from $520 per acre to $639 per acre depending on the type used, with an average cost of approximately $594 per acre.

Riparian buffers consisting of bare-root shrubs cost approximately $1.10 to $1.65 each while direct seeding of trees and/or shrubs costs approximately $741 per acre. The direct seeding scenario includes a planting rate of approximately 3,000 to 4,800 seeds per acre as well as the foregone income for the land taken out of crop production. Land preparation, including removing undesirable vegetation and improving site conditions, is estimated at $38 per acre. For cases where an herbaceous cover is preferable, such as native grass or certain species of forbs and/or shrubs, costs average $642 per acre.

Wetlands: The price to establish a wetland is very site-specific and depends on factors such as size and type of vegetation used. Examples of costs associated with constructed wetlands include excavation costs, vegetation removal, and revegetation costs. Costs for wetlands created on a flat-mineral uplands where surface runoff may be intercepted and ponded by excavation range from $3,186 (no embankment) to $3,680 (with embankment). Some areas may favor a wetlands setting that just needs to be enhanced or restored. In an area of natural depression fed by surface runoff, enhancement/restoration is approximately $2,557 per acre.

Enhancing or restoring a wetland on a floodplain site that has existing levees and/or ditches may consist of regrading or shaping the land, potentially including levee removal, for $1,167 per acre. Constructed wetlands to reduce the pollution potential of runoff and wastewater average $7,725 per acre where natural regeneration of wetland plants will be a major contributor to the working vegetation, and $10,286 per acre where wetland vegetation in the pool area is planted at a denser grid (3-foot by 3-foot or closer). As needed, embankments, water control and grade stabilization structures, and filter strips should be added.

9.4.2 Project Funding

Cost-share and incentive programs at the state and federal level are available to landowners, homeowners, and farmers in the watershed to help offset the costs of implementing many of the BMPs recommended in this report. Some of these programs are discussed in this section. When

reviewing the programs, it should be noted that some are only meant to provide incentives to encourage operators or landowners to try the practice. These incentive programs are not intended to cover the entire cost associated with implementing a practice. Additionally, some practices have many variables to consider that will affect both the cost of the program and the incentive or cost-share amount to be received (e.g., NMPs).

9.4.2.1 State-Level Funding

State-level programs to encourage landowners to implement resource-conserving practices for water quality and erosion control purposes are discussed in the paragraphs that follow. Local county representatives may be contacted for more information about available state funding opportunities (**Table 9-8**).

Table 9-8 Local SWCD, NRCS, and Farm Service Agency Contact Information

County	Address	Phone
Winnebago	4833 Owen Center Road Rockford, IL 61101	815-965-2392
Boone	211 N Appleton Road Belvidere, IL 61008	815-544-3465 Ext.3

IDA and Illinois EPA NMP Project: The IDA and Illinois EPA co-sponsor a cropland NMP project in watersheds that have developed or are developing TMDLs. This voluntary project supplies incentive payments to producers to have NMPs developed and implemented. Additionally, watersheds that have sediment or phosphorus identified as a cause for impairment (as is the case in this watershed) are eligible for cost-share assistance in implementing traditional erosion control practices through the NMP project.

Partners for Conservation Program: The Partners for Conservation Program (PFC)[64] provides cost sharing on a variety of practices such as no till systems, WASCOBs, pasture/hayland establishment, critical area planting, cover crops, temporary cover (if added to another practice in order to extend the construction season), filter strips, rain gardens, terrace systems, diversions, well decommissioning, NMPs, and grade stabilization structures. The PFC is funded through the IDA and administered by the local SWCDs. Life/maintenance contracts can be 1 to 10 years depending on the practice, and costs per acre vary significantly from project to project.

SWCD Grants Program: SWCDs assist local landowners improve their natural resource management practices by providing technical assistance and grants that support soil conservation, water quality protection, wetland management, flood control, soil erosion control at urban construction sites, streambank stabilization, recycling, soil interpretation, land use and site suitability, and conservation education.[65]

Conservation Fund Program: The IDNR Conservation Fund Program helps land owners experiencing erosion on their property. Eligible BMPs covered under this program include no till or strip till, cover crops, temporary cover, critical area plantings, filter strips, diversion, grate stabilization structures, grassed waterways, pasture and hayland planting, terraces, and

[64] IDNR. 2023a. https://dnr.illinois.gov/conservation/pfc.html
[65] IDNR. 2023b. https://dnr.illinois.gov/conservation/crep.html

WASCOBs. Funding assistance of up to 50 percent of the cost of the project is available with grant awards of up to $750,000.[66]

Division of Forestry Resources Forestry Assistance Program: Resources are available through the Rural Forest Landowner Assistance Program and the Urban and Community Forestry Program to help private landowners and cities, respectively, address forest stewardship practices.[67]

Green Infrastructure Grant Opportunities: Illinois EPA provides funding through the Green Infrastructure Grant Opportunities (GIGO) program for water quality improvement projects that decrease stormwater runoff. Examples of eligible projects include grassed waterways, permeable pavement, and downspout disconnection. The GIGO offers up to $2,500,000 per funding cycle with a minimum grant of $75,000. The program is a reimbursement program where Illinois EPA issues reimbursement for eligible costs expended after project implementation.[68]

Illinois Green Infrastructure Grant Program for Stormwater Management: The Illinois Green Infrastructure Grant Program for Stormwater Management provides funding to local government entities and organizations to implement green infrastructure practices that control stormwater runoff to protect water quality. Practices such as permeable pavements and other urban BMPs are eligible for funding.[69]

Water Pollution Control Loan Program: Illinois EPA supports local public or private entities implement wastewater and stormwater projects through the Water Pollution Control Loan Program State Revolving Fund loan program. Funding through this program is appropriated annually and combines federal capitalization funding with state matching funds, interest earnings, repayment money, and the sale of bonds to form a source of financing for infrastructure projects. Eligible projects include new or upgraded wastewater infrastructure construction, stormwater-related projects that benefit water quality, and a variety of other projects that improve the quality of Illinois's rivers, streams, and lakes. More information is available at https://epa.illinois.gov/topics/grants-loans/state-revolving-fund.html.

9.4.2.2 Federal Funding

There are several voluntary conservation programs established by various federal agencies that encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs apply to crop fields as well as rural grasslands that are currently used for livestock grazing. Federal-level programs are discussed in the paragraphs that follow. The EPA manages the CWA Section 319 grants. The Farm Service Agency (FSA) oversees the Conservation Reserve Program (CRP) and the Grasslands Reserve Program (GRP). Voluntary conservation programs established through the 2018 U.S. Farm Bill and managed by NRCS include the Agricultural Conservation Easement Program (ACEP), the Conservation Stewardship Program (CSP), and the Environmental Quality Incentives Program (EQIP).

---

[66] IDNR. 2020. https://dnr.illinois.gov/press-release.21619.html
[67] IDNR.2023c. https://dnr.illinois.gov/conservation/forestry/forestry-assistance-program.html
[68] Illinois EPA. 2023. https://epa.illinois.gov/topics/grants-loans/water-financial-assistance/gigo.html
[69] Illinois EPA. 2023.

CWA 319 Grants: Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the Section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive EPA 319(b) grants upon EPA's approval of the state's nonpoint source assessment report and nonpoint source management program. States may reallocate funds through subawards (e.g., contracts, subgrants) to both public and private entities, including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

EPA designates incremental funds, a $178 million award in 2022, for the restoration of impaired water through the development and implementation of WBPs and TMDLs for impaired waters. Base funds (i.e., funds other than incremental funds) are used to provide staffing and support to manage and implement the state nonpoint source management program. Section 319 funding can be used to implement activities that improve water quality such as filter strips and streambank stabilization.[70,71]

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement the Illinois Nonpoint Source Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling nonpoint source pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale; funding is also available for BMPs on a non-watershed scale and for the development of information/education regarding nonpoint source pollution control programs.

The maximum federal funding available is 60 percent of the total cost, with the remaining 40 percent coming from local match. The program period is 2 years unless otherwise approved. This is a reimbursement program. Section 319(h) funds are awarded for the purpose of implementing approved nonpoint source management projects. The funding will be directed toward activities that result in the implementation of appropriate BMPs for the control of nonpoint source pollution or to enhance public awareness of nonpoint source pollution. Applications are accepted June 1 through August 1.

CRP: The CRP is a voluntary program, administered through the FSA, which encourages landowners to agree to remove environmentally sensitive land from agricultural production and plant long-term, resource-conserving cover to improve water quality, prevent soil erosion, and reduce loss of wildlife habitat. The program was initially established in the Food and Security Act of 1985 and is the largest private-lands conservation program in the United States.

Participants can enroll in CRP in two ways and the duration of the contracts under CRP range from 10 to 15 years. The first enrollment method is through a competitive process known as the

---

[70] EPA. 2003.

[71] EPA. Historic 319 Grant Funding Spreadsheet for Fiscal Year 2022. https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fwww.epa.gov%2Fsystem%2Ffiles%2Fdocuments%2F2022-07%2F319_historic_funding_FY22.xlsx&wdOrigin=BROWSELINK

CRP General Sign-Up. These are announced on a periodic basis by the U.S. Secretary of Agriculture but do not occur on any fixed schedule. The second enrollment method is through CRP Continuous Sign-Up, which is offered on a continuous basis. Continuous sign-up provides management flexibility to farmers and ranchers to implement certain high-priority conservation practices on eligible land. All enrollment offers are processed through the local FSA office. Certain conditions must be met for land to be eligible for CRP enrollment. These conditions include the following:

- The applicant for enrollment must have owned or operated the land for at least 12 months prior to the previous CRP sign-up period (except in cases of a change in ownership because of the previous owner's death, foreclosure, or land purchase by the new owner without the sole intention of placing it in the CRP).
- Cropland that is planted or considered planted to an agricultural commodity for four of the six most recent crop years (including field margins) and must be physically and legally capable of being planted in a normal manner to an agricultural commodity.
- Certain marginal pastureland suitable for use as any of the following conservation practices: wetlands buffer or restoration, filter strips, riparian buffer, grass waterway, or contour grass strip.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted-average erosion index of 8 or higher
- Be expiring CRP acreage
- Be in a national or state CRP conservation priority area

The FSA bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or cash-rent equivalent. The maximum rental rate for each offer is calculated in advance of enrollment. Producers may offer land at the maximum rate or at a lower rental rate to increase likelihood of offer acceptance. In addition, the FSA provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation practices. FSA offers several financial incentives opportunities for certain sign-up practices. In 2020, FSA increased the practice incentive payment from 5 to 20 percent of annual rental payment rate and added a 10 percent incentive payment for water quality practices on land enrolled in CRP's continuous sign-up.[72]

A signing incentive payment is a one-time incentive payment of 32.5 percent of the amount of the first annual rental payment.[73] Eligible practices include field windbreaks; grassed waterways; shelter belts; living snow fences; filter strips; riparian buffers; marginal pastureland wildlife and wetland buffers; bottom timber establishment; field borders; longleaf pine establishment; duck nesting habitat; State Acres for Wildlife Enhancement (SAFE) buffers, wetlands, trees, longleaf

[72] FSA. 2020. USDA Announces Increase to Certain Incentive Payments for Continuous Conservation Reserve Program. https://www.fsa.usda.gov/news-room/news-releases/2020/usda-announces-increase-to-certain-incentive-payments-for-continuous-conservation-reserve-program

[73] eCFR Part 1410 – Conservation Reserve Program. https://www.ecfr.gov/current/title-7/subtitle-B/chapter-XIV/subchapter-B/part-1410

pine, and grass; pollinator habitat; and several wetlands practices. A performance incentive payment is a one-time incentive payment made to participants who enroll land in the CRP to be committed to all continuous sign-up practices except establishment of permanent vegetative cover on terraces, wetland restoration (including nonfloodplain), bottomland timber establishment, and duck nesting habitat establishment. Finally, in 2021, FSA enacted a Climate-Smart Practice Incentive for CRP General and Continuous Sign-Ups. This incentive encourages CRP practices that increase carbon sequestration and reduced greenhouse gas emissions through things like establishment of trees and permanent grasses, development of wildlife habitat, and wetland restoration. The Climate-Smart Practice Incentive is annual, and the amount is based on the benefits of each practice type.[74]

The maximum annual noncost share payment that an eligible "person" can receive under the CRP is $50,000 per fiscal year. This is a separate payment limitation applying only to CRP noncost share payment.

Refer to the FSA CRP website for more information: https://www.fsa.usda.gov/programs-and-services/conservation-programs/conservation-reserve-program/.

GRP: The purpose of the GRP, administered by the FSA, is to prevent grazing and pasture land from being converted into cropland, used for urban development, or developed for other nongrazing uses. Participants in the program voluntarily limit future development of the land while still being able to use the land for livestock grazing and activities related to forage and seed production. Some restrictions on activities may apply during the nesting season of certain bird species that are in decline or protected under federal or state law.

The GRP has several enrollment options including a rental contract for 10, 15, or 20 years, or enrollment of the land in a conservation easement for an indefinite period. Applications are accepted any time and are processed through the local FSA office. To be eligible for a rental agreement, the applicant must own or have control of the land for the length of the contract. To enroll in a conservation easement, the applicant must own and be willing to restrict use of the land either in perpetuity or under the maximum length of time under state law. Persons enrolled in the GRP receive an annual rental payment for their enrolled acres. Further information about the program, including payment amounts, eligibility and maintenance criteria, and land requirements may be obtained from the local FSA office.

ACEP: ACEP provides financial and technical assistance to help conserve agricultural lands and wetlands and their related benefits. Under the Agricultural Land Easements component, NRCS helps American Indian tribes, state and local governments, and nongovernmental organizations protect working agricultural lands and limit nonagricultural uses of the land. Land protected by agricultural land easements provides additional public benefits including environmental quality, historic preservation, wildlife habitat, and protection of open space. Under the Wetlands Reserve Easements component, NRCS helps to restore, protect, and enhance enrolled wetlands. Wetland reserve easements provide habitat for fish and wildlife including threatened and endangered species, improve water quality by filtering sediments and chemicals, reduce flooding, recharge

[74] FSA. 2022. Conservation Reserve Program Monthly Summary – May 2022. https://www.fsa.usda.gov/Assets/USDA-FSA-Public/usdafiles/Conservation/PDF/Summary%20May%202022%20CRPMonthly.pdf

groundwater, protect biological diversity, and provide opportunities for educational, scientific, and limited recreational activities.

- Agricultural Land Easements: NRCS provides financial assistance to eligible partners to purchase agricultural land easements that protect the agricultural use and conservation values of eligible land. In the case of working farms, the program helps farmers and ranchers keep their land in agriculture. The program also protects grazing uses and related conservation values by conserving grassland including rangeland, pastureland, and shrubland. Land eligible for agricultural easements includes cropland, rangeland, grassland, pastureland, and nonindustrial private forest land. NRCS will prioritize applications that protect agricultural uses and related conservation values of the land and those that maximize the protection of contiguous acres dedicated to agricultural use.

  To enroll land through agricultural land easements, NRCS enters into cooperative agreements with eligible partners. Each easement is required to have an agricultural land easement plan that promotes the long-term viability of the land. Under the agricultural land component, NRCS may contribute up to 50 percent of the fair market value of the agricultural land easement. Where NRCS determines that grasslands of special environmental significance will be protected, NRCS may contribute up to 75 percent of the fair market value of the agricultural land easement.

- Wetland Reserve Easements: NRCS also provides technical and financial assistance to restore, protect, and enhance wetlands through the purchase of a wetland reserve easement. These agreements include the right for NRCS to develop and implement a wetland reserve restoration easement plan to restore, protect, and enhance the wetland's functions and values. Land eligible for wetland reserve easements includes farmed or converted wetland that can be successfully and cost-effectively restored. NRCS will prioritize applications based the easement's potential for protecting and enhancing habitat for migratory birds and other wildlife. For acreage owned by an Indian tribe, there is an additional enrollment option of a 30-year contract. Through the wetland reserve enrollment options, NRCS may enroll eligible land through one of the following:

  - Permanent Easements – These are conservation easements in perpetuity. NRCS pays 100 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 75 to 100 percent of the restoration costs.

  - 30-Year Easements – These expire after 30 years. Under 30-year easements, NRCS pays 50 to 75 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.

  - Term Easements – Term easements are easements made for the maximum duration allowed under applicable state laws. NRCS pays 50 to 75 percent of the easement value for the purchase of the term easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.

  - 30-Year Contracts – 30-year contracts are only available to enroll acreage owned by Indian tribes. Program payment rates are commensurate with 30-year easements.

For wetland reserve easements, NRCS pays all costs associated with recording the easement in the local land records office including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Wetland Reserve Enhancement Partnership: The Wetland Reserve Enhancement Partnership (WREP) is an enrollment option under the ACEP. The WREP continues to be a voluntary program through which NRCS signs agreements with eligible partners to leverage resources to carry out high-priority wetland protection, restoration, and enhancement and to improve wildlife habitat. Partner benefits through WREP agreements include:

- Wetland restoration and protection in critical areas
- Ability to cost-share restoration or enhancement beyond NRCS requirements through leveraging
- Able to participate in the management or monitoring of selected project locations
- Ability to use innovative restoration methods and practices

For 2023, NRCS announced $20 million available in financial and technical assistance to help eligible conservation partners leverage local resources to voluntarily protect, restore, and enhance critical wetlands on private and tribal agricultural land nationwide. The funding is provided through the WREP, a special enrollment option under the ACEP.[75] Proposals for funding must be limited to $5 million and were due by August 15, 2021, with funding announcements released in October 2021. Landowners should check with their local NRCS state office to see about applying in future years. To enroll land, eligible partners may submit proposals to the local NRCS office.

CSP: The CSP helps agricultural producers maintain and improve their existing conservation systems and adopt additional conservation activities to address priority resources concerns. Participants earn CSP payments for conservation performance—the higher the performance, the higher the payment.

Through the CSP, participants take additional steps to improve resource conditions including soil quality, water quality and quantity, air quality, habitat quality, and energy. The CSP provides two types of payments through 5-year contracts: annual payments for installing new conservation activities and maintaining existing practices; and supplemental payments for adopting a resource-conserving crop rotation. Producers may be able to renew a contract if they have successfully fulfilled the initial contract and agree to achieve additional conservation objectives. Payments are made soon as practical after October 1 of each fiscal year for contract activities installed and maintained in the previous year.

Eligible lands include private and tribal agricultural lands, cropland, grassland, pastureland, rangeland and nonindustrial private forest land. The CSP is available to all producers regardless of operation size or type of crops produced, in all 50 states, the District of Columbia, and the Caribbean and Pacific Island areas. Applicants may include individuals, legal entities, joint

[75] NRCS. WREP Announcement for Fiscal Year 2023. USDA-NRCS Fiscal Year (FY) 2023 Wetland Reserve Enhancement Partnership (WREP) Announcement of Funding, Proposal Requirements and Review Criteria

operations, or Indian tribes that meet the stewardship threshold for at least two priority resource concerns when they apply. They must also agree to meet or exceed the stewardship threshold for at least one additional priority resource concern by the end of the contract. Producers must have effective control of the land for the term of the proposed contract, which include all eligible land in the agricultural operation. Some additional restrictions and program requirements may apply and interested applicants should contact the local NRCS office for more information.

EQIP: EQIP is a voluntary program that provides financial and technical assistance to agricultural producers to plan and implement conservation practices that improve soil, water, plant, animal, sir, and related natural resources on agricultural land and nonindustrial private forestland. Through EQIP, NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Persons engaged in livestock or agricultural production and owners of nonindustrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private nonindustrial forestland, and other farm or ranch lands. Eligible applicants must, at a minimum, meet the following criteria; additional program requirements may apply:

- Be an agricultural producer (person, legal entity, or joint operation who has an interest in the agricultural operation or who is engaged in agricultural production or forestry management)
- Control or own eligible land
- Comply with adjusted gross income for less than $900,000 (federally recognized Native American Indian tribes or Alaska Native corporations are exempt from the adjusted gross income payment limitations)
- Be in compliance with the highly erodible land and wetland conservation requirements
- Develop an NRCS EQIP plan of operations that addresses at least one natural resource concern

Persons interested in entering into a cost-share agreement with the NRCS for EQIP assistance may file an application at any time; however, each state may establish deadlines for one or more application periods in which to consider eligible applications for funding. Applications submitted after the deadlines will be evaluated and considered for funding during later funding opportunities.

As part of the program, a conservation activity plan can be developed for producers to address a specific natural resource concern on their agricultural operation. Each plan is developed by a certified technical service provider who is selected by the EQIP participant. Technical assistance payments for technical service providers do not count against the financial assistance aggregate payment limitation or the contract financial assistance payment limitation. The plan becomes the basis of the EQIP contract between NRCS and the participant, and the contracts can be up to 10 years long. Financial assistance payments are made to eligible producers once conservation practices are completed according to NRCS requirements. Payment rates are set for each fiscal year and are attached to the EQIP contract when it is approved.

Historically underserved producers (limited resource farmers/ranchers, beginning farmers/ranchers, socially disadvantaged producers, Indian tribes, and veteran farmers or ranchers) who self-certify on Form NRCS-CPA-1200, Conservation Program Application, are eligible for a higher practice payment rate to support implementation of contracted conservation practices and activities. Historically underserved producers may also be issued advance payments up to 50 percent of the established payment rate to go toward purchasing materials or contracting services to begin installation of approved conservation practices. Self-certified socially disadvantaged farmers/ranchers, beginning farmers/ranchers, and veteran farmer/rancher producers may elect to be evaluated in special EQIP funding pools. More information can be obtained from the local NRCS office.

EQIP provides payments up to 75 percent of the incurred costs and 100 percent estimated income foregone of certain conservation practices and activities. Conservation practices that are recommended BMPs for this watershed TMDL and eligible for EQIP funding include filter strips, conservation tillage, grade stabilization structures, grass waterways, riparian buffers, streambank/shoreline protection, terraces, and wetland restoration.

Farmer to Farmer Program: The Farmer to Farmer Program is a potential funding source from EPA that depends upon future funding. Funds are available to improve water quality, habitat, resilience, and environmental education through the demonstration of innovative practices on working agricultural lands. The project supports farmer-led or farm-focused organizations in the Gulf of Mexico watershed, which includes the Wabash River watershed.

Regional Conservation Partnership Program: The Regional Conservation Partnership Program (RCPP) is a stand-alone USDA program funded at $300 million annually. The RCPP website states that the program "promotes coordination of NRCS conservation activities with partners that offer value-added contributions to expand our collective ability to address on-farm, watershed, and regional natural resource concerns. Through RCPP, NRCS seeks to coinvest with partners to implement projects that demonstrate innovative solutions to conservation challenges and provide measurable improvements and outcomes tied to the resource concerns they seek to address." Information on eligibility, project types, funding, and how to apply can be found at https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/programs/financial/rcpp/.

9.4.3 Planning Level Cost Estimates for Implementation Measures

Cost estimates for different implementation measures are presented in **Table 9-9**. The columns labeled "Program" or "Sponsor" list the financial assistance program or sponsor available for the various BMPs discussed throughout Section 9. Illinois EPA 319 grants are applicable to all of the practices.

Table 9-9 Cost Estimates of Various BMP Measures[1]

Code	Practice	Units	Average Cost	Program
329	No Till/Strip Till	Acre	$2.27	CSP
340	Cover Crops	Acre	$18.49	CSP
342	Critical Area Planting	Acre	$134.88	CSP
362	Diversions	Foot	$13.26	EQIP
391	Riparian Forest Buffer	Acre	$1,103.90	EQIP
393	Filter Strip	Acre	$459.48	EQIP
410	Grade Stabilization Structures (drop structures, spillways, concrete block chute)	Square foot	$9.53	CSP
410	Grade Stabilization Structure (embankments, rip rap and concrete chutes)	Cubic yard	$20.13	CSP
412	Grassed Waterway Earthwork	Acre	$514.08	CSP
512	Pasture + Hayland Planting (Applies to land not in pasture or hayland within the past 5 years)	Acre	$43.20	CSP
590	Nutrient Management	Acre	$4.65	CSP
600	Terrace	Foot	$3.55	EQIP
600	Terrace	Acre	$1,122.04	EQIP
638	WASCOB	Foot	$3.89	EQIP
638	WASCOB	Cubic yard	$3.04	EQIP
656	Constructed Wetland (plantings and earthwork)	Acre	$8,054.13	EQIP
657	Wetland Restoration	Acre	$6,080.10	EQIP
658	Wetland Creation	Acre	$3,678.71	EQIP
659	Wetland Enhancement	Acre	$6,450.61	EQIP
NA	Septic System Maintenance	Per event	$250–$3,350	NA

Note:

NA – not applicable

9.5 Watershed-Specific Priority Areas and Projects

Illinois EPA is soliciting information from local stakeholders, watershed groups, and the SWCDs to identify and document any previous or in-progress watershed projects that target the parameters of concern. Information received during the public meeting process will be documented in this section of the final report.

Additionally, Section 5.5 of this report summarized previous watershed studies that have been completed within the watershed along with reference information to find addition details. Recently, Olson Ecological Solutions completed the *South Fork Kent Creek Watershed Resource Inventory* in December 2019. The report identifies the fecal coliform impairment for South Fork Kent Creek. Olson Ecological Solutions performed an evaluation of riparian buffer conditions, erosion rates, and channelization throughout the South Fork Kent Creek subwatershed. Surveys were performed in late October and early November 2019 along approximately 22,000 feet of stream segments for South Fork Kent Creek and its tributaries. About 57 percent of the surveyed segments were found to have poor riparian conditions, 42 percent good condition, and 3 percent fair condition. Streambank erosion was also noted for surveyed stream segments. Mapping and modeling efforts identified low-intensity developed areas as a significant source for bacteria

pollutants in the subwatershed.[76] This document can be used as guide to perform similar studies in the other impaired subbasins within the watershed to help identify areas of concern and direct targeted implementation that will be most cost-effective.

9.6 Information and Education

Public outreach and education campaigns that support TMDL implementation plans should take on a holistic approach that consider more than just water quality problems within a watershed. Stakeholder engagement and cooperation improves when outreach strategies also address broader stakeholder concerns such as water supply availability and aesthetics. Watershed plans that incorporate this holistic approach are more successful in changing social behaviors and implementing multi-benefit BMPs that help with attaining water quality standards while also protecting other important resources such as drinking water sources, agricultural resources, forests and rangeland, and parks and open space.

Additionally, implementation plans are usually more successful if stakeholders are brought into the planning process early and have the opportunity to share their concerns. Transparency throughout the planning and implementation process encourages continued support and a higher likelihood of participation in developing management options and supporting implementation of BMPs. A WBP was developed by R. Cassidy in 2020, which included stakeholder meetings where issues of concern were discussed. Primary stakeholder issues of concern included:

- Nitrogen, phosphorus, and manganese loading
- Depleted oxygen levels and excess siltation/sedimentation and TSS in water
- Erosion
- Dumping
- Trash burning
- Increased rain and flooding
- Impermeable areas of surface development
- Septic tank leakage and well water quality
- Human health problems and a diminished quality of life that arise from the problems listed above
- Potential for more regulation and government intervention as a result of WBP development

Small incremental improvements and individual adoption of BMPs can be achieved at a much lower cost compared to large-scale BMPs implemented watershed-wide. Moving forward,

[76] Adams, K., and R. Olson. 2019. South Fork Kent Creek Watershed Resource Inventory. https://wincoil.gov/images/departments/Highway/Plans/sfkc_final_inventory_12.29.2020.pdf

outreach and education efforts should focus on activities that support the watershed plan goals, including:

- Continued regular meetings of local stakeholder groups with intent of broadening audience/attendance
- Field visit days with demonstrations of agricultural conservation practices
- Continued outreach and messaging to landowners to encourage implementation of edge of field BMPs, nutrient management, conservation tillage, cover crops, and livestock/pasture management
- Soil testing
- Reducing the use of lawn chemicals (pesticides and phosphorus fertilizers)
- Education/outreach for rural residence on proper septic system maintenance
- Periodic updates on watershed health/monitoring results

A virtual public meeting was held for the watershed in June 2021 to present Stage 1 TMDL development with additional meetings planned upon completion of Stage 3 TMDL development. Feedback received from stakeholders and the county SWCD staff in attendance was incorporated throughout this plan to include local information and discuss BMPs that are thought to be most the effective and implementable in this watershed. Additional recommended activities to support public outreach and education include:

- Websites and social media to publicize meetings and upcoming events and provide links to resources
- Email updates
- Brochures or fact sheets with information on household pollutant reduction, fertilizer use, and proper septic tank maintenance
- Educational signs, school visits, or participation in local events such as the CWA anniversary celebration to educate the public on water quality issues, the purpose of BMPs, and environmental stewardship
- Public service announcements
- Informational meetings on state and federal cost-share programs
- Watershed group development through the University of Illinois College of Agricultural and Consumer Economics Extension office

9.7 Milestones and Success Criteria

The primary objective of this plan is to improve water quality conditions in impaired stream segments within the Rock River/Pierce Lake watershed. In support of this primary objective, ongoing involvement of stakeholders and community members to participate in the BMPs described herein is also crucial to achieving water quality improvement within the watershed. **Table 9-10** provides the milestone objectives and supporting success criteria that can be used to assess the effectiveness of implementation plan actions.

Table 9-10 Plan Milestones and Success Criteria

Milestone Objective	Success Criteria
Water quality improvement	Reduce TP levels to meet calculated TMDLs presented in Section 8
	Reduce fecal coliform levels to meet calculated TMDLs presented in Section 8
	Increase in no till or reduced till farming
	Increase in buffer areas around agricultural lands or impaired waterways (i.e., riparian buffers, filter strips, grassed waterways, etc.)
	Secure funding for identified near- and mid-term BMP projects
	Delisting of impaired stream and lake segments
Stakeholder involvement	Initiate regularly scheduled meetings of Rock River/Pierce Lake watershed stakeholder groups
	Increased traffic on social media platforms and websites
	Increased participation in grass-roots outreach activities including information sharing at local schools
	Increased participation and funding from local municipalities toward watershed improvement and protection activities
	Secure funding for priority stakeholders to implement BMPs on their property

9.8 Plan Monitoring and Schedule

Successful plan implementation relies on establishing a plan schedule that tracks progression toward achieving established milestones and success criteria. The following subsections provide an overview of a monitoring plan and recommended plan schedule for achieving established milestone objectives. Stakeholders should evaluate schedule/milestone progress on an annual basis and implement adaptive management to modify management measures, milestones, and schedule as necessary.

9.8.1 Monitoring Plan

The purpose of the monitoring plan is to assess the overall implementation of management actions outlined above. This can be accomplished by conducting the monitoring programs designed to:

- Track implementation of BMPs in the watershed
- Estimate the effectiveness of BMPs
- Further monitor point source discharges in the watershed
- Continue monitoring impaired stream segments and tributaries

- Monitor storm-based, high-flow events
- Monitor TP via low-flow means throughout the watershed

Tracking the implementation of management measures can be used to:

- Determine the extent to which management measures and practices have been implemented compared to action needed to meet the TMDL endpoints
- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support work-load and costing analysis for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

Estimating the effectiveness of the BMPs implemented in the watershed could be completed by monitoring before and after the BMP is incorporated into the watershed. Additional monitoring could be conducted on specific structural systems such as a sediment control basin. Inflow and outflow measurements could be conducted to determine site-specific removal efficiency.

Illinois EPA conducts Intensive Basin Surveys every 5 years. Additionally, select ambient sites are monitored nine times a year. Continuation of this state monitoring program will assess stream water quality as improvements in the watershed are completed. This data will also be used to assess whether water quality standards in the impaired segments are being attained.

9.8.2 Implementation Schedule

Table 9-11 provides an implementation schedule for meeting milestone objectives. Implementing the management actions outlined in this section should occur in phases, often over the course of several years, with effectiveness assessments made as improvements are completed. The process of obtaining funding and developing and implementing projects designed to improve water quality can take months or years to complete. Once in place, improvements in water quality as a result of BMPs may not be detectable for several years. Continued monitoring and reevaluation of the implementation measures during this time will allow for more expedient adjustment to BMP implementation measures that may result in earlier attainment of water quality targets.

Table 9-11 Implementation Schedule

Milestone Objective	Schedule Category	Description	Recommended Schedule
Water quality improvement	Assess existing BMPs	Assess existing BMPs within the watershed for effectiveness	Short-term (1–5 years)
	Monitoring	Monitor results of pilot studies to measure success and adapt/adjust wider-scale implementation	Short-term (1–5 years)
	Monitoring	Implement monitoring plan	Continuous (1–20 years)
	Implement identified near-term projects	Work with local SWCD to use TMDL priority to secure funding and implement "ready-to-go" projects	Short-term (1–5 years)
	Implement larger projects	Implement larger projects that require multiple funding sources and stakeholders	Mid-term (5–10 years)
	Erosion control measures	Work with SWCD to identify areas throughout the watershed where no till or reduced till practices would be beneficial to reducing TP loads in DO-impaired watersheds	Mid-term (5–10 years)
	Nonpoint source controls	Work with SWCD to identify and fund projects throughout the watershed where buffers can be implemented around waterways or agricultural operations	Mid-term (5–10 years)
	Point source controls	Consider implementing TP limits or monitoring requirements on existing NPDES permits to aid in meeting TP reduction goals	Mid-term (5–10 years)
Stakeholder involvement	Annual stakeholder meetings	Watershed stakeholder groups to hold annual meetings to gauge progress and discuss evolving needs and planned activities; conduct periodic self-assessments for members to evaluate effectiveness of watershed groups and partnerships	Continuous (1–10 years)
	Funding	Develop grant applications and work with landowners to secure funding for implementing BMPs discussed in this plan	Short-term (1–5 years)
	Education and outreach	Work with the University of Illinois College of Agricultural, Consumer and Environmental Sciences to regularly to publish Rock River/Pierce Lake watershed news on a variety of platforms	Short-term (1–5 years)
	Education and outreach	Partner with Future Farmers of America to bring regular watershed programming to local high schools and to spread knowledge of watershed matters	Short-term (1–5 years)
	Funding	Work with local municipalities to establish line items in their annual budgets allocated toward watershed improvement and protection projects	Short-term (1–5 years)

Appendix D

Public Comments

A summary of comments received following the Stage 1 Public Meeting (June 30, 2021) are provided below. Original emails are included following the summary for reference. Relevant information has been included in the Stage 1 Final Report:

- July 28 and August 4, 2021 Emails from Dennis Anthony, Executive Director of Winnebago County Soil and Water Conservation District, transmitting a 2002 watershed report for North Fork Kent Creek and a 2008 draft modeling report for Kinnickinnick Creek and North Fork Kent Creek.
- August 9, 2021 Email from Shelley Best, Sustainability & Resiliency Coordinator for the Region 1 Planning Council, noting a comment from Winnebago County.
- August 2, 2021 Email from Albert Ettinger inquiring about the arsenic 303(d) listing on Keith Creek.

Subject: [External] RE: Cycle 2018 Draft Stage 1 Illinois Vision TMDL Watersheds

Abel,

There was some work done as part of the IDNR C2000 program on the North Fork Kent Creek watershed in 2002. I'm not sure if you have access that to data.

In additional there may be some old limited data to one of the branches of the Kinnikinnick Creek, I can't remember which one, from around that time, as well as perhaps Willow Creek.

Sincerely,

Dennis Anthony
Executive Director
Winnebago County SWCD

Hello Dennis,

Thank you for sharing information about IDNR's C2000 program for the North Fork Kent Creek watershed.

Apologies for my late response.

Do you happen to have access or a link to the data (report)?

We plan to reach-out to IDNR to help us find any available WQ report\study completed in the past for the subject watershed.

In addition, we will also work with our Surface Water Monitoring Section to look for water quality data for Kinnikinnick Creek and Willow Creek.

Thanks,

Abel

Abel,

I have a hard copy of the report. I will check with the Rockford Park District to see if they have a digital copy.

Subject:	[External] RE: TMDL Draft Public Comment Opportunity
Date:	Monday, August 9, 2021 12:33:08 PM
Attachments:	image002.png

Good afternoon Abel,
I saw that the deadline to submit written comments had been extended. Below please find the official public comment. Please let me know if you need anything else.
"Winnebago County Chairman Joseph V. Chiarelli submits the following comments regarding the Cycle 2018 Draft State 1 Total Maximum Daily Load (Illinois Vision TMDL Watersheds) on behalf of the Winnebago County Board:
"Upon reviewing the Stage 1 Draft report for the Rock River and Pierce Lake watershed, Winnebago County has identified the need for updated local water quality sample collection to reflect and monitor changes since the last recorded collection in 2013. The County will continue to engage with the IEPA throughout TMDL report stages (2 and 3), and collaborate with the agency to locally monitor, address and mitigate potential sources of impairment to preserve water quality, public health and mitigate subsequent issues through long term planning and environmental regulation. The continued collaboration and communication with the IEPA will inform future local planning efforts related to the criteria stated above."

Subject: [External] Arsenic in Keith Creek
Date: Sunday, August 1, 2021 9:16:20 AM

I was glancing through the presentation on TMDLs that are underway and noticed a Keith Creek is listed for arsenic. Anything easy you can send me on the cause of that impairment. To my knowledge, that is the only arsenic impairment listed for a creek in Illinois. (my knowledge may be limited)

Subject: FW: [External] Arsenic in Keith Creek

Hi Allison and Nicole:

Please see email below for comments received for:

Cycle 2018 Draft Stage 1 Total Maximum Daily Load (please see attached Public Notice, page 2, and highlighted).

Rock River/Pierce Lake Watershed:

The potential TMDL causes of impairment include: Keith Creek (IL_PR-01 and IL_PR-99) for Arse , Fecal Coliform, pH and Zinc, and South Fork Kent Creek (IL_PSA) for

Fecal Coliform, and North Fork Kent Creek (IL_PSB-01) for Fecal Coliform, and South Kinnikinnick Creek (IL_PT) for Fecal Coliform, and North Kinnikinnick Creek (IL_PU) for Fecal Coliform, and Spring Creek-North (IL_PZZG) for Fecal Coliform, and Pierce Lake (IL_RPC) for Total Phosphorus;

The impairment information is also available on the 2018 Integrated Report (Appendix A-2, page 18 of 39,pdf) and link is below:
https://www2.illinois.gov/epa/topics/water-quality/watershed-management/tmdls/Documents/Appendix%20A-2_303d_by_name_FINAL_5-20-19.pdf

Any information that you could provide will be helpful to respond to the comments.

Thanks,
Abel

Attachments: additional sed data 2007 08_Crosstab.xlsx

Abel,

Segment IL_PR-01 has not been assessed for Aquatic Life Use. This segment is not supporting for Fecal Coliform
Segment IL_PR-99 was assessed for Aquatic Life Use in 2010 by Howard using Intensive Basin Survey Data from 2008. I reassessed this Segment reassessed in 2015 using Intensive Basin Survey data from 2013. From the comments below, copied from ATTAINS, it looks like Arsenic was found in sediment collected as part of the 2008 survey. Attached are the sediment results, scroll down to Row 190.

Comments in ATTAINS: 3/4/10 ALU. IBS 2008 station PR-99. mIBI = 48.1, MBI = 5.9 (replicate 20-jab: mIBI = 48.6, MBI = 5.7), fIBI = 28. QHEI = 47, Silt = normal, Cover = sparse, Channel = recovering/ed, Riparian = very narrow, Erosion = none. WQ - ok, Sediment: Ar, Methoxychlor. SCORE station Trib3 (10th Ave. Park): pH (1/25, 6.28), T. Ni chronic (1/24, no 4-quotient mean >1). T. Zn chronic (4/24, one 4-quotient mean >1). FC geom = 1724, 83% >400 (18 samples). 2012 Primary Contact: Rock R. Study Group (Tenth Ave.) GM=594, 80%>400, N=5 3/17/2015 Notes: IEPA\IDNR 2013 IBS at PR-99: fIBI=31, mIBI=39.2, QHEI=55.5, No IBS WQ or CM exceedences.

I hope this helps. Please give me a call if you need additional information.
Nicole
