

NPDES Permit No. IL0078972
Notice No. drgil0078972

Public Notice Beginning Date: **September 19, 2011**

Public Notice Ending Date: **October 19, 2011**

National Pollutant Discharge Elimination System (NPDES)
Permit Program

Draft Reissued NPDES Permit to Discharge into Waters of the State

Public Notice/Fact Sheet Issued By:

Illinois EPA
Bureau of Water
Facility Evaluation Unit
1021 North Grand Avenue East
Post Office Box 19276
Springfield, Illinois 62794-9276
217/782-3362

Name and Address of Discharger:

CONMAT
2283 U.S. 20 BR E
P.O. Box 750
Freeport, Illinois 61032

Name and Address of Facility:

Dwyer Quarry
Hollywood Road
Freeport, Illinois 61032
815/235-2200
(Stephenson County)

The Illinois Environmental Protection Agency (IEPA) has made a tentative determination to issue a NPDES Permit to discharge into the waters of the state and has prepared a draft Permit and associated fact sheet for the above named discharger. The Public Notice period will begin and end on the dates indicated in the heading of this Public Notice/Fact Sheet. The last day comments will be received will be on the Public Notice period ending date unless a commentor demonstrating the need for additional time requests an extension to this comment period and the request is granted by the IEPA. Interested persons are invited to submit written comments on the draft permit to the IEPA at the above address. Commentors shall provide his or her name and address and the nature of the issues proposed to be raised and the evidence proposed to be presented with regards to those issues. Commentors may include a request for public hearing. Persons submitting comments and/or requests for public hearing shall also send a copy of such comments or requests to the permit applicant. The NPDES permit and notice number(s) must appear on each comment page.

The application, engineer's review notes including load limit calculations, Public Notice/Fact Sheet, draft permit, comments received, and other documents are available for inspection and may be copied at the IEPA between 9:30 a.m. and 3:30 p.m. Monday through Friday when scheduled by the interested person.

If written comments or requests indicate a significant degree of public interest in the draft permit, the permitting authority may, at its discretion, hold a public hearing. Public notice will be given 45 days before any public hearing. Response to comments will be provided when the final permit is issued. For further information, please call Darren Gove at 217/782-0610.

The applicant is engaged in the operation of a limestone quarry (SIC 1442). Plant operation results in an average discharge of 1.296 MGD of pit pumpage, storm water runoff and wash water discharge from outfall 001, Stormwater runoff from outfall 002.

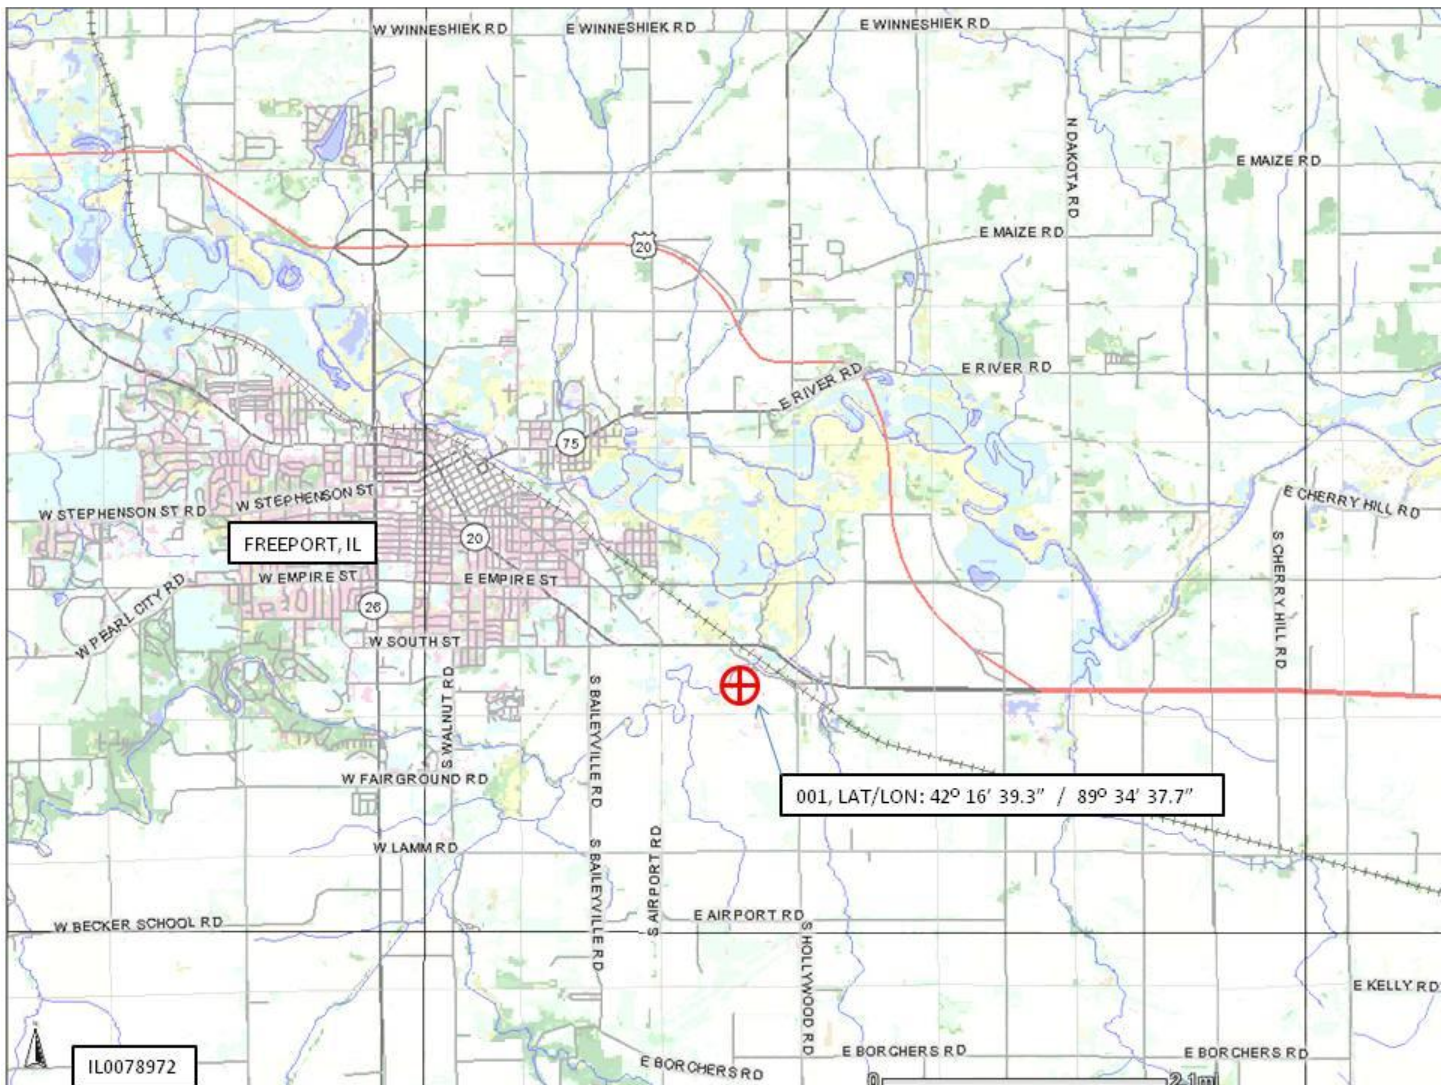

The following modification is proposed:

This permit increases the discharge of Outfall 001 from 0.792 MGD to 1.296 MGD, authorizes Outfall 002 for the discharge of stormwater runoff. In addition, the site will have an asphalt plant on its premises, the plant will not have a discharge.

Application is made for new existing discharge(s) which are located in Stephenson County, Illinois. The following information identifies the discharge point, receiving stream and stream classifications:

Outfall	Receiving Stream	Latitude		Longitude		Stream Classification	Biological Stream Characterization
001	Yellowe Creek	42°16'39.33"	North	89°34'37"	West	General Use	B
002	Yellow Creek	42°16'35.43"	North	89°34'23"	West	General Use	B

To assist you further in identifying the location of the discharge please see the attached map.

The stream segment receiving the discharge from outfall(s) 001 is on the 303 (d) list of impaired waters.

Pollutants	Potential Contributors
Fecal Coliform Bacteria	Livestock production industry/Agricultural Industry

The discharge(s) from the facility shall be monitored and limited at all times as follows:

Outfall: 001/002

PARAMETER	LOAD LIMITS lbs/day DAF (DMF)		REGULATION	CONCENTRATION LIMITS mg/l		REGULATION
	30 DAY AVERAGE	DAILY MAXIMUM		30 DAY AVERAGE	DAILY MAXIMUM	
Total Suspended Solids				35	70	406.106
pH	Shall be in the Range of 6-9 Standard Units					406.106
Offensive Conditions	No effluent shall contain settleable solids, floating debris, visible oil, grease, scum or sludge solids, color, or odor. Turbidity shall be below obviously visible levels.					406.107

Conmat – Dwyer Quarry Antidegradation Assessment
NPDES Permit No. IL0078972 Stephenson County

The subject facility has applied for an NPDES permit for increased discharges from a limestone quarry. Mining occurs through an open pit. Two outfalls currently exist; Outfall 001 consists of ground water and stormwater that collects in the deepest pit and will increase from 0.792 to 1.296 MGD. Outfall 002 is stormwater from other areas of the quarry and no increase is expected. Effluent is pumped from the pit to a series of settling ponds. An asphalt plant exists on site and therefore the general permit cannot be issued. The operations of the asphalt plant do not affect stormwater runoff with any process wastewater. The quarry expands about one acre per year, thereby generating more effluent. Outfall 001 discharges to Yellow Creek.

Identification and Characterization of the Affected Water Body.

Yellow Creek has a 7Q10 flow of approximately 19.8 cfs and is a General Use water. The stream is not listed on the 2006 Illinois 303(d) List. Yellow Creek (PWN-01) at this location is listed as impaired for primary contact uses on the Illinois Integrated Water Quality Report and Section 303(d) List – 2006. The cause listed is fecal coliform bacteria. The draft 2008 List is identical. Yellow Creek is rated as a “B” stream under the Agency’s 1996 Biological Stream Characterization (BSC) system. The stream is not listed as a biologically significant stream in the 1992 Illinois Natural History Survey Publication *Biologically Significant Illinois Streams*. The IDNR WIRT system lists no threatened or endangered species as inhabiting the receiving stream.

Identification of Proposed Pollutant Load Increases or Potential Impacts on Uses.

Load increases of dissolved and suspended solids will occur due to the increase in flow, but overall effluent quality will not change from the present condition, i.e., concentrations will be about the same. No impacts on stream uses are anticipated.

Fate and Effect of Parameters Proposed for Increased Loading.

Sediment load will not be greater than that coming into the receiving stream from surrounding lands. Sedimentation patterns should not be changed from those presently occurring.

Purpose and Anticipated Benefits of the Proposed Activity.

The existing mine is updating flow rates to reflect expansion of the quarry. Jobs will be maintained if the mine is allowed the increase.

Assessments of Alternatives for Less Increase in Loading or Minimal Environmental Degradation.

Capture of stormwater and groundwater contacting mined areas with settling in a pond or pit is typical treatment for limestone quarries. With adequate solids removal as required by permit conditions, the resulting effluents are benign. No alternatives exist given the characteristics of limestone quarries and the relatively good quality effluents produced.

Summary Comments of the Illinois Department of Natural Resources, Regional Planning Commissions, Zoning Boards or Other Entities

The Illinois Department of Natural Resources was consulted regarding threatened and endangered species issues via the EcoCAT system on December 17, 2008. It was immediately determined that no threatened or endangered species are present in the area and consultation was terminated.

Agency Conclusion.

This preliminary assessment was conducted pursuant to the Illinois Pollution Control Board regulation for Antidegradation found at 35 Ill. Adm. Code 302.105 (antidegradation standard) and was based on the information available to the Agency at the time the draft permit was written. We tentatively find that the proposed activity will result in the attainment of water quality standards; that all existing uses of the receiving stream will be maintained; that all technically and economically reasonable measures to avoid or minimize the extent of the proposed increase in pollutant loading have been incorporated into the proposed activity; and that this activity will benefit the community at large by providing building materials and jobs. Comments received during the NPDES permit public notice period will be evaluated before a final decision is made by the Agency.

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

Reissued (NPDES) Permit

Expiration Date:

Issue Date:

Effective Date:

Name and Address of Permittee:

CONMAT

2283 U.S. 20 BR E

P.O. Box 750

Freeport, Illinois 61032

Facility Name and Address:

Dwyer Quarry

Hollywood Road

Freeport, Illinois 61032

815/235-2200

StephensonCounty

Discharge Number and Name:

Receiving Waters:

001 Stormwater & Pit Pumpage

002 Stormwater

Yellow Creek

In compliance with the provisions of the Illinois Environmental Protection Act, Title 35 of Ill. Adm. Code, Subtitle C and/or Subtitle D, Chapter 1, and the Clean Water Act (CWA), the above-named permittee is hereby authorized to discharge at the above location to the above-named receiving stream in accordance with the standard conditions and attachments herein.

Permittee is not authorized to discharge after the above expiration date. In order to receive authorization to discharge beyond the expiration date, the permittee shall submit the proper application as required by the Illinois Environmental Protection Agency (IEPA) not later than 180 days prior to the expiration date.

Alan Keller, P.E.
Manager, Permit Section
Division of Water Pollution Control

SAK:drgil0078972

NPDES Permit No. IL0078972

Effluent Limitations and Monitoring

From the effective date of this permit until the expiration date, the effluent of the following discharge(s) shall be monitored and limited at all times as follows:

Outfall: 001 & 002

PARAMETER	LOAD LIMITS lbs/day DAF (DMF)		CONCENTRATION LIMITS mg/l		SAMPLE FREQUENCY	SAMPLE TYPE
	30 DAY AVERAGE	DAILY MAXIMUM	30 DAY AVERAGE	DAILY MAXIMUM		
Flow (MGD)					**	
Total Suspended Solids			35	70	***	****
pH	Shall be in the Range of 6 to 9 Standard Units.				1 per month	Grab
Offensive Conditions	No effluent shall contain settleable solids, floating debris, visible oil, grease, scum or sludge solids, color, or odor. Turbidity shall be below obviously visible levels.				Once per month	Visual Inspection

** Effluent sampling for flow shall be continuous if hardware allows otherwise it shall be a single reading when monitoring each parameter. Flows shall be reported as a monthly average on the Discharge Monitoring Reports (DMR).

pH shall be reported as a minimum and maximum.

*** Samples shall be taken three times a month as separate grab samples or one time a month as a composite sample.

**** Composite samples shall consist of at least 3 sample aliquots of approximately equal volume of at least 100 milliliters each, collected at periodic intervals within a 24-hour period. If the permittee elects to take and analyze grab samples, in lieu of a composite sample then: 1) if the discharge is expected to occur on only a single day, three grab samples may be taken within a single 24-hour period or, 2) if the discharge is expected to occur on more than one day three separate grab samples shall be taken over more than one day to represent the monthly discharge. The one composite sample or three grab samples shall be representative of the discharge over the calendar month. The analysis results of each composite and grab sample shall be reported on the Discharge Monitoring Reports. The monthly average shall be reported on the Discharge Monitoring Reports.

Discharge sampling and monitoring must be representative of the discharges from the facility considering factors such as frequency, duration and intensity of precipitation runoff and operational practices that effect discharge quality.

Special Conditions

SPECIAL CONDITION 1. The pH shall be in the range 6.0 to 9.0. The monthly minimum and monthly maximum values shall be reported on the DMR form.

SPECIAL CONDITION 2 Samples taken in compliance with the effluent monitoring requirements shall be taken at a point representative of the discharge, but prior to entry into the receiving stream.

SPECIAL CONDITION 3. The Permittee shall record monitoring results on discharge Monitoring Report (DMR) Forms using one such form for each outfall each month.

In the event that an outfall does not discharge during a monthly reporting period, the DMR Form shall be submitted with no discharge indicated.

The Permittee may choose to submit electronic DMRs (eDMRs) instead of mailing paper DMRs to the IEPA. More information, including registration information for the eDMR program, can be obtained on the IEPA website, <http://www.epa.state.il.us/water/edmr/index.html>.

The completed discharge Monitoring Report forms shall be submitted to IEPA no later than the 15th day of the following monthly, unless otherwise specified by the permitting authority.

Permittees not using eDMRs shall mail Discharge Monitoring Reports with an original signature to the IEPA at the following address:

Illinois Environmental Protection Agency
Division of Water Pollution Control
1021 North Grand Avenue East
Post Office Box 19276
Springfield, IL 62794-9276
Attn: Compliance Assurance Section, Mail Code #19

SPECIAL CONDITION 4. The permittee shall notify the Agency in writing by certified mail within thirty days of abandonment, cessation, or suspension of active mining for thirty days or more unless caused by a labor dispute. During cessation or suspension of active mining, whether caused by a labor dispute or not, the permittee shall provide whatever interim impoundment, drainage diversion, and wastewater treatment is necessary to avoid violations of the Act or Subtitle D, Chapter 1.

SPECIAL CONDITION 5. Storm Water Discharges: The Illinois Environmental Protection Agency has determined that the effluent limitations for the non-coal outfall(s) in this permit constitute BAT/BCT for storm water which is treated in the existing treatment facilities for purposes of this permit issuance, and no pollution prevention plan will be required for such storm water. This does not preclude the use of pollution prevention techniques as a means or partial means of meeting the effluent limits. In addition to the chemical specific monitoring required elsewhere in this permit, the permittee shall conduct an annual inspection of the facility site to identify areas contributing to a storm water discharge associated with mining and determine whether any facility modifications have occurred which result in previously treated storm water discharges no longer receiving treatment. If any such discharges are identified, the permittee shall request a modification of this permit within 30 days after the inspection unless such discharges meet the conditions of Special Condition 10. Records of the annual inspection shall be retained by the permittee for the term of this permit and shall be made available to the Illinois Environmental Protection Agency upon request.

SPECIAL CONDITION 6. Oil and Hazardous Substance Liability: Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under section 311 of the CWA.

SPECIAL CONDITION 7. Prohibited Storm Water Discharges: This permit is not applicable to storm water discharges from the following facilities:

- a. Hazardous waste treatment, storage or disposal facilities.
- b. Storm water discharges associated with inactive mining occurring on Federal lands where an operator cannot be identified.

SPECIAL CONDITION 8. Oil and Hazardous Substance Discharge Prohibition: This permit does not authorize the discharge of hazardous substances or oil resulting from an on-site spill, and does not supersede any reporting requirement for spills or releases of hazardous substances or oil.

SPECIAL CONDITION 9. Bulk Storage and Hazardous Waste Containment Area: Provisions for handling storm water from bulk storage and hazardous waste containment areas.

Special Conditions

- a. This permit does not authorize the discharge of storm water collected in containment areas at bulk storage and hazardous waste facilities where the storm water becomes contaminated by direct contact with a spill or release of stored materials into the containment area. Such storm water should be handled properly by on-site treatment or hauling off-site for treatment and disposal.
- b. Where a spill or release to a dry containment area occurs, the permittee shall institute procedures to clean up the spill in order to prevent contamination of any storm water, which subsequently collects in the containment area. Where these procedures are followed, collected storm water may be discharged; following visual inspection to assure that the storm water contains no unnatural turbidity, color, oil films, foams, settleable solids, or deposits.
- c. Storage piles of salt used for deicing or other commercial or industrial purposes must be enclosed or covered to prevent exposure to precipitation (except for exposure resulting from adding or removing materials from the pile). Piles of not need to be enclosed or covered where storm water from the pile is not discharged to waters of the state or the discharges from the piles are authorized under another permit.

SPECIAL CONDITION 10. Storm Water Runoff: All storm water runoff from areas affected by mining activities such as, earthen berms, aggregate processing plants, overburden stockpiles, and crushed stone stockpiles, sand and gravel stockpiles and industrial sand product stockpiles and all storm water associated with industrial activity at a mining site such as asphalt plants and ready mix plants, shall be routed to outfalls except for the following identified in (a) and (b) below:

- a. **Surface Runoff from Earthen Areas:** Surface runoff from earthen berms or other earthen areas using spoil from the mining operation is not required to be routed to the Outfall(s) when the earthen areas meet the following conditions:
 - i. The area is graded to an acceptable slope, covered with sufficient uncontaminated topsoil as needed to support vegetation, seeded at an adequate rate with an appropriate grass mixture to stabilize such areas, properly maintained with vegetation and other practices to minimize the potential for erosion and final stabilization has been completed for the area.
 - ii. For areas in which final stabilization under (a) (i) of this Special Condition are incomplete, erosion control measures described in the Illinois Urban Manual (IEPA/USDA, NRCS;2002) are implemented.
 - iii. The earthen berms or areas are not contaminated by mine refuse, chemical spillage, other wastes or wastewaters from mining activities at the site.
 - iv. The earthen material does not contain acid producing material.
 - v. The earthen area has no contact with waters of the State.
 - vi. Surface runoff from the earthen areas does not cause water quality violations.
 - vii. The area is identified in the storm water pollution prevention plan required in (b) below as meeting (a) (i-vi) of this Special Condition above.
- b. **Storm Water Discharges and Certain Non-storm Water Discharges.** Storm water runoff discharges and non-storm water discharges are allowed according to the following conditions and this permit provided that the discharges do not contain the following: mine process wastewater; pit pumpage; pit overflows; mine dewatering wastewaters; cooling waters, heated effluents or surface runoff from disturbed earthen areas that contain mine refuse, chemical spillage, other wastes, or acid producing material.
 - i. **Prohibition on Non-Storm Water Discharges.** All discharges covered by this special condition shall be composed entirely of storm water except for:

discharges from fire fighting activities; fire hydrant flushings; waters used to control dust on vehicle traffic areas outside the mine area and mined area; potable water sources including uncontaminated waterline flushings; irrigation drainages; routine external building washdown which does not use detergents; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate; springs; uncontaminated ground water; and foundation or footing drains where flows are not contaminated with process materials such as solvents. These non-storm water discharges must comply with (b) (ii) (D) (ii) (3) of this Special Condition.
 - ii. **Storm Water Pollution Prevention Plans**

A storm water pollution prevention plan shall be developed for surface runoff from each mining site covered by this special condition. Storm water pollution prevention plans shall be prepared in accordance with good engineering practices. The plan shall identify potential sources of pollution which may reasonably be expected to affect the quality

Special Conditions

of storm water discharges associated with industrial activity at a mining site. In addition, the plan shall describe and ensure the implementation of practices which will be used to reduce the pollutants in storm water discharges associated with industrial activity at a mining site and to assure compliance with the terms and conditions of this permit. Facilities must implement the provisions of the storm water pollution prevention plan required under this part as a condition of this permit.

(A) Deadlines for Plan Preparation and Compliance.

The plan shall:

- (i) Be completed prior to the start of the mining activities to be covered under this special condition and updated as appropriate; and
- (ii) Provide for compliance with the terms and schedule of the plan beginning with the initiation of mining activities.

(B) Signature, Plan Review and Notification.

- (i) The plan shall be signed in accordance with Standard Condition 11 Attachment H (Signatory Requirements), and be retained on-site at the facility which generates the storm water discharge in accordance with Standard Condition 8 Attachment H (Duty to Provide Information) of this permit.
- (ii) The permittee shall make plans available upon request from this Agency or a local agency approving sediment and erosion plans, grading plans, or storm water management plans; or in the case of a storm water discharge associated with industrial activity at a mining site which discharges through a municipal separate storm sewer system with an NPDES permit, to the municipal operator of the system.
- (iii) The Agency may notify the permittee at any time that the plan does not meet one or more of the minimum requirements of this special condition. Such notification shall identify those provisions of the permit which are not being met by the plan, and identify which provisions of the plan require modifications in order to meet the minimum requirements of this part. Within 30 days from receipt of notification from the Agency, the permittee shall make the required changes to the plan and shall submit to the Agency a written certification that the requested changes have been made. Failure to comply shall terminate authorization under this special condition.
- (iv) All storm water pollution prevention plans required under this permit are considered reports that shall be available to the public at any reasonable time upon request. However, the permittee may claim any portion of a storm water pollution prevention plan as confidential in accordance with 40 CFR Part 2, including any portion describing facility security measures.

(C) Keeping Plans Current. The permittee shall amend the plan whenever there is a change in design, construction, operation, or maintenance, which has a significant effect on the potential for the discharge of pollutants to the Waters of the State and which has not otherwise been addressed in the plan or if the storm water pollution prevention plan proves to be ineffective in eliminating or significantly minimizing pollutants from sources identified under (b) (ii) (D) (ii) of this Special Condition below, or in otherwise achieving the general objectives of controlling pollutants in storm water discharges associated with mining activities. Amendments to the plan may be reviewed by the Agency in the same manner as (b) (ii) (B) (ii) of this Special Condition above.

(D) Contents of Plan. The storm water pollution prevention plan shall include the following items:

- (i) Site Description. Each plan shall provide a description of the following:
 - 1. A description of the intended sequence of major activities which disturb soils for major portions of the site (e.g. grubbing, excavation, grading);
 - 2. Estimates of the total area of the site and the total area of the site that is expected to be disturbed by excavation, grading, or other activities;
 - 3. An estimate of the runoff coefficient of the site after mining activities are completed and existing data describing the soil or the quality of any discharge from the site;
 - 4. A site map indicating drainage patterns and approximate slopes anticipated before and after major grading activities, locations where vehicles enter or exit the site and controls to prevent offsite sediment

Special Conditions

tracking, areas of soil disturbance, the location of major structural and nonstructural controls identified in the plan, the location of areas where stabilization practices are expected to occur, an outline of storm water drainage areas for each storm water discharge point, paved areas and buildings, and locations where storm water is discharged to a surface water;

5. Description of the areas used for outdoor manufacturing, storage, or disposal of significant materials, including activities that generate significant quantities of dust or particulates.
 - a. Location of existing storm water structural control measures (dikes, coverings, detention facilities, etc.);
 - b. Surface water locations and/or municipal storm drain locations;
 - c. Areas of existing and potential soil erosion;
 - d. Vehicle service areas;
 - e. Material loading, unloading, and access areas.

6. A narrative description of the following:
 - a. The nature of the industrial activities conducted at the site, including a description of significant materials that are treated, stored or disposed of in a manner to allow exposure to storm water;
 - b. Materials, equipment, and vehicle management practices employed to minimize contact of significant materials with storm water discharges;
 - c. Industrial storm water discharge treatment facilities;
 - d. Methods of onsite storage and disposal of significant materials;
 - e. A list of the types of pollutants that have a reasonable potential to be present in storm water discharges in significant quantities;
 - f. An estimate of the size of the facility in acres or square feet, and the percent of the facility that has impervious areas such as pavement or buildings;
 - g. A summary of existing sampling data describing pollutants in storm water discharges;
 - h. The name of the receiving water(s) and the ultimate receiving water(s), and areal extent of wetland acreage at the site.

- (ii) **Controls.** Each plan shall include a description of appropriate controls that will be implemented at the mining site. The plan will clearly describe for each major activity identified in (b) (ii) (D) (i) (1) of this Special Condition above, appropriate controls and the timing during the mining process that the controls will be implemented. (For example, perimeter controls for one portion of the site will be installed after the clearing and grubbing necessary for installation of the measure, but before the clearing and grubbing for the remaining portions of the site. Perimeter controls will be actively maintained until final stabilization of those portions of the site upward of the perimeter control. Temporary perimeter controls will be removed after final stabilization). The description of controls shall address as appropriate the following minimum components:
 1. Erosion and Sediment Controls.
 - a. Stabilization Practices. A description of interim and permanent stabilization practices, including site-specific scheduling of the implementation of the practices. Site plans should ensure that existing vegetation is preserved where attainable and that disturbed portions of the site are stabilized. Stabilization practices may include: temporary seeding, permanent seeding, mulching, geotextiles, sod stabilization, vegetative buffer strips, protection of trees, preservation of mature vegetation, and other appropriate measures. A record of the dates when major grading activities

Special Conditions

occur, when construction activities temporarily or permanently cease on a portion of the site, and when stabilization measures are initiated shall be included in the plan. Except as provided in paragraphs i and ii below, stabilization measures shall be initiated as soon as practicable in portions of the site where mining activities have temporarily or permanently ceased, but in no case more than 14 days after the mining activities in that portion of the site has temporarily or permanently ceased.

- i. Where the initiation of stabilization measures by the 14th day after mining activities temporarily or permanently cease is precluded by snow cover, stabilization measures shall be initiated as soon as practicable.
 - ii. Where mining activities will resume on a portion of the site within 21 days from when activities ceased, (e.g. the total time period that mining activities is temporarily ceased is less than 21 days) then stabilization measures do not have to be initiated on that portion of site by the 14th day after mining activities temporarily ceased.
 - b. Structural Practices. A description of structural practices to the degree attainable, to divert flows from disturbed earthen areas, store flows or otherwise limit runoff and the discharge of pollutants from exposed areas of the site. Such practices may include silt fences, earth dikes, drainage swales, sediment traps, check dams, subsurface drains, pipe slope drains, level spreaders, storm drain inlet protection, rock outlet protection, reinforced soil retaining systems, gabions, and temporary or permanent sediment basins. Structural practices should be placed on upland soils to the degree attainable. The installation of these devices may be subject to Section 404 of the CWA.
 - c. Best Management Practices for Impaired Waters. For any site which discharges directly to an impaired water identified in the Agency's 303(d) listing for suspended solids, turbidity, or siltation the storm water pollution prevention plan shall be designed for a storm event equal to or greater than a 25-year 24-hour rainfall event. If required by federal regulations or the Illinois Environmental Protection Agency's Illinois Urban Manual, the storm water pollution prevention plan shall adhere to a more restrictive design criteria.
2. Storm Water Management. A description of measures that will be installed during mining to control pollutants in storm water discharges that will occur after mining operations have been completed. Structural measures should be placed on upland soils to the degree attainable. The installation of these devices may be subject to Section 404 of the CWA. This permit only addresses the installation of storm water management measures, and not the ultimate operation and maintenance of such structures after the mining activities have been completed and the site has undergone final stabilization. Permittees are responsible for only the installation and maintenance of storm water management measures prior to final stabilization of the site, and are not responsible for maintenance after storm water discharges associated with industrial activity at a mining site have been eliminated from the site.
 - a. Such practices may include: storm water detention structures (including wet ponds); storm water retention structures; flow attenuation by use of open vegetated swales and natural depressions; infiltration of runoff onsite; and sequential systems (which combine several practices). The pollution prevention plan shall include an explanation of the technical basis used to select the practices to control pollution where flows exceed predevelopment levels.
 - b. Velocity dissipation devices shall be placed at discharge locations and along the length of any outfall channel as necessary to provide a non-erosive velocity flow from the structure to a water course so that the natural physical and biological characteristics and functions are maintained and protected (e.g. maintenance of hydrologic conditions, such as the hydroperiod and hydrodynamics present prior to the initiation of mining activities).
 - c. Unless otherwise specified in the Illinois Environmental Protection Agency's Illinois Urban Manual, the storm water pollution prevention plan shall be designed for a storm event equal to or greater than a 25-year 24-hour rainfall event.
 - d. Other Controls.
 - i. No solid materials, including building materials, shall be discharged to Waters of the State, except as authorized by a Section 404 permit.

Special Conditions

- ii. The plan shall ensure and demonstrate compliance with applicable State and/or local waste disposal, sanitary sewer or septic system regulations.
- e. Pollution Prevention Practices
- i. Storm Water Pollution Prevention Personnel - Identification by job titles of the individuals who are responsible for developing, implementing, and revising the plan.
 - ii. Preventive Maintenance - Procedures for inspection and maintenance of storm water conveyance system devices such as oil/water separators, catch basins, etc., and inspection and testing of plant equipment and systems that could fail and result in discharges of pollutants to storm water.
 - iii. Good Housekeeping - Good housekeeping requires the maintenance of clean, orderly facility areas that discharge storm water. Material handling areas shall be inspected and cleaned to reduce the potential for pollutants to enter the storm water conveyance system.
 - iv. Spill Prevention and Response - Identification of areas where significant materials can spill into or otherwise enter the storm water conveyance systems and their accompanying drainage points. Specific material handling procedures, storage requirements, spill clean up equipment and procedures should be identified, as appropriate. Internal notification procedures for spills of significant materials should be established.
 - v. Storm Water Management Practices - Storm water management practices are practices other than those which control the source of pollutants. They include measures such as installing oil and grit separators, diverting storm water into retention basins, etc. Based on assessment of the potential of various sources to contribute pollutants, measures to remove pollutants from storm water discharge shall be implemented. In developing the plan, the following management practices shall be considered:
 - Containment - Storage within berms or other secondary containment devices to prevent leaks and spills from entering storm water runoff;
 - Oil & Grease Separation - Oil/water separators, booms, skimmers or other methods to minimize oil contaminated storm water discharges;
 - Debris & Sediment Control - Screens, booms, sediment ponds or other methods to reduce debris and sediment in storm water discharges;
 - Waste Chemical Disposal - Waste chemicals such as antifreeze, degreasers and used oils shall be recycled or disposed of in an approved manner and in a way which prevents them from entering storm water discharges.
 - Storm Water Diversion - Storm water diversion away from mining excavation, materials processing, materials storage and other areas of potential storm water contamination;
 - Covered Storage, Processing or Mining Areas - Covered fueling operations, materials processing and storage areas to prevent contact with storm water.
 - vi. Employee Training - Employee training programs shall inform personnel at all levels of responsibility of the components and goals of the storm water pollution control plan. Training should address topics such as spill response, good housekeeping and material management practices. The plan shall identify periodic dates for such training.
 - vii. Inspection Procedures - Qualified plant personnel shall be identified to inspect designated equipment and plant areas. A tracking or follow-up procedure shall be used to ensure appropriate response has been taken in response to an inspection. Inspections and maintenance activities shall be documented and recorded.
3. Verification of Non-Storm Water Discharges - The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall

Special Conditions

include a description of any tests for the presence of non-storm water discharges, the methods used, the dates of the testing, and any onsite drainage points that were observed during the testing. Any facility that is unable to provide this certification must describe the procedure of any test conducted for the presence of non-storm water discharges, the test results, potential sources of non-storm water discharges to the storm sewer, and why adequate tests for such storm sewers were not feasible. Except as provided in (b) (i) of this Special Condition, discharges not comprised entirely of storm water are not authorized by this Special Condition.

4. The permittee shall conduct an annual facility inspection to verify that all elements of the plan, including the site map, potential pollutant sources, and structural and non-structural controls to reduce pollutants in industrial storm water discharges are accurate. Observations that require a response and the appropriate response to the observation shall be retained as part of the plan. Records documenting significant observations made during the site inspection shall be submitted to the Agency in accordance with the reporting requirements of this permit.
5. This plan should briefly describe the appropriate elements of other program requirements, including Spill Prevention Control and Countermeasures (SPCC) plans required under Section 311 of the CWA and the regulations promulgated thereunder, and Best Management Programs under 40 CFR 125.100.
6. The plan shall include the signature and title of the person responsible for preparation of the plan and include the date of initial preparation and each amendment thereto.
7. Facilities which discharge storm water associated with industrial activity at a mining site to municipal separate storm sewers may also be subject to additional requirements imposed by the operator of the municipal system.
8. Approved State or Local Plans.

The management practices, controls and other provisions contained in the storm water pollution prevention plan must be at least as protective as the requirements contained in Illinois Environmental Protection Agency's Illinois Urban Manual, 2002. Facilities which discharge storm water associated with industrial activities at a mining site must include in their storm water pollution prevention plan procedures and requirements specified in applicable sediment and erosion site plans or storm water management plans approved by local officials. Requirements specified in sediment and erosion site plans or site permits or storm water management site plans or site permits approved by local officials that are applicable to protecting surface water resources are, upon the effective date of this NPDES permit to be authorized to discharge, incorporated by reference and are enforceable under this permit even if they are not specifically included in a storm water pollution prevention plan required under this permit. This provision does not apply to provisions of master plans, comprehensive plans, non-enforceable guidelines or technical guidance documents that are not identified in a specific plan or permit that is issued for the mining site.

- (iii) **Maintenance.** A description of procedures to maintain in good and effective operating conditions vegetation, erosion and sediment control measures and other protective measures identified in the site plan.
- (iv) **Inspections.** Qualified personnel (provided by the permittee) shall inspect disturbed areas of the mining site that have not been finally stabilized, structural control measures, and locations where vehicles enter or exit the site annually. Qualified personnel means a person knowledgeable in the principles and practice of erosion and sediment controls, such as a licensed professional engineer or other knowledgeable person who possesses the skills to assess conditions at the mining site that could impact storm water quality and to assess the effectiveness of any sediment and erosion control measures selected to control the quality of storm water discharges from the mining activities.
 1. Disturbed areas and areas used for storage of materials that are exposed to precipitation shall be inspected for evidence of, or the potential for, pollutants entering the drainage system. Erosion and sediment control measures identified in the plan shall be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters. Locations where vehicles enter or exit the site shall be inspected for evidence of off-site sediment tracking.
 2. Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with (b) (ii) (D) (i) of this Special Condition (Site Description) and pollution prevention

Special Conditions

measures identified in the plan in accordance with (b) (ii) (D) (ii) of this Special Condition (Controls) shall be revised as appropriate as soon as practicable after such inspection. Such modifications shall provide for timely implementation of any changes to the plan within 30 calendar days following the inspection.

3. A report summarizing the scope of the inspection, name(s) and qualifications of personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with (b) (ii) (D) (iv) 2 of this Special Condition above shall be made and retained as part of the storm water pollution prevention plan for at least three years from the date that the permit coverage expires or is terminated. The report shall be signed in accordance with standard conditions Attachment H (Signatory Requirements) of this permit.
4. The permittee shall complete and submit within 5 days an "Incidence of Noncompliance" (ION) report for any violation of the storm water pollution prevention plan observed during an inspection conducted, including those not required by the Plan. Submission shall be on forms provided by the Agency and include specific information on the cause of noncompliance, actions which were taken to prevent any further causes of noncompliance, and a statement detailing any environmental impact which may have resulted from the noncompliance.
5. All reports of noncompliance shall be signed by a responsible authority as defined in standard conditions Attachment H (Signatory Requirements).
6. All reports of noncompliance shall be mailed to the Agency at the following address:

Illinois Environmental Protection Agency
Compliance Assurance Section
1021 North Grand Avenue East
Post Office Box 19276
Springfield, Illinois 62794-9276

- (v) **Non-Storm Water Discharges** - Except for flows from fire fighting activities, sources of non-storm water listed in (b) (i) of this Special Condition that are combined with storm water discharges associated with industrial activity at a mining site must be identified in the plan. The plan shall identify and insure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

SPECIAL CONDITION 11. Reporting: The facility shall submit an annual inspection report to the Illinois Environmental Protection Agency. The report shall include results of the annual facility inspection which is required by Special Condition 10 (b) (ii) (D) (ii) (4) and (b) (ii) (D) (iv) and of the Storm Water Pollution Prevention Plan of this permit. The report shall also include documentation of any event (spill, treatment unit malfunction, etc.) which would require an inspection, results of the inspection, and any subsequent corrective maintenance activity. The report shall be completed and signed by the authorized facility employee(s) who conducted the inspection(s).

- a. The first report shall contain information gathered during the one year time period beginning with the effective date of coverage under this permit and shall be submitted no later than 60 days after this one year period has expired. Each subsequent report shall contain the previous year's information and shall be submitted no later than one year after the previous year's report was due.
- b. If the facility performs inspections more frequently than required by this permit, the results shall be included as additional information in the annual report.
- c. The permittee shall retain the annual inspection report on file at least 5 years. This period may be extended by request of the Illinois Environmental Protection Agency at any time.
- d. Annual inspection reports shall be mailed to the following address:

Illinois Environmental Protection Agency
Compliance Assurance Section
Annual Inspection Report
P.O. Box 19276
Springfield, Illinois 62794-9276

SPECIAL CONDITION 12. Heated Effluents and Cooling Water Discharges: Discharges of heated effluents and cooling waters must meet the water quality provisions of 35 Ill. Adm. Code Subtitle C for temperature.

Special Conditions

- a. The permittee with heated effluents or cooling water discharges shall develop a heated effluent and cooling water plan. The plan is incorporated as a condition of this permit and shall contain the following:
 - i. Identification of each internal heated effluent and cooling water wastestream at the mining site,
 - ii. All temperature monitoring data of the cooling waters or heated effluents within the last five years or that represents proposed temperature conditions,
 - iii. The daily average flow (MGD) of each internal heated effluent and cooling water wastestream,
 - iv. The mean detention time of each heated effluent and cooling water wastestream in any impoundments on the mining site,
 - v. Description and identification of any facilities such as impoundments that attenuate or treat heated effluent and cooling water wastestreams,
 - vi. The daily average flow (MGD) for each outfall that contains heated effluent or cooling water and,
 - vii. The predicted temperature increase of the receiving stream caused by the discharge.

SPECIAL CONDITION 13. Discharging Pollutants for Which a Water Body is Impaired With an Approved TMDL:

- a. Existing dischargers, new dischargers and new sources: you must carefully document the justifications for all BMP selections in your SWPPP, and install, implement and maintain BMPs that are consistent with all relevant TMDL allocations and with all relevant conditions in an implementation plan.
- b. Discharges to waters for which there is a TMDL allocation for sediment or a parameter that addressed sediment (such as total suspended solids, turbidity, or siltation) are not eligible for coverage under this permit unless the applicant develops and certifies a SWPPP that is consistent with the assumptions and requirements in the approved TMDL. To be eligible for coverage under this general permit, operators must incorporate into their SWPPP any conditions applicable to their discharges necessary for consistency with the assumptions and requirements of the TMDL within any timeframes established in the TMDL. If a specific numeric wasteload allocation has been established that would apply to the facility's discharges, the operator must incorporate that allocation into its SWPPP and implement necessary steps to meet that allocation.

SPECIAL CONDITION 14. Mine excavation operations shall maintain a minimum setback of 200 feet from the potable well identified as the facility owned well servicing the scale house and office pursuant to Section 14.2 of the Illinois Environmental Protection Act.

NPDES PERMIT NO. IL0078972
Construction Authorization

Authorization is hereby granted to the above designee to construct the mine and mine refuse area described as follows:

The facility is an existing, approximately 369 acre limestone quarry, designated as the CONMAT, Dwyer Quarry and Asphalt Plant, located in Section 4, T26N, R8E of the 4th P.M. in Stephenson County, Illinois, near Freeport. Quarry operations include blasting, crushing, screening and stockpiling of limestone aggregate. The on-site asphalt plant, Freeport – Gencore Portable, has operations that do not affect stormwater runoff with any process wastewater. Groundwater seepage pumped from the quarry pit and stormwater runoff discharge at an average rate of 1.296 MGD to Yellow Creek at Outfall 001. Stormwater runoff is the only discharge at Outfall 002.

The abandonment plan submitted with the application documents dated September 2, 2008 shall be executed and completed in accordance with Rule 405.109 of Subtitle D: Mine Related Water Pollution.

This Authorization is issued subject to the following Special condition(s). If such Special conditions require additional or revised facilities, satisfactory engineering plan documents must be submitted to this Agency for review and approval.

If any statement or representation in the application is found to be incorrect, this permit may be revoked and the permittee thereupon waives all rights thereunder.

The issuance of this permit (a) shall not be considered as in any manner affecting the title of the premises upon which the mine or mine refuse area is to be located; (b) does not release the permittee from any liability for damage to person or property caused by or resulting from the installation, maintenance or operation of the proposed facilities; (c) does not take into consideration the structural stability of any units or parts of the project; and (d) does not release the permittee from compliance with other applicable statutes of the State of Illinois, or with applicable local laws, regulations or ordinances.

This permit may not be assigned or transferred. Any subsequent operator shall obtain a new permit from the Illinois Environmental Protection Agency.

There shall be no deviations from the approved plans and specifications unless revised plans, specifications and application shall first have been submitted to the Illinois Environmental Protection Agency and a supplemental permit issued.

The permit holder shall notify the Illinois Environmental protection Agency (217/782-3637) immediately of any emergency at the mine or mine refuse area which causes or threatens to cause a sudden discharge of contaminants into the waters of Illinois and shall immediately undertake necessary corrective measures as required by Rule 405.111 under Chapter 1, Subtitle D: Mine Related Water Pollution of Illinois Pollution Control Board Rules and Regulations.

Final plans, specifications, application and supporting documents as submitted and approved shall constitute part of this permit and are identified in the records of the Illinois Environmental Protection Agency, by the permit number designated in the heading of this section.
