Appendix E

Responsiveness Summary/Public Comments

This page intentionally left blank.

Responsiveness Summary

Galena/Sinsinawa Rivers Watershed

Total Maximum Daily Load

The responsiveness summary responds to questions and comments received during the public comment period from September 28, 2017, through October 28, 2017.

What is a TMDL?

A Total Maximum Daily Load (TMDL) is the sum of the allowable amount of a pollutant that a water body can receive from all contributing sources and still meet water quality standards or designated uses. **The Galena/Sinsinawa Rivers Watershed** TMDL report contains a plan detailing the actions necessary to reduce pollutant loads to the impaired water bodies and ensure compliance with applicable water quality standards. The Illinois EPA implements the TMDL program in accordance with Section 303(d) of the federal Clean Water Act and regulations thereunder.

Background

The watershed targeted for TMDL development is **Galena/Sinsinawa Rivers Watershed** located in in northwestern Illinois and southwestern Wisconsin, flows in a southerly direction, and drains approximately 211,000 acres within the states of Illinois and Wisconsin. Approximately 77,000 acres (37 percent of the total watershed) lie in Jo Daviess County in Illinois, with the remaining 134,000 acres (63 percent of the total watershed) in Grant and Lafayette Counties in Wisconsin.

The Clean Water Act and USEPA regulations require that states develop TMDLs for waters on the Section 303(d) List. Illinois EPA is currently developing TMDLs for pollutants that have numeric water quality standards. Therefore, Total Phosphorus, and Dissolved Oxygen TMDLs were developed for Frenress Lake (waterbody segment RMA); and Fecal Coliform TMDL was developed for Galena River (waterbody segment (MQ-01) listed as impaired per the *Draft Illinois Integrated Water Quality Report and Section 303(d) List-2016*.

In addition, a Load Reduction Strategy (LRS) was developed for pollutant(s) that do not have numeric water quality standard. These include Sedimentation/Siltation for Sinsinawa River (waterbody segment (MS); Total Suspended Solids for Frenress Lake (waterbody segment - RMA); Total Suspended Solids and Sedimentation/Siltation for Galena River (waterbody segment – MQ-01)

Illinois EPA contracted with CDM Smith (TMDL Consultant) to prepare the TMDL report for Galena/Sinsinawa Rivers Watershed TMDL project.

Public Meetings

The draft Stage One public meeting was held on June 10, 2014 (6:00 pm) and June 11, 2014 (10:30 am) at Midwest Medical Center (Education Room), One Medical Center Drive in Galena, Illinois and the draft Stage 3 public meeting was held on September 28, 2017, in Galena City Hall, Galena Illinois. Illinois EPA provided public notice for both meetings by placing display-ad in Galena Gazette (the local newspaper). In addition, a direct mailing was sent to several stakeholders/Permittees in the watershed. The notice gave the date, time, location, and purpose of the meeting. The notice also provided references on how to obtain additional information about this specific site, the TMDL program, and other related information. The draft TMDL report was available for review at Galena City Hall, and on the Agency's webpage: www.epa.illinois.gov/public-notices/index.

The Stage 3 public meeting started at 6:30 p.m. on Thursday, September 28, 2017. It was attended by approximately 14 people and concluded at 8:00 p.m., with the meeting record remaining open until midnight, October 28, 2017.

Questions & Comments

1. Page 1-1 references the 2016 integrated report, but page 1- [4] references the 2014 Integrated report - which one is currently pertinent for proposed TMDLs?

Response: The report focused on the 2014-listing at the time the Stage One project was completed, while the draft Stage 3 was updated to reflect the Draft 2016 – Integrated Report (IR) listing, and the references in the report has been corrected to read as 2016 - IR listing.

2. Why aren't PCBs or Bottom Deposits mentioned as impairments?

Response: PCBs and bottom deposits are legacy pollutants (originating from historical sources that are no longer operating). Illinois EPA has reached out to USEPA - Region 5 for assistance for developing a "Statewide PCB -TMDL" for all impaired waterbody segments in Illinois.

3. Why isn't the impaired MQ-02 segment of Galena River included?

Response: See previous response – it is only listed for PCBs which is not addressed in this study.

4. Page 1- [6], define LRS (Load Reduction Strategy) first mentioned here.

Response: The acronym LRS is defined as Load Reduction Strategy on page 1-5 of the TMDL report.

5. In Section 2.3 - Land Use" section, it suggests that the most current Cropland Data Layer (CDL) dataset is 2013. Is 2017 data available, and if so can this be updated?

Response: The 2017 CDL was released in January 2018. We have looked at the dataset and it was similar to the 2013 CDL.

6. Page 2-13, ...maybe add last sentence in Section 2.5 Population section, "Other population centers in the watershed include East Dubuque, Menominee, and the Galena Territory in Illinois and Cuba City, Hazel Green, Benton, and Shullsburg in Wisconsin."

Response: This sentence has been added.

7. Page 2-13, regarding K factor, can an average be provided along with a statement that, in general, the watershed area is highly susceptible to sheet and rill erosion?

Response: The paragraph has been revised to include the above statement and the K-factor average value.

8. Can you please reiterate the TMDL equation in the narrative for easy reference relative to the table? Is it correct that Load Capacity (LC) is the TMDL, and if so can "TMDL" be included in the table heading on Table 8-5?

Response: The table is titled "Fecal Coliform TMDL for Galena River MQ-01."

9. Can you please include an explanation in the narrative about why no Reserve Capacity (RC) is involved?

Response: A sentence has been added to the end of Section 8.3: Note that RC has not been included in any of the TMDLs as large-scale future growth is not anticipated in the watershed.

10. Page 2-17, Not sure about the assumption that Dubuque weather data station can be considered representative of precipitation throughout the watershed. Where is the "similar NCDC climate station" in Galena, and how does the available data from that station compare with concurrent Dubuque data?

Response: Weather data collected for this study is used for historical reference and to provide general estimates. The selection of the Dubuque station was based on the completeness of the record.

11. Page 2-1[8], "2.6.3 Streamflow" section relies on the USGS gage on the Sinsinawa River. The draft Galena River Watershed Resource Inventory (12.0 Watershed Drainage System, p. 35) makes a strong case for relying on the USGS gage data on the Apple River as a reference for the Galena River. There is also

an active gage on the Galena River on Beebe Rd. at Buncombe that could be a meaningful reference (operated by the USGS from 1939-1992, and now by the National Weather Service in conjunction with the U.S. Army Corps of Engineers).

Response: The Sinsinawa River gage was selected based on the completeness of record/seamlessness of data and location within the watershed. Daily USGS data are available for download in a format that is most useful for load duration curve development used in this TMDL report.

12. Page (P) 2-21: The Sinsinawa gage is not positioned in the watersheds such that it would be a suitable reference gage on which to model the hydrology of these watersheds. The watershed that this gage measures is very different than the Galena River watershed, and only captures 80% of the Sinsinawa watershed, excluding the lower river from the Route 20 highway bridge to the mouth of the Mississippi River, where the channel gets notably flatter. The Apple River gage is below the dam in Hanover, IL, which may better model the pooling effect that the Mississippi River has on the lower reaches of these watersheds.

The following table compares characteristics : Parameters	Apple River (USGS Gage Site)	Sinsinawa River (USGS Gage Site)	Galena River (At mouth of Mississippi River)	Unit
Drainage Area	246.33	39.6	203.17	mi.2
Soil Permeability	1.294	1.304	1.321	ln/hr.
Channel Slope	10.483	19.304	7.742	Ft./mi.
Surface Water	0.339	0.08	0.155	percent
Impervious Surfaces	0.94	0.1	1.25	percent
Channel Length	24.65	13.89	30.24	miles
Maximum Elevation	1,250	984	1,250	feet
Watershed Relief	656	330	655	feet
2 Year Peak Flood	4,877	1,600	3,721	ft3/sec.
5 Year Peak Flood	8,406	2,840	6,352	ft3/sec.
10 Year Peak Flood	10,994	3,790	8,262	ft3/sec.
25 Year Peak Flood	14,467	5,060	10,807	ft3/sec.
50 Year Peak Flood	17,162	6,070	12,773	ft3/sec.
100 Year Peak Flood	19,894	7,100	14,756	ft3/sec.

500 Year Peak Flood	26,658	9,670	19,634	ft3/sec.
---------------------	--------	-------	--------	----------

Response: Thank you for the information. Note that an area-ratio multiplier is used to estimate flows as described in the report at each point used for load duration curve development. The data points used for load duration curve analysis are located slightly downstream of the USGS gage on Sinsinawa River and at Rt. 20 in Galena on the Galena River. This is standard practice for approved TMDLs in Illinois. We typically try to avoid gages with reservoirs upstream of them so natural flows are represented. The load duration curves are not trying to replicate flows at the mouths of each river.

13. Page 5-5, One of the big questions at the Stage 1 public meetings was, what about what's coming in from Wisconsin? Can a statement be added that explains that the water quality coming in from Wisconsin meets the TMDL requirements, and so every Galena tributary in Illinois must do the same?

Response: The water quality in Wisconsin was investigated as suggested/requested at the Stage 1 meeting and all available information has been included in the report. The data was very limited.

14. Page 5-5, last paragraph under "5.1.1 Stream Water Quality Data... 4th line: change" download" to "downloaded" fixed and " The Galena River at Beebe Rd [333230 & 333109]" stations don't appear on the Figure 5-1 map as described.

Response: Figure 5-1, and the text in Section 5.1.1 have been updated.

15. Page 5-17, Can an explanation be offered as to why the RMA-1 area remains relatively constant compared to spikes of RMA-2 and RMA-3?

Response: RMA-1 is closest to the dam and represents the largest volume of water. RMA-2 & RMA-3 are closer to the tributaries and likely to be impacted by weather events in the watershed.

16. Page 5-27, Only 8 NPDES locations shown on map - is this correct?

Response: The map and text have been updated to show only 7 sites that currently have discharge permit. RH Stewart was removed from the map (near Frentress) because the permit was terminated in 2010.

17. Page 5-31, Anecdotally, it is my understanding that the number of goats being raised in the area is going up - can goats be added to the tables?

Response: Goat numbers are now included (refer to Tables 5-15 thru 5-17) and additional text has been added to note the increased animal population in the watershed.

18. Page 5-34, River Watch data is available, and should be included in the report.

Response: Page 5-34, last paragraph states, “A volunteer water quality monitoring program also exists for streams within the watershed that is managed by the National Great Rivers Research & Education Center. This River Watch program’s data was collected by volunteers, and although it will not be directly used by Illinois EPA for the purposes of the TMDL program, data available from this program may be beneficial for watershed planning and BMP implementation purposes. Further monitoring recommendations are included in the Implementation Plan in Section 9”.

19. P5-34: The Apple Canyon Lake watershed plan was completed and accepted in 2016. The plan is available at: <http://www.epa.illinois.gov/Assets/iepa/water-quality/watershed-management/watershed-based-planning/2016/apple-canyon-lake-wbp.pdf>. Other watershed studies recently completed include, Jo Daviess County Watershed Resource Management Plan, and IEPA supported Galena River Watershed-based Plan.

Response: The watershed plans have been discussed in the last paragraph of Section 5.5 of TMDL report and the web link for the plan has also been included.

20. P6-1, §6.1: Simplistic approaches require less data, but less data leads to low precision and accuracy. When developing load reduction goals, which could be perceived as controversial to some stakeholders in the watershed, greater data inputs and more complex models are more desirable.

Response: Greater data inputs are always desirable. These TMDLs/LRSs were calculated using all available IEPA QA/QC accepted data and additional data were collected by IEPA and incorporated into the final report. Note that the load reductions associated with the TMDLs are nonpoint source related and implementation of controls is voluntary.

21. P6-2, Table 6-1: Flow data used for the load-duration methodology should be derived from an appropriate gage for each sampling event listed in the table if direct discharge data is not available for each sampling event at the sampling site.

Response: Load Duration Curves (LDCs) were developed by following the USEPA approved methodology. An area-ratio calculation was performed using historical daily USGS flow records from a gage within the watershed. Flow values for each day with sampling data were used to plot actual loads on figures in Section 7.

22. Page 7-3, shows Figure 5-7 rather than Figure 7-1.

Response: This has been corrected and Figure 7-1 is now on page 7-5.

23. P7-23: Was 55,000 cfs taken directly from the Clinton gage data or was it modeled from the Clinton data? Clinton is two pools below Fretress Lake, with flow regulated by two lock and dams in between; the Clinton gage receiving an

additional 59 river miles of Mississippi River drainage. The land area which feeds those 59 river miles is a very different landscape than the land area responsible for feeding the backwaters around Frentress Lake, and water will move very differently through these differing landscapes.

Response: The second paragraph on page 7-19 following Table 7-2 states that, "A simple Vollenweider model was constructed as a means for roughly approximating (emphasis added) the total Mississippi River watershed phosphorus (P) reduction required to achieve the Frentress in-lake concentration target." The average discharge at Clinton gage is 57,069 cfs. This gage is about 50 miles downstream of Frentress, but has a watershed area that is only about 3% greater than at Frentress. Because there are locks, reservoirs, point sources, diversions, etc. involved between the sites we used a rough estimate of 3% less flow for Frentress TMDL estimation purposes.

24. Page 8-5, Table 8-5, Can you please explain "Flow Exceedance Range in the narrative?"

Response: Additional text has been added to Section 7.2 (Methodology Development): Subsection - 7.2.1 Load Duration Curve Development:

Load duration curves are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. Flow duration curve development considers the cumulative frequency of historic flow data over a specified period. A flow duration curve relates flow values to the percent of time those values have been met or exceeded. The use of flow exceedance probability provides a uniform scale ranging between 0 and 100 and can be further broken down into ranges (e.g. 0-10%, 10-40%, etc.) for the TMDL analysis. Low flows are exceeded a majority of the time, while floods are exceeded infrequently. Flows are multiplied by the applicable numeric standard to develop a load-duration curve and historical data, coupled with its corresponding flows, are plotted against the curve to assess reduction needs. This approach was used to characterize the current loading of zinc, fecal coliform, and TSS to impaired segment MQ-01 of the Galena River, and loading of TSS to impaired segment MS of the Sinsinawa River.

25. Page 8-5, Is zinc also in the streambed sediment, and if so, what impact might it have?

Response: The report has been updated to state: Exceedances of the chronic standard have occurred under all flow scenarios with the highest excursions occurring during wet conditions. Zinc is a naturally occurring element within the watershed and bound to area soils. Zinc is carried to the streams as soils migrate from the land through erosive processes and can be resuspended through streambed scouring. Additionally, groundwater seepage from historic mine tailing deposits throughout the watershed floodplain is a likely contributor of zinc during drier periods.

Additionally, many sediment control options and streambed/bank erosion control measures are presented throughout Section 9.

26. The Dissolved Zn loading calculations in the draft TMDL report are routine and make sense. I would like to see plots of “Dissolved Zn concentration over discharge” and “dissolved Zn conc. over suspended sediment concentration” to help me evaluate sources and transport better, but it looks like the dissolved Zn is linked to nonpoint or rainfall/runoff inputs to some degree. This would be from runoff from mine sites, ground water seepage from mines and acidic tailings piles, and release of dissolved zinc to the water column from contaminated sediment introduced by erosion.

One source of Zn not really covered much in the TMDL is the large mass of stored Zn-rich tailings and contaminated sediment in floodplain deposits all along the Galena River and its tributaries. We see tailings strata in most floodplain cut-banks below mining areas. Therefore, **bank erosion = zinc pollution** below mining areas including the floodplains in the TMDL-targeted segment. Also, while we have not studied it, leaching and weathering of tailings and sediment in floodplains may release dissolved Zn to the water table and then to the stream during base flow. The TMDL described boiler-plate on-site treatments to reduce Zn from acid drainage and other drainage from mine sites which is good, but effectiveness is site condition specific. I realize the TMDL does not specifically address contaminated sediment released from floodplain erosion: it is focused on dissolved Zinc. But geochemically, high concentrations of dissolved Zn in the carbonate-buffered stream water like in the Galena River indicate that high Zn concentrations are in the fine-sediment fraction of bed and suspended sediment too. In fact, contaminated sediment itself could be the main source of dissolved Zn to the stream by desorption release to the water column (not dissolved Zn directly from ground water or leachates from tailings piles or old mining sites).

Identifying Dissolved Zn for control is a good idea, but to reduce loads of dissolved Zn by 50% (or so as indicated by the TMDL), more attention may need to be put on the role of sediment-Zn sources to the channel since the source of high dissolved Zn in the water may be by the Zn released from contaminated sediment.

Response: Thank you for the additional information. Additional text has been added in the nonpoint source discussion to include floodplain storage of zinc tailings. Note that the implementation plan (Section 9) includes many sediment and erosion control BMPs which would be applicable to this source. Further linkage has been noted throughout the TMDL report.

27. P8-8, Table 8 - [9]: At flow exceedance range 50-60%, almost 60% reduction is needed. At flow exceedance range 70-80%, almost 60% reduction is needed. But at flow exceedance range 60-70%, no reduction is needed? This seems incorrect.

Response: Percent reductions needed are based on historical data. Note that actual load is calculated using the 90th percentile of observed TSS

concentrations in a given flow range. The 90th percentile of all samples collected at the 60-70% flow exceedance range is below the standard and therefore does not require reduction.

28. Page 8-10, Should the Illinois Nutrient Loss Reduction Strategy be mentioned along with the Nutrient Task Force?

Response: Added text: The significant nutrient contributions from widespread agriculture in the Upper Mississippi River basin are well documented and efforts to reduce these loads are being studied through the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. In addition, a policy working group led by the Illinois Water Resource Center-Illinois Indiana Sea Grant, the Illinois EPA, and the Illinois Department of Agriculture is working on The Illinois Nutrient Loss Reduction Strategy which guides the state efforts to improve water quality by reducing nitrogen and phosphorus levels in lakes, streams, and rivers.

29. The references to the Appendices may need to be checked - e.g. Page 3-1 Appendix E referenced for TMDL comments, but is "Load Curve Documentation".

Response: This has been corrected. Appendix D is Load Duration Curve Documentation and Appendix E is TMDL comments.

30. P9-3: Filter strips along impaired stream segments will have less efficacy in these watersheds because of the land slope and number of smaller, ephemeral, eroded drainages which contribute stormwater flow to impaired stream segments.

Response: There are approximately 23,000 total acres within the various buffer distances of impaired stream segments MS and MQ-01 and their tributaries, an estimated 17,500 acres of which are agricultural lands where filter strips could potentially be installed. Note that filter strips may not be effective in areas with large slopes that are common throughout the watershed. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips.

31. Because many of the upland areas are forested, implementation of the standard design width of a filter strip on higher slopes would require conversion of forests to grass filters, which may not be desirable.

Response: Page 9-4 states: Not all land use types within the buffer areas are candidates for conversion to filter strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of developed residential or commercial lands is often infeasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips and will likely provide the greatest benefit to achieve water quality standards.

32. Forest stand improvement and invasive species control should be added as BMP recommendations. Bush honeysuckle (*Lonicera sp.*) and autumn olive (*Elaeagnus sp.*) are major invasive species concerns in Jo Daviess County.

These shallow rooted shrubs take over forest understories and are responsible for extensive erosion on the forested slopes of Jo Daviess County.

P9- [5], Table 9-2: This lists the average slope as greater than 30%. Will a filter strip be effective on a 30% slope?

Response: Please see response # 31 above.

33. Watershed studies: recently completed *Jo Daviess County Watershed Resource Management Plan*, and in-process IEPA supported *Galena River Watershed-based Plan*.

Response: This information has been added.

34. P9-9: The quoted 25-30% phosphorus removal rate for a 30-ft. riparian buffer and 70-80% phosphorus removal rate for a 60-90 ft. riparian buffer is not accurate if the average slope in the riparian area is $\geq 30\%$.

Response: Text added: Note that the efficacy of riparian buffers may be limited in portions of the watershed with high slopes along waterways and will likely provide the greatest benefit to water quality once converted.

35. P9-14: Terracing is generally not feasible in these watersheds because of the higher slopes. The necessary close spacing of the terraces is not compatible with larger modern farm equipment.

Response: Terracing has been removed from the report.

36. P9-15: It should be noted that the 10-year, 24-hour storm is the design standard for WASCOS. This design standard may provide some load reduction, but many storm flows in recent years have surpassed the 100-year storm event and caused WASCOS to fail. Future design should be increased to a 100-year storm event; a practice which has been adopted by the City of Galena.

Response: Added text: Stakeholders noted that recent storms have surpassed this design standard and that City of Galena now designs for the 100-year event.

37. P9-24: There are numerous examples of existing mine tailing piles, of which the passive treatment technologies could be an option. Local knowledge also suggests that mine tailings were used extensively for the construction of roads, railroad beds, and other infrastructure outlets where the material could be easily disposed of. If this is the case, remediation is almost certainly not feasible.

Response: Source discussion in this section has been expanded: As discussed in Section 8.3.2.4, there is one NPDES permitted facility in Illinois which discharges into Galena River segment MQ-01; however, Illinois EPA permit section staff reviewed data for the facility and determined that zinc is not considered a parameter of concern for the facility and loading from the discharges is not expected to exceed the water quality standards. Additionally,

the Illinois EPA has identified abandoned mines as a contributor to the zinc exceedances in the Galena River segment MQ-01 and local stakeholders provided documentation that deposits from zinc-rich mine tailings can be found throughout the Galena River floodplain. Additional sources of some metals contamination may be from naturally-occurring high background levels of the metal in soils which can then contribute loads through overland runoff, soil erosion, streambank erosion, and groundwater. All BMPs and implementation measures previously listed for sediment control and streambank stabilization provide the secondary benefit of reducing any contaminants that may be attached to the soil, primarily by limiting the amount of zinc-enriched sediment flowing into the stream segment. These control practices were described in Section 9.3.

38. P9-35: The Galena/Sinsinawa watersheds are not in the [Conservation Reserve Enhancement Program (CREP)] eligibility area.

Response: CREP has been removed from the report.

39. In Section 9.12.3 - Success Criteria, Table 9-10 shouldn't the 100% target reduction milestones be dated 2037?

Response: Table 9-10 has been updated.

40. PA-1: Appendices should either be included in the document or readily accessible as a second web-link.

Response: The appendices are available on the Agency's TMDL website following the Draft TMDL Report.

41. It appears that Galena's WWTF [NPDES Permit No.IL0075191] is located on the [303 (d)] listed segment of the Galena River. We did not talk about point sources during the meeting so I would like to follow up to see if you predict any changes to the WWTF's NPDES permit.

Response: A fecal coliform wasteload allocation (WLA) has been developed for the facility based on the water quality standards, during the months May through October, based on a minimum of five samples taken over not more than a 30 day period, fecal coliform shall not exceed a geometric mean of 200 per 100 ml, nor shall more than 10% of the samples during any 30 day period exceed 400 per 100 ml in the receiving stream (see Section 8 and Table 8.4 of the report). The fecal coliform WLA will be included in the NPDES Permit during the next permit renewal.

No WLA was included for zinc, since the June 14, 2017, Water Quality Based Effluent Limits (WQBEL) analysis conducted by the Agency's BOW/Water Quality Standards Section, concluded that there is no reasonable potential to exceed the acute water quality standard in the effluent. However, the facility is required to

continue annual zinc monitoring as part of the NPDES Permit Special Condition for metals monitoring.

42. When will the WLA be set for MS4 Permits? What information will be needed from IDOT to calculate the WLA? IDOT will need to be included in Galena/Sinsinawa River watershed for zinc.

Response: Note that no major highways run through the Galena/Sinsinawa Rivers watershed. Road surface covers 0.12% of the contributing watershed. The resulting calculations were negligible and a WLA for zinc was not included for IDOT MS4 Permit in this watershed.

Re: Galena/Sinsinawa River Watershed TMDL

Dear Mr. Haile:

Please accept these comments from Illinois Farm Bureau (IFB) and Jo Daviess County Farm Bureau (CFB) regarding the Illinois Environmental Protection Agency's (Illinois EPA) draft Stage 1 Total Maximum Daily Load (TMDL) Report (Draft Stage 1 Report) for the Galena/Sinsinawa River watershed in Jo Daviess county.

IFB is a member of the American Farm Bureau Federation[®], a national organization of farmers and ranchers. Founded in 1916, IFB is a non-profit, membership organization directed by farmers who join through their county Farm Bureau. IFB has a voting membership of more than 82,000. IFB represents three out of four Illinois farmers. IFB and the CFBs share the same set of individual members. Members and staff of the CFB were present at the public meeting regarding the Draft Stage 1 Report.

IFB and the CFB have the following comments and/or questions regarding the Draft Stage 1 Report:

1. Upon review of the 2012 Section 303d list, we noticed that stream segment MQ-2 is listed as impaired for PCBs. Can you explain why that is not part of this TMDL draft report?
2. The language in the draft report is confusing as to TMDLs and Load Reduction Strategies (LRSs). Early on, the report discusses the fact that TMDLs are only being prepared for pollutants for which there are numeric water quality standards and that LRSs will be done where target values are available. The only numeric standards in place for purposes of this report are DO and Total P for lakes and zinc and total fecal coliform for streams. In the note to Table 4-3, it states that no LRS will be done in

the report because loading of the parameters for which there are numeric standards is expected to reduce loading of other parameters. Then, in Section 6, it states that an LRS is being done for the Galena River. What is the situation with the LRS? If one is not done in this report, is there a timeline for when it will be done? What is the "target value"?

3. More of this watershed is in Wisconsin than in Illinois. In fact, the report states that 63% of the watershed acres (211,000) are in Wisconsin and 37% of the watershed acres (77,000) are in Illinois. The report says that it focuses on just the Illinois portion of the watershed. It is difficult to understand how IEPA can just look at a portion of the watershed and make science-based decisions. Throughout the report, watershed level data is discussed for things like land use percentage, river flow, etc. When the term "watershed" is used in those types of situations, is the reporting considering the impact from the Wisconsin portions?
4. In Section 2.3, NASS cropland data is mentioned from 2007. Why is the more current information (available from 2103) not used?
5. In Section 5.1.1 (stream water quality data), there are a number of data points for stream segments as current as 2011. Can you explain how many of the data points are from the most recent 10 years? Is there any data available that is more current than 2011? How many data points are available per year? When were the exceedances found? How is this data used to list on the Section 303d list versus how it is used in the draft report?
6. In Section 5.1.2 (lake water quality data), please explain why so few points are available over a number of years. (total P and DO only have data from 2001 and 2010, and TSS only has data from 2010). How is this data used to list on the Section 303d list versus how it is used in the draft report?
7. In Table 5-5, how did IEPA determine needs for future modeling? Why is chlorophyll-a and temperature added?
8. Section 5.4.1 - Why was the 2013 Tillage Report not used for Illinois (instead of the 2011 version)? In addition, only a percentage of Jo Daviess County is part of the watershed that is the subject of this TMDL, although county wide numbers are being used for the Draft Report. Statements should be included in the Draft Report to reflect that percentage.
9. Section 5.4.2 - Animal operations from 2007 NASS data are listed, but that same data is available from 2013. The most current data should be used. Again, the same issue as in point 9 above exists regarding the percentage of Jo Daviess County in the subject watershed.

Thank you for the opportunity to comment on the draft TMDL for the Galena/Sinsinawa River watershed.

Sincerely,

A handwritten signature in cursive script that reads "Lauren Lurkins".

Beth Baranski's Questions/Notes on Stage 3 Report

Page 1-1 references the 2016 integrated report, but page 1-2 references the 2014 Integrated report - which one is currently pertinent for proposed TMDLs?

From 2014 Integrated Report:

1115	Low	0706000502	FRENTRESS	IL_RMA	92	Aesthetic Quality	Phosphorus (Total), Total Suspended Solids (TSS), Turbidity
1116	Low	0706000502	FRENTRESS	IL_RMA	92	Aquatic Life	Dissolved Oxygen, Phosphorus (Total), Total Suspended Solids (TSS)
1117	Low	0706000503	Galena R.	IL_MQ-01	8.64	Aesthetic Quality	Bottom Deposits
1118	Low	0706000503	Galena R.	IL_MQ-01	8.64	Aquatic Life	Sedimentation/Siltation, Total Suspended Solids (TSS), Zinc
1119	Low	0706000503	Galena R.	IL_MQ-01	8.64	Fish Consumption	PCBs
1120	Low	0706000503	Galena R.	IL_MQ-01	8.64	Primary Contact Recreation	Fecal Coliform
1121	Low	0706000503	Galena R.	IL_MQ-02	8.62	Fish Consumption	PCBs
1114	Low	0706000502	Sinsinawa R.	IL_MS	10.27	Aquatic Life	Sedimentation/Siltation

From 2016 Integrated Report:

2716	Low	0706000502	FRENTRESS	IL_RMA	92.00	Aesthetic Quality	Phosphorus (Total)
2142	Medium	0706000502	FRENTRESS	IL_RMA	92.00	Aesthetic Quality	Total Suspended Solids (TSS)
2717	Low	0706000502	FRENTRESS	IL_RMA	92.00	Aquatic Life	Phosphorus (Total)
2143	Medium	0706000502	FRENTRESS	IL_RMA	92.00	Aquatic Life	Total Suspended Solids (TSS)
1966	Medium	0706000503	Galena River	IL_MQ-01	8.64	Aesthetic Quality	Bottom Deposits
1968	Medium	0706000503	Galena River	IL_MQ-01	8.64	Aquatic Life	Sedimentation/Siltation
1969	Medium	0706000503	Galena River	IL_MQ-01	8.64	Aquatic Life	Total Suspended Solids (TSS)
2719	Low	0706000503	Galena River	IL_MQ-01	8.64	Aquatic Life	Zinc
1967	Medium	0706000503	Galena River	IL_MQ-01	8.64	Fish Consumption	Polychlorinated biphenyls
2718	Low	0706000503	Galena River	IL_MQ-01	8.64	Primary Contact Recreation	Fecal Coliform
1970	Medium	0706000503	Galena River	IL_MQ-02	8.62	Fish Consumption	Polychlorinated biphenyls
2141	Medium	0706000502	Sinsinawa River	IL_MS	10.66	Aquatic Life	Sedimentation/Siltation

Why aren't PCBs or Bottom Deposits mentioned as impairments?

Why isn't the impaired MQ-02 segment of Galena River included?

Page 1-5, define LRS (Load Reduction Strategy) first mentioned here.

Page 2-13, ...maybe add last sentence in 2.5 Population section "Other population centers in the watershed include East Dubuque, Menominee, and the Galena Territory in Illinois and Cuba City, Hazel Green, Benton, and Shullsburg in Wisconsin."

Page 2-13 Regarding K factor, can an average be provided along with a statement that, in general, the watershed area is highly susceptible to sheet and rill erosion?

Page 2-17, Not sure about the assumption that Dubuque weather data station can be considered representative of precipitation throughout the watershed. Where is the "similar NCDC climate station" in Galena, and how does the available data from that station compare with concurrent Dubuque data?

Page 2-17, "2.6.3 Streamflow" section relies on the USGS gage on the Sinsinawa River. The draft Galena River Watershed Resource Inventory (12.0 Watershed Drainage System, p. 35) makes a strong case for relying on the USGS gage data on the Apple River as a reference for the Galena River. There is also an active gage on the Galena River on Beebe Rd. at Buncombe that could be a meaningful reference (operated by the USGS from 1939-1992, and now by the National Weather Service in conjunction with the U.S. Army Corps of Engineers).

Page 5-5, One of the big questions at the Stage 1 public meetings was, what about what's coming in from Wisconsin? Can a statement be added that explains that the water quality coming in from Wisconsin meets the TMDL requirements, and so every Galena tributary in Illinois must do the same?

Page 5-5, last paragraph under "5.1.1 Stream Water Quality Data... 4th line: change" download" to "downloaded" and " The Galena River at Beebe Rd [333230 & 333109]" stations don't appear on the Figure 5-1 map as described.

Page 5-17, Can an explanation be offered as to why the RMA-1 area remains relatively constant compared to spikes of RMA-2 and RMA-3?

Page 5-27, Only 8 NPDES locations shown on map - is this correct?

Page 5-31, Anecdotally, it is my understanding that the number of goats being raised in the area is going up - can goats be added to the tables?

Page 5-34, RiverWatch data is available

Page 5-34, Watershed studies: recently completed *Jo Daviess County Watershed Resource Management Plan*, and in-process IEPA supported *Galena River Watershed-based Plan*.

6-2, The determinations regarding Fretress Lake make a lot of sense to me, and directly answer the questions raised at the Stage 1 public meetings about the influence of the Mississippi River on issues in the lake.

Page 7-3, shows Figure 5-7 rather than Figure 7-1

Page 8-5, Table 8-5, Can you please explain "Flow Exceedance Range in the narrative? Can you please reiterate the TMDL equation in the narrative for easy reference relative to the table? Is it correct that LC is the TMDL, and if so, can "TMDL" be included in the table heading? Can you include an explanation in the narrative about why no Reserve Capacity is involved?

Page 8-5, Is zinc also in the streambed sediment, and if so, what impact might it have?

Page 8-10, Should the Illinois Nutrient Loss Reduction Strategy be mentioned along with the Nutrient Task Force?

The references to the Appendices may need to be checked - e.g. Page 3-1 Appendix E referenced for TMDL comments, but is "Load Curve Documentation"

Comments on the Galena/Sinsinawa Rivers Watershed TMDL Stage 3 Draft Report for Public Review

Submitted by:

Mike Malon, C.L.M., C.P.E.S.C.

Resource Conservationist, Jo Daviess County Soil and Water Conservation District
Navigation Specialist, US Army Corps of Engineers, Rock Island District

September 25, 2017

Page (P) 2-21: The Sinsinawa gage is not positioned in the watersheds such that it would be a suitable reference gage on which to model the hydrology of these watersheds. The watershed that this gage measures is very different than the Galena River watershed, and only captures 80% of the Sinsinawa watershed, excluding the lower river from the Route 20 highway bridge to the mouth of the Mississippi River, where the channel gets notably flatter. The Apple River gage is below the dam in Hanover, IL, which may better model the pooling effect that the Mississippi River has on the lower reaches of these watersheds.

The following table compares characteristics:

Parameters	Apple River (USGS Gage Site)	Sinsinawa River (USGS Gage Site)	Galena River (At mouth of Mississippi River)	Unit
Drainage Area	246.33	39.6	203.17	mi. ²
Soil Permeability	1.294	1.304	1.321	In/hr.
Channel Slope	10.483	19.304	7.742	Ft./mi.
Surface Water	0.339	0.08	0.155	percent
Impervious Surfaces	0.94	0.1	1.25	percent
Channel Length	24.65	13.89	30.24	miles
Maximum Elevation	1,250	984	1,250	feet
Watershed Relief	656	330	655	feet
2 Year Peak Flood	4,877	1,600	3,721	ft ³ /sec.
5 Year Peak Flood	8,406	2,840	6,352	ft ³ /sec.
10 Year Peak Flood	10,994	3,790	8,262	ft ³ /sec.
25 Year Peak Flood	14,467	5,060	10,807	ft ³ /sec.
50 Year Peak Flood	17,162	6,070	12,773	ft ³ /sec.
100 Year Peak Flood	19,894	7,100	14,756	ft ³ /sec.
500 Year Peak Flood	26,658	9,670	19,634	ft ³ /sec.

P5-34: The Apple Canyon Lake watershed plan was completed and accepted in 2016. The plan is available at: <http://www.epa.illinois.gov/Assets/iepa/water-quality/watershed-management/watershed-based-planning/2016/apple-canyon-lake-wbp.pdf>

P6-1, §6.1: Simplistic approaches require less data, but less data leads to low precision and accuracy. When developing load reduction goals, which could be perceived as controversial to some stakeholders in the watershed, greater data inputs and more complex models are more desirable.

P6-2, Table 6-1: Flow data used for the load-duration methodology should be derived from an appropriate gage for each sampling event listed in the table if direct discharge data is not available for each sampling event at the sampling site.

P7-21: Was 55,000 cfs taken directly from the Clinton gage data or was it modeled from the Clinton data? Clinton is two pools below Fretress Lake, with flow regulated by two lock and dams in between; the Clinton gage receiving an additional 59 river miles of Mississippi River drainage. The land area which feeds those 59 river miles is a very different landscape than the land area responsible for feeding the backwaters around Fretress Lake, and water will move very differently through these differing landscapes.

P8-8, Table 8-10: At flow exceedance range 50-60%, almost 60% reduction is needed. At flow exceedance range 70-80%, almost 60% reduction is needed. But at flow exceedance range 60-70%, no reduction is needed? This seems incorrect.

P9-3: Filter strips along impaired stream segments will have less efficacy in these watersheds because of the land slope and number of smaller, ephemeral, eroded drainages which contribute stormwater flow to impaired stream segments. Because many of the upland areas are forested, implementation of the standard design width of a filter strip on higher slopes would require conversion of forests to grass filters, which may not be desirable.

Also, forest stand improvement and invasive species control should be added as BMP recommendations. Bush honeysuckle (*Lonicera sp.*) and autumn olive (*Elaeagnus sp.*) are major invasive species concerns in Jo Daviess County. These shallow rooted shrubs take over forest understories and are responsible for extensive erosion on the forested slopes of Jo Daviess County.

P9-4, Table 9-2: This lists the average slope as greater than 30%. Will a filter strip be effective on a 30% slope?

P9-9: The quoted 25-30% phosphorus removal rate for a 30 ft. riparian buffer and 70-80% phosphorus removal rate for a 60-90 ft. riparian buffer is not accurate if the average slope in the riparian area is $\geq 30\%$.

P9-14: Terracing is generally not feasible in these watersheds because of the higher slopes. The necessary close spacing of the terraces is not compatible with larger modern farm equipment.

P9-15: It should be noted that the 10-year, 24-hour storm is the design standard for WASCOS. This design standard may provide some load reduction, but many storm flows in recent years have surpassed the 100-year storm event and caused WASCOS to fail. Future design should be increased to a 100-year storm event; a practice which has been adopted by the City of Galena.

P9-24: There are numerous examples of existing mine tailing piles, of which the passive treatment technologies could be an option. Local knowledge also suggests that mine tailings were used extensively for the construction of roads, railroad beds, and other infrastructure outlets where the material could be easily disposed of. If this is the case, remediation is almost certainly not feasible.

P9-35: The Galena/Sinsinawa watersheds are not in the CREP eligibility area.

PA-1: Appendices should either be included in the document or readily accessible as a second web-link.

Here are my final notes on the report prior to the meeting:

1. In the "2.3 Land Use" section, it suggests that the most current CDL dataset is 2013. Is 2017 data available, and if so can this be updated?
2. In "9.12.3 Success Criteria" Table 9-10 shouldn't the 100% target reduction milestones be dated 2037?

See you soon!

Subject: RE: The Galena River

Beth,

I read over the sections you mentioned in the draft TMDL. The Dissolved Zn loading calculations are routine and make sense. I would like to see plots of “Dissolved Zn concentration over discharge” and “dissolved Zn conc. over suspended sediment concentration” to help me evaluate sources and transport better, but it looks like the dissolved Zn is linked to nonpoint or rainfall/runoff inputs to some degree. This would be from runoff from mine sites, ground water seepage from mines and acidic tailings piles, and release of dissolved zinc to the water column from contaminated sediment introduced by erosion.

One source of Zn not really covered much in the TMDL is the large mass of stored Zn-rich tailings and contaminated sediment in floodplain deposits all along the Galena River and its tributaries. We see tailings strata in most floodplain cut-banks below mining areas. Therefore, **bank erosion = zinc pollution** below mining areas including the floodplains in the TMDL-targeted segment. Also, while we have not studied it, leaching and weathering of tailings and sediment in floodplains may release dissolved Zn to the water table and then to the stream during base flow. The TMDL described boiler-plate on-site treatments to reduce Zn from acid drainage and other drainage from mine sites which is good, but effectiveness is site condition specific. I realize the TMDL does not specifically address contaminated

sediment released from floodplain erosion: it is focused on dissolved Zinc... I know. But geochemically, high concentrations of dissolved Zn in the carbonate-buffered stream water like in the Galena River indicate that high Zn concentrations are in the fine-sediment fraction of bed and suspended sediment too. In fact, contaminated sediment itself could be the main source of dissolved Zn to the stream by desorption release to the water column (not dissolved Zn directly from ground water or leachates from tailings piles or old mining sites). Maybe the draft TMDL discusses this somewhere, but I did not go over the report too closely yet.

See Table 5 in my 1995 proceedings for sediment-Zn concentrations in floodplains. Also, see core trends in the Knox article above that shows how Zn concentrations correlate with mining history in the Galena River. Floodplain concentrations can be as high as 10,000 ppm near mining sites in Shullsburg Branch and 6,000 ppm just above the city of Galena. The other papers I sent you on Blue River show the same trends in floodplains (we find this trend of floodplain contamination at many mining areas in the USA and globally).

The bottom line is that I am not sure that the TMDL addresses to a significant enough degree the long-term storage and contamination potential of Zn stored in floodplains in the Galena River. Identifying Diss Zn for control is a good idea, but to reduce loads of diss Zn by 50% (or so as indicated by the TMDL), more attention may need to be put on the role of sed-Zn sources to the channel since the source of high dissolved Zn in the water may be by the Zn released from contaminated sediment.

If you have any questions, just ask. I will try to send you my dissertation in PDF asap. I try to estimate the mass of Zn metal storage in floodplains compared to tailings piles (back in 1990) and where it is stored. I think our sediment sampling from this past summer will shed some light on the question of sediment contamination as a potential source of Diss Zn to the Galena River.

Thanks for keeping me in the loop.

Subject: The Galena River

Hi, Bob -

I wanted to make you aware of the release of the Galena/Sinsinawa Rivers Watershed TMDL Stage 3 Report. The report talks about zinc in the Galena River, and can be seen at <http://bit.ly/2w2D7A8>.

The Illinois EPA will be presenting the report on Thursday September 28th, 6:30 p.m. at the Galena City Hall. I'm guessing it is unlikely that you would attend this meeting, but I would

appreciate it if you could take a look at the section related to zinc (especially sections 5.1.1.1, 7.2.1.2, 8.3.2, 9.5 and 9.7.4) and send the IEPA (or me) any thoughts or comments about the material.

I'm also very interested in the work you did on the Galena River sediments 25 years ago. If there is anything you can send me, I would be most grateful.

Sincerely,

— Beth Baranski

Subject: [External] Galena Wastewater Treatment Facility

Good morning Abel,

We met last week in Galena at the public meeting. I am associated with Galena's Wastewater Treatment Facility. It appears to me that Galena's WWTF is located on the "d" listed segment of the Galena River. We did not talk about point sources during the meeting so I would like to follow up to see if you predict any changes to the WWTF's NPDES permit?
