UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 5
77 WEST JACKSON BOULEVARD
CHICAGO, IL 60604-3590

REPLY TO THE ATTENTION OF:

JUN 04 2018

WW-16J

Sanjay Sofat, Chief
Bureau of Water
Illinois Environmental Protection Agency
P.O. Box 19276
Springfield, Illinois 62794-9276

Dear Mr. Sofat:

The U.S. Environmental Protection Agency has conducted a complete review of the final Total Maximum Daily Loads (TMDL) for segments within the Galena/Sinsinawa Rivers watershed (GSRW), including support documentation and follow up information. The GSRW is in northwestern Illinois in Jo Daviess County. The GSRW TMDLs address impaired primary contact recreation due to excessive bacteria, impaired aquatic life use due to excessive zinc and impaired aquatic life and aesthetic quality due to excessive nutrients (phosphorus).

EPA has determined that the GSRW TMDLs meet the requirements of Section 303(d) of the Clean Water Act and EPA's implementing regulations set forth at 40 C.F.R. Part 130. Therefore, EPA approves Illinois's one bacteria TMDL, one zinc TMDL and one total phosphorus TMDL. The statutory and regulatory requirements, and EPA's review of Illinois's compliance with each requirement, are described in the enclosed decision document.

We wish to acknowledge Illinois's efforts in submitting these TMDLs and look forward to future TMDL submissions by the State of Illinois. If you have any questions, please contact Mr. Peter Swenson, Chief of the Watersheds and Wetlands Branch, at 312-886-0236.

Sincerely,

A handwritten signature in blue ink, appearing to read "Chris Korleski".

Christopher Korleski
Director, Water Division

TMDL: Galena/Sinsinawa Rivers Watershed bacteria (fecal coliform), zinc & phosphorus TMDLs,
Jo Daviess County, Illinois
Date: June 4, 2018

**DECISION DOCUMENT
FOR THE GALENA/SINSINAWA RIVERS WATERSHED TMDLS,
JO DAVIESS COUNTY, ILLINOIS**

Section 303(d) of the Clean Water Act (CWA) and EPA's implementing regulations at 40 C.F.R. Part 130 describe the statutory and regulatory requirements for approvable TMDLs. Additional information is generally necessary for EPA to determine if a submitted TMDL fulfills the legal requirements for approval under Section 303(d) and EPA regulations, and should be included in the submittal package. Use of the verb "must" below denotes information that is required to be submitted because it relates to elements of the TMDL required by the CWA and by regulation. Use of the term "should" below denotes information that is generally necessary for EPA to determine if a submitted TMDL is approvable. These TMDL review guidelines are not themselves regulations. They are an attempt to summarize and provide guidance regarding currently effective statutory and regulatory requirements relating to TMDLs. Any differences between these guidelines and EPA's TMDL regulations should be resolved in favor of the regulations themselves.

1. Identification of Water body, Pollutant of Concern, Pollutant Sources, and Priority Ranking

The TMDL submittal should identify the water body as it appears on the State's/Tribe's 303(d) list. The water body should be identified/georeferenced using the National Hydrography Dataset (NHD), and the TMDL should clearly identify the pollutant for which the TMDL is being established. In addition, the TMDL should identify the priority ranking of the water body and specify the link between the pollutant of concern and the water quality standard (see Section 2 below).

The TMDL submittal should include an identification of the point and nonpoint sources of the pollutant of concern, including location of the source(s) and the quantity of the loading, e.g., lbs/per day. The TMDL should provide the identification numbers of the NPDES permits within the water body. Where it is possible to separate natural background from nonpoint sources, the TMDL should include a description of the natural background. This information is necessary for EPA's review of the load and wasteload allocations, which are required by regulation.

The TMDL submittal should also contain a description of any important assumptions made in developing the TMDL, such as:

- (1) the spatial extent of the watershed in which the impaired water body is located;
- (2) the assumed distribution of land use in the watershed (e.g., urban, forested, agriculture);
- (3) population characteristics, wildlife resources, and other relevant information affecting the characterization of the pollutant of concern and its allocation to sources;
- (4) present and future growth trends, if taken into consideration in preparing the TMDL (e.g., the TMDL could include the design capacity of a wastewater treatment facility); and

(5) an explanation and analytical basis for expressing the TMDL through *surrogate measures*, if applicable. *Surrogate measures* are parameters such as percent fines and turbidity for sediment impairments; chlorophyll *a* and phosphorus loadings for excess algae; length of riparian buffer; or number of acres of best management practices.

Comment:

Location Description/Spatial Extent:

The Galena/Sinsinawa Rivers Watershed (GSRW) (HUC-8 #07060005) is located in the Mississippi River Basin in northwestern Illinois in Jo Daviess County, Illinois. Surface waters in the GSRW generally flow from east to west where they empty into the main stem of the Mississippi River (Figure 1-1 of the final TMDL document). The GSRW covers land in Illinois (approximately 77,000 acres, 37% of the total GSRW area) and land in Wisconsin (approx. 134,000 acres, 63% of the total GSWR area). The Illinois GSRW TMDLs address impaired segments in the Illinois portion of the GSRW and contributing GSRW areas solely in the State of Illinois. The Illinois GSRW TMDLs do not account for upstream GSRW areas in the State of Wisconsin nor do any loadings assigned in the Illinois GSRW TMDLs apply to GSRW areas in Wisconsin.

There are three TMDLs addressed in this project. The Galena River segment (IL_MQ-01) has a TMDL for bacteria (fecal coliform) which addresses an impairment due to excessive bacteria and a TMDL for zinc which addresses an impairment due to excessive zinc in the water column. Frentress Lake (IL_RMA) has a nutrient TMDL which addresses an impairment due to excessive phosphorus (Table 1 of this Decision Document).

Table 1: Galena/Sinsinawa Rivers Watershed impaired waters addressed by this TMDL

Water body name	Assessment Unit ID	Affected Use	Pollutant or stressor	TMDL
Galena River	IL_MQ-01	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL
Galena River	IL_MQ-01	Aquatic Life	Zinc	Zinc TMDL
Frentress Lake	IL_RMA	Aquatic Life and Aesthetic Quality	Total Phosphorus	Total Phosphorus TMDL

IEPA explained that Frentress Lake has significant hydrologic connectivity to the Mississippi River and water quality and quantity within the lake is greatly influenced by water quality and flood stage in the Mississippi River (Section 9.6 of the final TMDL document). There are no tributaries contributing flow to Frentress Lake in its direct subwatershed and the overall Frentress Lake subwatershed area is very small. IEPA assumed that a majority of the nutrient loading to Frentress Lake originates from upstream areas and is transported to Frentress Lake via flow within the main stem of the Mississippi River.

Land Use:

Land use in the GSRW is predominantly agricultural, pasture/hay (35.9%), corn (29.1%), soybeans (8.5%) and alfalfa (4.4%) comprise four of the five top land uses in the GSRW. Adding these land uses together results in 77.9% of land use in the GSRW being agriculturally based (Table 2 of this Decision Document). The GSRW also is comprised of deciduous forest (11.3%), developed/open space (4.1%),

open waters (2.1%) and developed/low intensity (2.0%). The remainder of the land uses sum to approximately 2.5% of the total land area of the GSRW.

Table 2: Galena-Sinsinawa Watershed Land Cover and Land Use - based on Illinois and Wisconsin Statewide 2013 Cropland Data Layer (CDL)

USDA/NASS Land Use Cropland Category	Acres	Percentage
Pasture/Hay	75,675	35.9%
Corn	61,302	29.1%
Deciduous Forest	23,785	11.3%
Soybeans	17,930	8.5%
Alfalfa	9,166	4.4%
Developed/Open Space	8,689	4.1%
Open Waters	4,481	2.1%
Developed/Low Intensity	4,259	2.0%
Woody Wetlands	1,899	0.9%
Developed/Medium Intensity	723	0.3%
Grassland Herbaceous	663	0.3%
Oats	604	0.3%
Winter Wheat	308	0.15%
Evergreen Forest	213	0.10%
Herbaceous Wetlands	186	0.09%
Shrublands	177	0.08%
Developed/High Intensity	163	0.08%
Barren	156	0.07%
Other Hay/Non-Alfalfa	97	0.05%
Other Hay/Non-Alfalfa	30	0.01%
TOTAL	210,506	100%

Problem Identification:

Bacteria TMDL: The Galena River impaired segment (IL_MQ-01) identified in Table 1 of this Decision Document was included on the draft 2016 Illinois 303(d) list due to excessive bacteria. Water quality monitoring within the GSRW indicated that this segment was not attaining its designated aquatic recreation uses due to exceedances of the bacteria criteria. Excessive bacteria can negatively impact recreational uses (swimming, wading, boating, fishing etc.) and public health. At elevated levels, bacteria may cause illness within humans who have contact with or ingest bacteria laden water. Recreation-based contact can lead to ear, nose, and throat infections, and stomach illness.

Zinc TMDL: The Galena River impaired segment (IL_MQ-01) identified in Table 1 of this Decision Document was included on the draft 2016 Illinois 303(d) list due to excessive zinc measured in the water column. Zinc is an essential element in small amounts. However, excessive zinc within the water column may harm aquatic species such as fish and macroinvertebrates. Certain metals species dissolve in water and may be absorbed by fish and other aquatic organisms. Small concentrations of certain dissolved metals may be, in the short term, toxic to fish and aquatic species and, in the long term, may bioaccumulate in certain aquatic species.

Phosphorus TMDL: Frentress Lake (IL_RMA) identified in Table 1 of this Decision Document was included on the draft 2016 Illinois 303(d) list due to excessive nutrients (phosphorus). Water quality monitoring demonstrated that Frentress Lake was not attaining its designated aquatic life and aesthetic quality uses due to excessive nutrients. Water quality monitoring within the GSRW was completed at several locations and the data collected during these efforts served as the foundation for modeling efforts completed in this TMDL study.

While TP is an essential nutrient for aquatic life, elevated concentrations of TP can lead to nuisance algal blooms that negatively impact aquatic life and recreation (swimming, boating, fishing, etc.). Algal decomposition depletes dissolved oxygen levels within the water column. The decreases in dissolved oxygen can stress benthic macroinvertebrates and fish. Depletion of oxygen in the water column can also lead to conditions where phosphorus is released from bottom sediments (i.e. internal loading). Also, excess algae can shade the water column which limits the distribution of aquatic vegetation. Aquatic vegetation stabilizes bottom sediments, and also is an important habitat for macroinvertebrates and fish.

Priority Ranking:

The water bodies addressed by the GSRW TMDLs were given a priority ranking for TMDL development due to: the impairment impacts on aquatic life, recreation, aesthetic quality, the public value of the impaired water resource and completing TMDLs as part of the Illinois basin monitoring process.

Pollutants of Concern:

The pollutants of concern are bacteria (fecal coliform), zinc and nutrients (TP).

Source Identification (point and nonpoint sources):

Point Source Identification: The potential point sources to the GSRW are:

GSRW bacteria TMDLs:

National Pollutant Discharge Elimination Systems (NPDES) permitted facilities: NPDES permitted facilities may contribute bacteria loads to surface waters through discharges of treated wastewater. Permitted facilities must discharge treated wastewater according to their NPDES permit. Illinois Environmental Protection Agency (IEPA) determined that there is one wastewater treatment facility, the Galena River South Sewage Treatment Plant (STP) (IL0075191) which contributes bacteria from treated wastewater releases to IL_MQ-01. IEPA assigned the Galena River South STP a portion of the bacteria wasteload allocation (WLA) for IL_MQ-01.

Concentrated Animal Feedlot Operations (CAFOs): IEPA recognized the presence of one CAFO facility, Heller Brothers (ILG0100002), in the Galena River (IL_MQ-01) subwatershed (Figure 1-1 and Table 5-11 of the final TMDL document). CAFO facilities must be designed to contain all surface water runoff (i.e., have zero discharge from their facilities) and have a current manure management plan. IEPA explained that these facilities do not discharge effluent and therefore were not assigned a portion of the WLA (WLA = 0).

Municipal Separate Storm Sewer (MS4): IEPA explained that there are no MS4 communities contributing pollutants to the impaired segments of the GSRW.

Combined Sewer Overflows (CSOs) and Sanitary Sewer Overflows (SSOs): IEPA determined that the GSRW does not have CSOs nor SSOs which contribute bacteria to waters of the GSRW.

GSRW zinc TMDLs:

IEPA explained that there are no NPDES permitted facilities which contribute a zinc point source load to the Galena River segment (IL_MQ-01).

GSRW phosphorus TMDLs:

There are no NPDES permitted facilities which contribute a TP point source load to Frenress Lake (IL_RMA).

Nonpoint Source Identification: The potential nonpoint sources to the GSRW are:

GSRW bacteria TMDLs:

Stormwater from agricultural land use practices and feedlots near surface waters: Animal Feeding Operations (AFOs) in close proximity to surface waters can be a source of bacteria to water bodies in the GSRW. These areas may contribute bacteria via the mobilization and transportation of pollutant laden waters from feeding, holding and manure storage sites. Runoff from agricultural lands may contain significant amounts of bacteria which may lead to impairments in the GSRW. Feedlots generate manure which may be spread onto fields. Runoff from fields with spread manure can be exacerbated by tile drainage lines, which channelize the stormwater flows and reduce the time available for bacteria to die-off.

Unrestricted livestock access to streams: Livestock with access to stream environments may add bacteria directly to the surface waters or resuspend particles that had settled on the stream bottom. Direct deposition of animal wastes can result in very high localized bacteria counts and may contribute to downstream impairments. Smaller animal facilities may add bacteria to surface waters via wastewater from these facilities or stormwater runoff from near-stream pastures.

Discharges from septic systems or unsewered communities: Failing septic systems are a potential source of bacteria within the GSRW. Septic systems generally do not discharge directly into a water body, but effluents from septic systems may leach into groundwater or pond at the surface where they can be washed into surface waters via stormwater runoff events. Age, construction and use of septic systems can vary throughout a watershed and influence the bacteria contribution from these systems.

Non-regulated urban runoff: Runoff from urban areas (urban, residential, commercial or industrial land uses) can contribute bacteria to local water bodies. Stormwater from urban areas, which drain impervious surfaces, may introduce bacteria (derived from wildlife or pet droppings) to surface waters.

Wildlife: Wildlife is a known source of bacteria in water bodies as many animals spend time in or around water bodies. Deer, geese, ducks, raccoons, and other animals all create potential sources of bacteria. Wildlife contributes to the potential impact of contaminated runoff from animal habitats, such as urban park areas, forest, and rural areas.

GSRW zinc TMDLs:

Abandoned mining areas: IEPA identified zinc contributions from abandoned mining areas in the GSRW (Section 5.4.4 of the final TMDL document). These areas may contribute zinc to surface waters via stormwater runoff derived from precipitation which has fallen on zinc rich mine tailings piles. Stormwater may liberate metals and other soluble compounds and transport it into surface waters of the GSRW.

Contaminated sediment in riparian areas and floodplain deposits of the GSRW: Studies by Missouri State University indicated the presence of zinc rich contaminated sediments within floodplain deposits along the Galena River and its tributaries (pg. 5-33 of the final TMDL document).

Naturally occurring zinc within soils: IEPA explained that soils in the GSRW may also have a higher than normal background levels of zinc. These soluble species of zinc may be transported to surface waters via overland runoff, soil erosion and groundwater. Zinc solubility is mostly influenced by pH (i.e., zinc's ability to precipitate with carbonate minerals) and organic matter (i.e., presence of clays which, under the right pH conditions may encourage greater sorption to clays).

GSRW phosphorus TMDLs:

IEPA explained that Frentress Lake has significant hydrologic connectivity to the Mississippi River and water quality and quantity within the lake is greatly influenced by water quality and flood stage in the Mississippi River (Section 9.6 of the final TMDL document). There are no tributaries contributing flow to Frentress Lake in its direct subwatershed and the overall subwatershed area is very small. IEPA assumed that a majority of the nutrient loading to Frentress Lake originates from upstream areas and is transported to Frentress Lake via flow within the main stem of the Mississippi River. Therefore, any nonpoint source reduction characterizations would need to be targeted to upstream Mississippi River areas.

IEPA did discuss nonpoint source contributions to Frentress Lake from its direct subwatershed and a summary of those nonpoint sources is below.

Internal loading: The release of phosphorus from lake sediments contributes internal phosphorus loading to Frentress Lake. Phosphorus may build up in the bottom waters of the lake and may be resuspended or mixed into the water column when the thermocline decreases and the lake water mixes.

Stormwater runoff from agricultural land use practices: Runoff from agricultural lands may contain significant amounts of nutrients, organic material and organic-rich sediment which may lead to impairments in the GSRW. Manure spread onto fields is often a source of phosphorus, and can be exacerbated by tile drainage lines, which channelize the stormwater. Tile lined fields and channelized ditches enable particles to move more efficiently into surface waters. Phosphorus, organic material and organic-rich sediment may be added via surface runoff from upland areas which are being used for Conservation Reserve Program (CRP) lands, grasslands, and agricultural lands used for growing hay or other crops. Stormwater runoff may contribute nutrients and organic-rich sediment to surface waters from livestock manure, fertilizers, vegetation and erodible soils.

Discharges from septic systems or unsewered communities: Failing septic systems are a potential source of nutrients within the GSRW. Septic systems generally do not discharge directly into a water body, but effluents from septic systems may leach into groundwater or pond at the surface where they can be washed into surface waters via stormwater runoff events. Age, construction and use of septic systems can vary throughout a watershed and influence the nutrient contribution from these systems.

Wetland and Forest Sources: Phosphorus, organic material and organic-rich sediment may be added to surface waters by stormwater flows through wetland and forested areas in the GSRW. Storm events may mobilize phosphorus through the transport of suspended solids and other organic debris.

Wildlife: Wildlife is a known source of nutrients in water bodies as many animals spend time in or around water bodies. Deer, geese, ducks, raccoons, and other animals all create potential sources of nutrients. Wildlife contributes to the potential impact of contaminated runoff from animal habitats, such as urban park areas, forest, and rural areas.

Future Growth:

The population for the GSRW is fairly small (Section 2.5 of the final TMDL document). IEPA did not account for any future growth in the watershed. The WLA and load allocations (LA) for the GSRW TMDLs were calculated for all current and future sources. Any expansion of point or nonpoint sources will need to comply with the respective WLA and LA values calculated in the GSRW TMDLs.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of the first criterion.

2. Description of the Applicable Water Quality Standards and Numeric Water Quality Target

The TMDL submittal must include a description of the applicable State/Tribal water quality standard, including the designated use(s) of the water body, the applicable numeric or narrative water quality criterion, and the antidegradation policy (40 C.F.R. §130.7(c)(1)). EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

The TMDL submittal must identify a numeric water quality target(s) – a quantitative value used to measure whether or not the applicable water quality standard is attained. Generally, the pollutant of concern and the numeric water quality target are, respectively, the chemical causing the impairment and the numeric criteria for that chemical (e.g., chromium) contained in the water quality standard. The TMDL expresses the relationship between any necessary reduction of the pollutant of concern and the attainment of the numeric water quality target. Occasionally, the pollutant of concern is different from the pollutant that is the subject of the numeric water quality target (e.g., when the pollutant of concern is phosphorus and the numeric water quality target is expressed as Dissolved Oxygen (DO) criteria). In such cases, the TMDL submittal should explain the linkage between the pollutant of concern and the chosen numeric water quality target.

Comment:

Section 4 of the final TMDL document explains that water bodies in the GSRW are not meeting their General Use designation. The Illinois Pollution Control Board (IPCB) defines General Use standards as those that:

"will protect the state's water for aquatic life, wildlife, agricultural use, secondary contact use and most industrial uses, and ensure the aesthetic quality of the state's aquatic environment."

Under the General Use classification, waters are further designated as impaired for aquatic life use, aesthetic quality use and primary contact recreational use. Table 1 of this Decision Document shows the various water body segments and their associated impaired uses.

Primary contact uses, defined as

"any recreational or other water use in which there is prolonged and intimate contact with the water (where the physical configuration of the water body permits it) involving considerable risk of ingesting water in quantities sufficient to pose a significant health hazard, such as swimming and water skiing" (35 Ill. Adm. Code 301.355)

are protected for all General Use waters.

The applicable General Use water quality standards (WQS) for the GSRW TMDL water bodies are established in Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards, Subpart B. Table 3 of this Decision Document lists applicable water quality standards of the GSRW TMDLs.

Table 3: Water Quality Standards Applicable in the Galena-Sinsinawa Rivers Watershed TMDL

Parameter	Units	Water Quality Standard	Illinois Code - Regulatory Reference
Total Fecal Coliform ¹	# / 100 mL	400 in < 10% of samples ²	302.209
		Geometric Mean ³ < 200	
Zinc	µg/L	Acute = $e^{A+B \ln(H)} \times 0.978^*$ (Where A = 0.9035 & B = 0.8473) Chronic = $e^{A+B \ln(H)} \times 0.986^*$ (Where A = - 0.4456 & B = 0.8473)	302.208(e)
Total Phosphorus ⁴	mg/L	0.05	302.205

¹ = Fecal Coliform standards apply only between May 1 and October 31

² = Standard shall not be exceeded by more than 10% of the samples collected during any 30-day period

³ = Geometric mean based on minimum of 5 samples taken over not more than a 30-day period

⁴ = Standard applies to inland lakes and reservoirs (greater than 20 acres) and in any stream at the point where it enters any such lake or reservoir.

Bacteria TMDL target: The bacteria TMDL target employed for the GSRW bacteria TMDL is the 200 colony forming units (cfu) per 100 mL (200 cfu/100 mL) portion of the standard. IEPA believes that using the 200 cfu/100 mL portion of the standard for TMDL calculations will result in the greatest bacteria reductions within the GSRW and will result in the attainment of the 400 cfu/100 mL portion of

the standard. While the bacteria TMDLs will focus on the geometric mean portion of the water quality standard, attainment of both parts of the water quality standard is required.

Zinc TMDL target: IEPA estimated the lowest calculated zinc concentration (58.37 µg/L) which would meet the Zinc TMDL. This calculation was based on available water quality data and the chronic portion of the zinc WQS.

Phosphorus TMDL target: The phosphorus TMDL target for the GSRW phosphorus TMDL is 0.05 mg/L.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of the second criterion.

3. Loading Capacity - Linking Water Quality and Pollutant Sources

A TMDL must identify the loading capacity of a water body for the applicable pollutant. EPA regulations define loading capacity as the greatest amount of a pollutant that a water can receive without violating water quality standards (40 C.F.R. §130.2(f)).

The pollutant loadings may be expressed as either mass-per-time, toxicity or other appropriate measure (40 C.F.R. §130.2(i)). If the TMDL is expressed in terms other than a daily load, e.g., an annual load, the submittal should explain why it is appropriate to express the TMDL in the unit of measurement chosen. The TMDL submittal should describe the method used to establish the cause-and-effect relationship between the numeric target and the identified pollutant sources. In many instances, this method will be a water quality model.

The TMDL submittal should contain documentation supporting the TMDL analysis, including the basis for any assumptions; a discussion of strengths and weaknesses in the analytical process; and results from any water quality modeling. EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

TMDLs must take into account *critical conditions* for stream flow, loading, and water quality parameters as part of the analysis of loading capacity (40 C.F.R. §130.7(c)(1)). TMDLs should define applicable *critical conditions* and describe their approach to estimating both point and nonpoint source loadings under such *critical conditions*. In particular, the TMDL should discuss the approach used to compute and allocate nonpoint source loadings, e.g., meteorological conditions and land use distribution.

Comment:

GSRW bacteria TMDL: IEPA used the geometric mean (200 cfu/100 mL) of the bacteria (fecal coliform) WQS to calculate loading capacity values for the bacteria TMDLs. IEPA believes the geometric mean of the bacteria WQS provides the best overall characterization of the status of the watershed. EPA agrees with this assertion, as stated in the preamble of, “*The Water Quality Standards for Coastal and Great Lakes Recreation Waters Final Rule*” (69 FR 67218-67243, November 16, 2004) on page 67224, “...the geometric mean is the more relevant value for ensuring that appropriate actions are taken to protect and improve water quality because it is a more reliable measure, being less subject to random variation, and more directly linked to the underlying studies on which the 1986 bacteria

criteria were based.” IEPA stated that the bacteria TMDLs will focus on the geometric mean portion of the water quality standard (200 cfu/100 mL) and that it expects that by attaining the 200 cfu/100 mL portion of the bacteria (fecal coliform) WQS the 400 cfu /100 mL portion of the bacteria (fecal coliform) WQS will also be attained. EPA finds these assumptions to be reasonable.

Typically loading capacities are expressed as a mass per time (e.g. pounds per day). However, for fecal coliform loading capacity calculations, mass is not always an appropriate measure because fecal coliform is expressed in terms of colony forming units. This approach is consistent with the EPA’s regulations which define “load” as “an amount of matter that is introduced into a receiving water” (40 CFR §130.2). To establish the loading capacities for the GSRW bacteria TMDLs, IEPA used Illinois’s WQS for fecal coliform (200 cfu/100 mL). A loading capacity is, “the greatest amount of loading that a water can receive without violating water quality standards.” (40 CFR §130.2). Therefore, a loading capacity set at the WQS will assure that the water does not violate WQS. IEPA’s bacteria (fecal coliform) TMDL approach is based upon the premise that all discharges (point and nonpoint) must meet the WQS when entering the water body. If all sources meet the WQS at discharge, then the water body should meet the WQS and the designated use.

A flow duration curve (FDC) was created for the Galena River (IL_MQ-01) bacteria TMDL. The FDC was developed using flow data collected at a USGS gage (#5414820) on the Sinsinawa River near Menominee, IL (Section 7.2.1.1 of the final TMDL document). This gage is an active gage and has a flow record dating to 1967. Flow values from this gage were used to estimate flows at ungaged locations in the GSRW, such as the Galena River segment (IL_MQ-01) using a drainage area ratio method equation

$$Q_{\text{ungaged}} = (A_{\text{ungaged}} / A_{\text{gaged}}) * Q_{\text{gaged}}$$

where,

Q_{ungaged}	= Flow at the ungaged location
Q_{gaged}	= Flow at USGS gage station (#5414820)
A_{ungaged}	= Drainage area of the ungaged location
A_{gaged}	= Drainage area of the USGS gage location (#5414820)

Flow data focused on dates within the recreation season (May 1 to October 31). Daily stream flows were necessary to implement the load duration curve approach.

FDCs graphs have flow duration interval (percentage of time flow exceeded) on the X-axis and discharge (flow per unit time) on the Y-axis. The FDC were transformed into a load duration curve (LDC) by multiplying individual flow values by the bacteria WQS (200 cfu/100 mL) and then multiplying that value by a conversion factor. The resulting points are plotted onto a load duration curve graph. The LDC graph for the Galena River (IL_MQ-01) segment has flow duration interval (percentage of time flow exceeded) on the X-axis and bacteria (fecal coliform) concentrations (number of bacteria per unit time) on the Y-axis. The Galena River (IL_MQ-01) LDC used fecal coliform measurements in millions of bacteria per day. The curved line on a LDC graph represents the TMDL of the respective flow conditions observed at that location.

Water quality monitoring was completed in the Galena River (IL_MQ-01) segment and measured fecal coliform concentrations were converted to individual sampling loads by multiplying the sample concentration by the instantaneous flow measurement observed/estimated at the time of sample collection. The individual sampling loads were plotted on the same figure with the created LDC. The Galena River (IL_MQ-01) LDC is Figure 7-3 of the final TMDL document.

LDC plots were subdivided into five flow regimes; high flow conditions (exceeded 0–10% of the time), moist flow conditions (exceeded 10–40% of the time), mid-range flow conditions (exceeded 40–50% of the time), dry flow conditions (exceeded 50–90% of the time), and low flow conditions (exceeded 90–100% of the time). LDC plots can be organized to display individual sampling loads with the calculated LDC. Watershed managers can interpret LDC graphs with individual sampling points plotted alongside the LDC to understand the relationship between flow conditions and water quality exceedances within the watershed. Individual sampling loads which plot above the LDC represent violations of the WQS and the allowable load under those flow conditions at those locations. The difference between individual sampling loads plotting above the LDC and the LDC, measured at the same flow, is the amount of reduction necessary to meet WQS.

The strengths of using the LDC method are that critical conditions and seasonal variation are considered in the creation of the FDC by plotting hydrologic conditions over the flows measured during the recreation season. Additionally, the LDC methodology is relatively easy to use and cost-effective. The weaknesses of the LDC method are that nonpoint source allocations cannot be assigned to specific sources, and specific source reductions are not quantified. Overall, IEPA believes and EPA concurs that the strengths outweigh the weaknesses for the LDC method.

Implementing the results shown by the LDC requires watershed managers to understand the sources contributing to the water quality impairment and which Best Management Practices (BMPs) may be the most effective for reducing bacteria loads based on flow magnitudes. Different sources will contribute bacteria loads under varying flow conditions. For example, if exceedances are significant during high flow events this would suggest storm events are the cause and implementation efforts can target BMPs that will reduce stormwater runoff and consequently bacteria loading into surface waters. This allows for a more efficient implementation effort.

The calculated Galena River (IL_MQ-01) bacteria TMDL is presented in Table 4 of this Decision Document. The load allocations were calculated after the determination of the WLA, and the Margin of Safety (MOS) (10% of the loading capacity). Load allocations (e.g., stormwater runoff from agricultural land use practices and feedlots, septic systems, wildlife inputs etc.) were not split among individual nonpoint contributors. Instead, load allocations were combined together into a categorical LA to cover all nonpoint source contributions.

Table 4: Bacteria (fecal coliform) TMDL for the Galena River (IL_MQ-01) is attached

Table 4 of this Decision Document reports multiple points on the loading capacity curve. However, it should be understood that the components of the TMDL equation could be illustrated for any point on the entire loading capacity curve. The LDC method can be used to display collected bacteria monitoring data and allows for the estimation of load reductions necessary for attainment of the bacteria WQS. Using this method, daily loads were developed based upon the flow in the water body. Loading

capacities were determined for the segment for multiple flow regimes. This allows the TMDL to be represented by an allowable daily load across all flow conditions. Table 4 of this Decision Document identifies the loading capacity for the water body at each flow regime. Although there are numeric loads for each flow regime, the actual LDC is what is being approved for this TMDL.

Table 4 of the Decision Document presents IEPA's loading reduction estimates for the bacteria TMDL. These loading reductions (i.e., the percent reduction row at the bottom of each TMDL table) were calculated from field sampling data collected on the Galena River (IL_MQ-01) segment. IEPA explained that its load reduction estimates are likely more conservative since they are based on a limited water quality data set.

EPA concurs with the data analysis and LDC approach utilized by IEPA in its calculation of loading capacities, wasteload allocations, load allocations and the margin of safety for the Galena River (IL_MQ-01) bacteria TMDL. The methods used for determining the TMDL are consistent with U.S. EPA technical memos.¹

GSRW zinc TMDL: The zinc TMDL for the Galena River (IL_MQ-01) segment was developed in a similar fashion to the bacteria TMDL. IEPA calculated a FDC based on surrogate flows from USGS gage (#5414820) and then translated the FDC into a LDC. The FDC were transformed into LDC by multiplying individual flow values by the zinc water quality target (58.37 µg/L) and then multiplying that value by a conversion factor. The resulting points are plotted onto a LDC graph. The Galena River zinc LDC used zinc measurements in lbs of zinc per day. The curved line on a LDC graph represents the TMDL of the respective flow conditions observed at that location.

Water quality monitoring was completed in the GSRW and measured zinc concentrations were converted to individual sampling loads by multiplying the sample concentration by the instantaneous flow measurement observed/estimated at the time of sample collection. The individual sampling loads were plotted on the same figure with the created LDC. Individual LDCs are found in Section 7 (e.g., Figure 7-2) of the final TMDL document.

The LDC plots were subdivided into five flow regimes; high flow conditions, moist flow conditions, mid-range flow conditions, dry flow conditions, and low flow conditions. LDC plots can be organized to display individual sampling loads and the calculated LDC. Watershed managers can interpret these plots (individual sampling points plotted with the LDC) to understand the relationship between flow conditions and water quality exceedances within the watershed. Individual sampling loads which plot above the LDC represent violations of the WQT and the allowable load under those flow conditions at those locations. The difference between individual sampling loads plotting above the LDC and the LDC, measured at the same flow is the amount of reduction necessary to meet zinc water quality target.

The calculated Galena River (IL_MQ-01) zinc TMDL is presented in Table 5 of this Decision Document.

Table 5: Zinc TMDL for the Galena River (IL_MQ-01) is attached

¹ U.S. Environmental Protection Agency. August 2007. *An Approach for Using Load Duration Curves in the Development of TMDLs*. Office of Water. EPA-841-B-07-006. Washington, D.C.

Table 5 of the Decision Document presents IEPA’s loading reduction estimates for the Galena River (IL_MQ-01) zinc TMDL. These loading reductions (i.e., the percent reduction row at the bottom of each TMDL table) were calculated from field sampling data collected in the GSRW. IEPA explained that its load reduction estimates are likely more conservative since they are based on a limited water quality data set.

EPA concurs with the data analysis and LDC approach utilized by IEPA in its calculation of loading capacities, wasteload allocations, load allocations and the margin of safety for the Galena River (IL_MQ-01) zinc TMDL. The methods used for determining the TMDL are consistent with U.S. EPA technical memos.

GSRW phosphorus TMDL: IEPA constructed a Vollenweider model to estimate the phosphorus TMDL for Frentress Lake. IEPA explained that typically they would have used the BATHTUB model for a lake nutrient TMDL but the unique flow and loading influences impacting Frentress Lake encouraged IEPA to consider a different modeling platform. Frentress Lake’s hydrology and nutrient load is significantly impacted by water from the mainstem of the Mississippi River. The Vollenweider model is adept at linking in-lake annual phosphorous loads to lake hydraulics (i.e., depth, residence time, flushing of lake waters dependent on flow condition in the Mississippi River). IEPA stated that the Vollenweider model accurately captures shallower (in depth), low flushing lakes, which can be more sensitive to phosphorus loading.

$$P = L_p / q_s * (1 / (1 + \sqrt{(z / q_s)}))$$

- P = in-lake total phosphorus concentration (lbs/yr)
- L_p = annual total phosphorus rate / lake surface area (lbs/yr/acres)
- Q_s = surface overflow rate (z/T) (ft. /days)
- z = mean lake depth (ft.)
- T = hydraulic residence time (days)

The calculated Frentress Lake (IL_RMA) phosphorus TMDL is presented in Table 6 of this Decision Document. IEPA subdivided the loading capacity among the LA, and MOS (10%) components of the TMDL. These calculations were based on the critical condition, the summer growing season, which is typically when the water quality in Frentress Lake is typically degraded and phosphorus loading inputs are the greatest. TMDL allocations assigned during the summer growing season will protect Frentress Lake during the worst water quality conditions of the year. IEPA assumed that the loading capacities established by the TMDL will be protective of water quality.

Table 6: Total Phosphorus TMDL for Frentress Lake (RMA)

Allocation	Total Phosphorus
	(lbs / day)
<i>Wasteload Allocation</i>	0
<i>Load Allocation</i>	13,500
<i>Margin of Safety (10%)</i>	1,500
Loading Capacity	15,000
Actual Load	54,000
Estimated Load Reduction (%)	72%

Table 6 of this Decision Document communicates IEPA's estimate that 72% of the current load to Frentress Lake must be reduced for Frentress Lake to meet its water quality target. These loading reductions (i.e., the percentage column) were estimated from existing and TMDL load calculations. IEPA expects that these reductions will result in the attainment of the water quality targets and the lake water quality will return to a level where the designated uses are no longer considered impaired.

EPA supports the data analysis and modeling approach utilized by IEPA in its calculation of load allocations and the margin of safety for the Frentress Lake phosphorus TMDL. EPA finds IEPA's approach for calculating the loading capacity to be reasonable and consistent with EPA guidance.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of the third criterion.

4. Load Allocations (LA)

EPA regulations require that a TMDL include LAs, which identify the portion of the loading capacity attributed to existing and future nonpoint sources and to natural background. Load allocations may range from reasonably accurate estimates to gross allotments (40 C.F.R. §130.2(g)). Where possible, load allocations should be described separately for natural background and nonpoint sources.

Comment:

IEPA determined the LA calculations for each of the TMDLs based on the applicable WQS. IEPA recognized that LAs for each of the individual TMDLs addressed by the GSRW TMDLs can be attributed to different nonpoint sources.

GSRW bacteria and zinc TMDLs: The calculated LA values for the bacteria and zinc TMDLs are applicable across all flow conditions in the Galena River (IL_MQ-01) segment (Tables 4 and 5 of this Decision Document). IEPA identified several nonpoint sources which contribute bacteria loads to the surface waters of the GSRW, including; non-regulated urban stormwater runoff, stormwater from agricultural and feedlot areas, failing septic systems, wildlife (deer, geese, ducks, raccoons, turkeys and other animals) and bacteria contributions from upstream subwatersheds. IEPA identified abandoned mining areas, contaminated sediment in riparian and floodplain areas and naturally occurring zinc within soils as potential nonpoint sources which may contribute to the LA of the Galena River (IL_MQ-01) zinc TMDL.

GSRW phosphorus TMDL: IEPA identified several nonpoint sources which contribute nutrient loading to Frentress Lake (Table 6 of this Decision Document). These nonpoint sources included: internal loading, stormwater runoff from agricultural land use practices, discharges from septic systems, and wetland, forest and wild life inputs.

IEPA did not determine individual load allocation values for each of these potential nonpoint source considerations, but aggregated the nonpoint sources into a categorical LA value.

EPA finds IEPA's approach for calculating the LA to be reasonable and consistent with EPA guidance.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of the fourth criterion.

5. Wasteload Allocations (WLAs)

EPA regulations require that a TMDL include WLAs, which identify the portion of the loading capacity allocated to individual existing and future point source(s) (40 C.F.R. §130.2(h), 40 C.F.R. §130.2(i)). In some cases, WLAs may cover more than one discharger, e.g., if the source is contained within a general permit.

The individual WLAs may take the form of uniform percentage reductions or individual mass based limitations for dischargers where it can be shown that this solution meets WQSs and does not result in localized impairments. These individual WLAs may be adjusted during the NPDES permitting process. If the WLAs are adjusted, the individual effluent limits for each permit issued to a discharger on the impaired water must be consistent with the assumptions and requirements of the adjusted WLAs in the TMDL. If the WLAs are not adjusted, effluent limits contained in the permit must be consistent with the individual WLAs specified in the TMDL. If a draft permit provides for a higher load for a discharger than the corresponding individual WLA in the TMDL, the State/Tribe must demonstrate that the total WLA in the TMDL will be achieved through reductions in the remaining individual WLAs and that localized impairments will not result. All permittees should be notified of any deviations from the initial individual WLAs contained in the TMDL. EPA does not require the establishment of a new TMDL to reflect these revised allocations as long as the total WLA, as expressed in the TMDL, remains the same or decreases, and there is no reallocation between the total WLA and the total LA.

Comment:

GSRW bacteria TMDL: IEPA identified one NPDES permitted facility (Galena River South STP (IL0075191)) which contributes bacteria loads to the Galena River bacteria TMDL (Table 4 of this Decision Document). The WLA for this facility was calculated based on the facility's maximum wet weather design flow and the fecal coliform WQS (200 cfu/100 mL).

IEPA acknowledged the presence of one CAFO in the Galena River (IL_MQ-01) subwatershed, the Heller Brothers (ILG0100002), in Table 5-11 of the final TMDL document. CAFOs and other feedlots are generally not allowed to discharge to waters of the State. CAFOs were assigned a WLA of zero (WLA = 0) for the GSRW bacteria TMDL.

EPA finds IEPA's approach for calculating the WLA for the GSRW bacteria TMDLs to be reasonable and consistent with EPA guidance.

GSRW zinc TMDL: IEPA did not assign a WLA to any NPDES permitted facility in the Galena River (IL_MQ-01) subwatershed.

GSRW phosphorus TMDL: IEPA did not assign a WLA to the Frenress Lake phosphorus TMDL (Table 6 of this Decision Document).

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of the fifth criterion.

6. Margin of Safety (MOS)

The statute and regulations require that a TMDL include a margin of safety (MOS) to account for any lack of knowledge concerning the relationship between load and wasteload allocations and water quality (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)). EPA's 1991 TMDL Guidance explains that the MOS may be implicit, i.e., incorporated into the TMDL through conservative assumptions in the analysis, or explicit, i.e., expressed in the TMDL as loadings set aside for the MOS. If the MOS is implicit, the conservative assumptions in the analysis that account for the MOS must be described. If the MOS is explicit, the loading set aside for the MOS must be identified.

Comment:

The final TMDL submittal outlines the determination of the Margin of Safety for the bacteria, zinc and phosphorus TMDLs. The zinc and phosphorus TMDLs employed an explicit MOS set at 10% of the loading capacity while the bacteria TMDL used an implicit MOS in its TMDL calculation.

GSRW bacteria TMDL: The Galena River bacteria TMDL incorporated an implicit MOS in the TMDL calculations (Table 4 of this Decision Document). The WLA is based upon the 200 cfu/100 mL as a 30-day geometric mean portion of the WQS to determine the daily load. This essentially sets the monthly geometric mean portion of the WQS as a daily not-to-exceed value (i.e., no averaging), which significantly overestimates the bacteria reductions needed to attain WQS in the Galena River.

An additional conservative assumption which was applied to the bacteria TMDL development was that IEPA did not use a rate of decay, or die-off rate of pathogen species, in the TMDL calculations or in the creation of load duration curve for fecal coliform. Bacteria have a limited capability of surviving outside their hosts, and normally a rate of decay would be incorporated into the TMDL development process. IEPA determined that it was more conservative to use the WQS (200 cfu/100 mL) and not to apply a rate of decay, which could result in a discharge limit greater than the WQS.

As stated in *EPA's Protocol for Developing Pathogen TMDLs* (EPA 841-R-00-002), many different factors affect the survival of pathogens, including the physical condition of the water. These factors include, but are not limited to sunlight, temperature, salinity, and nutrient deficiencies. These factors vary depending on the environmental condition/circumstances of the water, and therefore it would be difficult to assert that the rate of decay caused by any given combination of these environmental variables was sufficient to meet the WQS of 200 cfu/100 mL. Thus, it is more conservative to apply the State's WQS as the water quality target for TMDL development, because this standard must be met at all times under all environmental conditions.

GSRW zinc and phosphorus TMDLs: The zinc and phosphorus TMDLs employed an explicit MOS set at 10% of the loading capacity. The explicit MOS was applied by reserving 10% of the total loading capacity, and then allocating the remaining loads to point and nonpoint sources (Tables 5 and 6 of this Decision Document). The use of the LDC approach minimized variability associated with the development of the zinc TMDL because the calculation of the loading capacity was a function of flow

multiplied by the target value. The MOS was set at 10% to account for uncertainty due to field sampling error and assumptions made during the TMDL development process.

The EPA finds that the TMDL document submitted by IEPA contains an appropriate MOS satisfying the requirements of the sixth criterion.

7. Seasonal Variation

The statute and regulations require that a TMDL be established with consideration of seasonal variations. The TMDL must describe the method chosen for including seasonal variations. (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)).

Comment:

The LDC process for bacteria and zinc TMDL efforts accounted for seasonal variation by utilizing streamflows over a wide range. For bacteria and zinc, runoff is the main transport mechanism which delivers pollutant loading into surface water environments. LDC graphs can provide insight toward understanding under which flow regimes/conditions exceedances of the WQS or water quality targets are occurring, and whether or not there is any seasonal flow component to those flow conditions (i.e., spring melt, summer precipitation events during lower flow periods, etc.)

GSRW bacteria TMDL: Bacterial loads vary by season, typically reaching higher numbers in the dry summer months when low flows and bacterial growth rates contribute to their abundance, and reaching relatively lower values in colder months when bacterial growth rates attenuate and loading events, driven by stormwater runoff events aren't as frequent. Bacterial WQS need to be met between May 1st to October 31st, regardless of the flow condition. The development of the LDCs utilized estimated flow data from the nearby USGS gage (#5414820) on the Sinsinawa River near Menominee, IL. Flow data from the USGS gage represents a variety of flow conditions occurring in the recreation season. LDCs incorporated this flow information which was deemed representative of differing flow conditions and seasonal variability observed during the recreation season.

GSRW zinc and phosphorus TMDLs: For the zinc TMDL the development of the LDC utilized surrogate flow measurements from a local USGS gage and flow measurements which were collected over a variety of flow conditions observed during the year. The LDC developed from these flow records represents a range of flow conditions within the Galena River subwatershed and thereby accounts for reasonable variability over the entire year.

IEPA explained that zinc exceedances occur across the full range of flow conditions (Section 8.3.2.2 of the final TMDL document) and that consideration of seasonality was part of the load duration analyses as part of the zinc TMDL development. The zinc water quality standard is not seasonally dependent and is dependent on hardness. IEPA believes the LDC process accounts for seasonal variation by using streamflows over the full range of flow conditions in the Galena River. Figure 7-2 of the final TMDL document shows that exceedance of the zinc chronic water quality target occurs across all flow conditions.

The Frentress Lake (IL_RMA) phosphorus TMDL accounts for seasonality by incorporating annual phosphorus loading data, compiled from varying flow conditions across multiple years of data, as part of the Vollenweider lake modeling efforts.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of the seventh criterion.

8. Reasonable Assurance

When a TMDL is developed for waters impaired by point sources only, the issuance of a NPDES permit(s) provides the reasonable assurance that the wasteload allocations contained in the TMDL will be achieved. This is because 40 C.F.R. 122.44(d)(1)(vii)(B) requires that effluent limits in permits be consistent with, “the assumptions and requirements of any available wasteload allocation” in an approved TMDL.

When a TMDL is developed for waters impaired by both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur, EPA’s 1991 TMDL Guidance states that the TMDL should provide reasonable assurances that nonpoint source control measures will achieve expected load reductions in order for the TMDL to be approvable. This information is necessary for EPA to determine that the TMDL, including the load and wasteload allocations, has been established at a level necessary to implement water quality standards.

EPA’s August 1997 TMDL Guidance also directs Regions to work with States to achieve TMDL load allocations in waters impaired only by nonpoint sources. However, EPA cannot disapprove a TMDL for nonpoint source-only impaired waters, which do not have a demonstration of reasonable assurance that LAs will be achieved, because such a showing is not required by current regulations.

Comment:

The GSRW bacteria, zinc and phosphorus TMDLs provide reasonable assurance that actions identified in the implementation section of the final TMDL (i.e., Sections 9 and 9.3 of the final TMDL document), will be applied to attain the loading capacities and allocations calculated for the impaired reaches within the GSRW. The recommendations made by IEPA will be successful at improving water quality if the appropriate local groups work to implement these recommendations. Those mitigation suggestions, which fall outside of regulatory authority, will require commitment from state agencies and local stakeholders to carry out the suggested actions.

IEPA has identified several local partners which have expressed interest in working to improve water quality within the GSRW. Implementation practices will be implemented over the next several years. The following groups are expected to work closely with one another to ensure that pollutant reduction efforts via BMPs are being implemented within the GSRW: the Jo Daviess Soil and Water Conservation District (SWCD), USDA-NRCS, Illinois Department of Agriculture (IDA), the Natural Land Institute, the Jo Daviess Conservation Foundation, the Prairie Enthusiast, the City of Galena, and the Illinois Department of Transportation (IDOT).

Reasonable assurance that the WLA set forth will be implemented is provided by regulatory actions. According to 40 CFR 122.44(d)(1)(vii)(B), NPDES permit effluent limits must be consistent with assumptions and requirements of all WLAs in an approved TMDL. IEPA's NPDES permit program is one of the implementing programs for ensuring WLA are consistent with the TMDL. Current NPDES permits will remain in effect until the permits are reissued, provided that IEPA receives the NPDES permit renewal application prior to the expiration date of the existing NPDES permit.

Section 9 of the TMDL discusses various BMPs that, when implemented, will significantly reduce bacteria, zinc and phosphorus inputs to surface waters of the GSRW. In Table 9-8 of Section 9.11 of the final TMDL document, IEPA lists site-specific BMP costs, the programming which typically provide financial assistance for these BMPs (e.g., USDA-NRCS - Conservation Reserve Program (CRP), USDA- NRCS-Environmental Quality Incentives Program (EQIP), IDA-Conservation Practices Program (CPP)) and potential sponsors. One of IEPA's main partners for implementation efforts in the GSRW is the Jo Daviess County SWCD (<http://www.jdswcd.com/>). The Jo Daviess County SWCD is the main point of contact in the GSRW for cost-share programming sponsored by IDA. Practices available include; abandoned well-sealing, contour buffer strips, contour farming, contour strip-cropping, cover crops, critical area planting, diversions, field border strips, filter strips, grade stabilization structures, grassed waterways, nutrient management, pasture and hayland planting, stream stabilization, strip-tillage, terraces, and water and sediment control basins.

Table 9-9 of the TMDL provides an estimated implementation schedule of actions and activities in the watershed that can reduce bacteria, zinc and phosphorus loads into waterbodies in the GSRW. These actions address immediate (1-2 years), mid-term (5-10 years) and long-term (continuous) timeframes.

IEPA has also developed Load Reduction Strategies (LRS) for various pollutants in the watershed. These LRSs address impairments where numeric criteria have not been developed (e.g., total suspended solids (TSS), sedimentation/siltation). Although these are not TMDLs, the LRSs discuss sources and reductions needed for the various pollutants which impact overall water quality in the GSRW. IEPA has concluded that reducing these pollutants will improve water quality in GSRW and assist in implementing BMPs in the watershed.

The EPA finds that this criterion has been adequately addressed.

9. Monitoring Plan to Track TMDL Effectiveness

EPA's 1991 document, *Guidance for Water Quality-Based Decisions: The TMDL Process* (EPA 440/4-91-001), recommends a monitoring plan to track the effectiveness of a TMDL, particularly when a TMDL involves both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur. Such a TMDL should provide assurances that nonpoint source controls will achieve expected load reductions and, such TMDL should include a monitoring plan that describes the additional data to be collected to determine if the load reductions provided for in the TMDL are occurring and leading to attainment of water quality standards.

Comment:

The final TMDL document contains discussion on future monitoring within the GSRW and milestones (Section 9.12 of the final TMDL document). Continued water quality monitoring within the basin is

supported by IEPA. Additional water quality monitoring results could provide insight into the success or failure of BMP systems designed to reduce bacteria, zinc and phosphorus loading into the surface waters of the watershed. Local watershed managers would be able to reflect on the progress of the various pollutant removal strategies and would have the opportunity to change course if observed progress is unsatisfactory.

Progress of TMDL implementation will be measured through monitoring efforts focused on:

- Tracking implementation of BMPs in the watershed;
- Estimating the effectiveness of BMPs;
- Additional monitoring of point source discharges in the watershed;
- Continued monitoring of impaired stream segments and tributaries;
- Monitoring storm-based high flow events; and
- Low flow monitoring in impaired stream segments.

IEPA anticipates to continue to gage water quality in the GSRW via its Intensive Basin Survey water quality monitoring which occurs every 5 years. Additionally, IEPA explained that select ambient water quality locations are sampled nine times a year. Continuation of these programs will enable IEPA to evaluate water quality improvements in the GSRW over time.

Water quality monitoring is a critical component of the adaptive management strategy employed as part of the implementation efforts utilized in the GSRW. Water quality information will aid watershed managers in understanding how BMP pollutant removal efforts are impacting water quality. Water quality monitoring combined with an annual review of BMP efficiency will provide information on the success or failure of BMP systems designed to reduce pollutant loading into water bodies of the GSRW. Watershed managers will have the opportunity to reflect on the progress or lack of progress, and will have the opportunity to change course if progress is unsatisfactory.

The EPA finds that this criterion has been adequately addressed.

10. Implementation

EPA policy encourages Regions to work in partnership with States/Tribes to achieve nonpoint source load allocations established for 303(d)-listed waters impaired by nonpoint sources. Regions may assist States/Tribes in developing implementation plans that include reasonable assurances that nonpoint source LAs established in TMDLs for waters impaired solely or primarily by nonpoint sources will in fact be achieved. In addition, EPA policy recognizes that other relevant watershed management processes may be used in the TMDL process. EPA is not required to and does not approve TMDL implementation plans.

Comment:

The findings from the GSRW TMDLs will be used to inform the selection of implementation activities in the watershed. The TMDL outlined some implementation strategies in Section 9 of the final TMDL document. IEPA outlined the importance of prioritizing areas within the GSRW, education and outreach efforts with local partners, and partnering with local stakeholders to improve water quality within the

watershed. The reduction goals for the bacteria, zinc and phosphorus TMDLs may be met via a combination of the following strategies:

GSRW bacteria TMDL: The potential BMPs which, if installed and maintained, would likely result in decreases in bacteria to surface waters of the GSRW are:

- ***Filter strips*** – Used to reduce pollutant loads from runoff in the watershed
- ***Private septic system inspection and maintenance program*** - Septic systems are believed to be a source of bacteria to waters in the GSRW. Failing systems are expected to be identified and addressed via upgrades to those septic systems not meeting local health ordinances. Septic system improvement priority should be given to those failing systems adjacent to surface waters (i.e., streams or lakes).
- ***Pasture management and fencing*** - Reducing livestock access to stream environments will lower the opportunity for direct transport of bacteria to surface waters. The installation of exclusion fencing near stream and river environments to prevent direct access for livestock, installing alternative water supplies, and installing stream crossings between pastures, would work to reduce the influxes of bacteria and improve water quality within the watershed. Additionally, introducing rotational grazing to increase grass coverage in pastures, and maintaining appropriate numbers of livestock per acre for grazing, can also aid in the reduction of bacteria inputs.

GSRW zinc TMDL: The potential BMPs which, if installed and maintained, would likely result in decreases in zinc to surface waters of the GSRW are:

- ***Aerobic wetland*** – A large surface area pond with surface flows designed to precipitate metals out of the water column through oxidation reactions.
- ***Compost or anaerobic wetland*** – A large pond with surface flows designed to filter water through organic substrates (e.g., mushroom compost, peat moss, wood chips, sawdust or hay). Dissolved metals would absorb to the surfaces of the compost materials.
- ***Open limestone channels*** – Increasing the alkalinity of the waters and encouraging the precipitation of the dissolved metals via limestone amendments. This can be accomplished via an open drainage ditch of limestone or the placement of crushed limestone directly into a contaminated stream.
- ***Diversion wells*** – Another method to encourage the precipitation of dissolved metals by increasing the alkalinity from limestone amendments. The wells encourage the mixing of crushed limestone substrate with the metals in solution.
- ***Anoxic limestone drains*** – This is typically a pre-treatment step prior to the use of a constructed aerobic wetland. This involves passing metals contaminated water through a buried bed of limestone in order to precipitate the dissolved metals from solution. The key component of this treatment system is to minimize the contact with atmospheric oxygen which may reduce the utility of the limestone substrate.
- ***Vertical flow reactors*** – Consists of a treatment cell with an under-drained limestone base, topped with organic materials. The contaminated water flows through the compost and limestone and increases alkalinity via limestone dissolution and bacterial sulfate reductions.
- ***Active chemical treatments*** – The addition of chemicals (e.g., calcium carbonate, sodium hydroxide, sodium bicarbonate and anhydrous ammonia) to create a reaction to decrease the solubility of metals in solution and precipitate the metals out of solution into metal salt species

which then settle out of solution. The main drawbacks of active chemical treatment systems are the costs, the operations and maintenance and the disposal of the precipitated metal sludge.

GSRW phosphorus TMDL: The potential BMPs which, if installed and maintained, would likely result in decreases in phosphorus to surface waters of the GSRW are:

- ***Filter strips, riparian buffers, bank stabilization and erosion control*** – Protection of streambanks within the watershed through planting of vegetated/buffer areas with grasses, legumes, shrubs or trees will mitigate phosphorus inputs into surface waters. These areas will filter stormwater runoff before the runoff enters the main stem or tributaries of the GSRW. An assessment of lakeshore erosional areas should be completed to evaluate areas where erosion control strategies (e.g., planting deep-rooted vegetation in areas thought to be eroding) could be implemented in the Frentress Lake watershed.
- ***Nutrient management*** – These strategies involve reducing nutrient transport from fields and minimizing soil loss. Specific practices would include; erosion control through conservation tillage, reduction of winter spreading of fertilizers, elimination of fertilizer spreading near open inlets and sensitive areas, installation of stream and lake shore buffer strips and nutrient management planning.
- ***Phosphorus-based lawn fertilizer restrictions*** – Runoff from urban and suburban areas may include phosphorus-based fertilizers. Reducing stormwater input from residential lawns, golf courses and other urban/suburban surfaces will reduce the phosphorus inputs to surface waters. Some of these practices could include; rain gardens, municipal street sweeping efforts, lake shore buffer strips, vegetation management and water quality educational programs which aim to inform the general public on nutrient reduction efforts and their impact on water quality.
- ***Private septic system inspection and maintenance program*** - Septic systems are believed to be a source of nutrients to waters in the GSRW. Failing systems are expected to be identified and addressed via upgrades to those septic systems not meeting local health ordinances. Septic system improvement priority should be given to those failing systems adjacent to surface waters (i.e., streams or lakes).
- ***In-lake phosphorus loading (internal loading)*** - Internal nutrient loads may be addressed to meet the TMDL allocations of the Frentress Lake phosphorus TMDL.
 - *Hypolimnetic aeration:* Increasing oxygen at selected depths in a lake may enhance oxygen transfer efficiencies and reduce internal loading from phosphorus laden lake bottom sediments.
 - *Phosphorus inactivation from aluminum addition (i.e., aluminum sulfate or alum):* The addition of chemical reactants (ex. aluminum sulfate) to Frentress Lake in order for those reactants to permanently bind phosphorus into the lake bottom sediments. This effort could decrease phosphorus releases from sediment into the lake water column during anoxic conditions.
 - *Dredging of lake bottom sediments:* IEPA explained that phosphorus release from lake bottom sediments is greatest from the recently deposited phosphorus rich layers of lake sediments. Removing this material, via dredging efforts, will contribute to reductions in internal loading.

Education and Outreach Efforts - Increased education and outreach efforts to the general public bring greater awareness to the issues surrounding bacteria, zinc and phosphorus contamination and strategies

for reducing loading and transport of these pollutants should be prioritized as part of the overall implementation strategy.

The EPA finds that this criterion has been adequately addressed. The EPA reviews but does not approve implementation plans.

11. Public Participation

EPA policy is that there should be full and meaningful public participation in the TMDL development process. The TMDL regulations require that each State/Tribe must subject calculations to establish TMDLs to public review consistent with its own continuing planning process (40 C.F.R. §130.7(c)(1)(ii)). In guidance, EPA has explained that final TMDLs submitted to EPA for review and approval should describe the State's/Tribe's public participation process, including a summary of significant comments and the State's/Tribe's responses to those comments. When EPA establishes a TMDL, EPA regulations require EPA to publish a notice seeking public comment (40 C.F.R. §130.7(d)(2)).

Provision of inadequate public participation may be a basis for disapproving a TMDL. If EPA determines that a State/Tribe has not provided adequate public participation, EPA may defer its approval action until adequate public participation has been provided for, either by the State/Tribe or by EPA.

Comment:

The public participation section of the TMDL submittal is found in Section 3 of the final TMDL document. Throughout the development of the GSRW TMDLs the public was given various opportunities to participate. An initial public meeting was held in Galena, Illinois in June of 2014, where IEPA described the watershed plan and TMDL process. The public comment period for the draft TMDL opened on September 28, 2017 and closed on October 28, 2017. IEPA posted the draft TMDL online at (<http://www.epa.illinois.gov/Assets/iepa/water-quality/watershed-management/tmdls/reports/galena-sinsinawa-rivers/stage3-combined-08172017.pdf>) for the public comment period.

IEPA received two public comments during the public comment period. One commenter requested clarification from IEPA regarding whether the Galena River South STP's NPDES permit is likely to change in response to the GSRW bacteria TMDL. IEPA responded that the Galena River South STP was included as a NPDES facility which is discharging bacteria to the Galena River (IL_MQ-01) segment and therefore would be receiving a bacteria WLA. EPA anticipates that discharge from this facility will meet bacteria water quality standards and be consistent with the WLA described in the Galena River (IL_MQ-01) TMDL (Table 4 of this Decision Document).

A WLA attributed to zinc discharges from the Galena River South STP was not included in the Galena River (IL_MQ-01) zinc TMDL. IEPA's permitting section found no reasonable potential for this facility to discharge zinc to the Galena River (IL_MQ-01) segment and recommended no additional requirements for this parameter.

One commenter submitted a grouping of comments related to various topics discussed in the public notice draft (see Appendix E of the final TMDL submittal) and requested that IEPA consider these

questions and additional information presented by the commenter as it finalized the GSRW TMDLs. Some of the suggestions related to the zinc TMDL and nonpoint sources potentially impacting the impaired segment (IL_MQ-01). IEPA considered all of the comments and information presented by the commenter and revised the final GSRW TMDL document accordingly.

EPA reviewed the comments and responses, and has determined that IEPA responded appropriately to the comments. IEPA submitted all comments received during the public notice period and its response summary with the final TMDL submittal packet received by the EPA on May 14, 2018.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this eleventh element.

12. Submittal Letter

A submittal letter should be included with the TMDL submittal, and should specify whether the TMDL is being submitted for a *technical review* or *final review and approval*. Each final TMDL submitted to EPA should be accompanied by a submittal letter that explicitly states that the submittal is a final TMDL submitted under Section 303(d) of the Clean Water Act for EPA review and approval. This clearly establishes the State's/Tribe's intent to submit, and EPA's duty to review, the TMDL under the statute. The submittal letter, whether for technical review or final review and approval, should contain such identifying information as the name and location of the water body, and the pollutant(s) of concern.

Comment:

The EPA received the final Galena/Sinsinawa Rivers watershed TMDL document, submittal letter and accompanying documentation from IEPA on May 14, 2018. The submittal letter explicitly stated that the final TMDLs referenced in Table 1 of this Decision Document were being submitted to EPA pursuant to Section 303(d) of the Clean Water Act for EPA review and approval. The submittal letter also included the name and location of the water bodies and the causes/pollutants of concern. This TMDL was submitted per the requirements under Section 303(d) of the Clean Water Act and 40 CFR 130.

The EPA finds that the TMDL transmittal letter submitted for the Galena/Sinsinawa Rivers watershed TMDLs by IEPA satisfies the requirements of this twelfth element.

13. Conclusion

After a full and complete review, the EPA finds that the 1 bacteria TMDL, the 1 zinc TMDL and the 1 phosphorus TMDL satisfy all elements for approvable TMDLs. This TMDL approval is for **three TMDLs**, addressing segments for primary contact recreation, aquatic life and aesthetic quality use impairments (Table 1 of this Decision Document).

The EPA's approval of these TMDLs extends to the water bodies which are identified above with the exception of any portions of the water bodies that are within Indian Country, as defined in 18 U.S.C. Section 1151. The EPA is taking no action to approve or disapprove TMDLs for those waters at this

time. The EPA, or eligible Indian Tribes, as appropriate, will retain responsibilities under the CWA Section 303(d) for those waters.

Section 1

Goals and Objectives for the Galena/Sinsinawa Rivers Watershed

1.1 Total Maximum Daily Load Overview

A total maximum daily load, or TMDL, is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA develops a list known as the "303(d) list" of water bodies not meeting water quality standards every 2 years, and it is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. The Illinois EPA's most recent Integrated Water Quality Report was submitted to the United States Environmental Protection Agency (USEPA) in July 2016. In accordance with USEPA's guidance, the report assigns all waters of the state to one of five categories. 303(d) listed water bodies make up category five in the integrated report (Appendix A of the Integrated Report).

In general, a TMDL is a quantitative assessment of water quality impairments, contributing potential sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a water body.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters; and
- Where attainable, to achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water.

Water quality standards consist of three elements:

- The designated beneficial use or uses of a water body or segment of a water body;
- The water quality criteria necessary to protect the use or uses of that particular water body; and
- An antidegradation policy.

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 TMDL Goals and Objectives for the Galena/Sinsinawa Rivers Watershed

The Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

This report addresses Stages 1 through 3 of TMDL development for the Galena/Sinsinawa Rivers watershed. Stage 2 data collection was performed by Illinois EPA in 2014. Additional data collected during Stage 2 has been incorporated into the analyses described in the remainder of this document.

Following are the impaired water body segments (as listed in the 2014 Integrated Report) in the Galena/Sinsinawa Rivers watershed:

- Sinsinawa River (MS)
- Frentress Lake (RMA)
- Galena River (MQ-01)

These impaired water body segments are shown on **Figure 1-1**. There are three impaired water body segments within the Galena/Sinsinawa Rivers watershed for which data have been collected and reviewed for TMDL and/or load reduction strategy (LRS) development. **Table 1-1** lists the water body segment, water body size, and potential causes and sources of impairment for the water body.

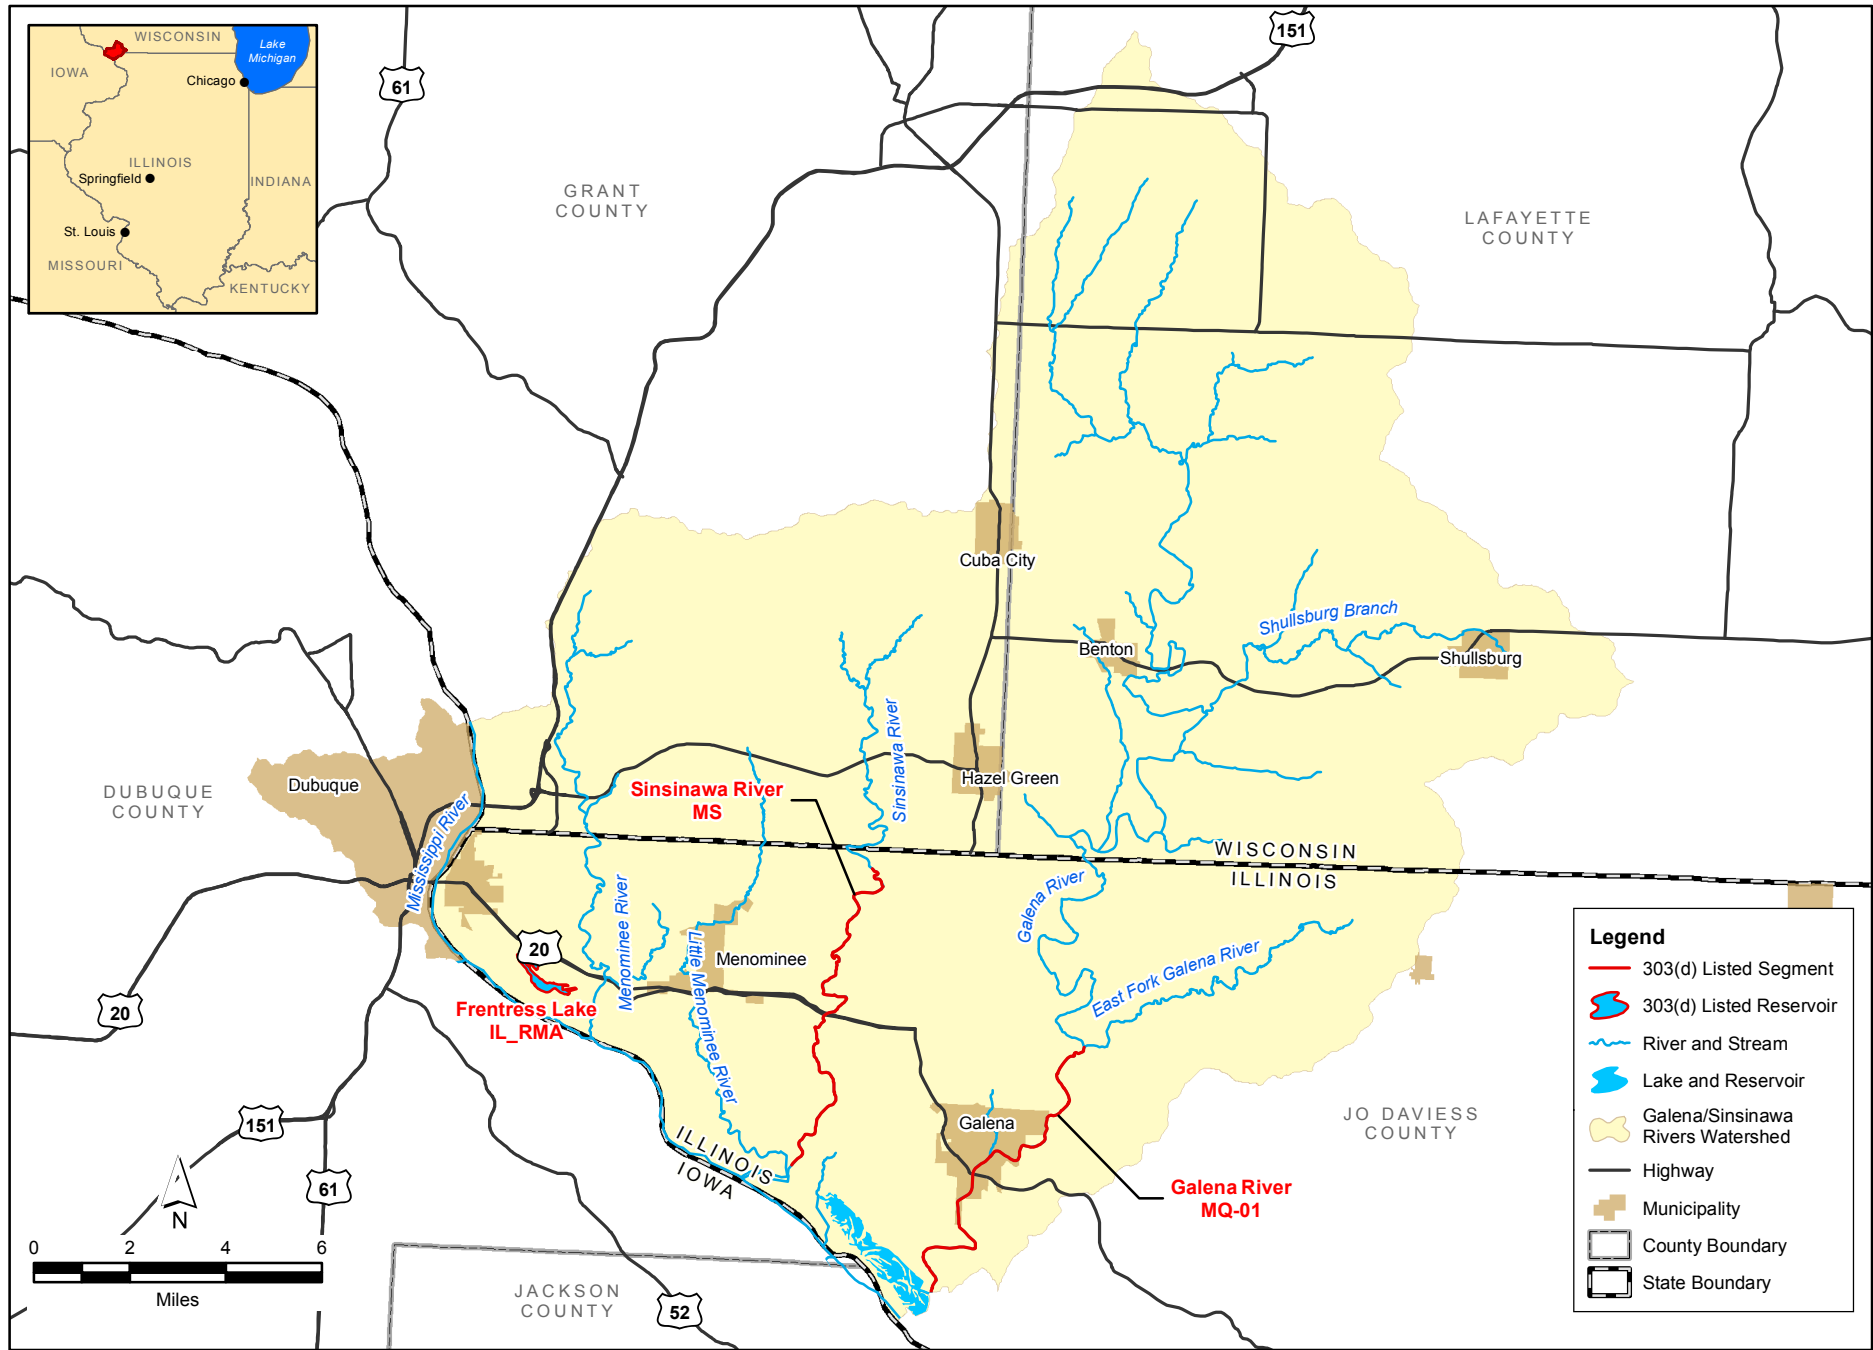

Sinsinawa River

Bold Causes of Impairment have numeric water quality standards. Italicized Causes of Impairment do not have numeric water quality standards and LRSs have been developed where appropriate. TMDLs for these parameters will be developed in the future when numeric standards are available. Section 9 includes implementation strategies for all the parameters listed in Table 1-1.

Illinois EPA is currently only developing TMDLs for parameters that have numeric water quality standards. For potential causes that do not have numeric water quality standards as noted in **Table 1-1**, TMDLs were not developed at this time. However, LRSs were developed where target values had been established by Illinois EPA to inform voluntary implementation activities within the watershed. In addition, some of these potential causes may be addressed by implementation of controls for the pollutants with numeric water quality standards.

The TMDLs for the segments listed above specify the following elements:

- Loading Capacity (LC), or the maximum amount of pollutant loading a water body can receive without violating water quality standards
- Waste Load Allocation (WLA), or the portion of the TMDL allocated to existing or future point sources
- Load Allocation (LA), or the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- Margin of Safety (MOS), or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- Reserve Capacity (RC), or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\text{TMDL} = \text{LC} = \Sigma \text{WLA} + \Sigma \text{LA} + \text{MOS} + \text{RC}$$

As part of the TMDL development process, Illinois EPA started to include LRSs in TMDL watershed projects in 2012 for those pollutants that do not currently have numeric water quality standards. Developing an LRS involves determining the LC and load reduction that is needed for the water body to meet “Full Use Support” for its designated uses. In an LRS, the LC is not divided into WLA, LA, or MOS. These TMDL components are represented by one number as a target concentration for load reduction within each unique watershed. The LRS provides guidance (with no regulatory requirements) for voluntary nonpoint source reduction efforts by implementing agricultural and urban stormwater best management practices (BMPs). TMDL and LRS development also considers the seasonal variability of pollutant loads so that water quality standards are met during all seasons of the year. Also, reasonable assurance that the TMDL and LRS targets will be achieved is described in the implementation plan. The implementation plan for the Galena/Sinsinawa Rivers watershed describes how water quality standards and targets will be met and attained. This implementation plan includes recommendations for implementing BMPs, cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completion of implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Galena/Sinsinawa Rivers Watershed Characteristics** provides a description of the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Public Participation and Involvement** discusses public participation activities that will occur throughout TMDL development.
- **Section 4 Galena/Sinsinawa Rivers Watershed Water Quality Standards** defines the water quality standards and water quality guidelines for the impaired water bodies.
- **Section 5 Galena/Sinsinawa Rivers Watershed Characteristics** presents the available water quality data needed to develop TMDLs and LRSs, discusses the characteristics of the impaired stream segments in the watershed, and describes the point and nonpoint sources with potential to contribute to the watershed load.
- **Section 6 Approach to Developing TMDL and Identification of Data Needs** makes recommendations for the models and analysis that are needed for TMDL and LRS development and suggests segments for Stage 2 data collection.
- **Section 7 Methodology Development for the Galena/Sinsinawa Rivers Watershed** details of the development of the TMDL analysis for each impaired stream segment and reservoir.
- **Section 8 Total Maximum Daily Load for the Galena/Sinsinawa Rivers Watershed** provides the results of the TMDL analysis for each impaired stream segment and reservoir.
- **Section 9 Implementation Plan for the Galena/Sinsinawa Rivers Watershed** makes recommendations for implementation actions, point source controls, management measures, and BMPs that can be used to address water quality issues in the watershed.

Section 2

Galena/Sinsinawa Rivers Watershed Description

2.1 Galena/Sinsinawa Rivers Watershed Location

The Galena/Sinsinawa Rivers watershed (refer to **Figure 1-1**) is located in northwestern Illinois and southwestern Wisconsin, flows in a southerly direction, and drains approximately 211,000 acres within the states of Illinois and Wisconsin. Approximately 77,000 acres (37 percent of the total watershed) lie in Jo Daviess County in Illinois, with the remaining 134,000 acres (63 percent of the total watershed) in Grant and Lafayette Counties in Wisconsin. It should be noted that the portions of the Galena and Sinsinawa Rivers within Wisconsin are not listed as impaired on the 2014 Wisconsin 303(d) list. An unnamed tributary to Schullsburg Branch (refer to **Figure 1-1**) is listed for impairment caused by TSS, zinc, and lead. Schullsburg Branch and its tributaries are a significant distance upstream of the impaired waters in the Illinois portion of the watershed.

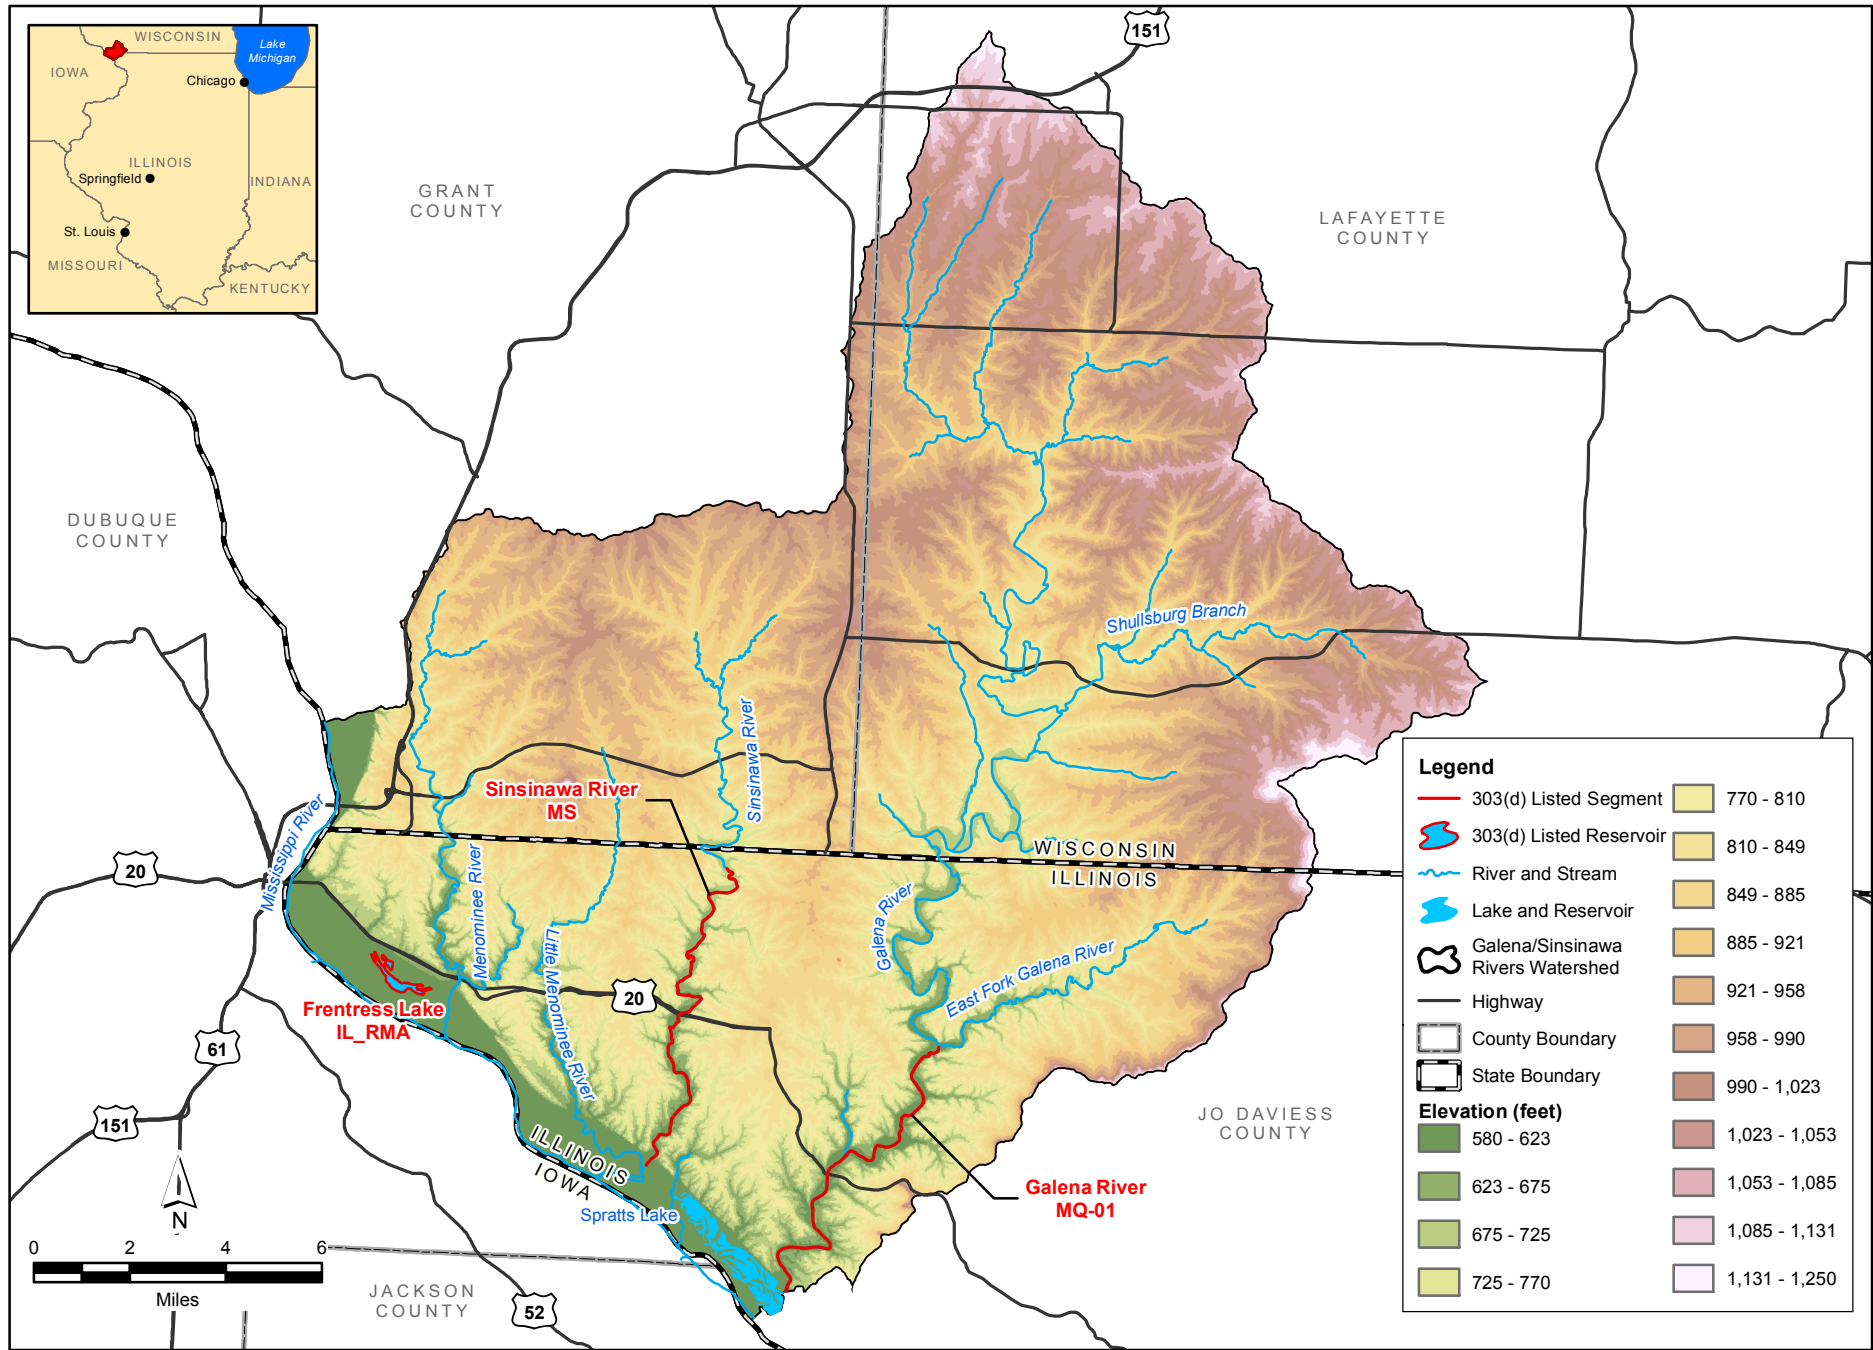

The watershed is located in an area of northwest Illinois and southwest Wisconsin that is unique to the states and the Midwest region. According to Jo Daviess County (www.jodaviess.org), "the county is part of the Wisconsin Driftless Region bypassed by continental glaciers of the Ice Age. This region covers parts of southern Minnesota and Wisconsin, Northwestern Illinois, and Northeastern Iowa. Glaciated areas were leveled, strewn with glacial debris or "drift," and dotted with lakes and ponds. The driftless areas, on the other hand, have bedrock close to the surface into which deep valleys have been carved by millions of years of weather and erosion. In Jo Daviess County, streams are numerous and the only two lakes are man-made. The relief from the higher ridges to the valley floors is typically 300 feet or more creating a rugged and scenic landscape (Jo Daviess County, Illinois, 2012)."

2.2 Topography

Topography is an important factor in watershed management because stream types, precipitation, and soil types can vary dramatically by elevation. As mentioned above, this region is considered the "driftless" area noted for its deeply carved river valleys. The terrain is a result of the area having escaped glaciation during the last glacial period. National Elevation Dataset (NED) coverages containing 30-meter grid resolution elevation data are available from the U.S. Geological Survey (USGS) for each 1:24,000-topographic quadrangle in the United States. Elevation data for the Galena/Sinsinawa Rivers watershed were obtained by overlaying the NED grid onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed. Elevation in the Galena/Sinsinawa Rivers watershed ranges from 1,250 feet above sea level in the northeastern portion of the watershed to 580 feet at the Mississippi River.

2.3 Land Use

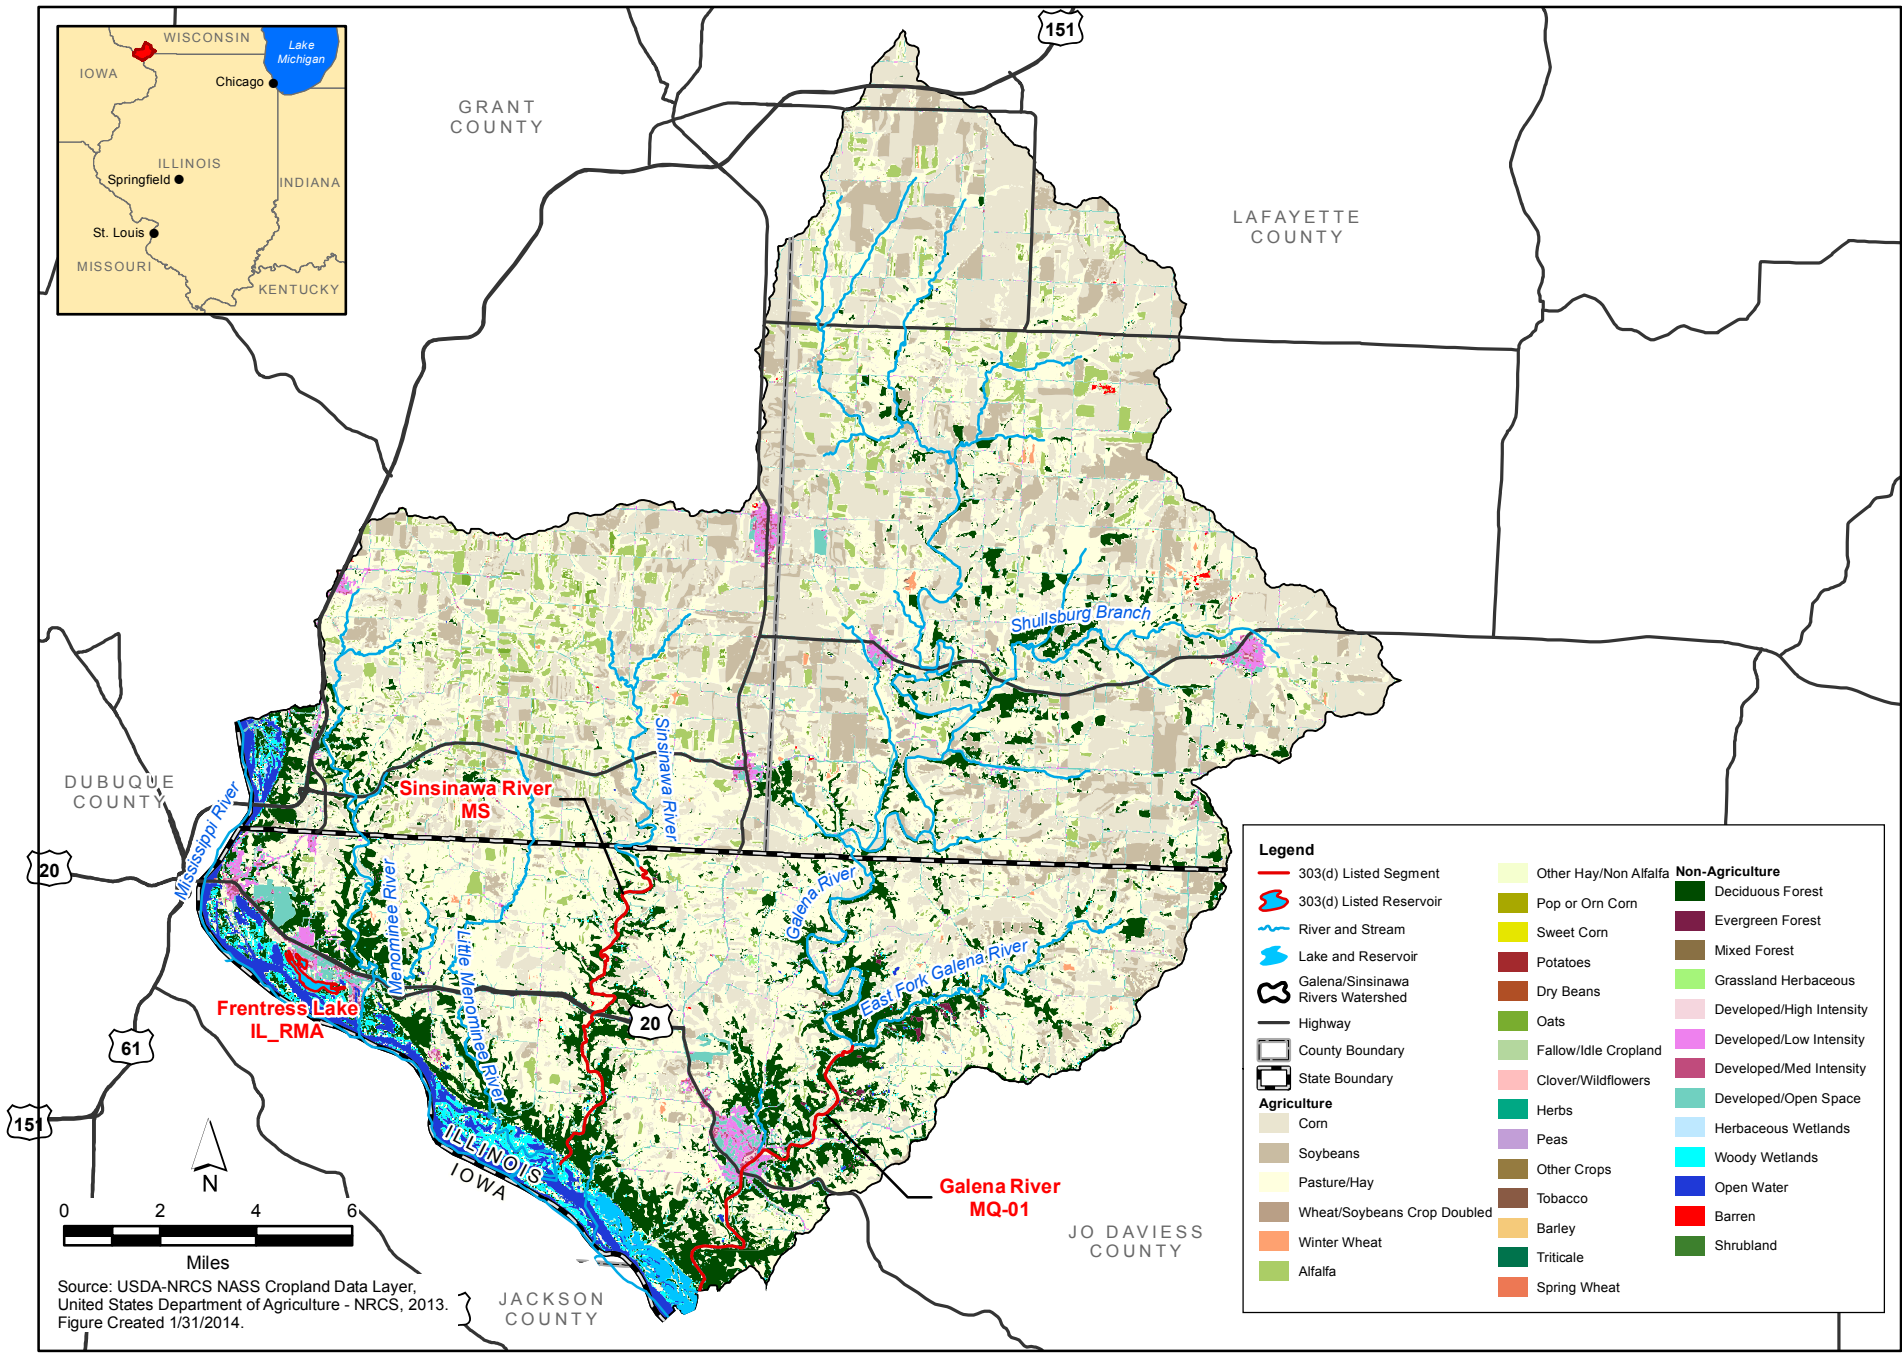

Land use data for the Galena/Sinsinawa Rivers watershed were extracted from the U.S. Department of Agriculture's (USDA) National Agriculture Statistics Service (NASS) 2013 Cropland Data Layer (CDL). The CDL is a raster based, geo-referenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities and to produce digital, crop-specific, categorized geo-referenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2013 and includes 34 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters. The 2013 CDL and extensive metadata are available at <http://www.nass.usda.gov/research/Cropland/SARS1a.htm>.

Land use characteristics of the watershed were determined by overlaying the Illinois and Wisconsin Statewide 2013 CDL data layers onto the GIS-delineated watershed. **Table 2-1** contains the land uses contributing to the Galena/Sinsinawa Rivers watershed, based on the 2013 CDL land cover categories and also includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed.

Table 2-1 Land Cover and Land Use in Galena/Sinsinawa Rivers Watershed

USDA/NASS Land Use Cropland Category	Acres	Percentage
Pasture/Hay	75,675	35.9%
Corn	61,302	29.1%
Deciduous Forest	23,785	11.3%
Soybeans	17,930	8.5%
Alfalfa	9,166	4.4%
Developed/Open Space	8,689	4.1%

Total	210,506	100%

This page intentionally left blank.

Galena/Sinsinawa Rivers Watershed Land Use

FIGURE 2-2

This page intentionally left blank.

The land cover data reveal that 165,111 acres, representing 78 percent of the total watershed area, are devoted to agricultural activities. Forests, woodland, grasslands, and shrubs cover 12 percent of the watershed (24,839 acres). Approximately 7 percent of the watershed area (13,991 acres) is developed, urbanized land. The remaining watershed (3 percent of land area) is wetland and open water.

Agricultural land use in the Sinsinawa River watershed

2.4 Soils

Soils data are available through the Soil Survey Geographic (SSURGO) database. For SSURGO data, field mapping methods using national standards are used to construct the soil maps. Mapping scales generally range from 1:12,000 to 1:63,360 making SSURGO the most detailed level of soil mapping done by the Natural Resources Conservation Service (NRCS).

Attributes of the spatial coverage can be linked to the SSURGO databases, which provide information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups as well as the K-factor, or soil erodibility factor. The following sections describe and summarize the specified soil characteristics for the Galena/Sinsinawa Rivers watershed.

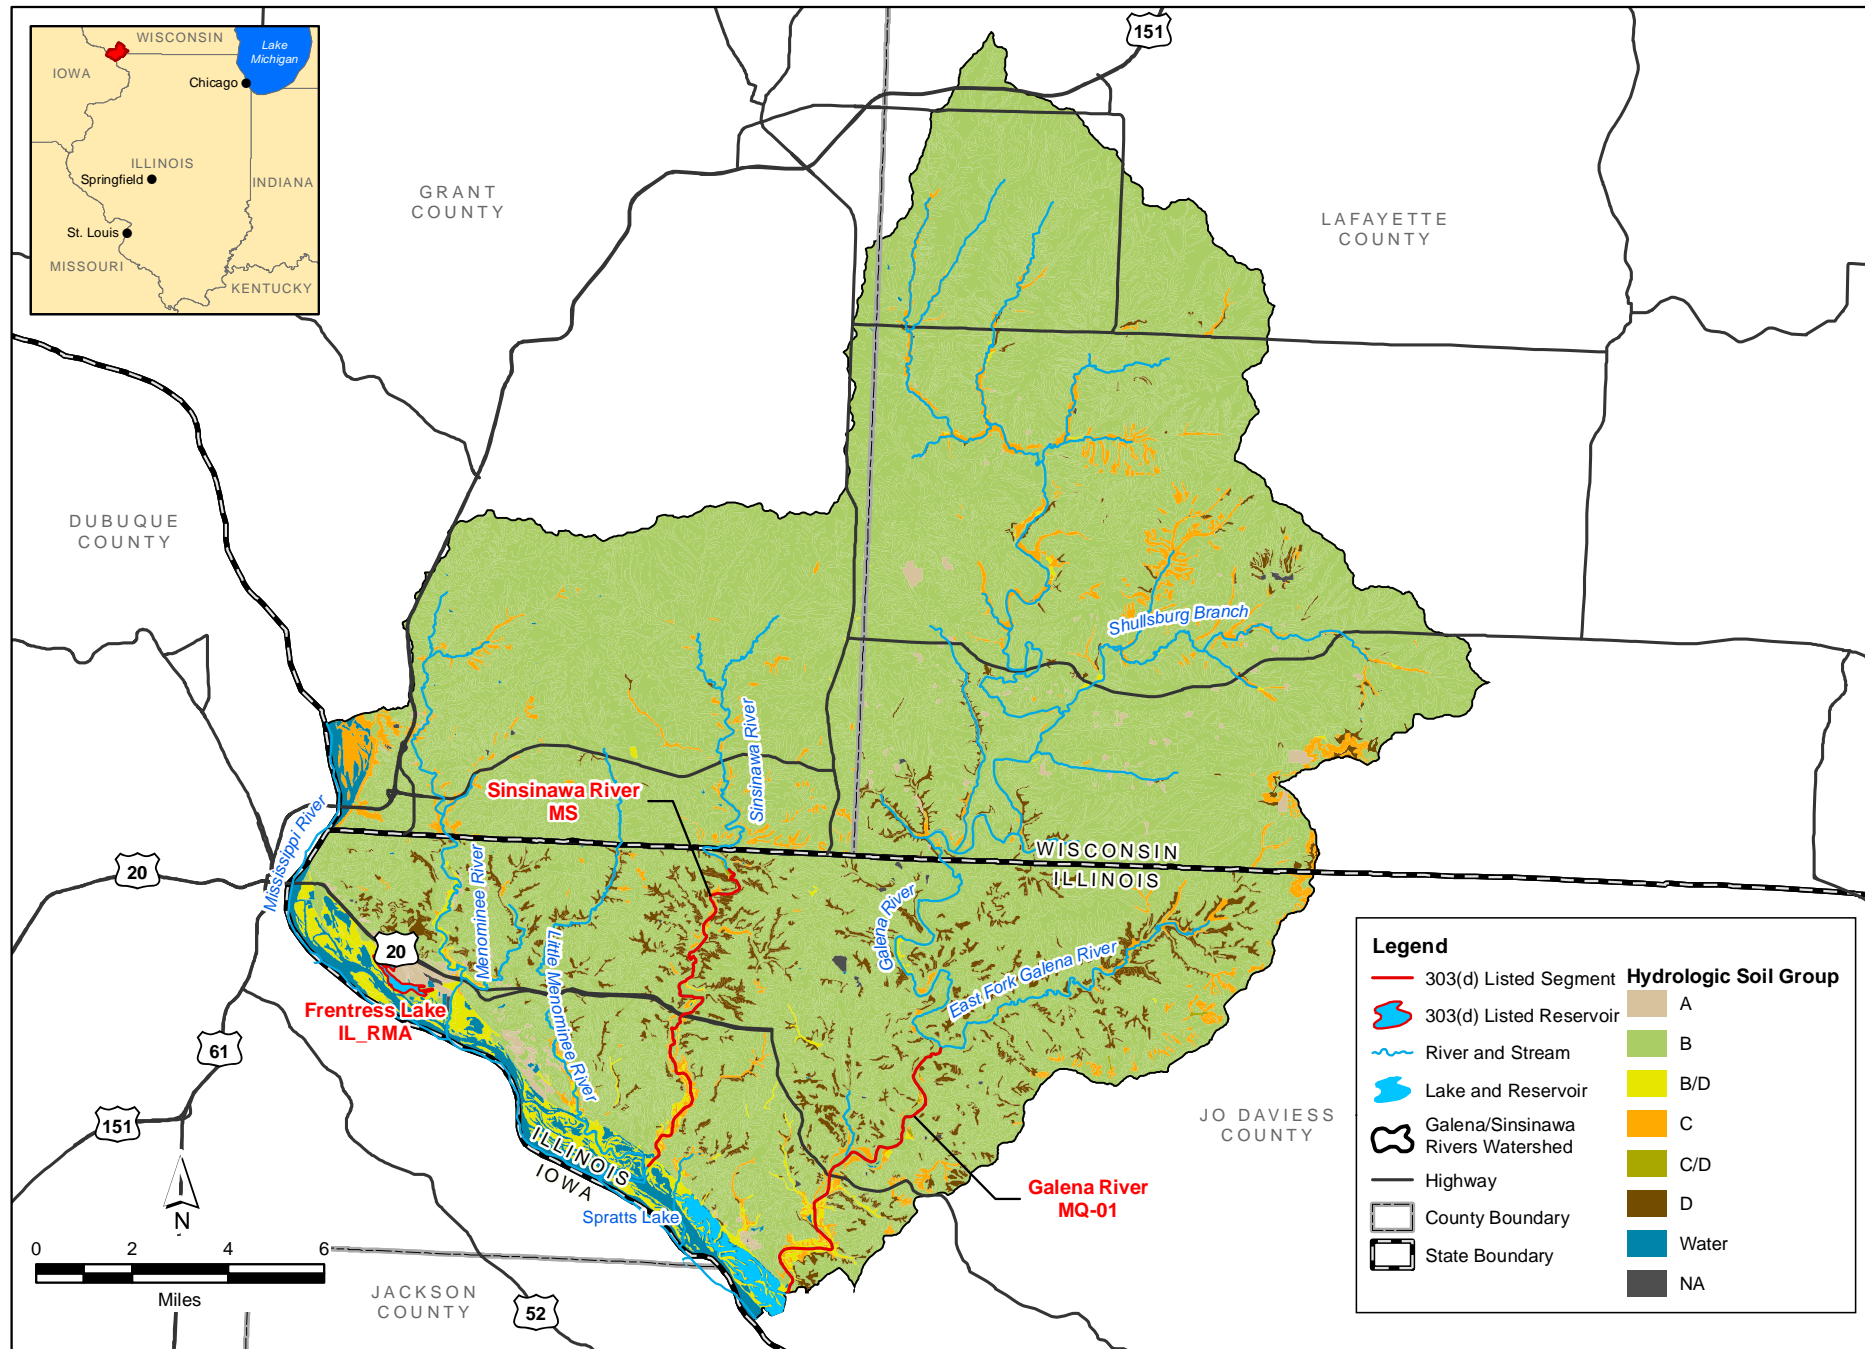

2.4.1 Galena/Sinsinawa Rivers Watershed Soil Characteristics

Appendix B contains a table of the SSURGO soil series for the Galena/Sinsinawa Rivers watershed. A total of 262 soil types exist in the watershed. The most common type—Tama silt loam (2 to 6 percent slopes, moderately eroded)—covers 10 percent of the watershed. All other soil types (covering the remaining 90% of the watershed) each represent less than 5 percent of the total watershed area. The table in Appendix B also contains the area, dominant hydrologic soil group, and k-factor range. Each of these characteristics is described in more detail in the following paragraphs.

Figure 2-3 shows the hydrologic soils groups found within the Galena/Sinsinawa Rivers watershed. Hydrologic soil groups are used to estimate runoff from precipitation. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

This page intentionally left blank.

Galena/Sinsinawa Rivers Watershed Soils

FIGURE 2-3

This page intentionally left blank.

While hydrologic soil groups A, B, C, D, B/D, and C/D are all found within the Galena/Sinsinawa Rivers watershed, group B soils are the most common type, representing 87 percent of the watershed. Group B is defined as having "moderately low runoff potential when thoroughly wet and water transmission through the soil that is unimpeded." **Figure 2-3** shows that Group D soils, which have high potential for runoff and the high potential for erosion, are located along tributaries and streams that drain to the impaired stream segments in Jo Daviess County.

A commonly used soil attribute is the K-factor. The K-factor:

Indicates the susceptibility of a soil to sheet and rill erosion by water. (The K-factor) is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. These estimates are based primarily on percentage of silt, sand, and organic matter (as much as 4 percent) and on soil structure and permeability. Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water (NRCS 2004).

The distribution of K-factor values in the Galena/Sinsinawa Rivers watershed range from 0.02 to 0.49 with an average K-factor of 0.36 (**Figure 2-4**). Stakeholders within the watershed have noted that the watershed slopes and soils make the land highly susceptible to sheet and rill erosion.

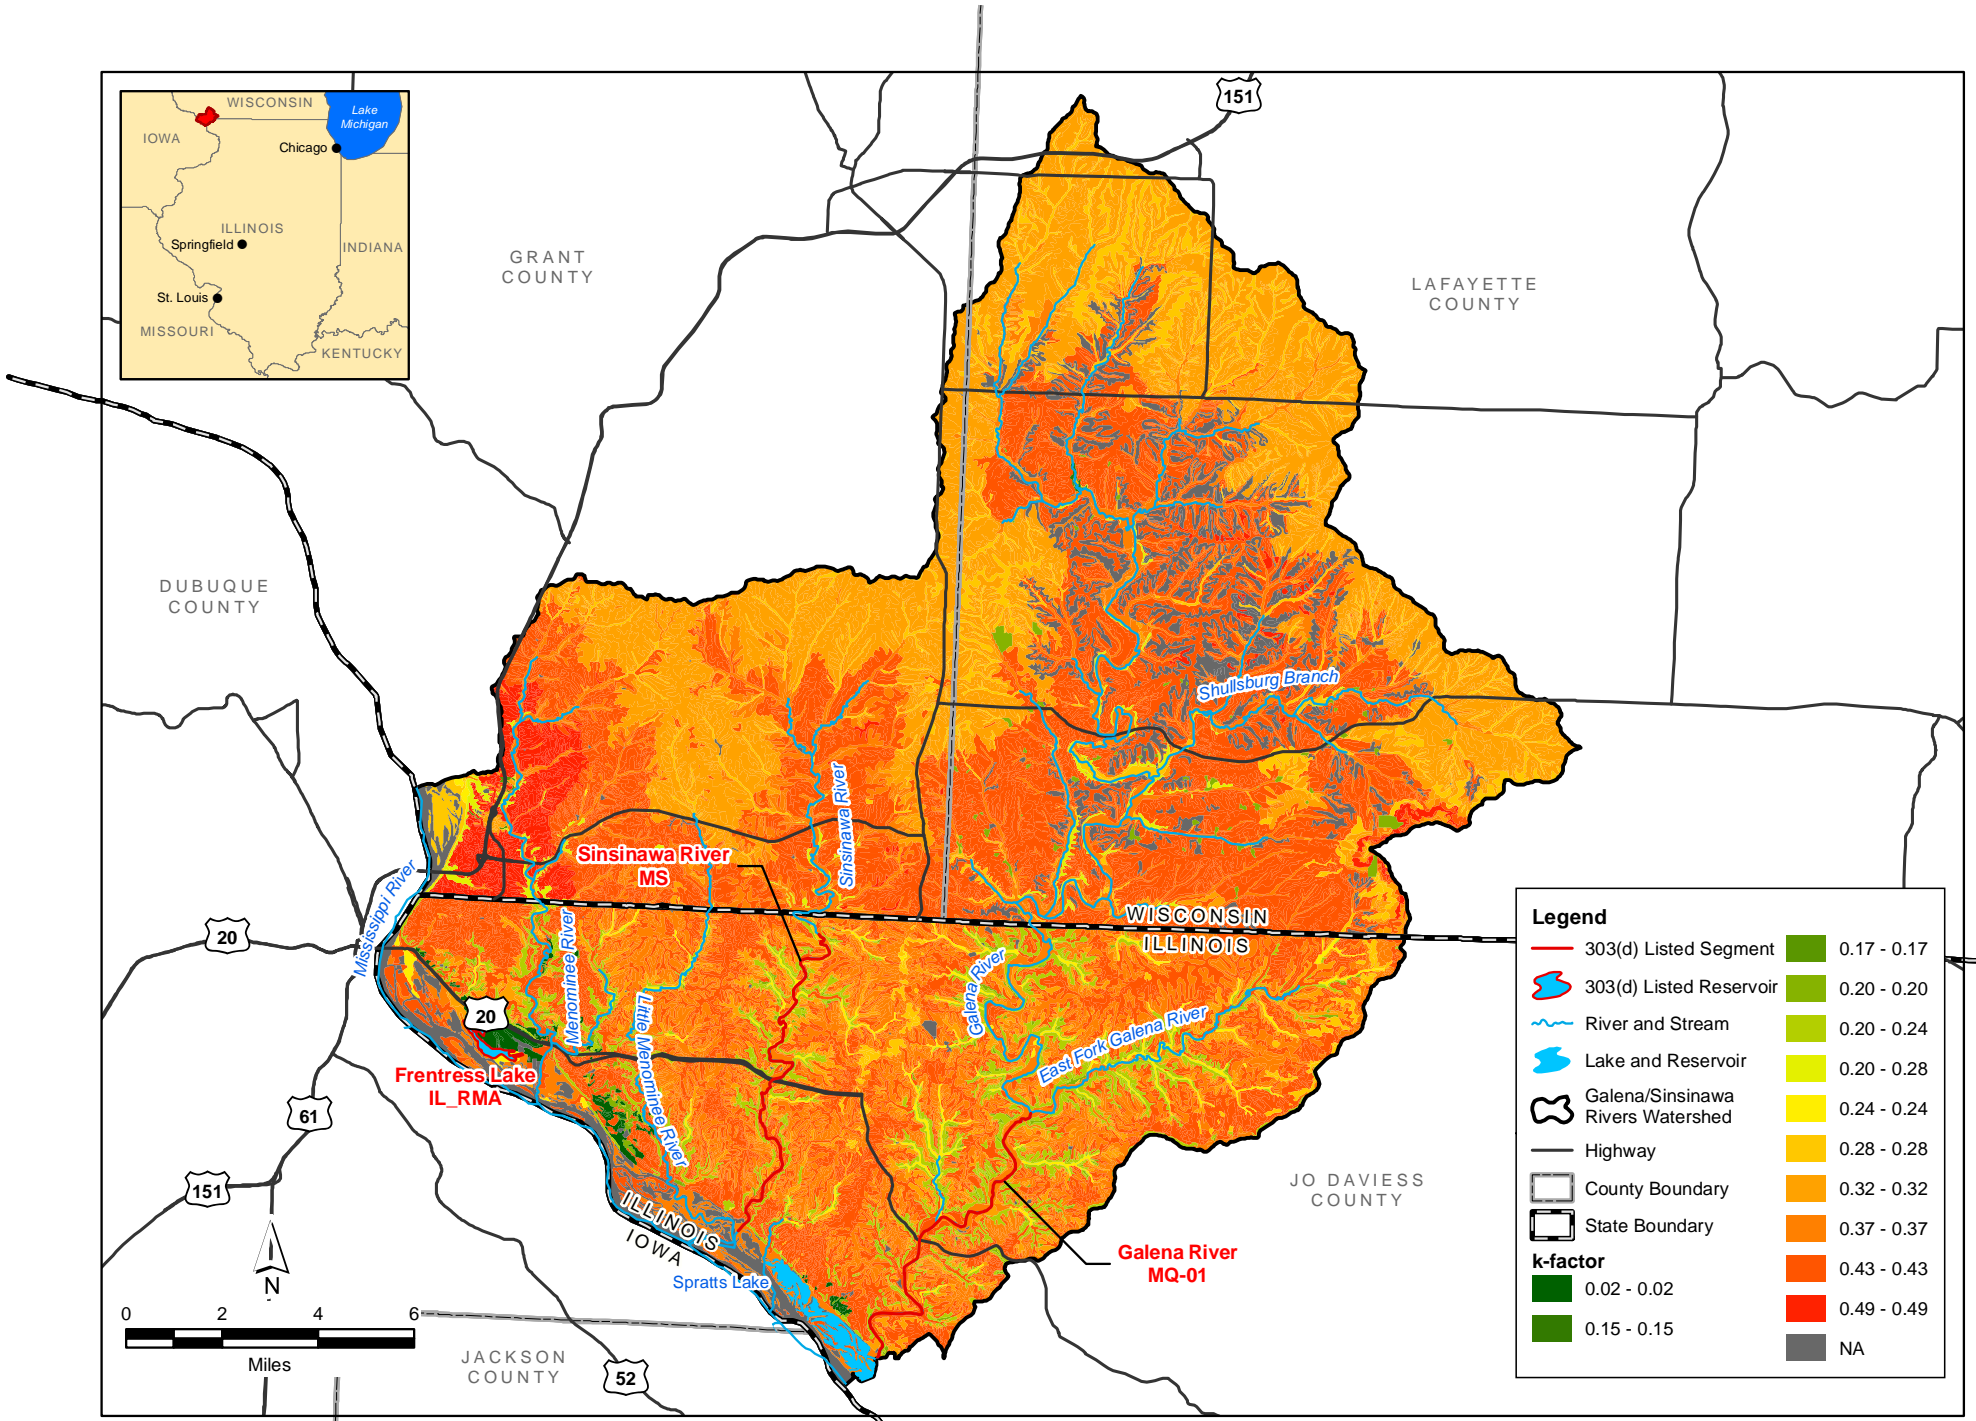

2.5 Population

The Census 2010 TIGER/Line data from the U.S. Census Bureau were retrieved. Geographic shapefiles of census blocks were downloaded for the entire state of Illinois. All census blocks that have geographic center points (centroids) within the watershed were selected and tallied in order to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Approximately 20,712 people reside in the Galena/Sinsinawa Rivers watershed. The major municipalities in the watershed were shown in **Figure 1-1**. The largest urban development in the watershed is the city of Galena, with a population of approximately 3,401 people. The population remains similar to that recorded during the 2000 Census when 3,565 people resided in Galena. Other population centers in the watershed include East Dubuque, Menominee, and the Galena Territory in Illinois and Cuba City, Hazel Green, Benton, and Shullsburg in Wisconsin.

2.6 Climate, Pan Evaporation, and Streamflow

2.6.1 Climate

Northwest Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly temperature and precipitation data from the Dubuque Regional Airport in Dubuque, Iowa (station id. 94908) were extracted from the National Climatic Data Center (NCDC) database for the years 1951 through 2013. This station was selected due to its proximity to the watershed (Approximately 6 miles west) and completeness of its dataset.

A similar NCDC climate station is located within the watershed in Galena, IL; however, temperature data were not available from 1927 through 2011 and an alternative station was selected. The data station at the Dubuque Regional Airport is near the watershed and is expected to be representative of precipitation throughout the watershed.

Table 2-2 contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is 37.4 inches. July and August are historically the wettest months while January and February are the driest.

Table 2-2 Average Monthly Climate Data for Dubuque, Iowa

Month	Average Total Precipitation (inches)	Average Daily Maximum Temperature (degrees F)	Average Daily Minimum Temperature (degrees F)
January	1.3	25.5	9.7
February	1.4	30.7	14.5
March	2.6	42.6	25.2
April	4.0	57.9	37.5
May	4.3	69.1	48.1
June	4.2	78.4	57.8
July	4.4	82.1	62.0
August	4.4	80.0	60.0
September	3.7	72.3	51.2
October	2.7	60.6	40.3
November	2.4	44.5	27.9
December	1.9	30.3	15.3
Total	37.4		

2.6.2 Pan Evaporation

Through the Illinois State Water Survey (ISWS) website, pan evaporation data are available from nine locations across Illinois (ISWS 2007). The DeKalb, Illinois station was chosen to be representative of pan evaporation conditions for the Galena/Sinsinawa Rivers watershed. The DeKalb station is located approximately 130 miles east southeast of the Galena/Sinsinawa Rivers watershed. This station was chosen due to being the closest pan evaporation station to the Galena/Sinsinawa Rivers watershed. The average annual pan evaporation at the DeKalb station for the years 1980 to 2000 is 36.8 inches. Actual evaporation is typically less than pan

evaporation, so the average annual pan evaporation was multiplied by 0.75 to calculate an average annual evaporation of 27.6 inches (ISWS 2009).

2.6.3 Streamflow

Analysis of the Galena/Sinsinawa Rivers watershed requires an understanding of flow throughout the drainage area. One active USGS gage and 5 inactive USGS Gages are located within the watershed (**Figure 2-5**). **Table 2-3** summarizes the station information.

Table 2-3 Streamflow Gages in the Galena/Sinsinawa Rivers Watershed

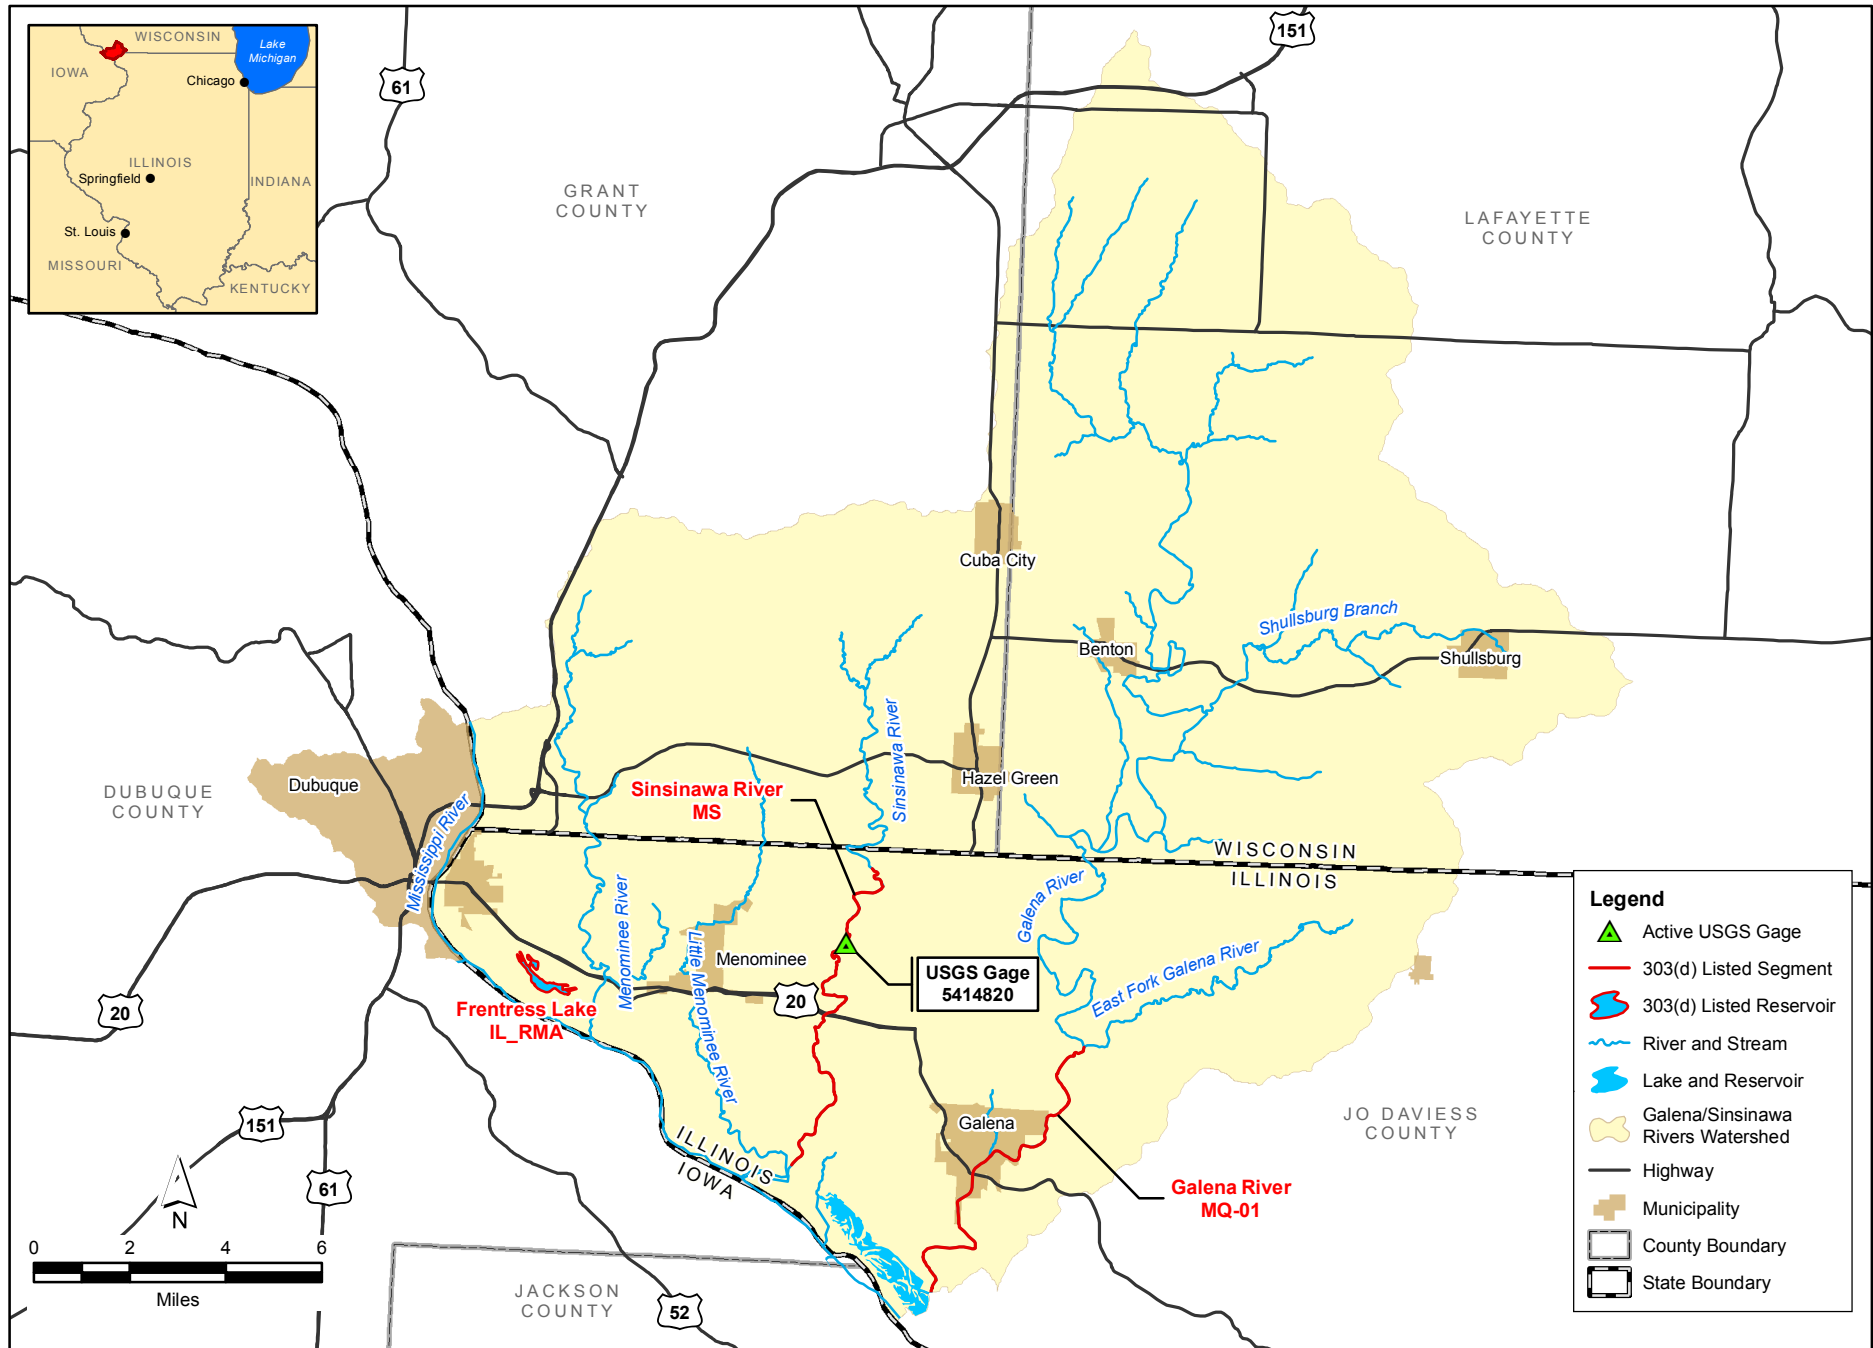

Gage Number	Name	Available Data Type	POR
5414820	SINSINAWA RIVER NEAR MENOMINEE, IL	Daily Discharge, Gage height	1967-2015
5414800	SINSINAWA RIVER NEAR HAZEL GREEN, WI	Daily Discharge	1987-1990
5415000	GALENA RIVER AT BUNCOMBE, WI	Daily Discharge	1939-1992
5414920	MADDEN BRANCH NEAR MEEKERS GROVE, WI	Daily Discharge	1980-1982
5414915	MADDEN BRANCH TRIBUTARY NEAR BELMONT, WI	Daily Discharge	1980-1982
5414894	PATS CREEK NEAR BELMONT, WI	Daily Discharge	1980-1982

Based on the single active stream gage in the watershed (USGS 05414820 Sinsinawa River near Menominee, IL), the average monthly flows in Sinsinawa River range from 20.98 cubic feet per second (cfs) in November to 41.78 cfs in March (see **Figure 2-6**). The gage drains an area of 53 square miles. Data from this gage were used to estimate flow values for other impaired waterbodies in the Galena/ Sinsinawa Rivers watershed using the drainage area ratio method, represented by the following equation:

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where, Q_{gaged} = Streamflow of the gaged basin
 Q_{ungaged} = Streamflow of the ungaged basin
 $\text{Area}_{\text{gaged}}$ = Area of the gaged basin
 $\text{Area}_{\text{ungaged}}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed, multiplied by the area of the ungaged watershed, estimates the flow for the ungaged watershed. Quantification of watershed contributions and flows for each impaired water body were performed during model development as part of the Stage 3 TMDL development and are discussed further in Sections 7 and 8 of this report.

Section 3

Galena/Sinsinawa Rivers Watershed Public Participation

3.1 Galena/Sinsinawa Rivers Watershed Public Participation and Involvement

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet recommended TMDLs. It is important to involve the public as early in the process as possible to achieve maximum cooperation and counter concerns as to the purpose of the process and the regulatory authority to implement any recommendations.

The Stage 1 public meetings were held in Galena, Illinois on June 10-11, 2014. Comments received at the meetings, or following the meetings during the 30-day comment period, have been incorporated into this document.

An additional public meeting was held following publication of the draft Stage 3 report on September 28, 2017. Comments received during the public comment period have also been incorporated into the Final Galena/Sinsinawa Watershed TMDL Report. Comments received throughout the TMDL process are included in Appendix E.

This page intentionally left blank.

Section 4

Galena/Sinsinawa Rivers Water Quality Standards and Guidelines

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the "designated uses" of the state's waterways. In the state of Illinois, water quality standards are established by the Illinois Pollution Control Board (IPCB). Illinois is required to update water quality standards every 3 years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA, in conjunction with USEPA. New standards are then developed or revised during the 3-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to the IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards.

4.2 Designated Uses

The waters of Illinois are classified by designated uses, which include: General Use, Public and Food Processing Water Supplies, Lake Michigan, and Secondary Contact and Indigenous Aquatic Life Use (Illinois EPA 2014). The designated use applicable to the Galena/Sinsinawa Rivers watershed is General Use.

4.2.1 General Use

The General Use classification is defined by IPCB as standards that "will protect the state's water for aquatic life, wildlife, agricultural use, secondary contact use and most industrial uses, and ensure the aesthetic quality of the state's aquatic environment." Primary contact uses, defined as "any recreational or other water use in which there is prolonged and intimate contact with the water (where the physical configuration of the water body permits it) involving considerable risk of ingesting water in quantities sufficient to pose a significant health hazard, such as swimming and water skiing" (35 Ill. Adm. Code 301.355), are protected for all General Use waters.

4.3 Illinois Water Quality Standards

According to the Illinois EPA Integrated Report, aquatic life use assessments in streams are typically based on the interpretation of biological information, physicochemical water data, and physical-habitat. The primary biological measures used are the fish Index of Biotic Integrity (fIBI), the macroinvertebrate Index of Biotic Integrity (mIBI) and the Macroinvertebrate Biotic Index (MBI). Physical-habitat information used in assessments includes quantitative or qualitative measures of stream-bottom composition and qualitative descriptors of channel and riparian conditions. Physicochemical water data used include measures of "conventional" parameters

(e.g., dissolved oxygen [DO], pH, and temperature), priority pollutants, non-priority pollutants, and other pollutants.

For public and food processing water supply waters, Illinois EPA compares available data with water quality standards to make impairment determinations. **Tables 4-1** and **4-2** present the numeric water quality standards of the potential causes of impairment for both lakes and streams in the Galena/Sinsinawa Rivers watershed. Only constituents with numeric water quality standards will have TMDLs developed at this time.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of Lake Impairments in Galena/Sinsinawa Rivers Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Dissolved Oxygen	mg/L	<p><i>March through July</i> ≥5.0 minimum & ≥6.0 7-day daily mean averaged over 7 days</p> <p><i>August through February</i> ≥3.5 minimum, ≥4.0 7-day minimum averaged over 7 days & ≥5.5 30-day daily mean⁽¹⁾</p>	302.206(b)
Total Phosphorus	mg/L	0.05 ⁽²⁾	302.205

mg/L = milligrams per liter NA = Not Applicable (1) Standard applies above the thermocline in stratified lakes and throughout the water column in unstratified lakes. (2) Standard applies to inland lakes and reservoirs (greater than 20 acres) and in any stream at the point where it enters any such lake or reservoir.

Table 4-2 Summary of Numeric Water Quality Standards for Potential Causes of Stream Impairments in Galena/Sinsinawa Rivers Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Zinc	µg/L	<p><i>Dissolved:</i> Acute = $e^{A+B \ln(H)} \times 0.978^*$ where A = 0.9035 and B = 0.8473</p> <p>Chronic = $e^{A+B \ln(H)} \times 0.986^*$ where A = -0.4456 and B = 0.8473</p>	302.208(e)
Total Fecal Coliform	Count/100 mL	<p><i>May through October</i> 200⁽¹⁾, 400⁽²⁾</p>	302.209

µg/L = micrograms per liter H = hardness * = Conversion factor multiplier for dissolved metals ⁽¹⁾ Geometric mean based on a minimum of five samples taken over not more than a 30-day period. ⁽²⁾ Standard shall not be exceeded by more than 10 percent of the samples collected during any 30-day period.

4.4 Water Quality Guidelines

As mentioned in Section 1.2, Illinois EPA began including LRSs in TMDL watershed projects in 2012 for pollutants that do not currently have numeric water quality standards. Developing an LRS involves determining the loading capacity and load reduction necessary to meet “Full Use Support” for its designated uses. The load capacity is not divided into WLA, LA, or MOS; these are represented by one number as a target concentration for load reduction within each unique watershed. The LRS provides guidance (with no regulatory requirements) for voluntary nonpoint source reduction efforts by implementing agricultural and urban stormwater BMPs.

For previous 303(d) determinations, the guideline for listing total suspended solids (TSS) for aquatic life in lakes was a non-volatile fraction of suspended solids or NVSS [TSS-volatile suspended solids (VSS)] greater than 12 mg/L. Aesthetic quality in lakes was considered impaired when NVSS was greater than 3 mg/L. Aquatic life in streams was considered to be impaired by siltation and sedimentation when TSS exceeded 116 mg/L. Additionally, streams had been listed for impairment caused by sedimentation/siltation when over 34% siltation was observed (prior to 2006), or over 75% siltation was observed (2008 and 2010). Since the development of the Stage 1 report in late 2014, Illinois EPA has developed additional watershed-specific target values for parameters without numeric standards to use in LRS development. The current LRS targets are based on data from all stream segments within the HUC-10 basins of the watershed, as well as stream segments or lakes which closely border the watershed in neighboring HUC-10 basins, to best represent the land use, hydrologic, and geologic conditions unique to the watershed. Load reduction targets were calculated by Illinois EPA using data from stream segments whose most current assessment shows full support for aquatic life and data that have passed quality assurance and quality checks within Illinois EPA and are in accordance with state and federal laws. Illinois EPA has established a target value of 24.1 mg/L for TSS in the Galena/Sinsinawa Rivers watershed.

4.5 Potential Pollutant Sources

In order to properly address the conditions within the Galena/Sinsinawa Rivers watershed, potential pollutant sources must be investigated for the pollutants where TMDLs will be developed. **Table 4-3** is a summary of the potential sources associated with the listed potential causes for the 303(d) listed segments in this watershed as identified by the 2014 303(d) list. Further investigation and documentation of sources is provided in Section 5.

Table 4-3 Impaired Water Bodies

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2014 303(d) list)
MS	Sinsinawa River	<i>Sedimentation/Siltation</i>	Aquatic Life	Agriculture
RMA	Frentress Lake	<i>Turbidity</i>	Aesthetic Quality	Littoral/shore Area Modifications (Non-riverine), Sediment Resuspension (Clean Sediment)
		Total Phosphorus	Aquatic Life, Aesthetic Quality	Agriculture, Urban Runoff/Storm Sewers
		Dissolved Oxygen	Aquatic Life	Agriculture, Urban Runoff/Storm Sewers
		<i>Total Suspended Solids</i>	Aquatic Life, Aesthetic Quality	Agriculture, Urban Runoff/Storm Sewers
MQ-01	Galena River	Zinc	Aquatic Life	Impacts from Abandoned Mine Lands (inactive), Urban Runoff/Storm Sewers
		<i>Sedimentation/Siltation</i>	Aquatic Life	Livestock (Grazing and Feeding Operations)
		<i>Total Suspended Solids</i>	Aquatic Life	Livestock (Grazing and Feeding Operations), Urban Runoff/Storm Sewers
		Fecal Coliform	Primary Contact Recreation	Source Unknown

Bold Causes of Impairment have numeric water quality standards. Italicized Causes of Impairment do not have numeric water quality standards and LRSs have been developed where appropriate. TMDLs for these parameters will be developed in the future when numeric standards are available. Section 9 includes implementation strategies for all the parameters listed.

This page intentionally left blank.

Section 5

Galena/Sinsinawa Rivers Watershed Characterization

To further characterize the Galena/Sinsinawa Rivers watershed, a wide range of pertinent data were collected and reviewed. Water quality data for streams and lakes, as well as information on potential point and nonpoint sources within the watershed, were compiled from a variety of data sources. This information is presented and discussed in further detail in the remainder of this section.

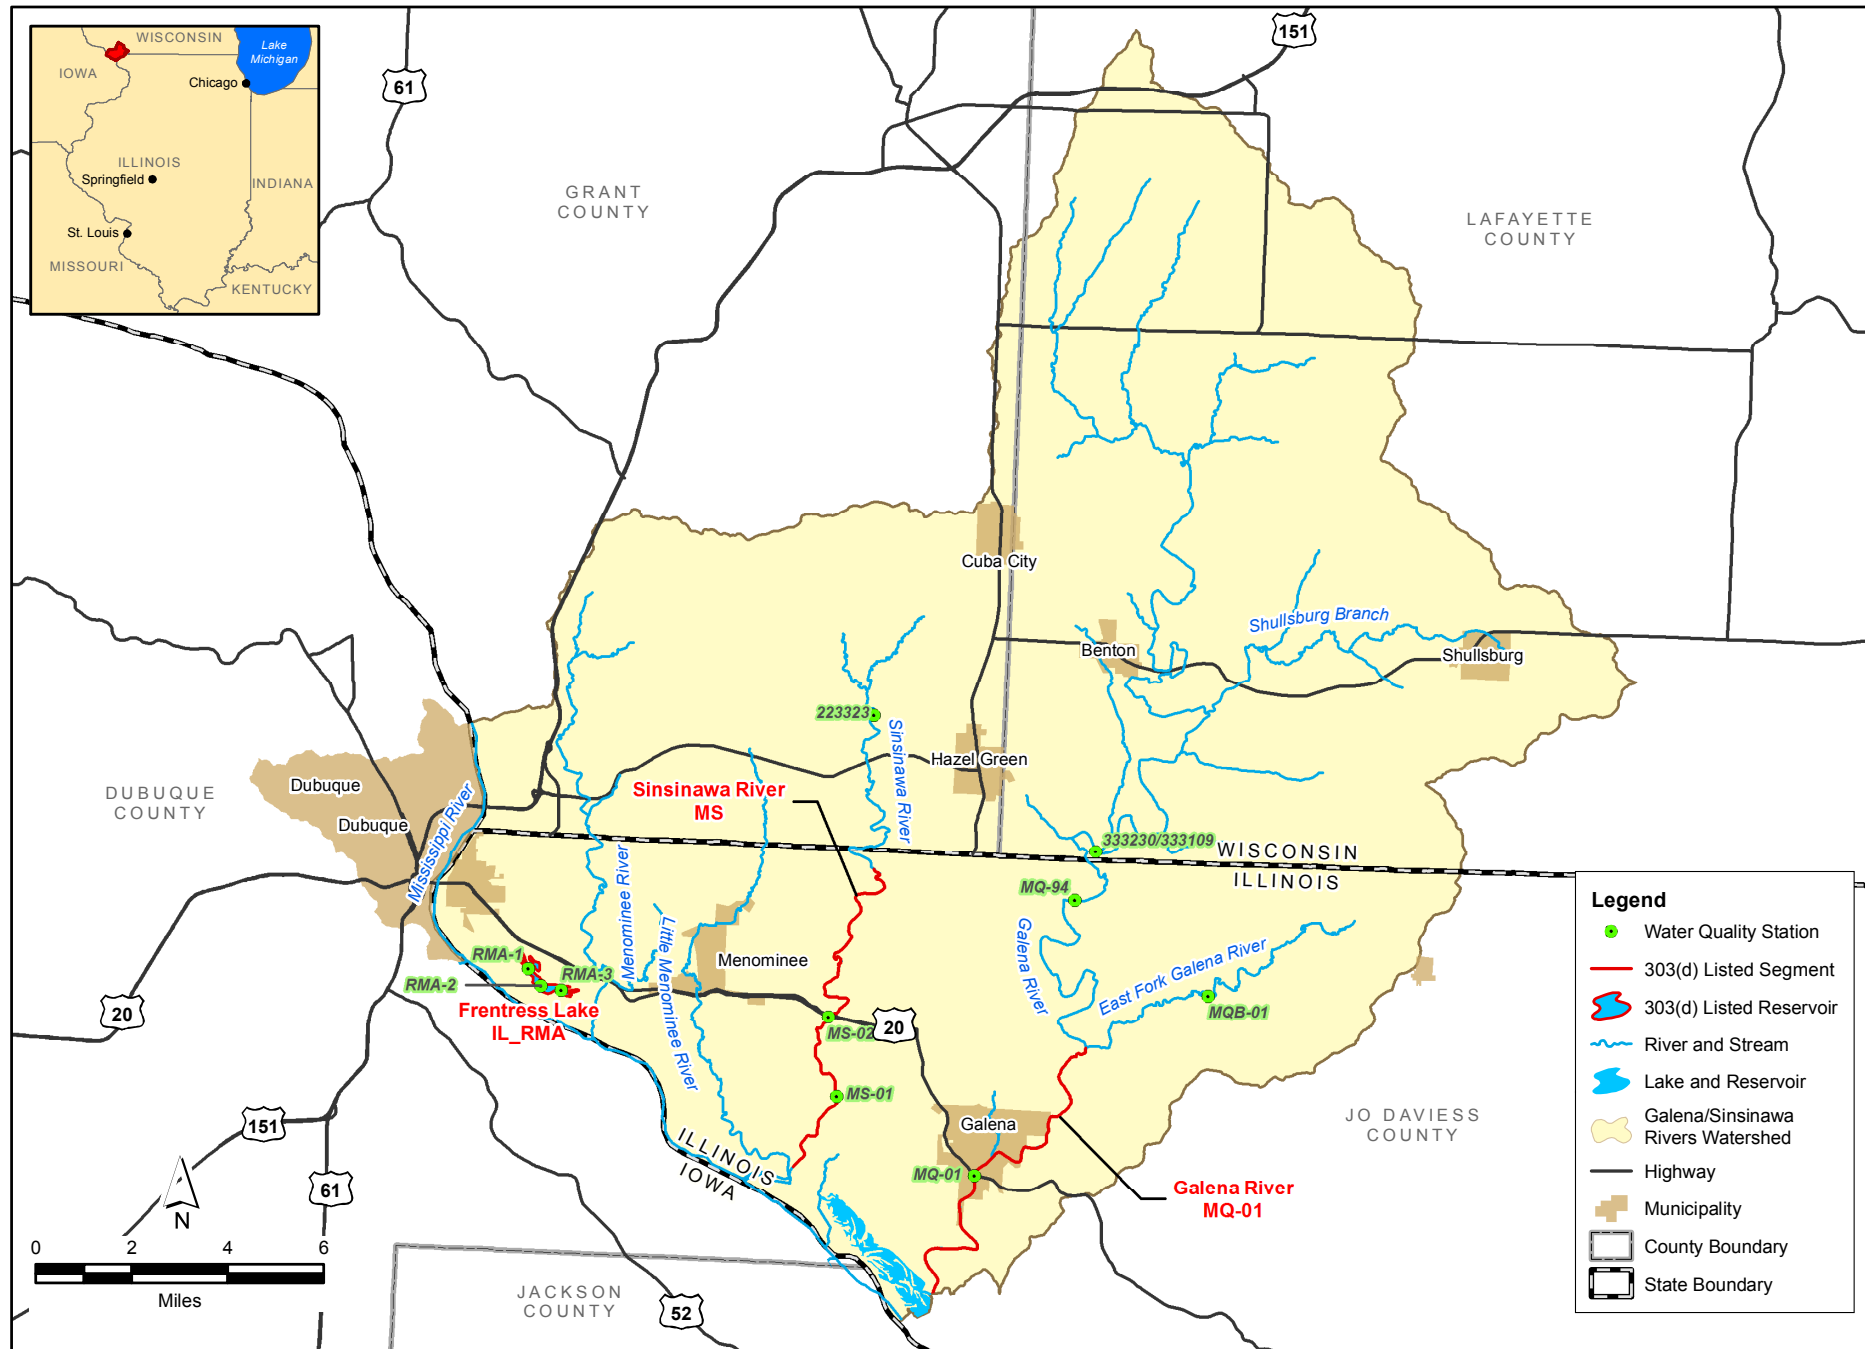

5.1 Water Quality Data

Data from a total of eight historical water quality stations within the Illinois portion of the Galena/Sinsinawa Rivers watershed were located and reviewed for this report (**Figure 5-1**). These water quality data were primarily provided by the Illinois EPA. Station MQ-01 on Galena River (at Route 20 in downtown Galena) is part of the Illinois EPA Ambient Water Program and was sampled approximately nine times a year through 2007. Sampling was discontinued in 2007 due to staff reduction. The station is currently being monitored through a contract with the USGS that began in 2009. Additional sampling on the Galena River was completed in 2014 by Illinois EPA to supplement Stage 3 analysis. This included additional sampling at stations MQ-01, MQ-94, and MQB-01. MQ-94 and MQB-01 are located upstream of the impaired segment, and data from these stations has been reviewed for additional analysis. Station MS-01 on the Sinsinawa River (at Chetlain Lane) is part of Illinois EPA's Intensive Basin Survey Program in which stations are monitored every 5 years (2000, 2005, and 2010). Additional data were collected by Illinois EPA in 2014 at station MS-01 and MS-02 on the Sinsinawa River. Frentress Lake (three lake stations) was sampled by the Illinois EPA Lake Program in 2001 and 2010.

Available data were also reviewed for the Galena River and Sinsinawa River from the upstream Wisconsin portion of the watershed. Although these segments are not 303(d) listed in Wisconsin, and are located upstream of any impaired segments for which TMDL and LRS work was completed for this report, data for the parameters of concern are documented throughout this section, where available, for reference.

The impaired water body segments in the Galena/Sinsinawa Rivers watershed were presented in Section 1. Refer to **Table 1-1** for impairment information specific to each segment. In general, data from 2009 to 2011 were used for the 2014 Integrated Report. The exception is bacteria, in which the last 5 years of data were used for assessment (2006-2011). The recent 2014 sampling completed by Illinois EPA was also utilized during TMDL development in Stage 3. Recent and historical data are included in this section for historical trends and observations. The following section addresses both stream and lake impairments. Data are summarized by impairment and discussed in relation to the relevant Illinois numeric water quality standard. Data summaries provided in this section include all available date ranges of collected data. The following sections will first discuss data for the impaired stream segments in the Galena/Sinsinawa Rivers watershed followed by data for Frentress Lake.

5.1.1 Stream Water Quality Data

Two impaired stream segments exist within the Illinois portion of the Galena/Sinsinawa Rivers watershed (Galena River segment MQ-01 and Sinsinawa River segment MS-01). As previously noted, an unnamed tributary to Schullsburg Branch (refer to **Figure 1-1**) is listed in the Wisconsin portion of the watershed for impairment caused by TSS, zinc, and lead. Schullsburg Branch and its tributaries are a significant distance upstream of the impaired waters in the Illinois portion of the watershed. The impaired segment of the Galena River in Illinois is listed for impairment of the aquatic life use by zinc, sedimentation and siltation, and TSS. The impaired segment of the Sinsinawa River in Illinois is listed for impairment of the aquatic life use by sedimentation and siltation. As discussed in Section 4.3, aquatic life use assessments are based on a combination of biological information, physicochemical water data, and physical-habitat data. Data from 2010 indicated that segment MQ-01 of the Galena River had a mIBI score of 11.3 while segment MS-01 of the Sinsinawa River had a mIBI score of 10.4. According to Table C-1 in Illinois EPA's Integrated Report, these scores indicate severe impairment of the aquatic life use. Segment MQ-01 of the Galena River is also listed for impairment of the primary contact recreation use by fecal coliform.

Data presented below relate to the constituents of concern that currently have numeric criteria, as well as those with water quality guideline targets established by Illinois EPA. As presented in Section 4.3, both zinc and fecal coliform have numeric criteria and impairment determinations can be confirmed through comparison of available historical data. Although sedimentation/siltation and TSS do not have numeric criteria, both parameters have target values that were presented in Section 4.4. These values will be used to confirm impairment listings in the following sections.

There is one active water quality monitoring location on each impaired stream segment. During Stage 2 of TMDL development, additional sampling was completed between July and September of 2014 on segments MQ-01 of the Galena River and MS-01 of the Sinsinawa River, as well as three additional sampling locations: MQB-01 (East Fork Galena River), MQ-94 (Galena River near the Wisconsin border), and MS-02 (Sinsinawa River near Highway 20) (refer to **Figure 5-1**). The Stage 2 sampling parameters of fecal coliform, TSS, and metals have been incorporated into this report. All historical water quality data for the impaired segments of the Galena/Sinsinawa Rivers watershed are available in Appendix C.

In addition to the sampling locations within the Illinois portion of the watershed, data were reviewed from stations within the Wisconsin portion of the watershed for reference. The water quality sampling locations closest to the border with data for the parameters of concern were downloaded through USEPA STORET and the limited data are included below. The Wisconsin stations (Galena River at Beebe Rd [333230 & 333109] and Sinsinawa River at Louisburg Rd [223323]) are also shown on **Figure 5-1**.

5.1.1.1 Zinc

Galena River segment MQ-01 is listed for impairment of the aquatic life use by elevated dissolved zinc concentrations. **Table 5-1** summarizes available historical zinc data for this segment. The current general use water quality standards include both an acute and a chronic limit for dissolved zinc concentrations. Both the acute and chronic standards are hardness-dependent

standards and are calculated for each sampling event based on current water hardness conditions. The summary of data presented in **Table 5-1** reflects all available dissolved zinc data for segment MQ-01. The available data set for segment MQ-01 consists of 103 records collected between 1999 and 2014. A total of 23 samples collected during this time period exceeded the currently applicable standard for chronic exceedances **Figure 5-2**. No dissolved zinc samples were available from the Galena River at Beebe Rd (WI) station during the last twenty years and the concentrations instream within the Wisconsin portion of the watershed are unknown.

Table 5-1 Existing Zinc Data for Galena River

Sample Location and Parameter	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Acute Exceedances	Number of Chronic Exceedances
Galena River Segment MQ-01						
Zinc (µg/L)	1999 - 2014; 103	82	200	ND	0	23

Note: Acute and chronic standards for dissolved zinc in streams are hardness-dependent.

ND = Non-detect

5.1.1.2 Fecal Coliform

Galena River segment MQ-01 is listed for impairment of the primary contact recreation use by fecal coliform. **Table 5-2** summarizes available historical fecal coliform data on this segment. The general use water quality standard for fecal coliform states that the standard of 200 colony forming units (cfu) per 100 milliliters (mL) shall not be exceeded by the geometric mean of at least five samples, nor can 10 percent of the samples collected exceed 400 cfu per 100 mL in protected waters, except as provided in 35 Ill. Adm. Code 302.209(b). Samples must be collected over a 30-day period or less during the months of May through October. Because the minimum sampling frequency requirements for assessing the 200 cfu/100 mL standard are not regularly achieved, single samples have been compared to the standards (200 cfu/100 mL and of the 400 cfu/100 mL) for purposes of this report. The summary of data presented in **Table 5-2** reflect single samples compared to the threshold values during the appropriate months for reference purposes. **Figure 5-3** shows the total fecal coliform samples collected over time at segment MQ-01. Only one fecal coliform sample is available within the last twenty years from the Galena River at Beebe Road (WI) sampling station. A single sample of 2100 cfu/100 mL was recorded in March 2007. Because fecal coliform counts vary greatly from sample to sample, it is difficult to know if this high count occurs regularly, took place during wet weather, or was irregularly high. The March sampling date is also outside of the months when the standard is applicable in Illinois.

Table 5-2 Existing Fecal Coliform Data for Galena River Impaired Stream Segments

Sample Location and Parameter	Period of Record and Number of Data Points	Geometric Mean of all samples	Maximum	Minimum	Number of samples > 200 ⁽¹⁾⁽²⁾	Number of samples > 400 ⁽¹⁾
Galena River Segment MQ-01						
Total Fecal Coliform (cfu/100 mL)	2000 – 2014; 42	453	6880	1	33	20

(1) Samples collected during the months of May through October (2) The 200 cfu/100mL standard is based on a geometric mean of at least 5 samples collected in a 30-day period. The number of single samples exceeding this value are shown in the table for reference only and do not necessarily indicate an exceedance of the standard.

Note: Acute and chronic WQ standards for dissolved zinc are hardness dependent

5.1.1.3 Total Suspended Solids

Galena River segment MQ-01 is listed for impairment of the aquatic life use by TSS. **Table 5-3** summarizes available historical suspended solids data for this segment. The previous water quality guideline for TSS in streams was a maximum value of 116 mg/L. **Figure 5-4** shows the TSS data collected over time at sampling location MQ-01. Within the available dataset, there have been three violations of the previous target value. Two violations occurred in 1999 and one violation was recorded in 2001. There were no violations of the previous TSS target in the water column during the last assessment period. TSS has decreased at this sampling location over time; maximum values were recorded in 1999 and violations of the previous target have not occurred since 2001.

As discussed in Section 4.4, Illinois EPA has developed a more recent watershed-specific TSS target of 24.1 mg/L based on values found in surrounding streams that fully support aquatic life uses. Within the available dataset, there have been 40 violations of the new target value. Recent data collected under Stage 2 efforts indicate two violations of the target value in August and September of 2014. TSS levels during the 2014 sampling period fluctuated between 41 and 9 mg/L, with an average of 20 mg/L. It should be noted that TSS was added to the list of impairments due to the siltation/sedimentation impairment.

Based on the siltation/sedimentation impairment on Sinsinawa River, available TSS data for segment MS has been added to **Table 5-3** (see discussion in Section 5.1.1.4 below). Sediment issues in both segments are addressed in Sections 7 and 8 of this document and sediment reduction strategies are provided in Section 9.

Table 5-3 TSS Data for Impaired Galena and Sinsinawa Rivers in Illinois

Sample Location and Parameter	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances > 116mg/L	Number of Exceedances > 24.1 mg/L
Galena River Segment MQ-01						
TSS (mg/L)	1999-2014; 83	37.59	440	ND	3	40
Sinsinawa River Segment MS						
TSS (mg/L)	2000-2014; 17	21.4	43	8	0	6

Table 5-4 shows the TSS data available from the upstream Wisconsin sampling locations for reference. Only one data point was available for the Sinsinawa River north of the Wisconsin border. TSS at the time of sampling (October 2007) was relatively low. TSS in the Galena River upstream of the Wisconsin border is historically similar to the concentrations recorded at site MQ-01 in Illinois.

Table 5-4 TSS Data for Galena/Sinsinawa Rivers in Wisconsin

Sample Location and Parameter	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances > 116mg/L	Number of Exceedances > 24.1 mg/L
Galena River at Beebe Road						
TSS (mg/L)	2002-2007; 16	44	428	2	1	4
Sinsinawa River at Louisburg Road

5.1.1.4 Siltation/Sedimentation

Galena River segment MQ-01 and Sinsinawa segment MS are both listed for impairment of the aquatic life use by sedimentation and siltation. These listings were based on field observations of Illinois EPA staff. A sediment thickness of 24 inches above the stream bed (>34 percent of stream depth) was recorded in 2006 on segment MQ-01 of the Galena River. A sediment thickness between 18 and 24 inches above the streambed (>75 percent of stream depth) was recorded in 2008 on segment MS of the Sinsinawa River. The most recent habitat data are from 2010 for both MQ-01 and MS-01. Estimated amounts of silt during habitat assessment were 75 percent at MS-01 and 90 percent at MQ-01.

5.1.2 Frentress Lake Water Quality Data

Frentress Lake is listed for impairment of the aesthetic quality use by total phosphorus and the aquatic life use by low DO. In addition, high turbidity has been linked to impaired aesthetic quality and TSS and turbidity are associated with impaired aquatic life use in the reservoir. Data are available from three separate water quality monitoring locations within Frentress Lake (refer to **Figure 5-1**). An inventory of all available data associated with the impairments in Frentress Lake is presented in **Table 5-5**. Additional water quality data are available from station M-13, located on the Mississippi River approximately 10 miles upstream of Frentress Lake. The Mississippi River is directly connected to Frentress Lake and available and relevant water quality data from the river was considered during TMDL development. Water quality data presented below are limited to data collected within the impaired water body, Frentress Lake.

Table 5-5 Data Inventory for Impairment at Frentress Lake

Frentress Lake Segment RMA; Sample locations RMA-1, RMA-2, RMA-3		
RMA-1	Period of Record	Number of Samples

Temperature, sample	2001 - 2010	6

5.1.2.1 Total Phosphorus in Frentress Lake

The applicable water quality standard for total phosphorus in Frentress Lake is 0.05 mg/L. Compliance with the total phosphorus standard is assessed using samples collected at a 1-foot depth from the lake surface. The number of samples, a count of exceedances, and the average total phosphorus concentrations at a 1-foot depth for each year of available data at each monitoring segment in Frentress Lake are presented in **Table 5-7** and shown on **Figure 5-5**. Based on the limited available dataset, total phosphorus concentrations in Frentress Lake are consistently high. All samples collected at 1-foot depth in the lake exceed the 0.05 mg/L standard, and the average concentrations at each site are greater than 0.15 mg/L, or three times the applicable water quality standard. No seasonal or annual trends in total phosphorus concentrations were observed based on the currently available dataset.

Table 5-7 Sample Counts, Exceedances of WQ Standard (0.05 mg/L), and Average Total Phosphorus Concentrations (mg/L) at One-Foot Depth in Frentress Lake

Station	RMA-1		RMA-2		RMA-3

2010	5; 5	0.16	5; 5	0.21	5; 5	0.20

Figure 5-5
Total Phosphorus
Frentress Lake

This page intentionally left blank.

5.1.2.2 Dissolved Oxygen in Frentress Lake

The water quality standard for DO in Frentress Lake is a seasonally variable standard based on a minimum instantaneous DO value of 5.0 mg/L from March through July, and 3.5 mg/L from August to February. Compliance with the minimum DO standard is assessed using measurements recorded at depths above the thermocline of a thermally stratified water body, or throughout the water column in an un-stratified water body. The thermocline is defined as the depth within the water column at which water temperatures decline sharply and indicates the boundary between the warmer upper layer of the lake (epilimnion) and the cooler lower layer of the lake (hypolimnion). The depth of the thermocline can vary from location to location and at different times of year; however, in the case of the Frentress Lake dataset, the thermocline appears to consistently begin less than approximately 10 feet below the water surface.

The number of sample events, a count of exceedances, and the average DO concentrations at all depths above the thermocline, for each year of available data at each monitoring segment in Frentress Lake, are presented in **Table 5-8**. The minimum DO concentrations recorded above the thermocline at each site during each sampling event are shown in **Figure 5-6**.

Table 5-8 Minimum Dissolved Oxygen Concentrations Above the Lake Thermocline and Monitoring Events with Reported Exceedances of the Minimum DO Standard in Frentress Lake

Year	RMA-1		RMA-2		RMA-3	
	Monitoring Events; Events with Exceedances	Minimum DO above Thermocline (mg/L)	Monitoring Events; Events with Exceedances	Minimum DO above Thermocline (mg/L)	Monitoring Events; Events with Exceedances	Minimum DO above Thermocline (mg/L)
2001	5; 1	4.3	5; 0	5.5	5; 1	3.0

This page intentionally left blank.

Figure 5-6
Dissolved Oxygen
Frentress Lake

This page intentionally left blank.

5.1.2.3 Total Suspended Solids in Frentress Lake

The previous guideline for listing TSS for aquatic life in lakes was a NVSS [TSS- VSS] greater than 12 mg/L. Aesthetic quality in lakes was considered impaired when NVSS is greater than 3 mg/L. **Table 5-9** summarized NVSS values calculated for Frentress Lake in 2010. All calculated values are above 3 mg/L, and all but three calculated values are above 12 mg/L. Data indicate that NVSS values are lowest during July and August.

As discussed in Section 4.4, Illinois EPA has developed a more recent watershed-specific TSS target of 24.1 mg/L. **Table 5-10** provides TSS sampling results for Frentress Lake from 2010. Individual sampling points and overall lake average TSS values exceed the 24.1 mg/L target in May, June, and October; however, there were no sampling exceedances during July and August.

5.2 Lake Characteristics

5.2.1 Frentress Lake

Frentress Lake is located within Jo Daviess County, approximately 10 miles northwest of the city of Galena, Illinois. The lake is a backwater lake located adjacent to the Mississippi River. Two permanent channels hydrologically connect Frentress Lake to the Mississippi River; and the influence of the Mississippi River on the water within the

lake is thought to be significant. Frentress Lake has a surface area of 158 acres and an average depth of 12.5 feet. This lake is currently used for recreational activities and as an access point for boaters to the Mississippi River via the Frentress Lake Marine Center boat launch and marina.

The overland watershed draining into Frentress Lake is relatively small at approximately 1,100 acres. Approximately half of the lake's watershed is located in the Mississippi River floodplain and consists primarily of agricultural land use. Further east, the remainder of the watershed is

mostly upland forest with considerable residential development. No significant or named tributaries flow into the lake from the east, further suggesting that water levels in the lake are maintained and heavily influenced by inflow from the Mississippi River.

5.3 Point Sources

There are 7 discharging point sources in both Wisconsin and Illinois that are located within the Galena/Sinsinawa Rivers watershed. **Table 5-11** contains permit information for the point sources discharging in the watershed in the past decade while **Figure 5-7** shows the locations of the outfalls for each facility that is currently discharging (as of 2014). It should be noted that facilities discharging in Wisconsin are regulated by the Wisconsin Department of Natural Resources (WDNR) while Illinois EPA maintains authority over permits within Illinois. National Pollutant Discharge Elimination System (NPDES) facilities with permit limits in Illinois are required to submit discharge monitoring reports (DMRs) to Illinois EPA. Stormwater permits require the development of a stormwater management program comprised of BMPs and measurable goals. An annual report is submitted that includes status of compliance, data collected, stormwater activities planned, and any changes in goals. Under the Concentrated Animal Feeding Operation (CAFO) permit, requirements include: a nutrient management plan, a spill control and prevention plan, a stormwater management plan, and annual reporting. The City of Galena does not have a Municipal Separate Storm Sewer (MS4) permit meaning that urban stormwater from Galena is considered a nonpoint source.

For pollutants of concern in this watershed, facilities discharging treated domestic wastewater have the potential to affect fecal coliform counts in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain metals and/or sediments, but industry is typically less likely to impact fecal coliform counts. A review of facilities in **Table 5-11** show a number of coal mines and/or quarries. These facilities no longer discharge within the watershed but may have been historical contributors to zinc and/or sediments in the watershed. General stormwater permits in the watershed cover limited/intermittent discharges associated with precipitation events and may contribute onsite pollutants although each permit is required to have a stormwater management plan to reduce the potential for onsite pollutants to enter the surrounding waterbodies. CAFOs and other permitted animal operations have permits that require zero liquid discharge, have requirements for manure and wastewater storage and handling, and specific management practices for land application. These facilities have the potential to contribute sediment and fecal material through grazing practices and manure spreading but are also required to have plans onsite for the reduction/elimination of pollutant migration offsite.

5.4 Nonpoint Sources

There are many potential nonpoint sources of pollutant loading to the impaired segments in the Galena/Sinsinawa Rivers watershed. This section will discuss site-specific cropping practices, animal operations, and area septic systems. Data were collected when available through communications with the local NRCS, Illinois Soil and Water Conservation Districts, and Wisconsin County Land and Water Conservation Departments and public health departments.

5.4.1 Crop Information

Approximately 76.1 percent of the land within the Galena/Sinsinawa Rivers watershed is devoted to agriculture. Agricultural practices are important nonpoint sources to consider in TMDL development because of their potential to contribute sediments through soil loss and erosion, and other naturally occurring pollutants bound in soils (such as zinc the Galena River) to area waterbodies. Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. Each tillage practice leaves varying levels of crop residue after planting (see detailed discussion in Section 9). Tillage practices directly relate to water quality through their effects on soil loss. Soil can be an instream pollutant (sedimentation/siltation and TSS) and can also carry pollutants (metals, fecal coliform, et al) to receiving waters.

The percentage of agricultural land under each tillage practice for corn, soybeans, and small grains by county are generated from County Transect Surveys by the Illinois Department of Agriculture (IDA) and the Wisconsin County Land and Water Conservation Departments. Data from the 2011 and 2013 surveys are presented in **Tables 5-12** and **5-13** for Jo Daviess County, Illinois and for 2011 in Grant County, Wisconsin, respectively. Data from Lafayette County, Wisconsin were unavailable at the time of report development. It should be noted that the Galena/Sinsinawa Rivers watershed only covers a portion of each county (22% of Lafayette County, 20% of Jo Daviess County, and 6% of Grant County).

Table 5-12 Tillage Practices in Jo Daviess County, Illinois – 2011 and 2013

Tillage System	Corn		Soybean		Small Grain	
	2011	2013	2011	2013	2011	2013
Conventional	13%	61%	3%	36%	0%	26%
Reduced – Till	28%	11%	10%	32%	28%	16%
Mulch – Till	45%	4%	46%	8%	72%	0%
No – Till	13%	25%	41%	24%	0%	58%

Conventional	2%	0%	0%
Reduced - Till	64%	22%	100%
Mulch - Till	12%	19%	0%
No – Till	23%	59%	0%

Tillage practices from the 2004 County Transect Survey for Jo Daviess County were also reviewed to provide further information on changes in tillage practices over time **Table 5-14**. The data available from Jo Daviess County indicate that while the percentage of farmland under conventional tillage has varied somewhat over time, a trend towards increased use of no-till practices is noted for small grains. Increased use of reduced-till practices for soybean production is also evident in the 2004, 2011, and 2013 data for Jo Daviess County. No-till leaves the soil undisturbed from harvest to planting thus leaving a high percentage of surface covered by crop residues, helping to reduce soil migration to area streams.

Table 5-14 Historical Tillage Practices in Jo Daviess County, Illinois – 2004

Tillage System	Corn	Soybean	Small Grain
Conventional	13%	2%	0%
Reduced - Till	30%	12%	56%
Mulch - Till	29%	28%	44%
No – Till	28%	58%	0%

Local NRCS offices reported that they currently do not keep records on which farms use tile drainage. The NRCS office in Jo Daviess County said the use of drain tile is common but they did not have exact numbers. NRCS officials in Lafayette County, Wisconsin also stated that they have no records but that tiling is very common throughout the county. NRCS officials from Grant County, Wisconsin also did not have records on tiling, although they did state that drain tile is not especially common there. Tile drainage can potentially be a path for dissolved pollutants. Extensive tiling can also change the volume and timing of runoff events by altering infiltration rates and directing water from saturated soils directly to streams. Overtime, the increase in water directed to area streams can increase streambank erosion which increases the sediment loading to the watershed.

Fields Near W Valley Road

5.4.2 Animal Operations

Information on animal operations is available from the NASS. Although watershed-specific data are not available, county-wide data for Jo Daviess County, Illinois, and Grant and Lafayette Counties in Wisconsin are presented in the following tables (**Tables 5-15 through 5-17**). As stated above, note that the Galena/Sinsinawa Rivers watershed only covers a portion of each county (22% of Lafayette County, 20% of Jo Daviess County, and 6% of Grant County). Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals have the potential to increase erosion and contribute fecal coliform through manure. Data from 2002 and 2012 have been published on the USDA website.

Table 5-15 Jo Daviess County Animal Population (2002 and 2012 Census of Agriculture)

Livestock Type	2002	2012	Percent Change
Cattle and Calves	57,276	53,057	-8%
Beef	18,471	15,473	-19%
Dairy	7,771	8,311	6%
Hogs and Pigs	18,983	14,146	-34%
Poultry	510	897 ¹	43%
Sheep and Lambs	1,198	1,312	9%
Goats	131	447	241%
Horses and Ponies	838	926	10%

Table 5-16 Grant County Animal Population (2002 and 2012 Census of Agriculture)

Livestock Type	2002	2012	Percent Change
Cattle and Calves	163,392	173,249	6%
Beef	21,828	22,171	2%
Dairy	46,564	46,466	0%
Hogs and Pigs	75,332	54,798	-37%
Poultry	11,126	87,038	87%
Sheep and Lambs	2,303	4,659	51%
Goats	4,442	7,623	72%
Horses and Ponies	3,011	2,977	-1%

Table 5-17 Lafayette County Animal Population (2002 and 2012 Census of Agriculture)

Livestock Type	2002	2012	Percent Change
Cattle and Calves	89,894	108,943	17%
Beef	9,370	10,967	15%
Dairy	30,090	30,831	2%
Hogs and Pigs	25,617	14,267	-80%
Poultry	6,173	12,860	52%
Sheep and Lambs	1,725	1,628	-6%
Goats	1,205	3,652	203%
Horses and Ponies	1,544	1,751	12%

Specific information on non-permitted animal operations was not available. An Illinois EPA site visit in March 2013 noted livestock near both impaired stream segments. Cattle having direct access to streams increases the potential for streambank erosion and direct deposits of manure. Small animal operations near area streams (such as the goats shown below) also increase the potential sediment and fecal coliform loading within the watershed. Stakeholders in the watershed noted that the number of goats in the watershed have increased in recent years which the data from the Census of Agriculture support.

Goats in watershed

Cattle in watershed

5.4.3 Septic Systems

Many households in rural areas of Wisconsin and Illinois that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. There are many types of septic systems, but the most common septic system is composed of a septic tank draining to a septic field, where nutrient and bacteria removal occurs. However, the degree of pollutant removal is limited by soils and system upkeep and maintenance.

Across the U.S., septic systems have been found to be a significant source of phosphorus pollution. Failing or leaking septic systems contribute to fecal coliform pollution, although animal waste, urban runoff, and permitted point sources can also contribute.

Information on the extent of sewerred and non-sewerred municipalities in the Galena/Sinsinawa Rivers watershed was obtained from the county health departments. Health department officials in Grant County, Wisconsin, stated that the towns of Hazel Green and Cuba City are served by sewer systems, but most county residents within the watershed rely on private septic systems. In Lafayette County, Wisconsin, town residents are generally on municipal sewer systems, but county health department officials stated that roughly half of county residents use private septic systems.

Jo Daviess County public health department officials indicated that the town of Galena is served by a municipal sewer system, although older homes still have private systems. However, any homes outside of the municipal boundary are generally served by septic systems.

5.4.4 Historic Mining Operations

The point source information presented in Section 5.3 indicated the historical presence of mining operations within the watershed. There are no longer any permitted mines discharging in the area but runoff from former mining operations can contribute to pollutant loads in the waterways. Data from the Illinois State Geological Survey (ISGS) indicate that there are a large number of underground industrial mineral mines surrounding the Galena River: (<http://isgs.illinois.edu/sites/isgs/files/maps/coal-maps/mines-series/mines-maps/pdf-files/mines-map-jodaviess.pdf>). Runoff that contacts mine spoils and waste can increase sediment loads and often contains elevated concentrations of metals and may have low pH levels which can further facilitate the suspension of dissolved metals into the water column.

Studies provided by Bob Pavlowsky (Missouri State University) indicate the presence of zinc-rich mine tailings and contaminated sediment within floodplain deposits along the Galena River and its tributaries. These historic deposits can enter the stream through overland and streambank erosion. Additionally, leaching and weathering of tailings and sediment in floodplains may release dissolved zinc to the water table and then to the stream during base flow.

5.5 Watershed Studies and Other Watershed Information

An "Assessment of Water Quality in the Galena River Watershed" was performed in 2007-2008 by the Wisconsin DNR. **Table 5-18** contains information on the projects known to have been implemented throughout the watershed. Additional information is available through the Resource Management Mapping Service at:

[http://www.rmms.illinois.edu/RMMSMigrated/\(S\(qbogdt552pfsuj55nharo055\)\)/Home.aspx](http://www.rmms.illinois.edu/RMMSMigrated/(S(qbogdt552pfsuj55nharo055))/Home.aspx).

In addition, stakeholders in the watershed have indicated that there are a substantial number of Conservation Reserve Program (CRP) practices in the watershed that are beneficial but are not available for mapping purposes.

Table 5-18 Watershed Projects

Program	Project Name	Description	Recipient/Grantee	Year	Receiving Water
IDNR Conservation 2000	Horseshoe Mound Restoration	Restoration of native oak savanna on 28 acres	Natural Land Institute	Ongoing	Galena River

The Jo Daviess County League of Women Voters has chosen to study the quality of the surface water, groundwater and drinking water of the area. Information on the group can be found at: <https://sites.google.com/site/jodaviesscountywatershedplan/home>. One area of focus for the group (and supported by Illinois EPA) is water resource management issues in the Galena River watershed. The Galena River Watershed-Based Planning Committee of the League of Women Voters meets monthly to address water resource management issues in the Galena River watershed. All meetings, held at the Galena City Hall, 101 Green Street in Galena, are open to the public. Additional information for the Galena River efforts can also be found at the link above.

The Illinois Department of Transportation (IDOT) is currently conducting study and planning operations related to future development and expansion of US 20, a major highway that crosses, and has the potential to impact the water quality of the impaired portions of, the Galena and Sinsinawa Rivers. US 20 also passes through the Frenress Lake overland catchment area and future expansion projects have the potential to influence water quality in this water body as well. Funding, engineering, and environmental impact studies have been ongoing related to this project since 2005. More information can be found at the IDOT project description webpage at: <http://www.idot.illinois.gov/projects/us20-freeport>.

A volunteer water quality monitoring program also exists for streams within the watershed that is managed by the National Great Rivers Research & Education Center. This River Watch program's data was collected by volunteers, and although it will not be directly used by Illinois EPA for the purposes of the TMDL program, data available from this program may be beneficial for watershed planning and BMP implementation purposes. Further monitoring recommendations are included in the Implementation Plan in Section 9.

County-wide information regarding hazard mitigation and specifically flood control planning for Jo Daviess County can be found in county's Multi-Jurisdictional All Hazards Mitigation Plan published in March 2013. This plan is available from the Illinois Emergency Management Agency's website:

http://www.iema.illinois.gov/iema/planning/Documents/Plan_JodaviessCounty.pdf.

Further information regarding county-wide growth and development planning for Jo Daviess County can be found in the *Jo Daviess County, Illinois Comprehensive Plan- 2012 Update*, available at: <http://www.jodaviess.org>.

In addition, there is an ongoing 319 Nonpoint Source Program project being performed for the Apple Canyon Lake watershed, a nearby watershed within Jo Daviess County, Illinois. The Apple Canyon Lake Property Owner's Association is working on this project to improve water quality by controlling nonpoint source pollution in the watershed. Along with an education component, there is in-lake and tributary monitoring. The end result will be a watershed based plan and recommendations for future implementation which may include items relevant and applicable to the Galena/Sinsinawa Rivers watershed. Additional information can be found at: <http://www.epa.illinois.gov/Assets/iepa/water-quality/watershed-management/watershed-based-planning/2016/apple-canyon-lake-wbp.pdf>.

Section 6

Approach to Developing TMDL and Identification of Data Needs

Illinois EPA is currently developing TMDLs for pollutants that have numeric water quality standards. Of the pollutants causing impairment in the Galena/Sinsinawa Rivers watershed, total phosphorus, zinc, fecal coliform, and DO are the only parameters for which numeric water quality standards currently exist. In addition, a LRS was developed for TSS in the Galena River. Analyses were also completed for sediment/siltation in impaired stream segments and additional discussion is provided for TSS and turbidity in Frenress Lake. It is likely that by addressing the parameters with numeric standards and water quality targets, an overall improvement in water quality will be observed due to the interrelated nature of the other listed pollutants. Recommended technical approaches for developing TMDLs for streams and lakes are presented in this section.

6.1 Simple and Detailed Approaches for Developing TMDLs

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass-balance, load-duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches and therefore these are the analyses recommended for the Galena/Sinsinawa Rivers watershed. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL. As discussed above, this link can be established through a variety of techniques. The objective of the remainder of this section is to recommend approaches for establishing these links for the constituents of concern in the Galena/Sinsinawa Rivers watershed.

6.2 Approaches for Developing TMDLs and LRSs for Stream Segments in Galena/Sinsinawa Rivers Watershed

6.2.1 Recommended Approach for Zinc, Fecal Coliform, and Total Suspended Solids (and Sedimentation/Siltation) in the Galena River

Table 6-1 contains summary information regarding data availability for the metals, fecal coliform, and suspended solids impairments on the Galena and Sinsinawa Rivers.

Table 6-1 Stream Impairment Data Availability for Zinc, Fecal Coliform, and TSS in the Galena River

Waterbody Name	Segment ID	Impairment	Data Count	Period of Record
Galena River	MQ-01	Zinc, Dissolved	103	1999-2014
		Fecal Coliform	42	2000-2014
		TSS	90	1999-2014
Sinsinawa River	MS	TSS (sedimentation/siltation surrogate)	17	2000-2014

The recommended approach for developing TMDLs/LRSs for these segments and parameters is the load-duration curve method. The load-duration methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a waterbody.

6.3 Approaches for Developing TMDLs for Frentress Lake

6.3.1 Recommended Approach for Total Phosphorus and DO TMDLs

Frentress Lake is listed for impairment caused by total phosphorus, DO, turbidity, and TSS. The BATHTUB model is typically recommended for TMDL development for lake and reservoir impairments such as those in Frentress Lake. However, Frentress Lake is a backwater of the Mississippi River that is permanently connected to the river by several channels along the western edge of the lake. The hydrologic connection between the lake and the river appears to be significant and water quality and water quantity in the lake are likely heavily influenced by conditions in the Mississippi River. Frentress Lake is not fed by any other significant tributaries and has a small connected land drainage area of approximately 1,100 acres, suggesting that a bulk of factors influencing water quality within Frentress Lake are a product of interactions with the Mississippi River. Illinois EPA has provided water quality data for the Mississippi River (see further discussion in Section 7.2.2).

Because of the relatively small directly-contributing watershed and lack of other tributaries besides the Mississippi River, the Vollenweider Lake Model is recommended for calculating allowable phosphorus loads to Frentress Lake. The Vollenweider Lake Model uses a statistical relationship between areal annual phosphorus loading to a lake normalized by mean depth and hydraulic residence time, to predict lake phosphorus concentration. The interaction of the lake with the Mississippi River will limit the efficacy of any load reduction strategies developed for the Frentress Lake watershed. However, improved watershed management strategies that are currently being, and have recently been, implemented throughout the Upper Mississippi River watershed will likely contribute to reduced nutrient loads within the river and as a result, will likely lead to improved water quality within Frentress Lake.

Section 7

Methodology Development for the Galena/Sinsinawa Rivers Watershed

7.1 Methodology Overview

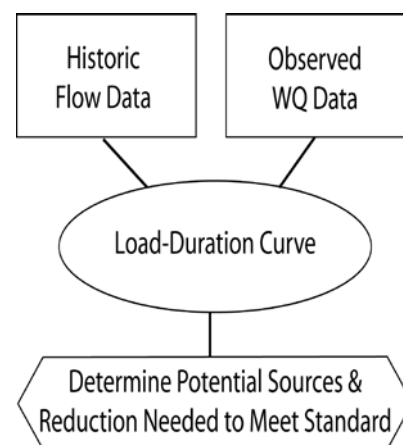

Table 7-1 contains information on the methodologies selected and used to develop TMDLs and LRSs for impaired waterbodies within the Galena/Sinsinawa Rivers watershed.

Table 7-1 Methodology Overview

Segment ID	Segment Name	Potential Causes of Impairment	Assessment Type	Methodology
MQ-01	Galena River	Zinc	TMDL	Load Duration Curve
		Sedimentation/Siltation	LRS	Addressed through Load Duration Curve for TSS
		Total Suspended Solids	LRS	Load Duration Curve
		Fecal Coliform	TMDL	Load Duration Curve
MS	Sinsinawa River	Sedimentation/Siltation	LRS	Addressed through Load Duration Curve for TSS
RMA	Frentress Lake	Total Phosphorus	TMDL for Total Phosphorus	Vollenweider Lake Load Model for Phosphorus
		Dissolved Oxygen		
		Turbidity	LRS	No LRSs developed. Implementation strategies for each parameter are provided in Section 9.
		Total Suspended Solids	LRS	

7.1.1 Load Duration Curve Overview

Loading capacity analyses were performed for zinc, TSS, and fecal coliform on the Galena River segment MQ-01 and for TSS in the Sinsinawa River through the development of load-duration curves. A load-duration curve is a graphical representation of the maximum load of a pollutant that a stream segment can assimilate over a range of flow scenarios while still meeting the instream water quality standard. The load-duration curve approach utilizes historical flow data and observed water quality data to assess the magnitude and frequency of exceedances, as well as to determine the flow scenarios when exceedances occur most often (see Schematic 1).

Schematic 1

7.1.2 Vollenweider Model Overview

The empirical Vollenweider Lake Model (Vollenweider 1975) was utilized to determine the annual phosphorus loading to the lake under existing conditions and the allowable phosphorus load in order to meet in-lake standards. This model describes the in-lake nutrient concentration of a lake as a function of the nutrient loading, mean depth, and hydraulic residence time based on

evaluation of many temperate lakes. It provides for the calculation of approximate annual watershed loadings associated with a specified in-lake phosphorus concentration, and vice versa.

7.2 Methodology Development

The following sections further discuss and describe the methodologies utilized to examine concentrations in the impaired stream segments of the Galena and Sinsinawa Rivers watershed.

7.2.1 Load Duration Curve Development

Load duration curves are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. Flow duration curve development considers the cumulative frequency of historic flow data over a specified period. A flow duration curve relates flow values to the percent of time those values have been met or exceeded. The use of flow exceedance probability provides a uniform scale ranging between 0 and 100 and can be further broken down into ranges (e.g. 0-10%, 10-40%, etc) for the TMDL analysis. Low flows are exceeded a majority of the time, while floods are exceeded infrequently. Flows are multiplied by the applicable numeric standard to develop a load-duration curve and historical data, coupled with its corresponding flows, are plotted against the curve to assess reduction needs. This approach was used to characterize the current loading of zinc, fecal coliform, and TSS to impaired segment MQ-01 of the Galena River, and loading of TSS to impaired segment MS of the Sinsinawa River.

7.2.1.1 Watershed Delineation and Flow Estimation

Watersheds for the areas contributing direct loading to the impaired stream segments were delineated using GIS analyses of data layers provided in the NED as discussed in Section 2.2 of this report.

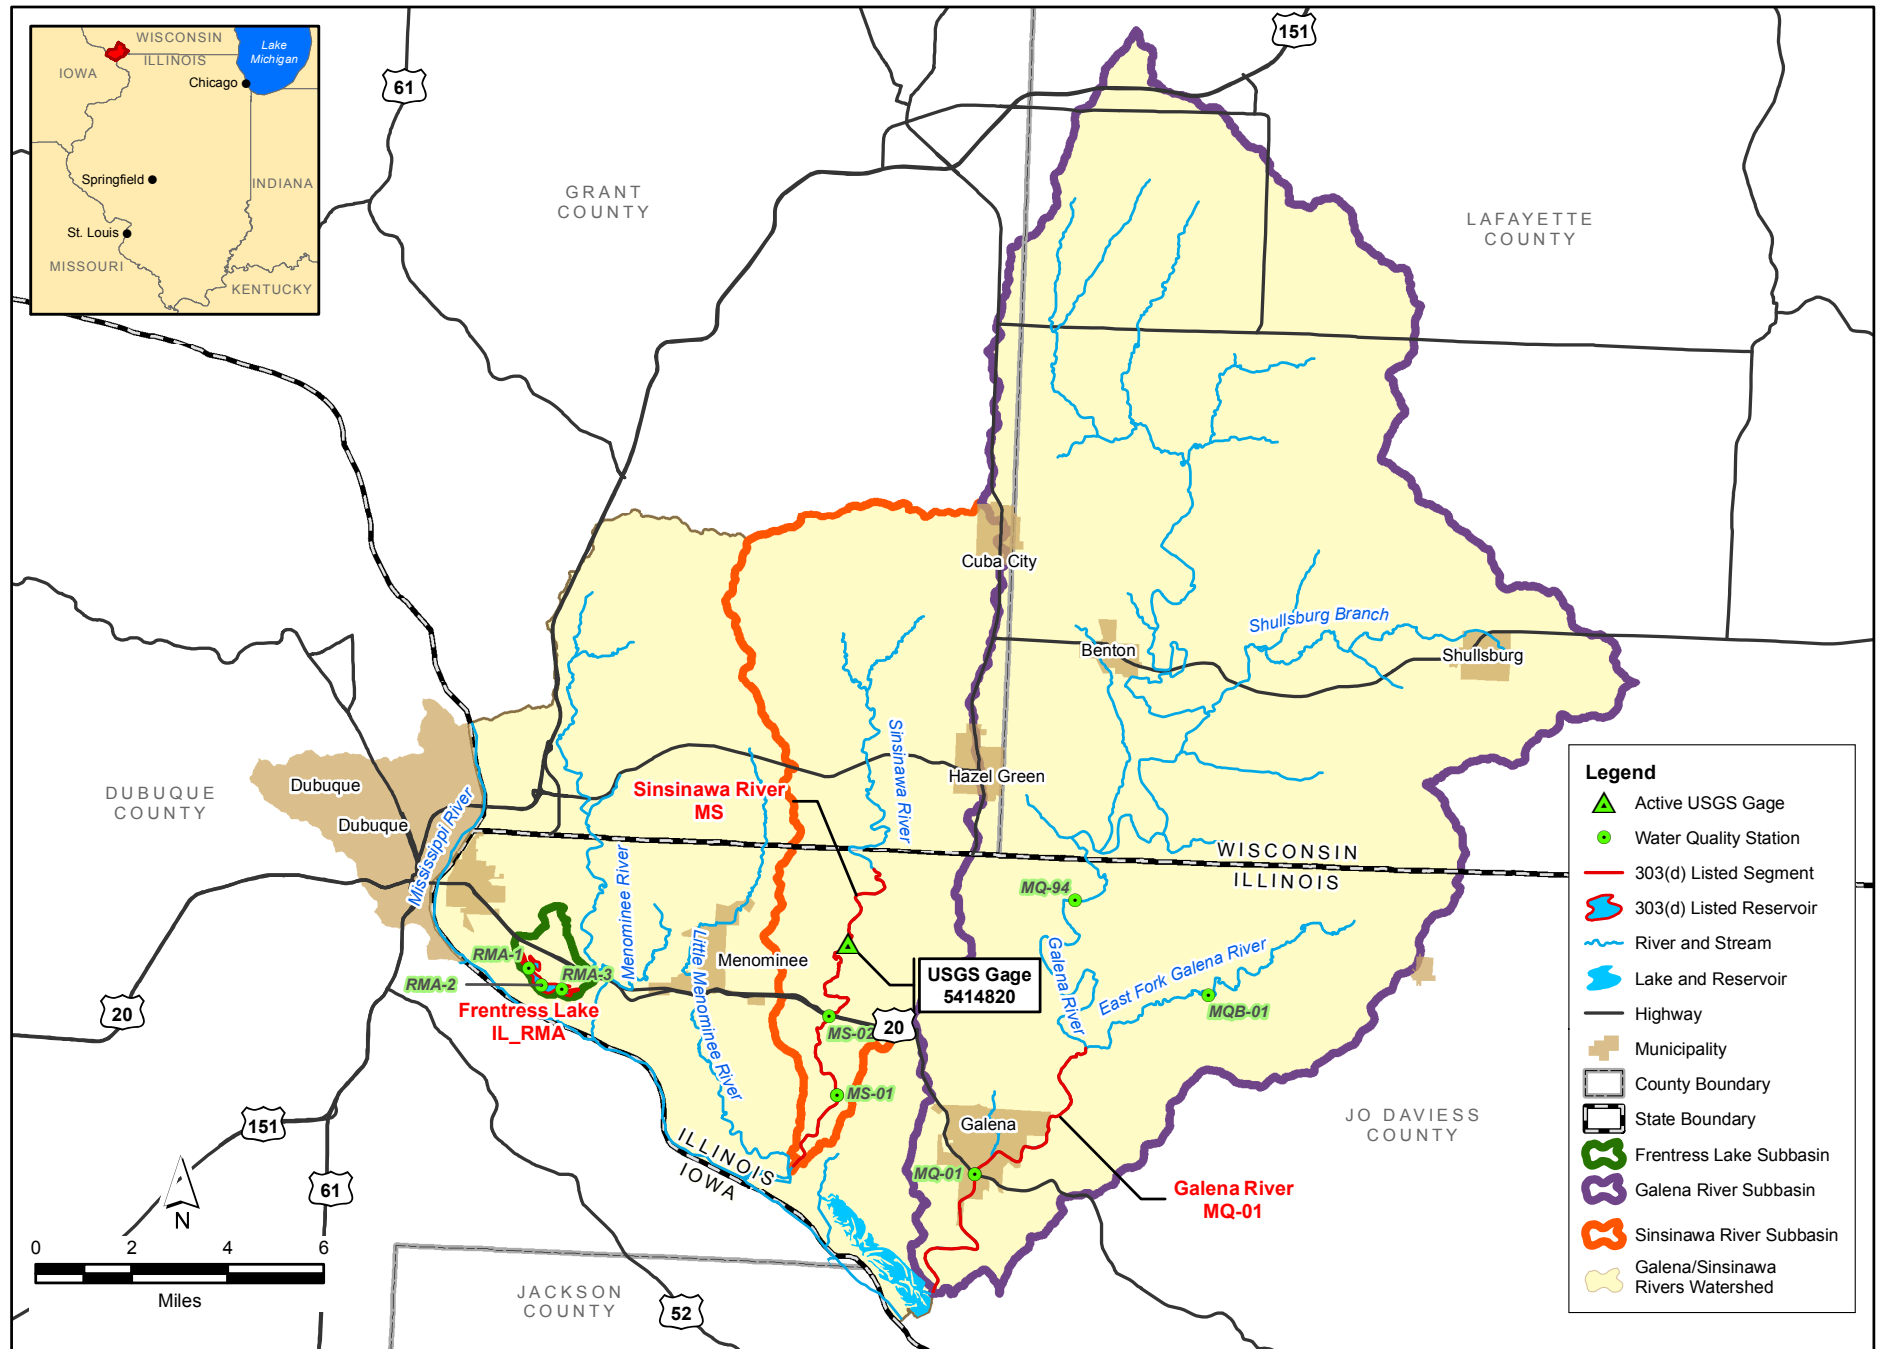

Watershed delineations show that segment MQ-01 of the Galena River captures flows from a directly contributing watershed of approximately 196.6 square miles at the water quality sampling station. Analysis was also completed on Segment MS of the Sinsinawa River where watershed delineations show the segment captures flows from a directly contributing watershed of approximately 48.3 square miles at the water quality sampling station. **Figure 7-1** shows the location of each of the water quality stations, as well as the boundary of the GIS-delineated watershed for this subbasin.

In order to create a load duration curve, it is necessary to obtain flow data corresponding to each water quality sample. Six USGS stream gages have historically existed in the Galena/Sinsinawa Rivers watershed; however, as discussed in Section 2.6.3 of this report, only one gage is currently active. The currently active gage utilized for these calculations is USGS gage 5414820 Sinsinawa River near Menominee, IL. The period of record for flow measurements at this gage extends from 1967 through the present, with average monthly flows ranging from 20.98 cubic feet per second (cfs) in November to 41.78 cfs in March. The drainage area to this gage is approximately 39.6 square miles. Data from this gage were used to estimate flow values at ungaged locations in the Galena/Sinsinawa Rivers watershed using the drainage area ratio method represented by the following equation:

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where Q_{gaged} = Streamflow of the gaged basin
 Q_{ungaged} = Streamflow of the ungaged basin
 $\text{Area}_{\text{gaged}}$ = Area of the gaged basin
 $\text{Area}_{\text{ungaged}}$ = Area of the ungaged basin

This page intentionally left blank.

Galena/Sinsinawa Rivers

Watershed Delineation and Flow Estimation Points for Load Duration Curves

FIGURE 7-1

This page intentionally left blank.

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Data downloaded through the USGS for the surrogate gage for the available period of record were adjusted to account for point source influence in the watershed upstream of the gaging station. Average daily flows from all NPDES permitted facilities upstream of the surrogate USGS gages are typically subtracted from the gaged flow prior to flow-per unit-area calculations; however, in this case, no permitted point sources exist upstream of the surrogate gage. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Galena/Sinsinawa Rivers watershed were then added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment.

7.2.1.2 Zinc in Galena River Segment MQ-01

A load duration curve for dissolved zinc in impaired segment MQ-01 of the Galena River was generated by ranking the daily flow data estimated through the area ratio method discussed above, determining the percent of days these flows were exceeded, and then graphically plotting the results. The flows in the duration curve were then multiplied by the lowest calculated chronic water quality standard to generate a load duration curve. Water quality standards for zinc that have been established to protect aquatic life include both chronic and acute standards that are calculated based on the existing total hardness concentration in stream at the time of sampling. As a conservative measure, the allowable load calculations for this TMDL are based on the lowest calculated chronic water quality standard in the available dataset for segment MQ-01 of 58.37 $\mu\text{g/L}$ (calculated using the lowest reported in-stream hardness of 209 mg/L).

Data collected from USEPA STORET and Illinois EPA databases during Stage 1 of TMDL development, as well as additional data collected by Illinois EPA in 2014, were paired with the corresponding flow for the sampling dates and plotted against the load duration curve. **Figure 7-2** shows the load duration curve developed for segment MQ-01. The load duration curve is depicted as a solid line and the historically observed pollutant loads for dissolved zinc as points on the graph.

Plotting the available sample data against the load duration curve for dissolved zinc shows that exceedances occurred during the full range of flow conditions. However, exceedances are less likely to occur during dry conditions and low flows. Spreadsheets used for the calculation of the load duration curve are provided in Appendix D.

This page intentionally left blank.

Figure 7-2
Galena River MQ-01
Zinc Load Duration Curve

This page intentionally left blank.

7.2.1.3 Fecal Coliform in Galena River Segment MQ-01

A load duration curve for fecal coliform was also developed for Galena River segment MQ-01 by determining the percent of days each estimated flow was exceeded, and then graphically plotting the results. However, because the fecal coliform standard is seasonal and is applicable between the months of May and October, only flows recorded during this time period were used in the analysis. The flows in the duration curve were then multiplied by the water quality standard of 200 cfu/100mL to generate a load duration curve. Fecal coliform data collected between May and October were compiled from data amassed earlier stages of TMDL development. These data were then paired with the corresponding flows for the sampling dates and plotted against the load duration curve. **Figure 7-3** shows the load duration curve for the segment as a solid line and the observed pollutant loads as points on the graphs.

A total of 34 of the 42 fecal coliform samples collected on segment MQ-01 between the months of May and October since 1999 have exceeded the geometric mean standard of 200 cfu/100mL. Plotting the available sample data against the load duration curve shows that exceedances of the fecal coliform standard at MQ-01 occurred at all flow levels. Appendix D contains spreadsheets used for the calculation of the load duration curves for fecal coliform.

7.2.1.4 TSS and Sedimentation/Siltation in Galena River Segment MQ-01 and Sinsinawa River Segment MS

Load duration curves were developed for TSS and sedimentation/siltation impairments on Galena River segment MQ-01 and Sinsinawa River segment MS. Numeric standards do not exist for TSS or sedimentation/siltation impairments in streams, so the watershed-specific LRS target value provided by Illinois EPA of 24.1 mg/L of TSS was used to develop the load duration curves for each of these impairments. TSS data for each reach obtained during Stage 1 and Stage 2 of TMDL development were paired with the corresponding flows estimated for each reach for the sampling dates to estimate loads. The observed load estimates were then plotted against the load duration curves developed for TSS in each segment.

Forty of the 83 TSS samples collected from Galena River segment MQ-01 exceed the LRS target value of 24.1 mg/L. Plotting the available sample data against the load duration curve shows that exceedances of the target value occurred at all flow levels **Figure 7-4**. However, a greater proportion of samples collected under mid to high flow conditions exceed the target TSS concentration than those collected under dry or low flow conditions.

Six of the 17 TSS samples collected on Sinsinawa River segment MS exceed the LRS target value of 24.1 mg/L. Although TSS data were collected in 2014, the existing dataset for TSS concentrations in the Sinsinawa River is limited. Based on available data, however, all exceedances occur during high and mid-range flows **Figure 7-5**.

Appendix D contains spreadsheets used for the calculation of each of these load duration curves.

7.2.2 Frentress Lake Total Phosphorus TMDL Assessment

Frentress Lake is listed for impairment caused by total phosphorus, DO, turbidity, and TSS. The BATHTUB model is typically used for TMDL development for lake and reservoir impairments such as those in Frentress Lake. However, as discussed in Section 6, Frentress Lake is a backwater of the Mississippi River that is permanently connected to the river by several channels along the western edge of the lake (**Figure 7-6**). The hydrologic connection between the lake and the river is significant and water quality and water quantity in the lake are heavily influenced by conditions in the Mississippi River. An initial review of data was performed to compare upstream Mississippi River concentrations to those collected in Frentress Lake (**Table 7-2**). **Table 7-2** shows data from Mississippi River station M-13 (Lock and Dam 11 at Dubuque). The station is located several miles upstream of Frentress Lake but shows that water from the Mississippi River has similarly elevated average and median values for total phosphorus and TSS.

Table 7-2: Frentress Lake vs Mississippi River Water Quality Data

Parameter	Total Phosphorus		TSS	
	Frentress Lake	Mississippi River	Frentress Lake	Mississippi River
Station	RMA-1, 2, 3	M-13	RMA-1, 2, 3	M-13
Sample Count	68	39	68	40
Minimum (mg/L)	0.102	0.024	11	4
Maximum (mg/L)	0.346	0.217	114	112
Average (mg/L)	0.173	0.122	37.7	30.1
Median (mg/L)	0.161	0.129	34	23.5

A simple Vollenweider model was constructed as a means for roughly approximating the total Mississippi River watershed phosphorus (P) reduction required to achieve the Frentress in-lake concentration target. This model relates in-lake P concentrations with total annual phosphorus loads to the lake. The model also incorporates lake hydraulics (depth and residence time), with an inverse relationship between P concentration and both depth and flushing. In other words, the model captures the fact that shallower and low flushing lakes are more sensitive to P loads compared to their counterparts. The Vollenweider model is expressed as:

$$P = \frac{Lp}{qs} \frac{1}{1 + \sqrt{z/qs}}$$

where:

P = in-lake total phosphorus concentration

Lp = annual total phosphorus load / lake surface area

qs = surface overflow rate = z/T

z = mean lake depth

T = hydraulic residence time.

This page intentionally left blank.

**Galena/Sinsinawa Rivers
Frentress Lake Aerial View**

FIGURE 7-6

This page intentionally left blank.

This equation was first solved for the current annual total P load using variable values presented in **Table 7-3**. For this application, full hydraulic connectivity is assumed to the upstream Mississippi River watershed. Therefore, the relevant loads and flow rates are those associated with the total upstream Mississippi River watershed. A mean annual in-lake P concentration of 0.17 mg/L was assumed in the model based on measured data from the period 2001 – 2013. A mean annual flow rate of 55,000 cfs was assumed based on historical USGS flow data (Mississippi River at Clinton, IA). Lastly, a lake surface area of 158 acres was assumed based on Illinois EPA data.

Table 7-3: Fretress Lake Vollenweider Model Parameters

Parameter	Value	Source
In-lake P concentration (mg/L)	0.17	measured
Total Current Watershed P load (lbs/year)	20,000	calculated (modeled)
Lake area (acres)	158	IEPA, personal communication
Inflow rate (cfs)	55,000	USGS gage (05420500)
Mean depth (ft)	12.5	Online summary
Residence time (days)	0.02	calculated

Section 8

Total Maximum Daily Loads for the Galena/Sinsinawa Rivers Watershed

8.1 TMDL Endpoints for the Galena/Sinsinawa Watershed

The TMDL endpoints and LRS target values for dissolved zinc, fecal coliform, TSS, and sedimentation/siltation in streams, and total phosphorus in Frentress Lake are summarized in **Table 8-1**. For all parameters, the concentrations must be less than the TMDL or LRS target value. The TMDL endpoints for fecal coliform vary seasonally and endpoints for dissolved zinc are hardness-dependent. Parameters with numeric water quality standards are assessed via the TMDL process and the TMDL endpoints directly correlate to the lowest applicable water quality standard established for a given parameter. Parameters without numeric water quality standards were assigned a watershed-specific LRS target value developed by Illinois EPA. These target values are voluntary measures that are intended to serve as planning tools for overall water quality improvement strategies in the watershed.

Table 8-1 TMDL Endpoints and Average Observed Concentrations for Impaired Constituents in the Galena River/Sinsinawa Rivers Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Assessment Type	TMDL Endpoint or Target Value
MQ-01	Galena River	Zinc	TMDL	58.37 µg/L ¹
		<i>Sedimentation/Siltation</i>	<i>LRS</i>	24.1 mg/L of TSS
		<i>Total Suspended Solids</i>	<i>LRS</i>	24.1 mg/L of TSS
		Fecal Coliform	TMDL	200 cfu/100 ml
MS	Sinsinawa River	<i>Sedimentation/Siltation</i>	<i>LRS</i>	24.1 mg/L of TSS
RMA	Frentress Lake	<i>Turbidity</i>	<i>No LRS developed</i>	Implementation Strategies included in Section 9
		Total Phosphorus	TMDL	0.05 mg/L of TP
		Dissolved Oxygen	TMDL for Total Phosphorus	
		<i>Total Suspended Solids</i>	<i>No LRS developed</i>	Implementation Strategies included in Section 9

¹ WQ standard is hardness dependent, lowest calculated chronic standard shown

8.2 Pollutant Source and Linkages

Potential pollutant sources for impaired lakes and streams in the Galena/Sinsinawa Rivers watershed include both point and nonpoint sources as described in Section 5 of this report. Load duration curves were developed for the zinc and fecal coliform TMDLs, as well as for the TSS and sedimentation/siltation LRSs. Load duration curves are useful in that they provide a link between historical sampling values and hydrologic condition. **Table 8-2** shows the example source area/hydrologic condition consideration developed by USEPA.

Table 8-2 Example Source Area/Hydrologic Condition Considerations (EPA, 2007)

Contributing Source Area	Duration Curve Zone				
	High Flow	Moist	Mid-Range	Dry	Low Flow
Point Source				M	H
Onsite Wastewater System			H	M	
Riparian Areas		H	H	H	
Stormwater: Impervious Areas		H	H	H	
Combined sewer overflows	H	H	H		
Stormwater: Upland	H	H	M		
Bank Erosion	H	M			

Note: potential relative importance of source area to contribute loads under given hydrologic conditions (H: High, M: Medium)

Further pollutant source discussion is provided throughout this section and implementation activities to reduce loading from the potential sources are outlined in Section 9.

8.3 TMDL Allocation

As explained in the Section 1 of this report, the TMDLs for impaired segments in the Galena River/Sinsinawa Rivers watershed address the following equation:

$$\text{TMDL} = \text{LC} = \Sigma \text{WLA} + \Sigma \text{LA} + \text{MOS} + \text{RC}$$

- where:
- LC = Loading capacity - the maximum amount of pollutant loading a water body can receive without violating water quality standards
 - WLA = Waste load allocation - the portion of the TMDL allocated to existing or future point sources
 - LA = Load allocation - the portion of the TMDL allocated to existing or future nonpoint sources and natural background
 - MOS = Margin of safety - an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
 - RC = Reserve capacity - the portion of the load explicitly set aside for future population growth and additional development in the watershed

Each of these elements is discussed in this section, as is the consideration of seasonal variation in the TMDL calculation. Note that RC has not been included in any of the TMDLs as large-scale future growth is not anticipated.

8.3.1 Fecal Coliform TMDL

Galena River Segment MQ-01 is listed for impairment of the primary contact recreation use caused by fecal coliform. Exceedances of the fecal coliform standards have occurred under all flow conditions indicating that fecal coliform loading within the Galena River subbasin originates from both point and nonpoint sources. High fecal coliform counts recorded during dry weather are associated with permitted discharges from municipal wastewater treatment facilities and can also be associated with failing septic systems. High fecal coliform counts seen during wet weather are associated with nonpoint sources such as urban and rural stormwater that washes livestock,

pet, and wildlife waste into the Galena River. A load duration curve was developed (see Section 7) to determine load reductions needed to meet the instream water quality standards under varying flow scenarios.

8.3.1.1 Loading Capacity

The LC is the maximum amount of fecal coliform that Galena River segment MQ-01 can receive and still maintain compliance with the water quality standards. The allowable fecal coliform loads that can be generated in the watershed and still maintain the geometric mean standard of 200 cfu/100mL were determined with the methodology discussed in Section 7. The fecal coliform loading capacity according to flow is presented in **Table 8-3**.

8.3.1.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the TMDL has been calculated to meet the standard during all flow conditions. In addition, seasonality is addressed because the TMDL has been calculated to address loading only when the seasonal standard is applicable (May through October).

The critical period for fecal coliform is the primary contact recreation season which is May through October each year. There is no one critical flow condition during the recreation season. The fecal coliform standard must be met under all flow scenarios and exceedances of the standard have occurred during the majority of flow scenarios. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

Table 8-3 Estimated Fecal Coliform Loading Capacities Under Various Flow Conditions for Galena River Segment MQ-01

Estimated Mean Daily Flow (cfs)	Load Capacity (mil col/day)
1	4,894
5	24,468
10	48,937
50	244,685
100	489,370
500	2,446,848
1,000	4,893,696
5,000	24,468,480
10,000	48,936,960
15,000	73,405,440

8.3.1.3 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings) or a combination of both. The MOS for the MQ-01 TMDL is implicit as the analysis used the more conservative 200 cfu/100mL chronic standard as opposed to the single-sample, acute maximum standard of 400 cfu/100mL. In addition, the TMDL does not account for die-off of bacteria, which occurs at an unquantified rate as bacteria move downstream in the system.

8.3.1.4 Waste Load Allocation

There are four small municipal treatment facilities with NPDES permitted discharges within the modeled portion of the Galena River segment MQ-01 watershed upstream of the MQ-01 sampling location (**Table 8-4**). Three facilities discharge within the Wisconsin portion of the watershed and are a significant distance upstream of the impaired waterbody. Waste loads have not been allocated to these facilities because of the significant distance upstream and because they are regulated by the Wisconsin DNR. The Galena South Sewage plant is the only domestic facility

discharging within the Illinois portion of the watershed. This facility currently has a daily maximum permit limit for fecal coliform of 400 cfu/100ml (applicable only from May through October). However, Illinois EPA is in the process of working with permittees in TMDL watersheds to lower permit limits for domestic wastewater treatment facilities from a daily maximum of 400 cfu/100ml to a geometric mean of 200 cfu/100ml. The lower limit (200 cfu/100ml), in combination with the facility’s design flow rates, was used to set the WLA for all flow levels. This methodology, ensures that the point sources will not be contributing to fecal coliform exceedances instream. The WLA for the domestic facilities in this watershed was determined to be 32,108 million colonies/day when calculated using the Galena South facility’s DMF. The WLA for the facility is shown in **Table 8-4**.

Table 8-4 WLA for Fecal Coliform for NPDES Permitted Municipal Treatment Facilities in the Galena River MQ-01 Watershed

Facility	NPDES Permit Number	Design Average Flow (MGD)	WLA-DAF (mil. col/Day)	Design Maximum Flow (MGD)	WLA-DMF (mil. col/Day)
GALENA SOUTH SEWAGE	IL0075191	1.17	17,730	4.24	32,108

In addition to the permitted wastewater plants in the Galena River subbasin, there are two permitted animal operations in the Wisconsin portion of the watershed: Darlington Ridge Farms and DC Kamps Farm. Both facilities are a significant distance upstream of the impaired segment of the Galena River in Illinois and regulated by the Wisconsin DNR. Wisconsin DNR CAFO permits have a zero discharge standard for feedlot and feed storage runoff.

8.3.1.5 Load Allocation and TMDL Summary

Table 8-5 shows a summary of the fecal coliform TMDL for Galena River segment MQ-01. The WLA was calculated using the DMF for the Illinois facility and the 200cfu/100ml (geometric mean) permit limit. Exceedances of the fecal coliform standard occurred across each of the ten possible flow categories. Flow categories are shown in the table as “Flow Exceedance Ranges”. The 90th percentile of the values across a given flow range were used in the actual load calculations and the resulting percentage of necessary load reduction by flow category range from 31% to 96%. Percent reductions presented under this scenario assume a reduction in the NPDES permit limit at the time of renewal. The remainder of reductions are needed from non-permitted non-point source loads. Recommendations for reducing in-stream fecal coliform concentrations on this segment are discussed in Section 9 of this report.

Table 8-5 Fecal Coliform TMDL for Galena River MQ-01

Zone	Flow Exceedance Range (%)	LC (mil col/day)	LA (mil col/day)	WLA (mil col/day)	MOS	Actual Load ¹ (mil col/day)	Percent Reduction Needed (%)
High	0 - 10	1,404,936	1,372,828	32,108	implicit	1,939,465	28%
Moist	10 - 20	773,221	741,113	32,108	implicit	14,388,764	95%
	20 - 30	603,144	571,036	32,108	implicit	3,599,428	83%
	30 - 40	505,957	473,849	32,108	implicit	11,855,169	96%
Mid-Range	40 - 50	433,067	400,959	32,108	implicit	805,418	46%
Dry	50 - 60	360,177	328,069	32,108	implicit	8,076,821	96%
	60 - 70	335,881	303,773	32,108	implicit	988,286	66%
	70 - 80	262,990	230,882	32,108	implicit	1,404,556	81%
	80 - 90	214,397	182,289	32,108	implicit	2,630,554	92%
Low Flow	90 - 100	158,515	126,407	32,108	implicit	249,464	36%

¹ Actual Load was calculated using the 90th percentile of observed Fecal coliform concentrations in a given flow range (EPA 2007) *mil col/day = million fecal coliform colony forming units/day

8.3.2 Zinc TMDL

Galena River Segment MQ-01 is listed for impairment caused by zinc. A load duration curve was developed (see Section 7) to determine load reductions needed to meet the instream water quality standards. Chronic and acute water quality standards developed for dissolved zinc are calculated based on total hardness concentrations in the water body at the time of sample collection (see Section 4 of this report). While counts of exceedances are based on sample-specific calculations of acute and chronic standards, load duration curves developed to determine load reductions needed to meet the standards at varying flow scenarios used the lowest calculated chronic standard based on the available hardness dataset.

Exceedances of the chronic standard have occurred under all flow scenarios with the highest excursions occurring during wet conditions. Zinc is a naturally occurring element within the watershed and bound to area soils. Zinc is carried to the streams as soils migrate from the land through erosive processes and can be resuspended through streambed scouring. Additionally, groundwater seepage from historic mine tailing deposits throughout the watershed floodplain is a likely contributor of zinc during drier periods.

8.3.2.1 Loading Capacities

The LC is the maximum quantity of dissolved zinc that the impaired segment can receive and still maintain compliance with the water quality standard. For the purpose of TMDL development, the lowest calculated chronic standard based on the lowest reported total hardness value in the

Table 8-6 Zinc Loading Capacity for Galena River MQ-01

Estimated Mean Daily Flow (cfs)	Load Capacity (lbs/day)
1	0.4
5	1.9
10	3.8
50	19
100	38
500	188
1,000	376
5,000	1,882

watershed was used to establish the loading capacity. This represents a conservative measure designed to reduce the potential for overestimation of loading capacity in the stream. **Table 8-6** contains the loading capacities for zinc under a range of flow conditions.

8.3.2.2 Seasonal Variations

Consideration of seasonality is inherent to load duration analysis. The dissolved zinc water quality standard is not seasonal and the full range of expected flows is represented in the loading capacity table (**Table 8-6**). Therefore, the loading capacity represents conditions throughout the year. Load duration curve development and analysis (Section 7) show that zinc exceedances have occurred across the full range of flow conditions.

8.3.2.3 Margins of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings) or a combination of both. The MOS for the zinc TMDL in MQ-01 is both implicit, as the analysis used the most conservative calculated chronic standard, and explicit as an additional 10% MOS was included in the TMDL calculations. The explicit MOS of 10 percent is employed to compensate for uncertainty in the TMDLs developed using the load duration curve methodology. This relatively modest MOS is adequate given that the fundamental calculation of the loading capacity is simply a function of flow multiplied by the target value, an approach which minimizes a great deal of uncertainty inherent to other modeling methodology. Most of the uncertainty is therefore associated with the estimation of flows in the assessed segment calculated by extrapolating flows from a surrogate USGS gage. The methodology employed in estimating watershed flows was discussed in Section 7 of this document.

8.3.2.4 Waste Load Allocation

One NPDES permitted facility discharges within the Illinois portion of the Galena River segment MQ-01 subbasin. There are currently no permitted effluent limits or monitoring requirements for zinc at the facility. The Illinois EPA permitting section reviewed the water-quality based effluent limits for the facility in 2017 and concluded that “There is no reasonable potential to exceed the acute water quality standard for zinc. The average of the zinc samples times the multiplier was less than the chronic water quality standard. (Illinois EPA’s) conclusion is that no regulation of Zinc is necessary and that no monitoring beyond the routine requirements is needed.”

8.3.2.5 Load Allocations and TMDL Summaries

Table 8-7 shows the summary of the dissolved zinc TMDL for segment MQ-01, along with the percent reductions required at various flow levels.

Table 8-7 Dissolved Zinc TMDL for Galena River MQ-01

Zone	Flow Exceedances Range (%)	LC ¹ (lbs/day)	LA (lbs/day)	WLA (lbs/day)	MOS	Actual Load ² (lbs/day)	Percent Reduction Needed (%)
High	0 - 10	94	84	0.0	9.4	252	63%
Moist	10 - 20	53	48	0.0	5.3	142	63%
	20 - 30	42	38	0.0	4.2	80	48%
	30 - 40	36	32	0.0	3.6	84	57%
Mid-Range	40 - 50	31	28	0.0	3.1	70	56%
Dry	50 - 60	27	24	0.0	2.7	47	43%
	60 - 70	25	22	0.0	2.5	63	61%
	70 - 80	20	18	0.0	2.0	36	43%
	80 - 90	17	15	0.0	1.7	42	59%
Low Flow	90 - 100	14	12	0.0	1.4	28	51%

¹ LC based on lowest calculated hardness-based chronic water quality standard.

² Actual Load was calculated using the 90th percentile of observed zinc concentrations in a given flow range (EPA 2007)

The historical exceedances of the dissolved zinc standard occurred across all of the ten possible flow categories. The 90th percentile of the values across a given flow range were used in the actual load calculations and the resulting percentage of necessary load reduction by flow category range from 43% to 63%. Recommendations for reducing in-stream zinc concentrations on this segment are discussed in Section 9 of this report.

8.3.3 TSS and Sedimentation/Siltation LRSs in Stream Segments

Galena River segment MQ-01 is listed for impairment of the aquatic life use caused by TSS. Sinsinawa River segment MS is listed for impairment of the aesthetic quality use caused by excess sedimentation and siltation, a similar measure of sediment loads in a waterbody. As no numeric water quality standard exists for either TSS or sedimentation/siltation in streams in Illinois, a watershed-specific numeric target of 24.1 mg/L of TSS was developed by Illinois EPA for use in assessing both TSS and sedimentation/siltation impairments in the Galena/Sinsinawa Rivers watershed. Load duration curves were developed (see Section 7) for each segment to determine load reductions needed to meet the instream water quality target under a full range of flow scenarios.

8.3.3.1 Target Loading Capacities

The LC is the maximum TSS load the impaired waters can receive and still meet the LRS target value for TSS or sedimentation/siltation in this watershed. The allowable loads that may be generated in the watershed were determined using estimated flow conditions and the numeric LRS target of 24.1 mg/L of TSS, as discussed in Section 7. The TSS and sedimentation/siltation loading capacity according to flow is presented in **Table 8-8**.

Table 8-8 TSS and Sedimentation/Siltation Loading Capacity in Streams of the Galena/Sinsinawa Rivers Watershed

Estimated Mean Daily Flow (cfs)	Target Load Capacity (lbs/day of TSS)
1	130
10	1,300
100	13,000
500	65,002
1,000	130,005
10,000	1,300,046
30,000	3,900,137

8.3.3.2 Percent Reduction and LRS Summary for TSS and Sedimentation/Siltation in Streams

Tables 8-9 and **8-10** provide summaries of the LRS and percent reductions from current conditions needed to meet the TSS and sedimentation/siltation targets under various flow conditions in Galena River segment MQ-01 and Sinsinawa River segment MS, respectively.

Measurements of instream TSS concentrations have been collected in the Galena River during each flow condition category presented in **Table 8-9**. TSS loads in this reach exceed the LRS target value across a wide range of flow conditions. Overall load reductions of 0-81 percent are needed to meet the instream target with the greatest reductions in TSS loads required at the highest flows.

Table 8-9 LRS Targets for TSS in Galena River Segment MQ-01

Zone	Flow Exceedance Range (%)	Target Loading Capacity (lbs/day)	Actual Load ¹ (lbs/day)	Percent Reduction Needed (%)
High	0 - 10	37,297	122,452	70%
Moist	10 - 20	20,527	107,008	81%
	20 - 30	16,012	45,691	65%
	30 - 40	13,432	24,425	45%
Mid-Range	40 - 50	11,497	22,914	50%
Dry	50 - 60	9,562	23,382	59%
	60 - 70	8,917	5,554	0%
	70 - 80	6,982	16,234	57%
	80 - 90	5,692	9,973	43%
Low Flow	90 - 100	4,208	9,225	54%

¹ Actual Load was calculated using the 90th percentile of observed TSS concentrations in a given flow range (EPA 2007)

TSS data availability for the Sinsinawa River are somewhat limited with 17 samples having been collected across only four of the 10 flow categories presented in **Table 8-10**. Based on the available data, exceedances of the LRS target value have occurred only under moist and mid-range conditions; however, insufficient data exist to accurately characterize the range of flow conditions susceptible to impairment.

Table 8-10 LRS Targets for TSS in Sinsinawa River Segment MS

Zone	Flow Exceedance Range (%)	Target Loading Capacity (lbs/day)	Actual Load ¹ (lbs/day)	Percent Reduction Needed (%)
High	0 - 10	9,505	no data	-
Moist	10 - 20	5,386	2,673	0%
	20 - 30	4,277	no data	-
	30 - 40	3,644	5,480	34%
Mid-Range	40 - 50	3,168	3,896	19%
Dry	50 - 60	2,693	no data	-
	60 - 70	2,535	no data	-
	70 - 80	2,059	no data	-
	80 - 90	1,743	1,263	0%
Low Flow	90 - 100	1,378	no data	-

¹ Actual Load was calculated using the 90th percentile of observed TSS concentrations in a given flow range (EPA 2007)

8.4.1 Phosphorus TMDL

Based on the Vollenweider modeling described in Section 7, a large reduction in phosphorus load is required to achieve the established in-lake target for Frentress Lake. Under the assumption of 100% connectivity with the upstream Mississippi River watershed, a large reduction in total watershed load (75%) is required to achieve the target of 0.05 mg/L, as a mean annual value (**Table 8-11**). A single discharger was previously permitted to discharge within the directly contributing watershed of Frentress Lake. RH Properties had a noncontact cooling water industrial discharge permit (IL0078204) that was terminated in 2010. As such, no WLA was included in this TMDL for the directly contributing watershed.

The large reduction in phosphorus loading highlights the challenges of this particular lake with its unique connectivity to a much larger system. In-lake mitigation options may be a more viable alternative for achieving the desired water quality goal. These mitigation options and other nonpoint source reduction strategies for the directly contribution watershed are included in Section 9.

Table 8-11 Phosphorus TMDL, Frentress Lake

TMDL Component	Total Phosphorus (lbs/day)
Current Load	54,000
LC	15,000
LA	13,500
MOS (10%)	1,500
TMDL % Reduction	75%

8.4.2 Dissolved Oxygen and TSS in Frentress Lake

Frentress Lake is also listed as being impaired by low dissolved oxygen, which is often closely linked to phosphorus impairment. Phosphorus is a nutrient found in fertilizers and human and animal waste. It binds easily to sediment, and is often naturally occurring in soils. Phosphorus enters surface water through both point sources (permitted discharges) and nonpoint sources (stormwater runoff). Soluble forms of phosphorus come from municipal sewage treatment plants and permitted industrial discharges. As discussed above, there are no permitted facilities currently discharging effluent within the directly contributing watershed of Frentress Lake, however there are many dischargers within the upstream, large Upper Mississippi River basin.

The non-point sources of phosphorus include: natural decomposition of rocks and minerals, stormwater runoff, agricultural runoff, erosion and sedimentation, atmospheric deposition, and direct input by animals/wildlife. Phosphorus load from rural stormwater varies depending on land use and management practices and includes contributions from livestock, pastures, and row crop agriculture. High phosphorus levels are often closely tied to soil erosion from agricultural land uses. As discussed throughout this TMDL report, Frentress Lake is hydrologically linked to the Mississippi River. The significant nutrient contributions from widespread agriculture in the Upper Mississippi River basin are well documented and efforts to reduce these loads are being studied through the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force. In addition, a policy working group led by the Illinois Water Resource Center-Illinois Indiana Sea Grant, the Illinois EPA, and the Illinois Department of Agriculture is working on The Illinois Nutrient Loss Reduction Strategy which guides the state efforts to improve water quality by reducing nitrogen and phosphorus levels in lakes, streams, and rivers.

An often-cited scholarly article about the subject (Sharpley, et al, 1994) documents the established link between excessive agricultural-related phosphorus inputs, such as those found to be major contributors of phosphorus to Frentress Lake, and lake eutrophication associated with depleted dissolved oxygen concentrations at certain times of year. Excessive phosphorus loadings increase algal and aquatic plant life production. As algae and aquatic plants die off, they consume oxygen resulting in depressed oxygen levels in the lake. Reducing the phosphorus levels in the lake will shift plant production back to natural levels, which in turn will result in increased dissolved oxygen levels. The article also points out that “in many cases reduction in external loads may not translate into immediate benefit to the lake, because of steady release of nutrients from bottom sediments. Long-term nutrient loading to lakes has resulted in accumulation in bottom sediments, and thus provides a steady source”.

Given the linkages between phosphorus, sediment, and oxygen, it is expected that the measures taken to reduce the loads of phosphorus and sediment within the Upper Mississippi River basin and the directly-contributing Frentress Lake watershed, will, over time, improve the fluctuations in oxygen levels and improve conditions for the biotic community in the impaired lake. Therefore, no TMDL for dissolved oxygen in Frentress Lake was calculated at this time. Management measures addressing phosphorus from the contributing watershed and lake sediments, as well as erosion reduction are included in Section 9.

Section 9

Implementation Plan for the Galena/Sinsinawa Rivers Watershed

9.1 Implementation Overview

The goal of this watershed plan is to identify BMPs to be implemented in the Galena/Sinsinawa Rivers watershed that will provide reasonable assurance that impaired waters in the watershed will meet water quality criteria developed to ensure waterbodies are able to support their designated uses.

The USEPA has identified nine minimum elements that a watershed plan for impaired waters is expected to include. A watershed plan is expected to:

1. Identify causes and sources of pollution that will need to be controlled to achieve pollutant load reduction requirements estimated within the watershed plan.
2. Estimate pollutant load reductions expected as a result of implementation of management measures described in #3 below.
3. Describe the nonpoint source management measures that will need to be implemented to achieve load reductions estimates and identify the critical areas where measures need to be implemented.
4. Estimate the level of technical assistance, associated costs, potential funding sources and parties that will be relied upon to implement the prescribed measures.
5. Include a public information/education component designed to change social behavior.
6. Develop an implementation schedule for the plan.
7. Develop a description of interim, measurable milestones.
8. Identify indicators that can be used to determine whether pollutant loading reductions are being achieved over time.
9. Develop a monitoring component to evaluate the effectiveness of the implementation efforts over time.

For Element 1, the causes and sources of pollutions are described in Section 5 of this report.

9.2 Adaptive Management

An adaptive management or phased approach is recommended for the implementation of management practices designed to meet the TMDLs and LRSs developed for the Galena/Sinsinawa Rivers watershed. Adaptive management conforms to the USEPA guidelines

outlined above because it is a systematic process for continually improving management policies and practices through learning from the outcomes of operational programs. Some of the defining characteristics of adaptive management include:

- Acknowledgement of uncertainty about what policy or practice is "best" for the particular management issue
- Thoughtful selection of the policies or practices to be applied (the assessment and design stages of the cycle)
- Careful implementation of a plan of action designed to reveal the critical knowledge that is currently lacking
- Monitoring of key response indicators
- Analysis of the management outcomes in consideration of the original objectives and incorporation of the results into future decisions (British Columbia Ministry of Forests 2000)

Implementation actions, point source controls, management measures, and/or BMPs are used to control the generation or distribution of pollutants within a watershed. BMPs are either structural; such as wetlands, sediment basins, fencing, or filter strips; or managerial, such as conservation tillage practices, nutrient management plans, or crop rotation. Both structural and managerial BMPs require effective management to be successful in reducing pollutant loading to water resources (Osmond et al. 1995).

It is typically most effective to install a combination of point source controls and BMPs or a BMP system. A BMP system is a combination of two or more individual BMPs that are used to control pollutants from a single critical source. If the watershed has more than one identified pollutant, but the transport mechanism is the same, then a BMP system that establishes controls for the transport mechanism can be employed (Osmond et al. 1995).

To assist in development of an adaptive management program; implementation actions, management measures, available assistance programs, and recommended continued monitoring are all discussed throughout the remainder of this section. The point source BMPs described below are generally required and typically already being implemented although some modifications may be appropriate. The nonpoint source BMPs are entirely voluntary based on the landowner's preference.

9.3 BMP Recommendations for Reducing TSS and Sedimentation/Siltation in Watershed Streams

Soil erosion is the process of moving soil particles or sediment by flowing water or wind. Additionally, eroding soil transports pollutants that can potentially degrade water quality. TSS and/or sedimentation/siltation load reductions are needed for the following impaired stream segments/waterbodies in order to meet the watershed-specific LRS target value:

- Sinsinawa River segment MS
- Galena River segment MQ-01
- Frentress Lake (RMS)

The percent reductions needed to meet TSS targets for the watershed are discussed in Section 8. Sedimentation/siltation and TSS are LRS parameters and reduction strategies are provided below to help inform voluntary implementation to reduce contributions from nonpoint sources.

Nonpoint source runoff from agricultural areas and unstable streambanks are the main contributors to high sediment loads throughout the watershed. As such, nonpoint source controls designed to reduce erosion are expected to reduce TSS and sedimentation/siltation as well as provide a secondary benefit of reducing other contaminants such as fecal coliform, zinc, and total phosphorus that may be entering waterways via erosive processes. As discussed in Section 5.4.4, zinc-rich mine tailings have been documented throughout the Galena River floodplain. Measures presented below, particularly streambank erosion BMPs, will help reach the reduction goals set for zinc in the watershed.

Filter Strips: Filter strips are strips or areas of permanent herbaceous vegetation situated between cropland, grazing land, or disturbed land and environmentally sensitive areas, such as waterways. Filter strips serve as controls to reduce, sediment, particulate organic matter, and sediment-absorbed contaminant and pollutant loading in runoff. The filter strips are permanently designated plantings to treat runoff and are not part of an adjacent cropland's rotation. Grass filter strips have been shown to remove as much as 65 percent of sediment loads from runoff (USEPA 2003).

The filter strip vegetation may consist of a single species or a mixture of grasses, legumes, and/or other forbs that are appropriately adapted to the soil and climate, as well as to the farm chemicals used in the adjacent land. Approved seed listings are provided in the Illinois NRCS Conservation Practice Standard (CPS) 393 (June 2003). Applicable maintenance should be performed as needed to ensure the strips continue to function properly, including removal of state-listed noxious weeds, gully repair, removal of excess sediment, and re-seeding. Overland flow entering the filter strip should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the filter strip. Harvesting of the filter strip vegetation, where appropriate, will help to encourage dense growth, maintain an upright growth habit, and remove contaminants and unwanted nutrients contained in the plant tissue. Prescribed burning may be used to manage and maintain the filter strip when an approved burn plan has been developed.

The installation of filter strips adjacent to the impaired stream segments, as well as any contributing tributaries, can result in considerable reduction of overland contributions of sediments and suspended solids to an impaired waterbody. Filter strips implemented along stream segments slow and filter runoff and provide bank stabilization thereby decreasing erosion and re-sedimentation; however, they should not be installed on unstable channel banks already eroding due to undercutting of the bank toe. In some cases, riparian vegetation also provides bank stability that further reduces sediment loading to the stream. When used in support of a riparian forest buffer, filter strips can also restore or maintain sheet flow.

The Illinois NRCS Conservation Practice Standard (CPS) 393 (June 2003) describes filter strip requirements based on land slope; the requirements are designed to achieve a minimum flow through time of 15 to 30 minutes at a one-half inch depth. **Table 9-1** provides a summary of the guidance for filter strip width, or flow length, as a function of slope (NRCS 2003).

Table 9-1 Filter Strip Flow Lengths Based on Land Slope

Percent Slope	0.5%	1.0%	2.0%	3.0%	4.0%	5.0% or greater
Minimum (feet)	36	54	72	90	108	117
Maximum (feet)	72	108	144	180	216	234

GIS land use and topographic data, described in Section 2 of this report, were used in conjunction with soil slope data to provide an estimate of acreage where filter strips could be installed. As discussed in Section 2.4.1 of this report, a total of 262 soil types exist in the watershed. The most common type (Tama silt loam) shows 2-6 percent slopes, moderately eroded and covers 10 percent of the watershed. All other soil types, covering the remaining 90% of the watershed, each represent less than 5 percent of the total watershed area. Therefore, there is a wide diversity of soil types in the watershed.

In conjunction with the available land use, topography, and soil information discussed in Section 2, mapping software was used to buffer impaired stream segments, and their major tributaries, to determine the total area found within the appropriate footages of the stream segments. Due to the wide range of soil types and slopes found in the watershed, the appropriate buffer widths were estimated in GIS based on the average slope of land within the maximum buffer areas of each impaired segment's major tributaries. These average slopes were then used to calculate approximate buffer distances based on the NRCS guidance using a best-fit equation to interpolate between the slope percentages to buffer width relationships provided in the NRCS guidance.

Not all land use types within the buffer areas are candidates for conversion to filter strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of developed residential or commercial lands is often infeasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips and will likely provide the greatest benefit to water quality once converted. Therefore, GIS software was used to extract the approximate acreage of agricultural lands within the appropriate buffer area for each impaired stream segment and its tributaries. The calculated overall buffer areas and acreage of agricultural land within the buffer distances for each impaired stream segment and its tributaries are provided in **Table 9-2**. These data represent an approximation of the maximum acreage of land potentially available for conversion to filter strips. More detailed assessment of a given property is necessary to determine the exact size and extent of convertible lands likely to provide the greatest benefit to instream water quality following conversion to filter strips.

Table 9-2 Average Slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land Within Buffers Potentially Suitable for Conversion to Filter Strips, by Stream Segment

Stream Name	Segment ID	Average Slope Adjacent to Streams (%)	Filter Strip Flow Length (feet)	Total Area in Buffer (Acres)	Agricultural Land in Buffer (Acres)
Sinsinawa River	MS	30.8	234	5,070	3,958
Galena River	MQ-01	32.8	234	18,019	13,547

There are approximately 23,000 total acres within the various buffer distances of impaired stream segments MS and MQ-01 and their tributaries, an estimated 17,500 acres of which are agricultural lands where filter strips could potentially be installed. Note that filter strips may not be effective in areas with large slopes that are common throughout the watershed. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table 9-1**. The buffered areas and agricultural lands suitable for conversion to filter strips in each subbasin are provided on **Figure 9-1**. Note that a significant amount of agricultural land within the buffered area lies in the Wisconsin portion of the watershed.

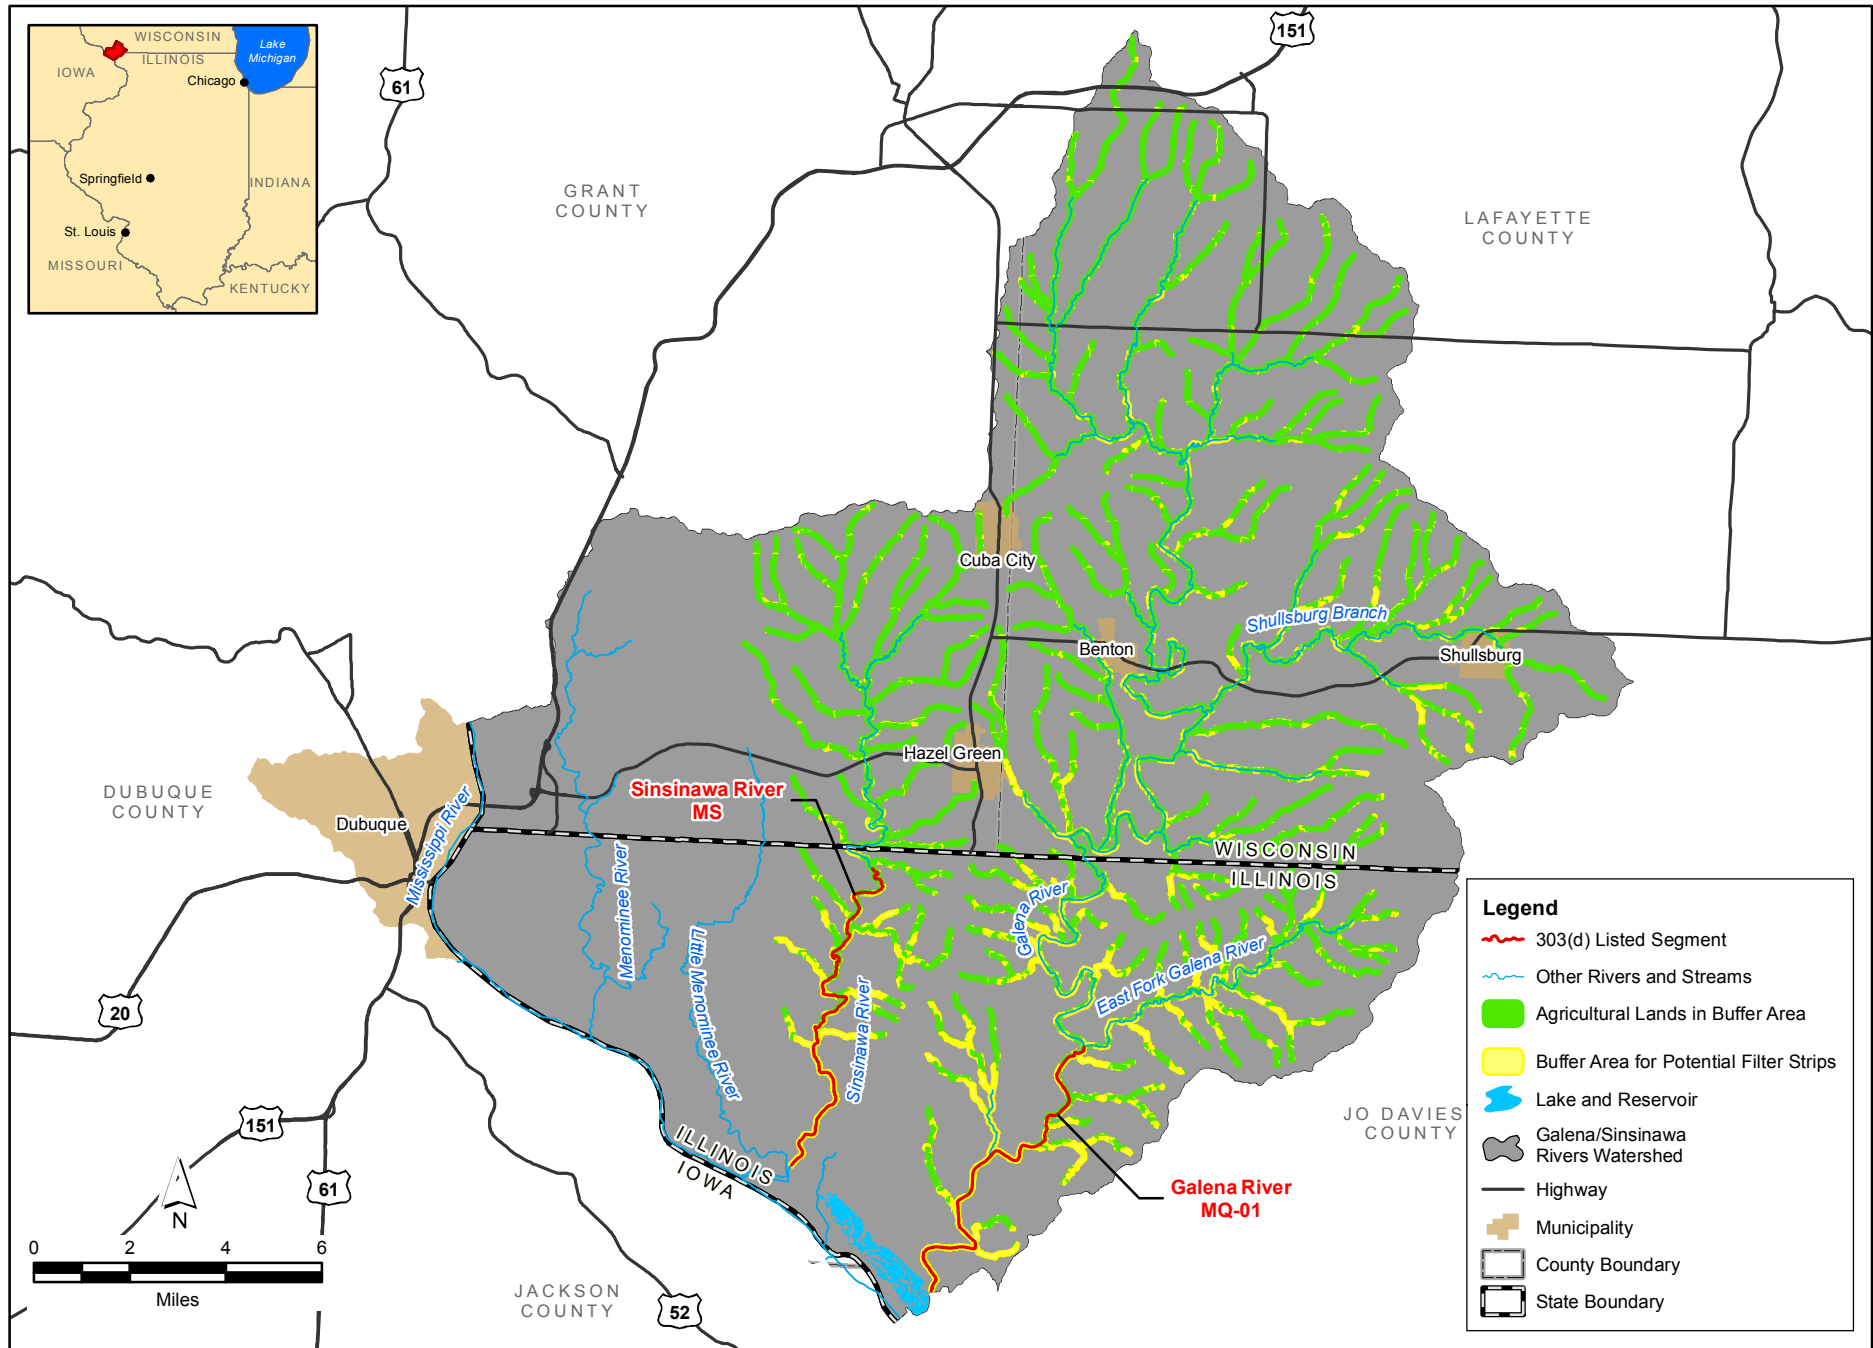

Field Borders: A field border is a strip of permanent vegetation established at the edge or around the perimeter of a field to reduce erosion from wind and water and to protect soil and water quality. This practice applies to cropland and grazing lands which are often farmed to the extent possible, sometimes even into adjacent road ditches and to creek banks. Leaving a field border will reduce erosion and transportation of sediment, including contaminant-impacted materials, to nearby environmentally sensitive areas.

As a minimum, field borders should be located along the edge(s) of fields where runoff enters or leaves the field. The minimum width should be 30 feet; wider if needed to meet the resource needs. When determining the border width, consideration should be given to factors such as equipment turning, parking, loading/unloading, grain harvest operations, and other related activities. For example, field borders planned to be used for turn strips should be at least twice as wide as the widest equipment to be used. Border widths should also comply with all applicable state and local manure and chemical application setbacks. The field border should not be used as a hay yard or machinery parking lot for any extended period of time, especially if doing so will damage or impair the function of the field border. When crossing the border, sprayers should be shut off and tillage equipment raised to avoid damage to the borders.

The field border should be established using permanent stiff-stemmed, upright grasses; grass/legumes; forbs; and/or shrubs to trap wind- or water-borne soil particles. These plants should be appropriately adapted to the soil and climate, have the physical characteristics necessary to control wind and water erosion to tolerable levels in the field border area, be tolerant to sediment deposition and the chemicals planned for application in the cropfield, be tolerant to equipment traffic, and should not include any state-listed noxious plant. For water quality purposes in particular (adsorbed, dissolved and suspended contaminants), the field border should have a vegetation stem density/retardance of moderate to high (e.g., equivalent to a good stand of wheat). Field border establishment should be timed so that the soil will be

adequately protected during the critical erosion period(s). Seedbed preparation, seeding rates, dates, depths, fertility requirements, and planting methods will be consistent with approved local criteria and site conditions.

Applicable maintenance should be performed as needed to ensure the borders continue to function properly, including removal of state-listed noxious weeds and excess accumulated sediment. Overland flow entering the border should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the border. Any area damaged by animals, chemicals, tillage, or equipment traffic should be repaired as soon as possible. Use of contour buffer, no-till, or other conservation practices on adjacent upland areas will help to reduce surface runoff and excessive sedimentation of field borders.

Galena/Sinsinawa Rivers
Buffer Areas and Agricultural Lands Potentially Suitable for Conversion to Filter Strips

This page intentionally left blank.

If field borders are selected for use by a landowner, a separate plan should be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 386.

Riparian Buffers: Riparian corridors, including both the stream channel and adjacent land areas, are important components of watershed ecology. Riparian vegetation, specifically the shade-producing variety, plays a significant role in controlling stream temperature change. The shade provided will reduce both solar radiation loading to the stream and peak temperatures during the growing season which can in turn increase the water body DO saturation level. Furthermore, preserving natural vegetation along stream corridors can effectively reduce water quality degradation associated with development. The root structure of the vegetation in a buffer enhances infiltration of runoff and subsequent trapping of nonpoint source pollutants, such as phosphorus. The buffers are only effective in this manner, however, when the runoff enters the buffer as a slow moving, shallow sheet. Concentrated flow in a ditch or gully will quickly pass through the buffer offering minimal opportunity for retention and uptake of pollutants.

Even more important than the filtering capacity of the buffers is the protection they provide to streambanks. The rooting systems of the vegetation serve as reinforcements in streambank soils, which help to hold streambank materials in place and minimize erosion. Due to the increase in stormwater runoff volume and peak rates of runoff associated with agriculture and other land development, stream channels are subject to greater erosional forces during stormflow events. Thus, preserving natural vegetation along stream channels minimizes the potential for water quality and habitat degradation due to streambank erosion, as well as that additional sediment load entering the stream.

Converting land adjacent to streams for the creation of riparian buffers will provide stream bank stabilization, stream shading, and nutrient uptake and trapping from adjacent areas. Minimum buffer widths of 25 feet are required for water quality benefits. Higher removal rates are provided with greater buffer widths. The USEPA (2003) reports phosphorus removal rates of approximately 25 to 30 percent for 30-foot-wide buffers and 70 to 80 percent for 60 to 90-foot-wide buffers. Riparian corridors can typically treat a maximum of 300 feet of adjacent land before runoff forms small channels that short circuit treatment. In addition to the treated area, the land converted from agricultural land to buffer strip will generate up to a 90 percent lower nutrient load based on data presented in Haith et al. (1992). Note that the efficacy of riparian buffers may be limited in portions of the watershed with high slopes along waterways.

Land use data for the impaired stream segments were clipped to 25 feet buffer zones created around the impaired stream segments and Fretress Lake. Grassland, forest, and agricultural areas within the 25-foot buffer zones are shown in **Table 9-3** by segment. There are approximately 550 acres within 25 feet of segment MS; approximately 330 of these acres are existing grassland or forest while 181 acres are currently classified as agricultural and may be candidates for riparian buffer improvements. Approximately 1,950 acres of land exists within 25 feet of segment MQ-01; approximately 975 of these acres are existing grassland or forest while 850 acres are currently classified as agricultural and may be candidates for riparian buffer improvements. Approximately 18 acres of land exists within 25 feet the Fretress Lake shoreline; the areas that may be candidates for riparian buffer improvements are limited to 8 of

those acres. Landowners should be encouraged to assess parcels adjacent to the stream channels and lake shore and maintain or improve existing riparian areas or potentially convert cultivated lands.

Table 9-3 Total Area and Area of Grassland, Forest, and Agricultural Land Within 25-Foot Buffer, by Waterbody Segment

Stream Name	Segment ID	Total Area in 25 ft Buffer (Acres)	Grassland in 25 ft Buffer (Acres)	Forest in 25 ft Buffer (Acres)	Agricultural Land In 25 ft Buffer (Acres)
Sinsinawa River	MS	549	246	84	181
Galena River	MQ-01	1,947	631	343	850
Frentress Lake	RMS	18	<0.1	8	-

Conservation Tillage Practices: Conservation tillage practices could help reduce sediment loads into the impaired stream segments by reducing erosion of soils. **Table 9-4**, shows the areas (acres) in each subbasin that are under cultivation, along with the percent of the corresponding watershed area which is cultivated. Crop residuals or living vegetation cover on the soil surface protects against soil detachment from water and wind erosion.

Table 9-4 Cultivated Areas for the MS, MQ-01, and RMS Impaired Waterbody Segments

Waterbody Name	Segment ID	Land Cover Area (Acres)	Cultivated Area (Acres)	Percent Cultivated
Sinsinawa River	MS	31,596	17,502	55%
Galena River	MQ-01	129,977	78,392	60%
Frentress Lake	RMS	1,097	118	11%

Conservation tillage practices are no-till and reduced-till. No-till is the practice of limiting soil disturbance in order to manage the amount, orientation, and distribution of crop and plant residue on the soil surface year around (Illinois NRCS CPS 329). Reduced-till is managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year round while limiting the soil-disturbing activities used to grow and harvest crops in systems where the field surface is tilled prior to planting (Illinois NRCS CPS 345).

The no-till practice consists only of an in-row soil tillage operation during the planting activities and a seed row/furrow closing device. No full-width tillage is performed from the time of harvest or termination of one cash crop to the time of harvest/termination of the next cash crop in the rotation regardless of the depth of the tillage operation. Limited tillage is allowed to close or level ruts from harvesting equipment; however, no more than 25 percent of the field may be tilled for this purpose.

As noted above, the reduced-till practice consists of managing plant residue on the soil surface while limiting soil-disturbing activities. The practice includes tillage methods commonly referred to as mulch tillage or conservation tillage where the entire soil surface is disturbed by tillage operations such as chisel plowing, field cultivating, tandem disking, or vertical tillage. It also includes tillage/planting systems with few tillage operations (e.g., ridge till) but which do not meet the criteria for the no-till practice as described above and in Illinois NRCS CPS 329.

In both the no-till and reduced-till practices, removal of residue from the row area prior to or as part of the planting operation is acceptable. In the no-till practice, however, the disturbed portion of the row width should not exceed one third of the crop row width. In either practice, none of the residue should be burned. To reduce erosion to the targeted level, the current approved water and/or wind erosion prediction technology should be used to determine the amount of randomly distributed surface residue needed, the period of the year the residue needs to be present in the field, and the amount of surface soil disturbance allowed. All residues should be uniformly distributed over the entire field. Residue should not be shredded after harvest because shredding makes it susceptible to movement by wind or water, and areas where the shredded residue accumulates may interfere with planting of the next crop.

If the no-till BMP is selected for use by a landowner, a separate plan should be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 329. If the reduced-till BMP is selected for use by a landowner, a separate plan should be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 345.

Studies have found around 93 percent less erosion occurred from no-till acreage compared to acreage subject to moldboard plowing (USEPA 2003). Tillage practices adjacent to the impaired segments should be assessed and possibly improved upon to reduce sediment loads.

Conservation Crop Rotation – Conservation crop rotation is a planned sequence of at least two different crops grown on the same ground over a period of time (i.e., the rotation cycle), and applies to all cropland where at least one annually-planted crop is included in the crop rotation. This practice can reduce sheet, rill, and wind erosion as well as reduce water quality degradation due to excess nutrients. For the purposes of the practice, a cover crop is considered a different crop. Where applicable, suitable crop substitutions may be planted when the planned crop cannot be planted due to weather, soil conditions, or other local situations. Acceptable substitutes are crops having similar properties that will accomplish the purpose of the original crop.

For reducing sheet, rill, and wind erosion, the crops, a tillage system, and cropping sequences should be selected that will produce sufficient and timely quantities of biomass or crop residue which will reduce erosion to the planned soil loss objective, as calculated using current approved erosion prediction technology. Selection of high-residue producing crops and varieties, use of cover crops, and adjustment of plant density and row spacing can enhance production of the kind, amount, and distribution of residue needed, especially when used in combination with Illinois NRCS CPSs for Residue and Tillage Management (Codes 329 and 345, discussed above under “Conservation Tillage”). Crop damage by wind erosion can be reduced by selecting crops tolerant to abrasion from windblown soil or high wind velocity. Alternately, if crops sensitive to wind erosion damage are grown, the potential for plant damage can be reduced by crop residue management, field windbreaks, herbaceous wind barriers, intercropping, or other methods of wind erosion control.

To recover excess nutrients from the soil profile in order to reduce water quality degradation, crops with the following qualities should be used: quick germination and root system formation, a rooting depth sufficient to reach the nutrients not removed by the previous crop, and nutrient requirements that readily utilize the excess nutrients. In addition, including perennial or annual

legume crops in the rotation can help provide nitrogen for the non-legume crops, especially in fields where manure applications are restricted by high or excessive soil phosphorus or potassium levels.

When using conservation crop rotation, a separate plan should be prepared for each field or treatment unit which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 328.

Stripcropping: Stripcropping is the practice of growing planned rotations of erosion-resistant and erosion-susceptible crops or fallow in a systematic arrangement of approximately equal strips (two or more) across a field. This practice reduces sheet, rill, and wind erosion as well as the transport of sediment and other water- and wind-borne contaminants. Stripcropping can be applicable on steeper slopes but is less effective on slopes exceeding 12 percent. The practice has the greatest impact where cropped or fallow strips having less than 10 percent cover are alternated with close grown and/or grass/legume strips or crop strips with 75 percent or greater surface cover. Stripcropping is not well suited to rolling topography and does not apply to situations where the widths of alternating strips cannot be made generally equal.

Vegetation in a stripcropping arrangement consists of crops and/or forages grown in a planned rotation. No two adjacent strips should be in an erosion-susceptible condition at the same time during the year although two adjacent strips may be in erosion-resistant cover at the same time. Erosion-resistant strips should be crops or crop residues that provide the needed protective cover during those periods when erosion is expected to occur. Acceptable protective cover is tolerant of the anticipated depth of sediment deposition and includes a growing crop, including grasses, legumes, or grass-legume mixtures, standing stubble, residue with enough surface cover to provide protection, or surface roughness sufficient to provide protection. When the erosion-resistant strip is in permanent vegetation, the species established should either be tolerant to herbicides used on the cropped strips or protected from damage by herbicides used on the cropped strips.

All tillage and planting operations will follow an established strip line. Strip boundaries should run parallel to each other and follow as close to the contour as practical. Strips widths should be determined using currently approved erosion prediction technologies but should not exceed 50 percent of the slope length used for erosion prediction or 150 feet, whichever is less. Strips susceptible to erosion should be alternated down the slope with strips of erosion-resistant cover.

When using stripcropping, a separate plan should be prepared for each field which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 585, including arrangement and vegetative condition of strips, minimum and maximum row grades, minimum ridge height, critical slope length, headlands and end rows, and establishment of stable outlets to control runoff. Sediment accumulations along strip edges should be smoothed or removed and re-distributed over the field as necessary to maintain practice effectiveness. When headlands are in permanent cover, they should be renovated as needed to keep ground cover above 65 percent. No-till renovation of headlands is recommended, but in any case should only include the immediate seedbed preparation and reseeding to a sod-forming crop with or without a nurse crop. Full headland width should be maintained to allow turning of farm implements at the end of a tilled strip to double back on the same strip.

Conservation Cover: Conservation cover is the practice of establishing and maintaining permanent vegetative cover in order to: reduce sheet, rill, and wind erosion and sedimentation; and reduce ground and surface water quality degradation by nutrients and surface water quality degradation by sediment. This practice applies on all lands needing permanent herbaceous vegetative cover and can be applied on only a portion of a field; however, it does not apply to plantings for forage production or to critical area plantings.

When using conservation cover, the amount of plant biomass and cover needed to reduce wind and water erosion to the planned soil loss objective should be calculated using the current approved wind and/or water erosion prediction technology. The selected plant species should be suitable for the planned purpose as well as adapted to the soil, ecological, and climatic conditions of the area. Planting dates, planting methods, and care in handling and planting of the seed or planting stock should ensure that planted materials have an acceptable rate of survival. No-till seeding methods are preferred where erosion concerns are present. Periodic removal of some products such as high value trees, medicinal herbs, nuts, and fruits is permitted provided the conservation purpose is not compromised by the loss of vegetation or harvesting disturbance.

When using conservation cover, a separate plan should be prepared for each field which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 327, including seeding periods; seed quality; seedbed preparation and seeding; use of temporary and/or nurse crops (if necessary); native species; seed mixtures; soil testing; fertilizer, lime, and pesticide requirements; weed and companion crop control; and maintenance of the vegetative cover. Mowing after the establishment period (except for noxious weed control) should be done prior to April 15 or after August 1 to protect nesting wildlife. Exceptions can be made to allow mowing, burning, and/or chemical treatments when necessary to maintain the health and diversity of the plant community.

Cover Crop: A cover crop consists of grasses, legumes, and forbs planted for seasonal vegetative cover. This practice can help reduce wind and water erosion as well as reduce water quality degradation by utilizing excessive soil nutrients. Cover crops may either be established between successive production crops, or companion-planted or relay-planted into production crops. Species and planting dates should be selected that will not compete with the production crop yield or harvest. Cover crops should not be harvested for seed, nor should the residue be burned.

As discussed in Illinois NRCS CPS 340, plant species, seeding rates, seeding dates, and seeding depths should be determined using the Illinois Cover Crop Selection Tool (<http://www.mccc.msu.edu/selectorINTRO.html>). Cover crops should be selected based on having the physical characteristics necessary to provide adequate erosion protection, their ability to effectively utilize the nutrients of concern, and their ability to produce higher volumes of organic material and root mass in order to maintain or increase soil organic matter. Use of deep-rooted species will help maximize nutrient recovery. The cover crop should be established as soon as practical prior to or after harvest of the production crop, and terminated as late as practical to maximize plant biomass production and nutrient uptake, while allowing time to prepare the field for the next production crop.

When using a cover crop, a separate plan should be prepared for each field which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 340.

The cover crop should be evaluated periodically to determine if the cover crop is meeting the planned purpose. If not, changes to the crop species, management, or technology should be implemented.

Grassed Waterways: A grassed waterway is a shaped or graded channel, established with suitable vegetation, used to convey surface water at a non-erosive velocity by way of a broad and shallow cross-section to a stable outlet. The vegetative cover within the waterway reduces peak discharge and protects the channel surface from rill and gully erosion. Waterways are often constructed in naturally-occurring depressions where the water collects and flows to an outlet but can be constructed in any area where added water conveyance capacity and vegetative protection are needed to prevent erosion resulting from concentrated surface flow. In addition to reducing erosion, grassed waterways can positively affect water quality through uptake of other pollutants attached to soils such as nutrients. Criteria for constructing grassed waterways are discussed in Illinois NRCS CPS 412, including capacity, stability, width, depth, side slopes, drainage and outlets, and establishment of vegetation.

When using a grassed waterway, a separate plan should be prepared for each treatment unit which will use this practice and which describes how the practice requirements will be applied to that particular area. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 342, The NRCS recommends these maintenance measures for grassed waterways:

- Plant a good quality NRCS-approved seed mixture. Fertilization of the vegetation should not be necessary unless the waterway is proven to lack proper nutrients. Avoid spraying herbicides in or adjacent to the waterway. Mowing or periodic grazing of the vegetation may be appropriate to maintain waterway capacity and reduce sediment deposition. Noxious weeds should be controlled.
- Inspect the area frequently for eroding areas, places needing reseeding, and damage caused by machinery, herbicides, or livestock. Repair all areas as needed; e.g., minor rills or gullies may be repaired by reshaping and reseeding. Outlets should also be maintained to prevent gullies from forming. This may include reshaping and reseeding the outlet, or repairing components of structural outlets.
- Maintain the width of the grass area when tilling and planting adjacent fields. If possible, bring row crop patterns up to (but not into) the waterway nearly on the contour. Do not plant end rows along the side of the waterway. Do not use the waterway as a turn area because this can result in damage to the vegetation.
- Avoid driving up and down, or crossing, grassed waterways, especially during wet conditions. This can damage the vegetation and the ruts caused by tire tracks can lead to gullies.
- When crossing grassed waterways, lift tillage equipment off of the waterway and turn off chemical application equipment.

Water and Sediment Control Basins (WASCOBs): WASCOBs are earth embankments or combination ridge and channel systems constructed across the slopes of minor watercourses to

reduce watercourse and gully erosion. These basins act as water detention basins and trap sediments (and the pollutants bound to the sediment) prior to them reaching a receiving water. The WASC OB reduces gully erosion by controlling flow within the drainage area, and the basins may be installed singly or in series as part of a system. The practice applies to sites where the topography is generally irregular, runoff and sediment damage land and improvements, and watercourse or gully erosion is a problem. Adequate and stable outlets from the basin are required to convey runoff water to a point where it will not cause damage. Additionally, sheet and rill erosion should be controlled by other conservation practices; i.e., the WASC OB would be part of another conservation system that adequately addresses resource concerns both above and below the basin. However, if land ownership or physical conditions preclude treatment of the upper portion of a slope, a WASC OB may be used to separate the upper area from and permit treatment of the lower slope.

WASC OBs should, at a minimum, be designed to be large enough to control runoff from at least a 10-year, 24-hour storm using a combination of flood storage and discharge through the outlet. Additionally, the WASC OB must be designed to have the capacity to store at least the anticipated 10-year sediment accumulation. Otherwise, periodic sediment removal is required as part of the maintenance activities in order to maintain the required capacity. Locations are determined based on slopes, erosion areas, crop management, and soil survey data. Stakeholders note that recent storms have surpassed this design standard and that City of Galena now designs for the 100-year event.

When using a WASC OB, a separate plan should be prepared for each treatment unit which will use this practice. Local NRCS personnel can often provide information and advice for design and installation. Illinois NRCS CPS 638 also provides additional information on the design and maintenance requirements for WASC OBs, as well as information on cropping activity recommendations and requirements around the basin. Maintenance includes reseeding or planting the basins in order to maintain vegetation, where specified, and periodically checking them, especially after large storms, to determine the need for embankment repairs or mechanical removal of excess sediment. Inlets and outlets should be cleaned regularly. Damaged components should be replaced promptly.

Sediment Control Basins: A sediment control basin is a basin formed by an embankment or excavation, or combination of these, and constructed with an engineered outlet. These basins are used to capture and detain sediment-laden runoff, or other debris, for a sufficient length of time to allow it to settle out in the basin. They differ from WASC OBs in that the sediment control basins are the last line of defense for capturing sediment when erosion has already occurred and these basins act more like ponds; sediment control basins also differ in where they can be used.

The sediment control basin practice applies to urban land, construction sites, agricultural land, and other disturbed lands where a sediment basin offers the most practical solution. This includes areas where physical conditions or land ownership preclude treatment of a sediment source by the installation of erosion-control measures, and where failure of the basin will not result in loss of life, damage to homes, commercial or industrial buildings, main highways or railroads; or in the use of public utilities. A sediment basin should be located so that it intercepts as much of the runoff as possible from the disturbed area while minimizing the number of entry

points for runoff into the basin. These basins should also be located to minimize interference with construction or farming activities but should not be located in perennial streams.

The sediment basin must have sediment storage capacity, detention storage, and temporary flood storage capacities. Flood storage capacity is based on the design storms for the principal and auxiliary spillways. Sediment storage should be for a minimum of 900 ft³/acre of disturbed area, and the detention storage for a minimum of 3,600 ft³/acre of drainage area. For maximum sediment retention, the basin should be designed so that the detention storage remains full of water between storm events. However, if site conditions, safety concerns, or local laws preclude a permanent pool of water, all or a portion of the detention and sediment storages may be designed to be dewatered between storm events.

A large sediment basin may have an effect on the peak discharge rate from a watershed and this should be taken into account during and placement of the basin. In these cases, steps should be taken to mitigate any potential negative effects on riparian habitat downstream of the structure. In many cases, the use of a sediment basin alone may not provide sufficient protection against offsite sedimentation. To work most effectively, the sediment basin should be the last practice in a series of erosion control and sediment capturing practices installed in the disturbed area. This incremental approach will reduce the load on the basin and improve the effectiveness of the overall effort to prevent offsite sedimentation problems. Additionally, because the sediment basin must be designed to handle all of the contributing drainage whether it is from disturbed areas or not, diverting runoff from undisturbed areas away from the basin will improve the function of the basin.

When using a sediment control basin, a separate plan should be prepared for each treatment unit which will use this practice. Local NRCS personnel can often provide information and advice for design and installation. Illinois NRCS CPS 350 also provides additional information on the design and maintenance requirements for sediment control basins. Maintenance includes periodic inspections and maintenance of the embankment, principal and auxiliary spillways, and dewatering device especially following significant runoff events. Damaged components should be replaced promptly and accumulated sediment should be removed when it reaches the pre-determined storage elevation for the basin. Where applicable, planting, reseeding, and mowing of the basin should be performed in order to maintain vegetation and to control trees, brush, and invasive species.

Streambank and Shoreline Protection: Treatments used to stabilize and protect banks of streams or constructed channels, and shorelines of lakes, reservoirs, or estuaries, are discussed in Illinois NRCS CPS 580. This practice can be used to help maintain the flow capacity of streams or channels, and to reduce the offsite or downstream effects of sediment resulting from bank erosion.

Prior to implementation of the practice, an assessment of the unstable streambank or shoreline sites should be conducted in sufficient detail to identify the causes contributing to the instability (e.g., livestock access, watershed alterations resulting in significant modifications of discharge or sediment production, and in channel modifications such as water level fluctuations and boat-generated waves). Protective treatments need to be compatible with the bank or shoreline

materials, water chemistry, channel or lake hydraulics, and slope characteristics above and below the water line.

Treatment area designs should provide for protection of installed treatments from overbank flows resulting from upslope runoff and flood return flows, and from bank seepage. The designs should also account for any anticipated ice action, wave action, and fluctuating water levels. End sections of treatment areas should be adequately anchored to existing treatments, terminate in stable areas, or be otherwise stabilized to prevent flanking of the treatment. Livestock traffic along treated streambanks and shorelines should be limited to stable access points. All disturbed areas around protective treatments should be protected from erosion through cultivation or selected vegetation suitable for the site conditions and intended purposes.

Streambanks should be assessed to determine if the causes of instability are local (e.g., poor soils, high water table in banks, alignment, obstructions deflecting flows into the bank, etc.) or systemic (e.g., aggradation due to increased sediment from the watershed, increased runoff due to urban development in the watershed, degradation due to channel modifications, etc.). Bank protection treatment should not be installed in channel systems undergoing rapid and extensive changes in bottom grade and/or alignment unless the treatment is designed to control or accommodate the changes. Bank treatment should be constructed to a depth at or below the anticipated lowest depth of streambed scour. When appropriate, a buffer strip and/or diversion may be established at the top of the bank or shoreline protection zone to help maintain and protect installed treatments; improve their function; and filter out sediments, nutrients, and pollutants from runoff.

Some available approaches to potentially decrease nonpoint TSS, sedimentation/siltation, and/or pollutant source loads, as well as helping to stabilize eroding banks include the following:

- **Stone Toe Protection:** Non-erodible materials are used to protect the eroding banks of a stream. Meandering bends found in the watershed could potentially be stabilized by placing the hard armor only on the toe of the bank. Stone toe protection is most commonly implemented "using stone quarry stone that is sized to resist movement and is placed on the lower one third of the bank in a windrow fashion" (STREAMS 2005).
- **Rock Riffle Grade Control:** Naturally stable stream systems typically have an alternating riffle-pool sequence that helps to dissipate stream energy. Riffle rock grade control places loose rock grade control structures at locations where natural riffles would occur to create and enhance the riffle-pool flow sequence of stable streams. By installing riffle rock in an incised channel, the riffles will raise the water surface elevation resulting in lower effective bank heights, which increases the bank stability by reducing the tractive force on the banks (STREAMS 2005).
- **Floodplain Excavation:** Rather than raising the water level, Floodplain Excavation lowers the floodplain to create a more stable stream. Floodplain Excavation uses mechanical means to restore the floodplain by excavating and utilizing the soil that would eventually be eroded away and deposited in the stream (STREAMS 2005).

- **Rock chutes:** Rock chutes are riprap lined water conveyance structures used to move water down a slope in a non-erosive manner. The main purpose of a rock chute is to reduce channel flow velocity by dissipating energy and to provide a stable grade at the outlet to prevent erosion.

The extent of streambank and shoreline erosion within and upstream of the Sinsinawa River (MS), Galena River (MQ-01), and Frentress Lake impaired segments is unknown but has been noted in previous studies on mine tailings found in floodplain deposits. Further investigation is recommended to determine the extent that erosion control measures could help manage TSS and/or sedimentation/siltation, as well as other TMDL parameter loads in the reaches.

Grade Stabilization Structure: A grade stabilization structure is a structure used to control the grade in either natural or constructed channels to reduce erosion and improve water quality. This practice does not apply to structures designed to control the rate of flow or to regulate the water level in channels, or to structures designed to stabilize the bed or bottom of a continuous flow (non-intermittent) stream channel. Grade stabilization structures may be open flow or closed flow. Open flow structures, such as toe walls or chutes, are used where there is downstream stability. Closed structures are required where the downstream is unstable but can also be used where it is stable. In this case, topography, cost, or landowner preference can sometimes dictate what type of structure is used.

Regardless of the type of structure used, sufficient discharge should be provided to minimize crop damaging water detention. Fences may be needed to protect structures, earth embankments, and vegetated spillways from livestock, or, near urban areas, to control access and exclude traffic. When designing and implementing each structure, consideration should be given to the effect of the structure on fluvial geomorphic conditions (especially in natural channels), aquatic habitat, and landscape resources and forms; i.e., select sites to reduce adverse impacts or create desirable focal points.

The following general considerations apply to either open or closed flow structures. The crest of the inlet should be set at an elevation that will stabilize the channel and prevent upstream head cutting. Runoff should be able to safely pass through a principal spillway or a combination of principal and auxiliary spillways. Soil material proposed for use as fill and for foundation must be verified as suitable for the purpose, using soil borings, review of existing data, or other suitable means. A foundation cutoff may be needed if the structure will impound permanent water and the total embankment height is greater than 4 feet. See Illinois NRCS CPS 410 for more information. Seepage control is needed for all embankments over 25 feet high. For embankments less than 25 feet high, seepage control is to be included if pervious layers are not intercepted by the cutoff, seepage could create swamping downstream, or such control is needed to ensure a stable embankment. Seepage may be controlled by foundation, abutment, or embankment drains and/or reservoir blanketing.

The grade stabilization structure must include an embankment or berm to direct flow to the entrance of the principal spillway. See Illinois NRCS CPS 410 for more information on sizing of the embankment depending on concurrent use; e.g., public road. The upstream and downstream side slopes of the settled embankment must each be no steeper than two horizontal to one vertical. For all embankments with effective height greater than 4 feet, the sum of the upstream and

downstream side slope of the settled embankment must be at least 5 horizontal to one vertical. All slopes must be designed to be stable, even if flatter side slopes are required. Downstream or upstream berms can be used to help achieve stable embankment sections. An auxiliary spillway must be provided for each grade stabilization structure unless the principal spillway is large enough to pass the peak discharge from the design event, and associated trash, while still meeting the freeboard requirements. See Illinois NRCS CPS 410 for more information on settlement allowance requirements, freeboard requirements, and auxiliary spillways. The exposed surfaces of earthen embankments, earth spillways, non-cropped borrow areas, and other disturbed areas should be seeded or sodded following construction, or covered by an inorganic cover such as gravel.

When using a grade stabilization structure, a separate plan should be prepared for each structure. Additional information on the types of structures and their design requirements may be found in Illinois NRCS CPS 410. As with other practices, regular maintenance should be performed to ensure the structure is operating as intended. Maintenance activities include the following: periodic inspection of the structure and prompt repair of any identified concerns; prompt removal of sediment once the accumulation reaches the pre-determined storage elevation; periodic removal of trees, brush, and invasive species; and maintenance of vegetative cover and immediate seeding of bare areas as needed.

9.4 BMP Recommendations for Reducing Fecal Coliform in the Galena River Impaired Segment

Results for approximately 78% of the fecal coliform single samples exceeded the 200 cfu per 100 mL geometric mean water quality standard and approximately 48% of the samples exceeded 400 cfu per 100 mL maximum standard (as indicated in **Table 5-2**). The TMDL analyses performed for fecal coliform bacteria in Galena River segment MQ-01 are discussed in Section 8.3.1. Potential sources of fecal coliform include a wastewater treatment plant and/or failed septic system discharges/leaks, general nonpoint source runoff, and animal-related runoff (as discussed in Section 5 of this report). Animal impacts often consist of livestock, where present, but may also include other animals such as resident and migratory waterfowl and other wildlife such as deer.

9.4.1 NPDES Permitted Point Sources of Fecal Coliform

Table 8-4 of this report listed one NPDES permitted point source in Galena River segment MQ-01. As noted in Section 8.3.1.4, the Galena South Sewage plant is the only domestic facility discharging within the Illinois portion of the watershed. Three other facilities discharge within the Wisconsin portion of the watershed and are a significant distance upstream of the impaired waterbody.

The WLA for the Galena South Sewage plant (IL0075191) was shown in **Table 8-4**. The WLA for fecal coliform was calculated using the 200 cfu/100mL geometric mean water quality standard and the facility's DAF and DMF. The TMDL uses the WLA calculated using the DMFs for high flow conditions and the DAFs under dry to midrange flow conditions. The Galena South Sewage plant is currently permitted to discharge 400 cfu/100ml, and the WLA allocation will be incorporated in the next NPDES permit renewal cycle.

9.4.2 Nonpoint Sources of Fecal Coliform

Several BMPs have been identified to help reduce fecal coliform counts in the impaired segment of Galena River (MQ-01). These BMPs focus on the most likely sources of fecal coliform within the subbasin, such as agricultural runoff, septic systems, and livestock.

Filter Strips: As mentioned in Section 9.3, filter strips can be used as a control to reduce both pollutant loads from runoff and sedimentation to impaired waterbodies. Filter strips have a similar benefit in reducing fecal coliform loads from nonpoint sources in the watershed and land areas are calculated as described in Section 9.3. Based on those calculations and as shown in **Table 9-2**, there are approximately 13,547 acres of agricultural land within the 234 foot buffer developed for MQ-01 and its tributaries (**Figure 9-1**).

Private Septic System Inspection and Maintenance Program: As indicated in Section 2.3, approximately seven percent of the Galena/Sinsinawa Rivers watershed consists of developed or urbanized land. Many businesses, residences, and other structures in the developed areas are served by a municipal sewer district and septic systems are uncommon in these areas. However, many households in rural areas of Illinois, as well as in some smaller townships, that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. The degree of nutrient removal in these systems is limited by soils and system upkeep and maintenance.

Failing or leaking septic systems can be a significant source of fecal coliform pollution. A program that actively manages functioning systems and addresses non-functioning systems could be implemented to reduce the potential bacteria loads from septic systems in the watershed. USEPA has developed guidance for managing septic systems, which includes assessing the functionality of systems, public health, and environmental risks (USEPA 2005). It also introduces procedures for selecting and implementing a management plan.

To reduce the discharge of excessive amounts of contaminants from a faulty septic system, a scheduled maintenance plan that includes regular pumping and maintenance of the septic system should be followed. The majority of failures originate from excessive suspended solids, nutrients, and biochemical oxygen demand loading to the septic system. Reduction of solids entering the tank can be achieved by limiting the use of garbage disposals.

Septic system management practices can extend the life, and maintain the efficiency, of a septic system. Water conservation practices, such as limiting daily water use or using low flow toilets and faucets, are the most effective methods to maintain a properly functioning septic system. Additionally, septic systems should not be used for the disposal of solids, such as cigarette butts, cat litter, cotton swabs, coffee grounds, disposable diapers, etc. Physical damage to the drain field can be prevented by:

- Maintaining a vegetative cover over the drain field to prevent erosion
- Avoiding construction over the system
- Protecting the area down slope of the system from excavation
- Landscape the area to divert surface flow away from the drain field (Johnson 1998)

The cost of each management measure is highly variable and site-specific data on septic systems and management practices do not exist for the watershed; therefore, homeowners with septic systems should contact their county health department for septic system management costs.

Current protocols in Illinois for addressing failing septic systems in the rural areas noted above should adhere to the Illinois Private Sewage Disposal Licensing Act and Code "to prevent the transmission of disease organisms, environmental contamination and nuisances resulting from improper handling, storage, transportation and disposal from private sewage disposal systems". Any new, replaced, or renovated system must be installed by a licensed contractor or the homeowner and permitted through the county health department. The department must receive both an application for permit and the appropriate fee from the contractor/homeowner. Once reviewed and approved, a permit is issued and an inspection of the system is conducted during and after construction. The county health department also investigates private sewage disposal system complaints. Wisconsin has similar requirements for private septic systems.

A long-range solution to failing septic systems is connection to a municipal sanitary sewer system. Connection to a sanitary sewer line would reduce existing fecal coliform sources by replacing failing septic systems with municipal treatment and will allow communities to develop without further contribution of pathogens to the Galena River. Costs for the installation are generally paid over a period of several years (average of 20 years) and help to avoid forcing homeowners to shoulder the entire initial cost of installing a new septic system. In addition, costs are sometimes shared between the community and the utility responsible for treating the wastewater generated from replacing the septic tanks. The planning process is involved and requires participation from townships, cities, counties, businesses, and citizens.

It is unknown at this time how many septic systems are present within the watershed. However, as discussed in Section 2.5, approximately 20,712 people reside in the Galena/Sinsinawa Rivers watershed, and the largest urban development is the city of Galena with an estimated population of approximately 3,401 people. As discussed in Section 5.4.3, Jo Daviess County, Illinois health department officials indicated that the town of Galena is served by a municipal sewer system, although older homes still have private systems. Homes outside of the municipal boundary are generally served by private septic systems. Additional towns within the watershed include Menominee, in Jo Daviess County; Hazel Green and Cuba City in Grant County, Wisconsin; and Benton and Shullsburg in Lafayette County, Wisconsin. Grant County health department officials indicated that the towns of Hazel Green and Cuba City are served by sewer systems. In Lafayette County, town residents are generally on municipal sewer systems; however, county health department officials have stated that roughly half of county residents use private septic systems.

Based on this information, the following assumptions have been used to estimate the number of people with private septic systems. Menominee residents are assumed to use private septic systems. Hazel Green and Cuba City (Grant County) are each approximately one-half the size of Galena; therefore, approximately 1,700 residents each. In Lafayette County, Shullsburg is estimated at approximately 40% of the size of Galena and Benton at approximately 20% of the size of Galena; therefore, 1,300 and 680 residents, respectively.

Based on these assumptions, up to 11,930 people remain and which are or may be served by private septic systems. If a typical household is assumed to consist of four people, there may be around 2,900 households which have septic systems.

Pasture Management/Fencing: As discussed in Section 5.4 of this report, significant quantities of livestock are present within the Galena/Sinsinawa Rivers watershed. Data from NASS indicates there were approximately 53,057 head of cattle within Jo Daviess County, Illinois in 2012, and an additional 282,192 head of cattle in Grant and Lafayette Counties, Wisconsin in 2012. The 2012 data also indicated 14,146 hogs/pigs and 1,312 sheep in Jo Daviess County, and 69,065 hogs/pigs and 6,287 sheep in Grant and Lafayette Counties, Wisconsin.

It is unknown to what extent livestock have access to the Galena River. Reduction of livestock access to streams, however, is recommended to reduce bacteria loads and limit damage to streambanks. Access of livestock and other animals to streams can increase bank erosion, trample filter strips and riparian buffers causing short circuiting of pollutant treatment, and provide direct input of manure to the waterbody. Exclusion or restricting pet, livestock, and wildlife access to streams with fencing helps reduce pollutant loads. The USEPA found that livestock exclusion from waterways and other grazing management measures were successful in reducing fecal coliform counts by 29 to 46 percent (2003).

Fencing and alternate watering systems are effective ways to restrict livestock from streams; however, fencing emplacement is not always feasible from either a cost or animal management viewpoint. If used, fencing should be placed outside of the filter strip/riparian area to prevent manure from being entrained during flooding. Another option is to limit access of people to areas of the waterbody; this indirectly keeps a large percentage of pet waste at a distance from the waterbody. Waterfowl are an issue for phosphorus and fecal coliform loading at lakes and slow moving streams. Acoustic devices and other repellants can be used to stress nuisance waterfowl so they avoid congregating in select areas.

Fencing can also be used for pasture management to reduce erosion and fecal coliform loss from land. Additionally, pasture fencing can greatly enhance the efficiency of farming operations. When livestock are penned up in the same field or paddock for the entire grazing season, the plants in that area are grazed too short or even down to bare earth which increases the likelihood of soil loss. Guidance for rotation suggests livestock be moved into a grazing enclosure when the forage is around six inches high and moved off again when it is two inches high. This will also encourage the growth of the forage and will sometimes break the life cycle of parasites. As more pasture is divided into smaller paddocks, the utilization of forages by grazing livestock can increase. As utilization of forages is increased and cattle are moved more frequently, the ungrazed paddocks will have fresh forage available for grazing and the previously grazed paddocks will have time to rest. Rest periods from grazing allow forage regrowth and prevent overgrazing, which can lead to increased storm water runoff and unnecessary sediment/manure loss.

9.5 BMP Recommendations for Reducing Zinc in the Galena River Impaired Segment

Galena River segment MQ-01 is listed for impairment of aquatic life use due to detections of dissolved zinc concentrations exceeding the chronic standard. Zinc can combine with other

elements, such as chlorine, oxygen, and sulfur, to form zinc compounds. Most zinc ore found naturally in the environment is in the form of zinc sulfide. Zinc mobility and bioavailability is mainly governed by pH. As with many trace metals, zinc solubility is higher under more acidic conditions. Alkaline conditions favor adsorption of zinc to oxides and oxyhydroxides of iron, manganese, and aluminum; and to clay minerals and organic matter; and sorption and/or precipitation with carbonate minerals. Organic matter appears to play a more important role on zinc adsorption as compared to the hydroxides. Under low reduction-oxidation conditions, zinc may form insoluble sulfides. Naturally-occurring chelating agents, such as many organic acids, can increase the solubility and mobility of zinc. TMDLs for zinc are discussed in Section 8.3.2.

As discussed in Section 8.3.2.4, there is one NPDES permitted facility in Illinois which discharges into Galena River segment MQ-01; however, Illinois EPA permit staff reviewed data for the facility and determined that zinc is not considered a parameter of concern for the facility and loading from the discharges is not expected to be an issue. Additionally, the Illinois EPA has identified abandoned mines as a contributor to the zinc exceedances in the Galena River segment MQ-01 and local stakeholders provided documentation that deposits from zinc-rich mine tailings can be found throughout the Galena River floodplain. Local knowledge also suggests that mine tailings were used extensively for the construction of roads, railroad beds, and other infrastructure outlets where the material could be easily disposed of. Additional sources of some metals contamination may be from naturally-occurring high background levels of the metal in soils which can then contribute loads through overland runoff, soil erosion, streambank erosion, and groundwater. BMPs that could be utilized to treat the MQ-01 nonpoint sources are described below.

All implementation measures previously listed for sediment control and streambank stabilization provide the secondary benefit of reducing any contaminants that may be attached to the soil, primarily by limiting the amount of zinc-enriched sediment or water flowing into the stream segment. These control practices were described in Section 9.3.

Additional BMPs for zinc include chemical or passive treatment methods and mine reclamation. Active chemical treatment typically involves the addition of other chemicals, such as calcium carbonate, sodium hydroxide, sodium bicarbonate, and anhydrous ammonia, to create a reaction, decrease the solubility of dissolved metals, and precipitate metal salts which then settle out of solution. Active chemical treatment is not likely to be a viable option for the MQ-01 stream segment because the chemicals are expensive and the treatment system requires additional costs associated with operation and maintenance, as well as the disposal of metal-laden sludge. Reclamation of abandoned mine land involves clearing site vegetation, removing contaminated topsoil and other materials, and restoring functionality of the area for recreational, agricultural, or wildlife habitat purposes. The environmental benefits realized from abandoned mine reclamation projects are numerous and significant, including restoring land for future use and improving water quality. Restoration of the land can result in increased and enhanced pasture land, recreational areas, or wildlife habitat. However, reclamation projects tend to be costly and resource intensive and may not be appropriate for all abandoned mine sites in the Galena/Sinsinawa Rivers watershed. Passive methods could be utilized until full reclamation of a mine occurs. Chemical addition and energy consuming treatment processes are virtually eliminated with passive treatment systems, and the operation and maintenance requirements of

passive systems are considerably less than active treatment systems. Examples of passive treatment technologies include the following:

Aerobic Wetland: An aerobic wetland consists of a large surface area pond with horizontal surface flow. These wetlands can only effectively treat water that is net alkaline (pH greater than 7). In aerobic wetland systems, metals are precipitated through oxidation reactions to form oxides and hydroxides. A typical aerobic wetland will have a water depth of 6 to 18 inches and can be planted with cattails and other wetland species (Zipper et al. 2011).

Compost or Anaerobic Wetland: Compost, or anaerobic, wetlands, consist of a large pond with a lower layer of organic substrate. A typical compost wetland will have 12 to 24 inches of organic substrate and be planted with cattails or other emergent vegetation (Zipper et al. 2011). Typically, the compost layer consists of spent mushroom compost that contains about 10 percent calcium carbonate. Other compost materials include peat moss, wood chips, sawdust, or hay. The flow is horizontal within the substrate layer of the basin. Piling the compost a little higher than the free water surface can encourage the flow within the substrate.

Open Limestone Channels: Open limestone channels may be the simplest passive treatment method available. These channels are constructed in two ways. The first method collects contaminated acid mine drainage water within a drainage ditch constructed of limestone while the second method consists of placing limestone fragments directly in a contaminated stream. In either case, dissolution of the limestone adds alkalinity to the water and raises the pH causing precipitation of the metals. This treatment requires large quantities of limestone for long-term success (Zipper et al. 2011).

Diversion Wells: Diversion wells are another simple way to increase the alkalinity of contaminated waters. Acidic water is conveyed by a pipe to a downstream "well," which contains crushed limestone aggregate. The hydraulic force of the pipe flow causes the limestone to turbidly mix and abrade into fine particles preventing armoring (Zipper et al. 2011).

Anoxic Limestone Drains: An anoxic limestone drain is a buried bed of limestone constructed to intercept subsurface mine water flow and prevent contact with atmospheric oxygen. Keeping oxygen out of the water prevents oxidation of metals and armoring of the limestone. An anoxic limestone drain can be considered a pre-treatment step to increase alkalinity and raise pH before the water enters a constructed aerobic wetland (Zipper et al. 2011).

Vertical Flow Reactors: Vertical flow reactors were conceived as a way to overcome the alkalinity producing limitations of anoxic limestone drains and the large area requirements of compost wetlands. The vertical flow reactor consists of a treatment cell with an under-drained limestone base topped with a layer of organic substrate and standing water. The water flows vertically through the compost and limestone and is collected and discharged through a system of pipes. The vertical flow reactor increases alkalinity by limestone dissolution and bacterial sulfate reduction (Zipper et al. 2011).

9.6 BMP Recommendations for Frentress Lake – TSS, Turbidity, DO, and Total Phosphorus

Frentress Lake is listed for impairment of aquatic life by DO, for impairment of both aquatic life and aesthetic quality by total phosphorus and TSS, and for impairment of aesthetic quality by turbidity. As discussed in Sections 6 and 7.2.2, Frentress Lake has a significant hydrologic connection with the Mississippi River and water quality and quantity in the lake are assumed to be heavily influenced by conditions in the Mississippi River. Because Frentress Lake has no other tributaries and a relatively small direct drainage area, a basic TMDL for phosphorus was calculated that includes the majority of the load originating in the Mississippi River.

Implementation strategies for phosphorus reduction throughout the Upper Mississippi River basin is beyond the scope of this project, however, management measures to reduce overland nutrient and sediment loading from the directly-contributing local watershed are discussed below.

The primary causes of the phosphorus and DO impairments originate from both internal and external sources and include both point and nonpoint sources of nutrient loads. Internal cycling of phosphorus from lake sediments is also likely a contributor. Phosphorus is a nutrient critical to healthy ecosystems at low concentrations; however, over enrichment of phosphorus can result in aquatic ecosystem degradation. Nutrient enrichment can result in rapid algal growth as available nutrients and carbon dioxide are consumed. This response can alter pH, decrease DO (which is critical to other aquatic biota), alter the diurnal DO pattern, and even create anoxic conditions. In addition, nutrient enrichment can reduce water clarity and light penetration and is aesthetically displeasing. Oxygen levels must be considered when evaluating BMPs for phosphorus because phosphorus is released from sediment at higher rates under anoxic conditions; increased water temperature and photosynthesis decrease DO levels and create anoxic conditions.

Nonpoint source runoff from the surrounding local watershed land uses and unstable shorelines are the locally controllable sources of oxygen-demanding materials and sediment loads to Frentress Lake. Therefore, as with streams, nonpoint source controls designed to reduce erosion are expected to reduce TSS and turbidity in the lake as well as provide a secondary benefit of reducing other contaminants such as total phosphorus that may be entering waterways via erosive processes. The BMPs discussed in Section 9.3 are also applicable to Frentress Lake impairments although based on land uses as discussed in Section 2, conservation tillage, grassed waterways, and, to some extent, WASCObS may be more applicable to upland areas rather than at the lake itself. Additional BMPs applicable to local sources of phosphorus include nutrient management, phosphorus-based lawn fertilizer restrictions, and in-lake management measures.

Filter Strips and Riparian Buffers: Filter strips and riparian buffers were discussed in Section 9.3. The exercise completed in Section 9.3 identified 8 acres surrounding the lake that could be evaluated for enhanced riparian buffers.

Bank Stabilization/Erosion Control: The extent of bank erosion surrounding the lake is unknown. Further investigation is recommended to determine the extent that erosion control measures could help manage TSS and/or sedimentation/siltation loads in the waterbody.

Nutrient Management: Nutrient management programs could result in reduced nutrient loads to Frenress Lake. Crop management of nitrogen and phosphorus originating in cultivated areas can be accomplished through Nutrient Management Plans (NMPs) that focus on increasing the efficiency with which applied nutrients are used by crops, thereby reducing the amount available to be transported to both surface water and groundwater. A more detailed evaluation of the agricultural land areas associated with the Mississippi River is beyond the scope of this project; however, the cultivated areas associated with the lake and Mississippi River should be evaluated to determine which areas may benefit from NMPs. **Table 9-4** identified 118 acres of land under cultivation within the directly-contributing watershed.

The overall goal of nutrient reduction from agriculture should be to increase the efficiency of nutrient use by balancing nutrient inputs in feed and fertilizer with outputs in crops and animal produce as well as to manage the concentration of nutrients in the soil. The four “Rs” of nutrient management are applying the right fertilizer source at the right rate at the right time and in the right place. It is not unusual for crops in fields or portions of fields to show nutrient deficiencies during periods of the growing season, even where an adequate NMP is followed. The fact that nutrients are applied does not necessarily mean they are available. Plants obtain most of their nutrients and water from the soil through their root system. Any factor that restricts root growth and activity has the potential to restrict nutrient availability and result in increased nutrient runoff.

Reducing nutrient loss in agricultural runoff may be brought about by source and transport control measures, such as filter strips or grassed waterways. The NMPs account for all inputs and outputs of nutrients to determine reductions. NMPs typically include the following measures:

- A review of aerial photography and soil maps
- Recommendation for regular soil testing – Traditionally, soil testing has been used to decide how much lime and fertilizer to apply to a field. With increased emphasis on precision agriculture, economics, and the environment, soil tests have become a logical tool to determine areas where adequate or excessive fertilization has taken place. Additionally, they can be used to monitor nutrient buildup in soils due to past fertility practices and aid in determining maintenance fertilization requirements. Appropriate soil sampling and analysis techniques are described in the Illinois Agronomy Handbook (<http://extension.cropsciences.illinois.edu/handbook/>).
- A review of current and/or planned crop rotation practices
- Establishment of yield goals and associated nutrient application rates – Matching nutrient applications to crop needs will minimize the potential for excessive buildup of phosphorus soil tests and reallocate phosphorus sources to fields or areas where they can produce agronomic benefits.
- Development of nutrient budgets with planned application rates (which may be variable), application methods, and timing and form of nutrient application

- Identification of sensitive areas and restrictions on application when land is snow covered, frozen or saturated

Phosphorus is listed as a potential cause of impairment in Fretress Lake. Regional differences in phosphorus-supplying power are shown in **Figure 8-4** of the Illinois Agronomy Handbook (<http://extension.cropsciences.illinois.edu/handbook/>). The differences were broadly defined primarily based on variability in parent material, degree of weathering, native vegetation, and natural drainages. For example, soils developed under forest cover appear to have more available subsoil phosphorus than those developed under grass. In Jo Daviess County in northwestern Illinois, soils are generally considered to have high phosphorus-supplying power; therefore, little to no buildup and maintenance of phosphorus levels are usually needed in this area. Application amounts should be determined by periodic soil testing; however, excessively high-phosphorus soil test levels should not be maintained.

While soil test procedures were designed to predict where phosphorus was needed, not to predict environmental problems, the likelihood of phosphorus loss increases with high-phosphorus test levels. Environmental decisions regarding phosphorus applications should include such factors as distance from a significant lake or stream, infiltration rate, slope, and residue cover. One possible problem with using soil test values to predict environmental problems is in sample depth. Normally samples are collected to a 7-inch depth for predicting nutritional needs. For environmental purposes, it would often be better to collect the samples from a 1- or 2-inch depth, which is the depth that will influence phosphorus runoff. Another potential problem is variability in soil test levels within fields in relation to the dominant runoff and sediment-producing zones. Several fertilizer placement recommendations are described in the Illinois Agronomy Handbook (<http://extension.cropsciences.illinois.edu/handbook/>). However, given the propensity of phosphorus to bind tightly to soil particles and subsequently enter waterbodies through erosion, the deep fertilizer placement technique may be most appropriate in phosphorus impaired areas. Under the deep placement technique, the fertilizer is placed 4 to 8 inches deep into the soil rather than being spread near the surface.

Phosphorus-Based Lawn Fertilizer Restrictions: Runoff from managed areas may include phosphorus-based fertilizers applied to residential lawns, golf courses, and other surfaces. If used too close to a receiving water body, phosphorus present in stormwater runoff, if any, will enter the waterbody. Illinois has a statute in place which governs the use of phosphorus-based fertilizers in urban areas: Lawn Care Products Application and Notice Act (415 ILCS 65/). This act includes the following prohibitions for phosphorus-based fertilizers (see act for limited exceptions):

- They should not be applied to lawns unless it can be demonstrated by soil test that the lawn is lacking in phosphorus when compared against the standard established by the University of Illinois; see the act for exceptions
- They should not be applied to impervious surfaces
- They should not be applied within 3 feet of any waterbody if a spray, drop, or rotary spreader is used. If other equipment is used, the fertilizer may not be applied within 15 feet of a water body.

- They should not be applied when the ground is frozen or saturated
- Appropriate lawn markers for the application event and notifications to potentially affected adjacent properties are required

Private Septic System Inspection and Maintenance Program: Failing or leaking septic systems can be a source of phosphorus pollution. A program that actively manages functioning systems and addresses non-functioning systems could be implemented to reduce the potential phosphorus loads from septic systems in the watershed. Guidance for managing septic systems was described in Section 9.4.2 of this document.

In-Lake Phosphorus Loading: In some waterbodies, internal loading of phosphorus may be a significant contributor to overall watershed loads. In these situations, a reduction of phosphorus from in-lake cycling through in-lake management strategies is necessary for attainment of the TMDL load allocations. Internal phosphorus loading can occur when the water above the sediments becomes anoxic causing the release of phosphorus from the sediment in a form which is available for plant uptake. The addition of bioavailable phosphorus in the water column stimulates more plant growth and die-off, which may perpetuate or create anoxic conditions and enhance the subsequent release of phosphorus into the water. Internal phosphorus loading can also occur in shallow lakes through release from sediments by the physical mixing and reintroduction of sediments into the water column as a result of wave action, winds, boating activity, and other means.

For lakes experiencing high rates of phosphorus input from bottom sediments, several management measures are available to control internal loading. Three BMP options for the control of internal loading include the installation of an aerator, the addition of aluminum, and dredging.

- **Hypolimnetic (bottom water) aeration** involves an aerator air-release that can be positioned at a selected depth or at multiple depths to increase oxygen transfer efficiencies in the water column and reduce internal loading by establishing aerobic conditions at the sediment-water interface. Installation of an aeration device will also directly contribute to the alleviation of DO issues present in Fentress Lake.
- **Phosphorus inactivation by aluminum addition** (specifically aluminum sulfate or alum) to lakes is the most widely-used technique to control internal phosphorus loading. Alum forms a polymer that binds phosphorus and organic matter. The aluminum hydroxide-phosphate complex (commonly called alum floc) is insoluble and settles to the bottom, carrying suspended and colloidal particles with it. Once on the sediment surface, alum floc inhibits phosphate diffusion from the sediment to the water (Cooke et al.1993).
- Phosphorus release from the sediment is greatest from recently deposited layers. **Dredging** approximately one meter of recently deposited phosphorus-rich sediment can remove approximately 80 to 90 percent of the internally loaded phosphorus without the addition of potentially toxic compounds to the reservoir. Dredging may also contribute to reductions in internal phosphorus loading by increasing the depth of large portions of the waterbody, reducing the degree of reintroduction of sediments into the water column through physical

mixing. However, dredging is typically more costly than other management options (NRCS 1992).

9.7 Cost Estimates of BMPs

Cost estimates for a number of suggested BMPs are available through the SWCD (**Table 9-5**). Cost information for additional BMPs not included in the table are discussed below.

Table 9-5 Fiscal Year 2017 SWCD BMP Cost Data

Practice	Component	Unit	Average Cost
329A	No-till	acre	\$33.33
329C	Strip-till	acre	\$33.33
340A	Cover Crops	acre	\$66.67
340B	Temporary Cover	acre	\$266.66
342	Critical Area Planting	acre	\$350
345	Mulch-till	acre	N/A
362	Diversions	foot	\$3.80
410	Block Lined Chute (Includes earthwork)	block	\$7.00
410	Metal Toewall (including aluminum) - (weir length x overfall = sq.ft.) (Includes earthwork)	square foot	\$140
410	Modular Block Structure (Includes earthwork)	block	\$85
410	Rock Lined Chute (Includes earthwork)	ton	\$40
412	Grassed Waterway Earthwork	acre	\$2,900
512	Pasture+Hayland Planting (Applies to land not in pasture or hayland within the past 5 years)	acre	\$300
590A	Nutrient Management Plan	acre	\$4
590B	Nutrient Management Plan Implementation	acre	\$12
638	Water & Sediment Control Basin, < 3 feet (Earthwork for narrow base)	foot	\$3.30
638	Water & Sediment Control Basin, > 3 feet (Earthwork for narrow base)	foot	\$3.80

9.7.1 Filter Strips and Riparian Buffers

Several types of filter strip practices are available, including areas for native herbaceous vegetation with or without fertility measures required and areas of introduced species, also with or without fertility measures required. Filter strip implementation that includes seedbed preparation and native seed application ranges from \$520/acre to \$639/acre depending on the type used, with an average cost of approximately \$594/acre.

Riparian buffers consisting of bare-root shrubs cost approximately \$1.10 to \$1.65 each while direct seeding of trees and/or shrubs costs approximately \$741/acre. The direct seeding scenario includes a planting rate of approximately 3,000 to 4,800 seeds per acre as well as the foregone income for the land taken out of crop production. Land preparation, including removing undesirable vegetation and improving site conditions, is estimated at \$38/acre. For cases where an herbaceous cover is preferable, such as native grass or certain species of forbs and/or shrubs, costs average \$642/acre.

9.7.2 Livestock and Wildlife Exclusion

Costs for livestock and/or wildlife exclusion depend on the type of fencing used. For example, permanent high tensile electric fencing is approximately \$0.79/foot for a single strand, \$1.16/foot for 2 to 3 strands, \$1.42/foot for 4 to 6 strands (with fence post centers no more than 30 feet apart), and \$1.78/foot for 7 or more strands (with double H bracing and fence post centers no more than 30 feet apart). A permanent, multi-strand barbed wire fence averages \$1.62/foot, and a permanent woven wire fence averages \$1.96/foot.

The cost for providing an alternate water supply will vary depending on the supply system used. For example, in areas frequently used by livestock for limited access to drinking water from a pond or stream, an access ramp may be constructed to provide a stable, non-eroding surface and is approximately \$1.44/square foot. This includes earthwork, geotextile, gravel, and other surfacing materials that might be part of the design, as well as a small diversion berm to protect the ramp from concentrated overland flow. If vegetation should be established near the access ramp, costs for a dozer for grading and shaping of small gullies, seedbed preparation with typical tillage implements, grass/legume seed, companion crop, and fertilizer and lime with application are \$716.03/acre. Straw mulch or other approved natural material may be applied where needed to facilitate establishment of vegetative cover. The cost for mulching averages \$238/acre.

Several tank types may be used in areas where lower capacity water supplies are needed and only a backup supply is required for peak demand periods. Above ground tanks vary from \$2,220 for a 1,000 to 3,000 gallon tank and \$3,717 for a tank greater than 3,000 gallons. A large, permanent water tank (500 to 1,000 gallons) or fountain averages \$975, a small permanent tank (less than 500 gallons) is approximately \$400, a frost-free waterer is approximately \$1,011, and a portable tank is \$153. Heavy use protection should be established around these tanks and costs range from \$0.86 to \$4.91/square foot for gravel beds up to a 12 foot width. An underground storage tank may also be used, \$3,600 each, with a livestock pipeline for overflow. A plastic, buried pipeline, less than 2 inches diameter, averages \$1.94/foot. If a bedded pipeline is needed due to special considerations, such as rocky soil, the cost is \$3.38/foot. A non-electric livestock pump is approximately \$961.

9.7.3 Septic System Maintenance

Septic tanks are designed to accumulate sludge in the bottom portion of the tank while allowing water to pass into the drain field. If the tank is not pumped out regularly, the sludge can accumulate and eventually become deep enough to allow for flow into the drain field. Pumping the tank every three to five years prolongs the life of the system by protecting the drain field from solid material that may cause clogs and system back-ups. In addition, septic systems should not be connected to field tile lines.

The cost to pump a typical septic tank ranges from \$250 to \$350 depending on how many gallons are pumped out and the disposal fee for the area. If a system is pumped once every three to five years, this expense averages out to less than \$100 per year.

The cost of developing and maintaining a watershed-wide database of the onsite wastewater treatment systems in the Galena/Sinsinawa Rivers watershed depends on the number of systems that need to be inspected and the means by which the systems are inventoried. Education of home and business owners that use onsite wastewater treatment systems should occur periodically. Public meetings; mass mailings; radio, newspaper, and TV announcements can all be used to remind and inform owners of their responsibility to maintain their systems. The costs associated with education and inspection programs will vary depending on the level of effort required to communicate the importance of proper maintenance and the number of systems in the area. Grand scale estimates of watershed septic systems were included in Section 9.4.2.

9.7.4 Passive BMPs for Mine-related Waste

Some treatment technologies associated with mine waste and associated zinc loading were presented in Section 9.5. The USEPA produced a “Reference Guide to Treatment Technologies for Mining-Influenced Water” in 2015 which contains the following cost estimate information:

- Open Limestone Channel: The cost of treatment varies between \$32 and \$9,303 per ton per year (2013 US dollars). Most open limestone channels treat water at or less than \$300 per ton per year.
- Anoxic Limestone Drains (ALD): Constructing and operating ALDs to treat mining influenced waters can be cost effective. Specific constituents in the water determine ALD installation costs. The Interstate Technology and Regulatory Council reported capital costs at an abandoned mine in Alabama of about \$0.27 per 1,000 gallons of water. Operation and maintenance costs were about \$0.11 per 1,000 gallons of treated water.
- Constructed Wetland: The U.S Naval Facilities Engineering Service Center’s Remediation Technology Online Help Program lists the costs of constructed wetlands treatment at between \$0.15 and \$1.00 (2013 US dollars) per gallon of water treated.

9.8 Site-Specific BMPs/Reasonable Assurance

In the previous two decades, efforts have been made within the Galena/Sinsinawa Rivers watershed to secure grant funding and implement water quality related BMPs. **Table 9-6** provides information on site-specific management measures within the watershed and provides reasonable assurance that recommendations contained in this implementation plan will have support within the local watershed community.

Table 9-6 Water Quality Management Measures within the Galena/Sinsinawa Rivers Watershed

Program	Project Name	Description	Recipient/Grantee	Year	Receiving Water
IDNR Conservation 2000	Horseshoe Mound Restoration	Restoration of native oak savanna on 28 acres	Natural Land Institute	Ongoing	Galena River
IDA Conservation Practices Program	Cover and Green Manure Crops	160 acres	Jo Daviess SWCD	2012	Galena River
Conservation Easement (NCED)	Gateway Easement	100 acres permanently put in conservation easement	Jo Daviess Conservation Foundation	2011	Galena River
IDA Streambank and Shoreline Restoration Practice (SSRP)	Streambank and Shoreline Protection	1305 feet of stabilized shoreline	Jo Daviess SWCD	2010	Galena River
IDA Streambank and Shoreline Restoration Practice (SSRP)	Streambank and Shoreline Protection	525 feet of stabilized shoreline	Jo Daviess SWCD	2007	Galena River
IEPA Nonpoint Source Program (319)	Sealing of Abandoned water wells and mine holes	180 water wells/min holes were sealed and demonstrations were made (5 sealed in watershed)	Jo Daviess SWCD	2007	Galena River
IDA Streambank and Shoreline Restoration Practice (SSRP)	Streambank and Shoreline Protection	310 feet of stabilized shoreline	Jo Daviess SWCD	2005	Galena River
IEPA Nonpoint Source Program (319)	Northwest Illinois Livestock Project	Waste storage structures (2 in Sinsinawa watershed and 1 in Galena watershed)	Blackhawk Hills RC & D	2004	Sinsinawa and Galena Rivers
IDA Streambank and Shoreline Restoration Practice (SSRP)	Streambank and Shoreline Protection	180 feet of stabilized shoreline	Jo Daviess SWCD	2003	Galena River
IDA Streambank and Shoreline Restoration Practice (SSRP)	Streambank and Shoreline Protection	365 feet of stabilized shoreline	Jo Daviess SWCD	2003	Galena River
IDNR Conservation 2000	Galena River Ecological Study	Inventoried specific natural resources of the Galena River watershed	The Prairie Enthusiast	2001	Galena River
IDNR Conservation 2000	Certified and Prescribed Burn Training	Provided burning training for restoration areas	Jo Daviess SWCD	1999	Galena River
IDOT Mitigation Banks and Sites	Galena River Bridge Wetland Site	Wetland mitigation at Stagecoach Trail site/ wetland and upland buffer created on 7.75 acres	IDOT/INHS	1998	Galena River

9.9 Information and Education

As discussed in Section 3, public education and participation is a key factor for TMDL and watershed plan implementation. Increased public awareness can increase implementation of BMPs. Small incremental improvements and individual adoption of BMPs can be achieved at a much lower cost compared to the large-scale BMPs identified above. Outreach and education efforts should focus on activities that support the watershed plan goals, including:

- Continued regular meeting of local stakeholder group with intent of broadening audience/attendance
- Biological and water quality monitoring
- Lake and stream management
- Encouraging native landscaping including buffers along lakeshores and streambanks
- Buffer strips
- Reducing the use of lawn chemicals (pesticides and phosphorus fertilizers)
- Nutrient management
- Water conservation
- Education/outreach for rural residence on proper septic system maintenance
- Soil testing
- Field visit days with demonstrations of agricultural conservation practices

Illinois EPA staff have met with the local stakeholder group, including county SWCD staff, to discuss BMPs used throughout the watershed and continued future collaboration. An additional public meeting will be held within the watershed to present the final TMDL results and the implementation plan. Additional recommended activities to support public outreach and education include:

- Websites and social media to publicize meetings, upcoming events and links to resources
- E-mail updates
- Brochures with information on household pollutant reduction, fertilizer use, and septic tanks maintenance upkeep
- Educational signs to educate viewers on water quality issues, purpose of BMPs, and environmental stewardship
- Public service announcements
- Informational meetings on State and Federal cost share programs

9.10 Project Funding

Cost-share and incentive programs at the state and federal level are available to landowners, homeowners, and farmers in the watershed to help offset costs of implementing many of the BMPs recommended in this report. Some of these programs are discussed below. When reviewing the programs, it should be noted that some of the programs are only meant to provide incentives to encourage operators or landowners to try the practice. These incentive programs are not intended to cover the entire cost associated with implementing a practice. Additionally, some practices have many variables to consider that will affect both the cost of the program and the incentive or cost-share amount to be received; e.g., NMPs.

9.10.1 Available State-Level Programs for Nonpoint Sources

State-level programs to encourage landowners to implement resource-conserving practices for water quality and erosion control purposes are discussed in the following paragraphs.

9.10.1.1 Illinois Department of Agriculture and Illinois EPA Nutrient Management Plan Project

The IDA and Illinois EPA co-sponsor a cropland Nutrient Management Plan project in watersheds that have developed or are developing TMDLs. This voluntary project supplies incentive payments to producers to have NMPs developed and implemented. Additionally, watersheds that have sediment or phosphorus identified as a cause for impairment (as is the case in this watershed), are eligible for cost-share assistance in implementing traditional erosion control practices through the Nutrient Management Plan project.

9.10.1.2 Partners for Conservation Program

The Partners for Conservation Program (PFC) provides cost sharing on a variety of practices such as no-till systems, WASCObS, pasture/hay land establishment, critical area planting, cover crops, temporary cover (if added to another practice in order to extend the construction season), filter strips, rain gardens, diversions, well decommissioning, NMPs, and grade stabilization structures. The PFC is funded through the IDA and administered by the local SWCDs. Life/maintenance contracts can be 1 to 10 years depending on the practice and costs per acre vary significantly from project to project.

9.10.1.3 Streambank Stabilization and Restoration Program

The Streambank Stabilization and Restoration Program (SSRP) was established to address problems associated with streambank erosion, such as loss or damage to valuable farmland, wildlife habitat, and roads; stream capacity reduction through sediment deposition; and degraded water quality, fish, and wildlife habitat. The primary goals of the SSRP are to develop and demonstrate vegetative, stone structure, and other low cost bio-engineering techniques for stabilizing streambanks and to encourage the adoption of low-cost streambank stabilization practices by making available financial incentives, technical assistance, and educational information to landowners with critically eroding streambanks. A cost share of 75 percent is available for approved project components such as willow post installation, bendway weirs, rock riffles, stream barbs/rock, vanes, lunger structures, gabion baskets, and stone toe protection techniques. There is no limit on the total program payment for cost-share projects that a landowner can receive in a fiscal year. However, maximum cost per foot of bank treated is used to

cap the payment assistance on a per foot basis and maintain the program's objectives of funding low-cost techniques (IDA 2000). All project proposals must be sponsored and submitted by the local Soil and Water Conservation District (SWCD).

9.10.2 Available Federal-Level Programs for Nonpoint Sources

There are several voluntary conservation programs established by various federal agencies that encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs apply to crop fields as well as rural grasslands that are presently used for livestock grazing. Federal-level programs are discussed in the following paragraphs. The USEPA manages the Clean Water Act Section 319 Grants. The Farm Service Agency (FSA) oversees the Conservation Reserve Program (CRP) and the Grasslands Reserve Program (GRP). Voluntary conservation programs established through the 2014 U.S. Farm Bill, and managed by the NRCS, include the Agricultural Conservation Easement Program (ACEP), the Conservation Stewardship Program (CSP), and the Environmental Quality Incentives Program (EQIP).

9.10.2.1 Clean Water Act Section 319 Grants

Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive USEPA 319(b) grants upon USEPA's approval of the state's Nonpoint Source Assessment Report and Nonpoint Source Management Program. States may reallocate funds through sub-awards (e.g., contracts, sub-grants) to both public and private entities, including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

USEPA designates incremental funds, a \$163-million award in 2016, for the restoration of impaired water through the development and implementation of watershed-based plans and TMDLs for impaired waters. Base funds, funds other than incremental funds, are used to provide staffing and support to manage and implement the state Nonpoint Source Management Program. Section 319 funding can be used to implement activities which improve water quality, such as filter strips, streambank stabilization, etc. (USEPA 2003).

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement Illinois' Nonpoint Source Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling nonpoint source pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale; funding is also available for BMPs on a non-watershed scale and the development of information/education nonpoint source pollution control programs.

The maximum Federal funding available is 60 percent of the total cost, with the remaining 40 percent coming from local match. The program period is two years unless otherwise approved. This is a reimbursement program.

Section 319(h) funds are awarded for the purpose of implementing approved nonpoint source management projects. The funding will be directed toward activities that result in the implementation of appropriate BMPs for the control of nonpoint source pollution or to enhance the public's awareness of nonpoint source pollution. Applications are accepted June 1 through August 1.

9.10.2.2 Conservation Reserve Program

The CRP is a voluntary program, administered through the FSA, which encourages landowners to agree to remove environmentally sensitive land from agricultural production and plant long-term resource-conserving cover to improve water quality, prevent soil erosion, and reduce loss of wildlife habitat. The program was initially established in the Food & Security Act of 1985 and is the largest private-lands conservation program in the United States.

Participants can enroll in CRP in two ways and the duration of the contracts under CRP range from 10 to 15 years. The first enrollment method is through a competitive process known as the CRP General Sign-up. These are announced on a periodic basis by the Secretary of Agriculture but do not occur on any fixed schedule. The second enrollment method is through CRP Continuous Sign-up, which is offered on a continuous basis. Continuous sign-up provides management flexibility to farmers and ranchers to implement certain high-priority conservation practices on eligible land. All enrollment offers are processed through the local FSA office.

Certain conditions must be met in order for land to be eligible for CRP enrollment. These conditions include the following:

1. The farmer applying for enrollment must have owned or operated the land for at least 12 months prior to the previous CRP sign-up period (except in cases of a change in ownership due to the previous owner's death, foreclosure, or land purchase by the new owner without the sole intention of placing it in the CRP).
2. Cropland that is planted or considered planted to an agricultural commodity for four of the six most recent crop years (including field margins) and must be physically and legally capable of being planted in a normal manner to an agricultural commodity.
3. Certain marginal pastureland suitable for use as any of the following conservation practices: buffer for wildlife habitat, wetlands buffer or restoration, filter strips, riparian buffer, grass waterway, shelter belt, living snow fence, contour grass strip, salt tolerant vegetation, or shallow water area for wildlife.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted average erosion index of 8 or higher
- Be expiring CRP acreage

- Be located in a national or state CRP conservation priority area.

The FSA bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or cash-rent equivalent. The maximum rental rate for each offer is calculated in advance of enrollment. Producers may offer land at the maximum rate or at a lower rental rate to increase likelihood of offer acceptance. In addition, the FSA provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation practices (USDA 2016: <https://www.fsa.usda.gov/programs-and-services/conservation-programs/prospective-participants/index>). CRP annual rental payments may include an additional amount up to \$2 per acre per year as an incentive to perform certain maintenance obligations (up to \$7 for certain continuous sign-up practice).

Finally, the FSA offers additional financial incentives for certain continuous sign-up practices. Signing Incentive Payment is a one-time incentive payment of \$10/acre for each acre enrolled for each full year of the contract. Eligible practices include field windbreaks; grassed waterways; shelter belts; living snow fences; filter strips; riparian buffers; marginal pastureland wildlife and wetland buffers; bottom timber establishment; field borders; longleaf pine establishment; duck nesting habitat; SAFE buffers, wetlands, trees, longleaf pine, and grass; pollinator habitat; and several wetlands practices. The Performance Incentive Payment is a one-time incentive payment made to participants who enroll land in CRP to be devoted to all continuous sign up practices except establishment of permanent vegetative cover on terraces, wetland restoration (including non-floodplain), bottomland timber establishment, and duck nesting habitat.

The maximum annual payment (from a program for which a cost share is not required) that an eligible “person” can receive under the CRP is \$50,000 per fiscal year. This is a separate payment limitation applying only to CRP non-cost share payment.

The current extent of land enrolled in CRP within the Galena/Sinsinawa Rivers watershed is unknown.

9.10.2.3 Conservation Stewardship Program

The CSP helps agricultural producers maintain and improve their existing conservation systems and adopt additional conservation activities to address priority resources concerns. Participants earn CSP payments for conservation performance—the higher the performance, the higher the payment.

Through CSP, participants take additional steps to improve resource conditions including soil quality, water quality and quantity, air quality, habitat quality, and energy. CSP provides two types of payments through 5-year contracts: annual payments for installing new conservation activities and maintaining existing practices; and supplemental payments for adopting a resource-conserving crop rotation. Producers may be able to renew a contract if they have successfully fulfilled the initial contract and agree to achieve additional conservation objectives. Payments are made soon as practical after October 1 of each fiscal year for contract activities installed and maintained in the previous year. In fiscal year 2016, NRCS made \$150 million available for producers through the CSP.

Eligible lands include private and Tribal agricultural lands, cropland, grassland, pastureland, rangeland and non-industrial private forest land. CSP is available to all producers, regardless of operation size or type of crops produced, in all 50 states, the District of Columbia, and the Caribbean and Pacific Island areas. Applicants may include individuals, legal entities, joint operations, or Indian tribes that meet the stewardship threshold for at least two priority resource concerns when they apply. They must also agree to meet or exceed the stewardship threshold for at least one additional priority resource concern by the end of the contract. Producers must have effective control of the land for the term of the proposed contract, which include all eligible land in the agricultural operation. Some additional restrictions and program requirements may apply and interested applicants should contact the local NRCS office for more information.

9.10.2.4 Grassland Reserve Program

The purpose of the GRP, administered by the FSA, is to prevent grazing and pasture land from being converted into cropland, used for urban development, or developed for other non-grazing uses. Participants in the program voluntarily limit future development of the land while still being able to use the land for livestock grazing and activities related to forage and seed production. Some restrictions on activities may apply during the nesting season of certain bird species that are in decline or protected under federal or state law.

The GRP has several enrollment options, including a rental contract for 10, 15, or 20 years, or enrollment of the land in a conservation easement for an indefinite period of time. Applications are accepted any time and are processed through the local FSA office.

To be eligible for a rental agreement, the applicant must own or have control of the land for the length of the contract. To enroll in a conservation easement, the applicant must own and be willing to restrict use of the land either in perpetuity or under the maximum length of time under state law. Persons enrolled in GRP receive an annual rental payment for their enrolled acres.

Rental payments were not available on the USDA website as of June 2016

(<https://www.fsa.usda.gov/programs-and-services/conservation-programs/grassland-reserve/index>); however, further information about the program, including payment amounts, eligibility and maintenance criteria, and land requirements may be obtained from the local FSA office.

9.10.2.5 Agricultural Conservation Easement Program

ACEP provides financial and technical assistance to help conserve agricultural lands and wetlands and their related benefits. Under the Agricultural Land Easements component, NRCS helps American Indian tribes, state and local governments, and non-governmental organizations protect working agricultural lands and limit non-agricultural uses of the land. Land protected by agricultural land easements provides additional public benefits, including environmental quality, historic preservation, wildlife habitat, and protection of open space. Under the Wetlands Reserve Easements component, NRCS helps to restore, protect, and enhance enrolled wetlands. Wetland Reserve Easements provide habitat for fish and wildlife, including threatened and endangered species, improve water quality by filtering sediments and chemicals, reduce flooding, recharge groundwater, protect biological diversity and provide opportunities for educational, scientific and limited recreational activities.

Agricultural Land Easements: NRCS provides financial assistance to eligible partners purchase Agricultural Land Easements that protect the agricultural use and conservation values of eligible land. In the case of working farms, the program helps farmers and ranchers keep their land in agriculture. The program also protects grazing uses and related conservation values by conserving grassland, including rangeland, pastureland and shrubland. Land eligible for agricultural easements includes cropland, rangeland, grassland, pastureland and non-industrial private forest land. NRCS will prioritize applications that protect agricultural uses and related conservation values of the land and those that maximize the protection of contiguous acres devoted to agricultural use.

To enroll land through agricultural land easements, NRCS enters into cooperative agreements with eligible partners. Each easement is required to have an agricultural land easement plan that promotes the long-term viability of the land. Under the Agricultural Land component, NRCS may contribute up to 50 percent of the fair market value of the agricultural land easement. Where NRCS determines that grasslands of special environmental significance will be protected, NRCS may contribute up to 75 percent of the fair market value of the agricultural land easement.

Wetland Reserve Easements: NRCS also provides technical and financial assistance to restore, protect, and enhance wetlands through the purchase of a wetland reserve easement. These agreements include the right for NRCS to develop and implement a wetland reserve restoration easement plan to restore, protect, and enhance the wetland's functions and values. Land eligible for wetland reserve easements includes farmed or converted wetland that can be successfully and cost-effectively restored. NRCS will prioritize applications based the easement's potential for protecting and enhancing habitat for migratory birds and other wildlife. For acreage owned by an Indian tribe, there is an additional enrollment option of a 30-year contract. Through the wetland reserve enrollment options, NRCS may enroll eligible land through one of the following:

- **Permanent Easements** – These are conservation easements in perpetuity. NRCS pays 100 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 75 to 100 percent of the restoration costs.
- **30-year Easements** – These expire after 30 years. Under 30-year easements, NRCS pays 50 to 75 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- **Term Easements** – Term easements are easements made for the maximum duration allowed under applicable State laws. NRCS pays 50 to 75 percent of the easement value for the purchase of the term easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- **30-year Contracts** – 30-year contracts are only available to enroll acreage owned by Indian tribes, and program payment rates are commensurate with 30-year easements.

For wetland reserve easements, NRCS pays all costs associated with recording the easement in the local land records office, including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Wetland Reserve Enhancement Partnership – The 2014 Farm Bill replaced the Wetland Reserve Enhancement Program with the Wetland Reserve Enhancement Partnership (WREP) as an enrollment option under ACEP. WREP continues to be a voluntary program through which NRCS signs agreements with eligible partners to leverage resources to carry out high priority wetland protection, restoration, and enhancement and to improve wildlife habitat.

- Partner benefits through WREP agreements include:
 - Wetland restoration and protection in critical areas
 - Ability to cost-share restoration or enhancement beyond NRCS requirements through leveraging
 - Able to participate in the management or monitoring of selected project locations
 - Ability to use innovative restoration methods and practices

In 2016, NRCS made \$15 million in financial and technical assistance available to help eligible conservation partners leverage local resources to voluntarily protect, restore, and enhance critical wetlands on private and tribal agricultural land nationwide. The funding is provided through the WREP, a special enrollment option under the Agricultural Conservation Easement Program. Proposals were due to the local NRCS offices by May 16, 2016; however, landowners should check with the NRCS to see about applying in future years. To enroll land eligible partners may submit proposals to the local NRCS office.

9.10.2.6 Environmental Quality Incentive Program

EQIP is a voluntary program that provides financial and technical assistance to agricultural producers to plan and implement conservation practices that improve soil, water, plant, animal, air, and related natural resources on agricultural land and non-industrial private forestland. Through EQIP, the NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Persons engaged in livestock or agricultural production and owners of non-industrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private non-industrial forestland, and other farm or ranch lands. Eligible applicants must, at a minimum, meet the following criteria; additional program requirements may apply:

- Be agricultural producer (person, legal entity, or joint operation who has an interest in the agricultural operation, or who is engaged in agricultural production or forestry management).
- Control or own eligible land.
- Comply with adjusted gross income for less than \$900,000. Note: Federally recognized Native American Indian Tribes or Alaska Native corporations are exempt from the adjusted gross income payment limitations.
- Be in compliance with the highly erodible land and wetland conservation requirements.

- Develop an NRCS EQIP plan of operations that addresses at least one natural resource concern

Persons interested in entering into a cost-share agreement with the NRCS for EQIP assistance may file an application at any time; however, each state may establish deadlines for one or more application periods in which to consider eligible applications for funding. Applications submitted after the deadlines will be evaluated and considered for funding during later funding opportunities.

As part of the program, a Conservation Activity Plan (can be developed for producers to address a specific natural resource concern on their agricultural operation. Each plan is developed by a certified Technical Service Provider, who is selected by the EQIP participant. Technical assistance payments for Technical Service Providers do not count against the financial assistance aggregate payment limitation or the contract financial assistance payment limitation. The plan becomes the basis of the EQIP contract between NRCS and the participant, and the contracts can be up to 10 years in duration. Financial assistance payments are made to eligible producers once conservation practices are completed according to NRCS requirements. Payment rates are set for each fiscal year and are attached to the EQIP contract when it is approved.

Historically underserved producers (limited resource farmers/ranchers, beginning farmers/ranchers, socially disadvantaged producers, Indian Tribes, and veteran farmer or ranchers) who self-certify on Form NRCS-CPA-1200, Conservation Program Application are eligible for a higher practice payment rate to support implementation of contracted conservation practices and activities. Historically underserved producers may also be issued advance payments up to 50 percent of the established payment rate to go toward purchasing materials or contracting services to begin installation of approved conservation practices. Self-certified socially disadvantaged farmer/rancher, beginning farmer/rancher, and veteran farmer/rancher producers may elect to be evaluated in special EQIP funding pools. More information can be obtained from the local NRCS office.

EQIP provides payments up to 75 percent of the incurred costs and 100 percent estimated income foregone of certain conservation practices and activities. Payments received by producers through EQIP contracts after February 7, 2014 may not exceed \$450,000 for all EQIP contracts entered into during the period from 2014 to 2018. Payment limitations for organic production may not exceed an aggregate \$20,000 per fiscal year or \$80,000 during any 6-year period for installing conservation practices.

Conservation practices eligible for EQIP funding which are recommended BMPs for this watershed TMDL include filter strips, conservation tillage, grade stabilization structures, grass waterways, riparian buffers, streambank/shoreline protection, and wetland restoration. More information regarding state and local EQIP implementation can be found at <http://www.nrcs.usda.gov/wps/portal/nrcs/main/il/programs/financial/eqip/>.

Also of note, the Driftless Area Landscape Conservation Initiative (DALCI) is a program under EQIP to address soil erosion, water quality, and wildlife concerns in the Driftless Area, a unique landscape in the Upper Midwest. In Illinois the counties in the DALCI area are: Carroll, Jo Daviess, Ogle, Stephenson, and Winnebago. NRCS uses the EQIP to provide technical and financial

assistance to help producers accelerate installation of conservation practices. The initiative focuses on restoring coldwater stream corridors. Common practices include protecting streambanks from erosion, adding fences to keep livestock out of streams, removing obstructions in the water, adding stream crossings and fish ladders and managing habitat for wildlife.

Through DALCI, NRCS helps producers use voluntary conservation practices to conserve the Driftless Area’s natural resources ensuring economic viability of cropland, pastureland, and forestland. This collaborative stewardship provides a five-year funding source for participants. By taking immediate action, landowners and producers can reverse the decline for at-risk species and habitats, resulting in the overall health of the watersheds and their natural resources.

9.10.3 Local Program Contact Information

The FSA administers the CRP and GRP. NRCS administers the ACEP, CSP, and EQIP. Local contact information for counties containing some portion of the Galena/Sinsinawa Rivers watershed are listed in the **Table 9-7** below.

Table 9-7 Local SWCD, NRCS, and FSA Contact Information

County	Address	Phone
Jo Daviess County	227 N Main St, P.O. Box 502 Elizabeth, IL 61028	(815) 858-3418

9.11 Planning Level Cost Estimates for Implementation Measures

Cost estimates for different implementation measures are presented in **Table 9-8**. The column labeled "Program" or "Sponsor" lists the financial assistance program or sponsor available for various BMPs (as discussed in Section 9.10). Illinois EPA 319 Grants are applicable to all of the practices.

Table 9-8 Cost Estimates of Various BMP Measures

BMP	Units	Installation Cost	Program	Sponsor(s)
Filter strip (seeded)	per ac	\$520 - \$639, avg \$594	CRP	NRCS, IDA
Riparian buffer – bare-root shrubs	each	\$1.10 - \$1.65	CRP	NRCS, IDA
– forested	per ac	\$741		
– herbaceous cover	per ac	\$642		
– land preparation	per ac	\$38		
Nutrient management – development and implementation	per ac	\$16	EQIP	NRCS, IDA, Illinois EPA
Livestock exclusion			EQIP	NRCS
Fencing – permanent high-tensile, 1 strand	per ft	\$0.79		
– permanent high-tensile, 2-3 strands	per ft	\$1.16		
– permanent high-tensile, 4-6 strands	per ft	\$1.42		
– permanent high-tensile, 7 or more strands	per ft	\$1.78		

BMP	Units	Installation Cost	Program	Sponsor(s)
– barbed wire, multi-strand	per ft	\$1.62		
– woven wire	per ft	\$1.96		
Alternate water				
– access ramp	per SF	\$1.44		
– tanks, at or above ground	each	\$153 - \$3,717;		
– tanks, at or above ground, heavy use protection	per SF	\$0.86 - \$4.91		
– tanks, frost-free waterer	each	\$1,011		
– tank, below ground	each	\$3,600		
– tank, below ground, pipeline and pump	per ft each	\$1.94 - \$3.38/ft for pipeline, \$961/pump		
Water and sediment control basin, <3 ft	per ft	\$3.30		
– >3ft	per ft	\$3.80	CPP	IDA
Bank stabilization	per ac	\$27 - \$52/ft		
– weirs/rock riffles	each	\$2,448 - \$6,305		
– stream barb/bendway weir with longitudinal peaked stone toe	per ft	\$27.27 - \$52.50		
– bank armor	per CY	\$37.55	SSRP	IDA
Grade stabilization				
– concrete block chutes	per block	\$7.00		
– rip rap-lined (rock) chute	per ton	\$40.00		
– metal toe wall	per SF	\$140		
– modular block structure	Per block	\$85	CPP, SSRP	IDA
Grassed waterway	per ac	\$2,900	CPP CRP	IDA NRCS
Conservation tillage				
– no-till/strip-till	per ac	\$133.33	EQIP	NRCS, IDA
Contour farming	per ac	\$6.06	EQIP	NRCS
Cover Crops	per ac	\$66.67	EQIP	NRCS
Wetland – enhancement/restoration	per ac	\$1,167 - \$3,680		
– constructed	per ac	\$7,725 - \$10,286	ACEP	NRCS
Mulch as needed for various BMPs, such as alternate water access ramp and WASCObS	per ac	\$440 for mulch	See corresponding program and sponsor listed above	
Septic system maintenance	per event	\$250 - \$350	Private system owner	

ac = acre
ft = foot

CY = cubic yard
SF = square foot

9.12 Milestones and Monitoring

Successful plan implementation relies on establishing and tracking milestones to measure progress. **Table 9-9** below identifies an implementation schedule for meeting milestones listed in **Table 9-10**. Stakeholders should evaluate schedule/milestone progress on an annual basis and

implement adaptive management to modify management measures, milestones, and schedule as necessary.

9.12.1 Implementation Schedule

Implementation of the management actions outlined in this section should occur in phases, often over the course of several years, with effectiveness assessments made as improvements are completed. The process of obtaining funding, and developing and implementing projects designed to improve water quality, can take months or years to complete and once in place, improvements in water quality, as a result of BMPs, may not be detectable for several years. Continued monitoring and reevaluation of the implementation measures during this time will allow for more expedient adjustment to BMP implementation measures that may result in earlier attainment of water quality targets.

Table 9-9 Implementation Schedule

Schedule Category – General	Detailed Description	Recommended Schedule
Funding	Develop grant applications	Short term: 2-5 years
Implement Short-term Projects	Identify and implement short-term pilot projects that can be completed (i.e. willing landowners and available funding)	Mid-term: 2-5 years
Monitoring	Implement monitoring plan	Continuous: 1-20 years
Annual Stakeholder meetings	Stakeholders will convene at once a year to gauge progress and discuss evolving needs and planned activities	Annually
Implement Larger Projects	Identify and implement larger projects. These projects are more likely to have multiple funding sources and stakeholders.	Mid- Term: 5-10 years
Education and outreach	Prepare and implement and education and outreach plan. Conduct at least two public meetings annually.	Immediate: 1-2 years
Schedule Category – Critical Areas	Detailed Description	Recommended Schedule
Interstate Coordination	Coordination between county SWCD staff in the Illinois and Wisconsin portions of the watershed	Initiate coordination now
Implement Identified Projects	Work with local SWCD to use TMDL priority to secure funding and implement “ready-to-go” projects	Begin process in 2018
Erosion Control Measures	Identify willing landowners in upstream areas of impaired subbasins to participate in pilot studies to implement edge of field BMPs and/or in-field cover BMPs	Begin process in 2018
	Monitor results of pilot studies to measure success and adapt/adjust wider-scale implementation	Throughout 2019 under varying flow scenarios
	Identify key farmland and work with landowners to implement erosion control BMPs along impaired	Begin by 2020

Schedule Category – General	Detailed Description	Recommended Schedule
	segments and tributaries (refer to Figure 9-1 for identified filter strip conversion areas).	
	Work with local stakeholders to identify key areas of shoreline erosion around Lake Frenress.	Throughout 2018
	Implement shoreline stabilization measures in identified key areas.	By the end of 2028
Reduce Septic System Loading	Perform community outreach with septic system management educational information to non-sewered areas in the Galena River watershed	2019-2020
Reduce Livestock Access to Galena River and Tributaries	Work with SWCD to identify areas throughout Galena River watershed where livestock regularly enter the streams	2019-2020
	Work with landowners to secure funding for fencing/alternate watering source implementation	2020-2023
Reduce In-Lake Phosphorus	Perform cost-benefit study to understand options of dredging, alum addition, and/or reaeration in Frenress Lake	By the end of 2028
	Implement in-lake management measures to reduce TP (if above study shows cost-effectiveness)	By 2038

9.12.2 Monitoring Plan

The purpose of the monitoring plan for the Galena/Sinsinawa Rivers watershed is to assess the overall implementation of management actions outlined above. This can be accomplished by conducting the monitoring programs designed to:

- Track implementation of BMPs in the watershed
- Estimate effectiveness of BMPs
- Further monitor point source discharges in the watershed
- Continued monitoring of impaired stream segments and tributaries
- Monitor storm-based high flow events
- Low flow monitoring of total phosphorus, iron, pH, DO, TSS, and fecal coliform in impaired streams

Tracking the implementation of management measures can be used to:

- Determine the extent to which management measures and practices have been implemented compared to action needed to meet the TMDL endpoints

- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support work-load and costing analysis for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

Estimating the effectiveness of the BMPs implemented in the watershed could be completed by monitoring before and after the BMP is incorporated into the watershed. Additional monitoring could be conducted on specific structural systems such as a sediment control basin. Inflow and outflow measurements could be conducted to determine site-specific removal efficiency.

Illinois EPA conducts Intensive Basin Surveys every 5 years. Additionally, select ambient sites are monitored nine times a year. Continuation of this state monitoring program will assess lake and stream water quality as improvements in the watershed are completed. This data will also be used to assess whether water quality standards in the impaired segments are being attained.

9.12.3 Success Criteria

Measuring the plan’s success depends largely on tracking milestones. Implementing BMPs should equate to improved water quality and attainment of designated uses and water quality standards. Monitoring pollutant-load reductions will be the primary success criteria. General components include:

- Securing funding for priority projects within 5 years
- Meeting the identified milestones
- Meeting 25-50% of target reductions within 10 years
- Meeting 100% of target reductions within 20 years
- Utilizing adaptive management to ensure best management practices
- Delisting of the impaired waterbodies

Table 9-10 Implementation Milestones

Milestone	Detailed Description	Milestone Date
Stakeholder Engagement	Continue work that has been completed to date through the local stakeholder group and continue attempts to engage additional landowners, municipalities, environmental groups, and others.	Minimum of annual stakeholder meeting
TSS Reduction (and associated reductions in nutrients, zinc, and fecal coliform and improvement in SOD)	10% of target reductions through implementation of “ready-to-go” projects	End of 2020
	25% of target reductions through beginning implementation of filter strips and other key farmland erosion control in Galena and	End of 2023

Milestone	Detailed Description	Milestone Date
	Sinsinawa River subbasins and shoreline stability BMPs around Frentress Lake	
	50% of target reductions through continued implementation of erosion control BMPs and adaptive management	End of 2028
	100% or target reductions achieved through implementation of most successful BMPs continuously identified through regular monitoring and adaptive management	2038
Nutrient Reduction	10% of target reductions through implementation of “ready-to-go” projects (Jo Daviess SWCD)	End of 2020
	25% of target reductions through implementation of erosion control measures, septic system maintenance outreach, and expanded nutrient management planning	End of 2023
	50% of target reductions through continued implementation of erosion control BMPs and adaptive management	End of 2028
	100% or target reductions achieved through implementation of most successful BMPs continuously identified through regular monitoring and adaptive management and cost-effective in-lake management measures	2038
Fecal Coliform Reduction	10% of target reductions through implementation of “ready-to-go” projects	End of 2020
	25% of target reductions through beginning implementation of erosion control measures and livestock exclusion in key areas	End of 2023
	50% of target reductions through continued implementation of erosion control BMPs and adaptive management	End of 2028
	100% or target reductions achieved through implementation of most successful BMPs continuously identified through regular monitoring and adaptive management	2038
