UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION 5
77 WEST JACKSON BOULEVARD
CHICAGO, IL 60604-3590

MAY 04 2018

REPLY TO THE ATTENTION OF

WW-16J

Sanjay Sofat, Chief
Bureau of Water
Illinois Environmental Protection Agency
P.O. Box 19276
Springfield, Illinois 62794-9276

Dear Mr. Sofat:

The U.S. Environmental Protection Agency has conducted a complete review of the final Total Maximum Daily Loads (TMDL) for fecal coliform, chloride, and zinc for the Little Vermilion River, including supporting documentation and follow up information. The waterbody is located in north-central Illinois. The TMDLs submitted by the Illinois Environmental Protection Agency address the impaired Aquatic Life and Primary Contact Uses for the waterbody.

The TMDLs meet the requirements of Section 303(d) of the Clean Water Act and EPA's implementing regulations at 40 C.F.R. Part 130. Therefore, EPA hereby approves Illinois's three TMDLs for fecal coliform, chloride, and zinc as noted in the enclosed decision document. The statutory and regulatory requirements, and EPA's review of Illinois's compliance with each requirement, are described in the enclosed decision document.

We wish to acknowledge Illinois's effort in submitting these TMDLs and look forward to future TMDL submissions by the State of Illinois. If you have any questions, please contact Mr. Peter Swenson, Chief of the Watersheds and Wetlands Branch, at 312-886-0236.

Sincerely,

A handwritten signature in black ink, appearing to read "Chris Korleski".

Handwritten initials "CK" in black ink.
Christopher Korleski
Director, Water Division

Enclosure

TMDL: Little Vermilion River, LaSalle County, Illinois
Date: 5/04/2018

DECISION DOCUMENT FOR THE APPROVAL OF THE LITTLE VERMILION RIVER, IL TMDL

Section 303(d) of the Clean Water Act (CWA) and EPA's implementing regulations at 40 C.F.R. Part 130 describe the statutory and regulatory requirements for approvable TMDLs. Additional information is generally necessary for EPA to determine if a submitted TMDL fulfills the legal requirements for approval under Section 303(d) and EPA regulations, and should be included in the submittal package. Use of the verb "must" below denotes information that is required to be submitted because it relates to elements of the TMDL required by the CWA and by regulation. Use of the term "should" below denotes information that is generally necessary for EPA to determine if a submitted TMDL is approvable. These TMDL review guidelines are not themselves regulations. They are an attempt to summarize and provide guidance regarding currently effective statutory and regulatory requirements relating to TMDLs. Any differences between these guidelines and EPA's TMDL regulations should be resolved in favor of the regulations themselves.

1. Identification of Waterbody, Pollutant of Concern, Pollutant Sources, and Priority Ranking

The TMDL submittal should identify the waterbody as it appears on the State's/Tribe's 303(d) list. The waterbody should be identified/georeferenced using the National Hydrography Dataset (NHD), and the TMDL should clearly identify the pollutant for which the TMDL is being established. In addition, the TMDL should identify the priority ranking of the waterbody and specify the link between the pollutant of concern and the water quality standard (see Section 2 below).

The TMDL submittal should include an identification of the point and nonpoint sources of the pollutant of concern, including location of the source(s) and the quantity of the loading, e.g., lbs/per day. The TMDL should provide the identification numbers of the NPDES permits within the waterbody. Where it is possible to separate natural background from nonpoint sources, the TMDL should include a description of the natural background. This information is necessary for EPA's review of the load and wasteload allocations, which are required by regulation.

The TMDL submittal should also contain a description of any important assumptions made in developing the TMDL, such as:

- (1) the spatial extent of the watershed in which the impaired waterbody is located;
- (2) the assumed distribution of land use in the watershed (e.g., urban, forested, agriculture);
- (3) population characteristics, wildlife resources, and other relevant information affecting the characterization of the pollutant of concern and its allocation to sources;
- (4) present and future growth trends, if taken into consideration in preparing the TMDL (e.g., the TMDL could include the design capacity of a wastewater treatment facility);
- and
- (5) an explanation and analytical basis for expressing the TMDL through *surrogate*

measures, if applicable. *Surrogate measures* are parameters such as percent fines and turbidity for sediment impairments; chlorophyll *a* and phosphorus loadings for excess algae; length of riparian buffer; or number of acres of best management practices.

Comment:

Location Description: The Illinois Environmental Protection Agency (IEPA) developed TMDLs for fecal coliform, chloride, and zinc for impaired waters in the Little Vermilion River watershed in north-central Illinois (Table 1 of this Decision Document). The Little Vermilion River watershed is located in LaSalle County, and flows south into the Illinois River near LaSalle, Illinois (Figure 1-1 of the TMDL). Table 1 of this Decision Document lists the waterbodies addressed by this TMDL.

Table 1 TMDLs in the Little Vermilion River watershed

Segment ID	Segment Name	Designated use	Pollutant Addressed
DR-01	Little Vermilion River	Aquatic Life	Chloride
			Zinc
		Primary Contact Recreation	Fecal coliform

The Little Vermilion River watershed is approximately 80,000 acres in size. The impaired portion of the river is the downstream-most portion of the river, 3.79 miles in length. Mendota Creek is a tributary to the Little Vermilion River, and is also impaired. IEPA has not developed TMDLs for Mendota Creek, but instead has developed a Load Reduction Strategy (LRS) for total phosphorus, until numeric phosphorus criteria are developed for Illinois streams. LRSs have also been developed for total phosphorus and total suspended solids for the Little Vermilion River (Section 1.1 of the TMDL). IEPA also noted that TMDLs were not developed for pH in the Little Vermilion River and for dissolved oxygen in Mendota Creek. IEPA explained that recent monitoring data do not support the impairment listings, and the State will pursue a delisting decision in the next 303d listing cycle.

Distribution of land use: The land use for Little Vermilion River watershed is mainly agricultural, pasture, and urbanized in nature, with most of the agricultural land use in row crop (corn/soybean). Urban and open space makes up a significant portion of the watershed near the actual impaired segment (DR-01) (Section 2.3 and Figure 2-2 of the TMDL). IEPA noted that abandoned (1931) underground coal mining operations cover approximately 1,090 acres of land within the watershed. The City of Mendota is located within the watershed, with a population of approximately 7,200. A portion of the City of LaSalle (population 9,300) is located in the lowermost portion of the watershed. Table 2 of this Decision Document contains a summary of the land use for the Little Vermilion River watershed.

Table 2: Land use in the Little Vermilion River Watershed

Land Use	Little Vermilion River	
	%	acres
Agriculture - corn	45.9	36,943
Agriculture - soybeans	27.8	22,332
Developed	12.3	9,900
Grasslands	11.8	9,505
Other	2.2	1,740
Total	100	80,420

Problem Identification:

The Little Vermilion River segment DR-01 was added to the 1998 303(d) list for impairment due to high levels of phosphorus, metals, and fecal coliform. Chlorides were added in later 303(d) listings as a pollutant of concern.

Pollutants of Concern:

The pollutants of concern are fecal coliform, zinc, and chlorides (Table 1 of this Decision Document). IEPA developed LRSs to address pollutants that are not being addressed through a TMDL. LRSs have been developed for TSS and TP in Little Vermilion River, and for TP in Mendota Creek, a tributary to Little Vermilion River (Table 8-1 of the TMDL).

Pollutant:

Chlorides: Chloride is essential for aquatic life to carry out a range of biological functions. However, high concentrations of chloride in the surrounding water can harm cellular osmotic processes in aquatic life. Excessive dissolved chlorides in water may stress aquatic species and prohibit the transport of needed molecules into the cell. Persistent elevated concentrations of chloride in the water may result in aquatic life such as fish, invertebrates and even some plant species becoming stressed and/or dying.

Fecal coliform: Bacteria exceedances can negatively impact recreational uses (fishing, swimming, wading, boating, etc.) and public health. At elevated levels, bacteria may cause illness within humans who have contact with or ingest bacteria-laden water. Recreation-based contact can lead to ear, nose, and throat infections, and stomach illness.

Zinc: Zinc is an essential element in small amounts. However, in higher doses, zinc can be toxic to aquatic life. Zinc can deposit on the gills of fish and other aquatic life. The zinc can also build up in the liver and other organs, causing reproductive problems (Giardina, *et al.*, 2009, *Env. Toxicology and Chemistry*, v. 28, pp 287-295).

Priority Ranking:

The watershed was given priority for TMDL development due to the impairment impacts on the public value of the impaired water resource, and the timing as part of the Illinois basin monitoring process.

Source Identification (point and nonpoint sources):

Point Source Identification:

Zinc: IEPA identified several wastewater treatment facilities (WWTF) in the Little Vermilion River watershed, but noted that none of these systems are expected to discharge zinc (Section 8.3.1.4 of the TMDL). IEPA also noted that the Illinois Department of Transportation (IDOT) has a Municipal Separate Storm Sewer System (MS4) permit for roadways within the watershed. A small portion of the loading was assigned to this source.

Fecal coliform: IEPA identified seven individual point sources located in the Little Vermilion watershed (Table 8-11 of the TMDL). IEPA noted that five of these facilities are industrial dischargers, and are unlikely to discharge bacteria (Section 8.3.3.4 of the TMDL). The other two permitted facilities are WWTFs, which have allocations for fecal coliform assigned. IEPA also identified Combined Sewer Overflow (CSO) discharge outfalls in the watershed.

Chloride: IEPA identified two NPDES-permitted facilities in the Little Vermilion River watershed. One is the Carus Corporation, an industrial wastewater system in the watershed at the site of a former zinc-smelting operation. A chloride allocation was determined for this facility. IEPA also calculated a chloride load for the IDOT MS4 permit for roadways within the watershed. A portion of the loading was assigned to this source.

Nonpoint Source Identification: The potential nonpoint sources for the Little Vermilion River watersheds TMDLs are:

Fecal coliform:

Non-regulated stormwater runoff: Non-regulated stormwater runoff can add fecal coliform to the impaired waters. The sources of bacteria in stormwater include animal/pet wastes, and wildlife.

Animal Operations: Runoff from agricultural/animal lands may contain significant amounts of bacteria which may lead to impairments in the Little Vermilion River watershed. Manure spread onto fields is often a source of bacteria, and can be exacerbated by tile drainage lines, which channelize the stormwater. Tile lined fields and channelized ditches enable bacteria to move more efficiently into surface waters. Furthermore, livestock with direct access to a waterway can directly deposit nutrients via animal wastes into a waterbody, which may result in very high localized bacteria concentrations.

Failing septic systems: IEPA noted that failing septic systems, where waste material can pond at the surface and eventually flow into surface waters or be washed in during precipitation events, are potential sources of bacteria. IEPA consulted with the county health departments and determined that while some of the watershed is served by sewer systems, portions of the watershed are not, and the potential for septic failure is possible.

Chloride:

Road salt runoff: IEPA determined that the major source of chloride loading to the Little Vermilion River is run-off from roadways containing road salt (Section 5.3.5 of the TMDL).

Zinc:

Historical Smelting Operations: IEPA explained that the main source of zinc in the Little Vermilion River is from the historic smelting operations on the Matthiessen and Hegler Zinc Company site in LaSalle. The site no longer operates as a zinc smelter, but historical contamination is being addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), or “Superfund”.

The EPA Superfund website notes “The Matthiessen and Hegeler Zinc Co. operated a zinc smelter on the industrial portion of the site from 1858 until 1961. The company added a rolling mill to its operations in 1866 to produce zinc sheets. The Matthiessen and Hegeler company declared bankruptcy in 1968, and only basic rolling mill operations took place from 1968 until 1978. The industrial portion of the site houses an inactive zinc smelting and rolling facility as well as an active chemical manufacturing plant, which is owned and operated by Carus Chemical Co. The site also includes the Little Vermilion River and a 6-acre slag pile located along the river containing metals such as cadmium, copper, chromium, lead, nickel and zinc.”
<https://cumulis.epa.gov/supercpad/SiteProfiles/index.cfm?fuseaction=second.Cleanup&id=0507364#bkground>)

Population and future growth trends: The population for the watershed is fairly small. IEPA did not account for any future growth in the watershed.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this first element.

2. Description of the Applicable Water Quality Standards and Numeric Water Quality Target

The TMDL submittal must include a description of the applicable State/Tribal water quality standard, including the designated use(s) of the waterbody, the applicable numeric or narrative water quality criterion, and the antidegradation policy. (40 C.F.R. §130.7(c)(1)). EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

The TMDL submittal must identify a numeric water quality target(s) - a quantitative value used to measure whether or not the applicable water quality standard is attained. Generally, the pollutant of concern and the numeric water quality target are, respectively, the chemical causing the impairment and the numeric criteria for that chemical (e.g., chromium) contained in the water quality standard. The TMDL expresses the relationship between any necessary reduction of the pollutant of concern and the attainment of the numeric water quality target. Occasionally, the pollutant of concern is different from the pollutant that is the subject of the numeric water quality target (e.g., when the pollutant of concern is phosphorus and the numeric water quality target is expressed as Dissolved Oxygen (DO) criteria). In such cases, the TMDL submittal should explain the linkage between the pollutant of concern and the chosen numeric water quality target.

Comment:

Designated Use/Standards: Section 4.2 of the TMDL states that the Little Vermilion River is not meeting the General Use designation. The applicable water quality standards (WQS) for these

waterbodies are established in Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards, Subpart B for General Use Water Quality Standards. The portions of the WQS that apply to Little Vermilion River is General Use, specifically the Aquatic Life Use and Primary Contact Use (Section 4.2 of the TMDL).

Criteria: The applicable criteria are found in Table 3 of this Decision Document.

Table 3: WQSs for the Little Vermilion River DR-01

Pollutant	Units	Criteria
Chloride	mg/L	500
Zinc	µg/L	<i>Dissolved:</i> Acute = $e^{A+B\ln(H)} \times 0.978^*$ where A = 0.9035 and B = 0.8473 (not to be exceeded at any time) Chronic = $e^{A+B\ln(H)} \times 0.986^*$ where A = -0.4456 and B = 0.8473 (not to exceed the arithmetic average of 4 samples taken over at least 4 days)
Fecal coliform	Count/100 mL	May through October 200**, 400***

* - conversion factor multiplier for dissolved metals

** - geometric mean based upon a minimum of 5 samples in a 30 day period

*** - not to be exceeded by more than 10% of the samples in a 30 day period

Target: The water quality targets for these TMDLs are in Table 4 of this Decision Document. For zinc, IEPA determined that the chronic portion of the standard is most protective, and had the greatest number of exceedences (Table 5-1 of the TMDL). As the criteria for zinc is based upon the hardness of the water (zinc is less toxic in harder water), IEPA calculated the most restrictive value for zinc as 60.7 µg/L, based upon the lowest reported in-stream hardness of 219 mg/L (Section 7.2.1.2 of the TMDL). For fecal coliform, IEPA used the 200 counts per 100 mL monthly geometric mean portion of the standard to calculate loads in the Little Vermilion River (Section 7.2.1.4 of the TMDL).

Table 4: TMDL targets for the Little Vermilion River DR-01

Pollutant	Target
Chloride	500 mg/L
Zinc	60.7 µg/L
Fecal coliform	200 counts/100 mL

Other pollutants: As noted previously, IEPA has developed LRSs to address pollutants that do not have a numeric criterion. While these are not TMDLs, the LRSs will likely reduce other pollutants in the watershed. For these LRSs, IEPA developed water quality targets as goals to reduce TSS and TP impacts in flowing waters (Table 5 of this Decision Document). For these waters, the targets are:

Table 5: LRS Targets for the Little Vermilion River watershed

Waterbody	Segment ID	Pollutant	Target
Little Vermilion	DR-01	TP	0.289 mg/L
		TSS	25.3 mg/L
Mendota Creek	DRD	TP	0.289 mg/L

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this second element.

3. Loading Capacity - Linking Water Quality and Pollutant Sources

A TMDL must identify the loading capacity of a waterbody for the applicable pollutant. EPA regulations define loading capacity as the greatest amount of a pollutant that a water can receive without violating water quality standards (40 C.F.R. §130.2(f)).

The pollutant loadings may be expressed as either mass-per-time, toxicity or other appropriate measure (40 C.F.R. §130.2(i)). If the TMDL is expressed in terms other than a daily load, e.g., an annual load, the submittal should explain why it is appropriate to express the TMDL in the unit of measurement chosen. The TMDL submittal should describe the method used to establish the cause-and-effect relationship between the numeric target and the identified pollutant sources. In many instances, this method will be a water quality model.

The TMDL submittal should contain documentation supporting the TMDL analysis, including the basis for any assumptions; a discussion of strengths and weaknesses in the analytical process; and results from any water quality modeling. EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

TMDLs must take into account *critical conditions* for stream flow, loading, and water quality parameters as part of the analysis of loading capacity. (40 C.F.R. §130.7(c)(1)). TMDLs should define applicable *critical conditions* and describe their approach to estimating both point and nonpoint source loadings under such *critical conditions*. In particular, the TMDL should discuss the approach used to compute and allocate nonpoint source loadings, e.g., meteorological conditions and land use distribution.

Comment:

The approach utilized by the IEPA to calculate the loading capacity for the fecal coliform, zinc, and chloride TMDLs is described in Section 7.2 of the final TMDL and are presented in Tables 6-8 of this Decision Document.

For the bacteria TMDL, a geometric mean of 200 cfu/100 ml fecal coliform for five samples equally spaced over a 30-day period was used to calculate the loading capacity of the TMDLs. IEPA determined that the geometric mean portion of the WQS provides the best overall characterization of the status of the watershed. The EPA agrees with this assertion, as stated in the preamble of *The Water Quality Standards for Coastal and Great Lakes Recreation Waters Final Rule* (69 FR 67218-67243, November 16, 2004) on page 67224, "...the geometric mean is the more relevant value for ensuring that appropriate actions are taken to protect and improve

water quality because it is a more reliable measure, being less subject to random variation, and more directly linked to the underlying studies on which the 1986 bacteria criteria were based."

IEPA stated that while the bacteria TMDL will focus on the geometric mean portion of the water quality standard (i.e., the chronic WQS of 200 cfu/100mL), attainment of the WQS involves the water body meeting both the chronic (200 cfu/100 mL) and acute (400 cfu/100 mL) portions of the water quality standard. EPA finds these assumptions to be reasonable.

Typically loading capacities are expressed as a mass per time (e.g. pounds per day). However, for bacteria loading capacity calculations, mass is not always an appropriate measure because bacteria is expressed in terms of organism counts. This approach is consistent with the EPA's regulations which define "load" as "an amount of matter that is introduced into a receiving water" (40 CFR §130.2). To establish the loading capacities for the Little Vermilion River bacteria TMDL, IEPA used Illinois's water quality standards for fecal coliform (200 cfu/100 mL). A loading capacity is, "the greatest amount of loading that a water can receive without violating water quality standards." (40 CFR §130.2). Therefore, a loading capacity set at the WQS will assure that the water does not violate WQS. IEPA's fecal coliform TMDL approach is based upon the premise that all discharges (point and nonpoint) must meet the WQS when entering the water body. If all sources meet the WQS at discharge, then the water body should meet the WQS and the designated use.

For the zinc and chloride TMDLs, water quality targets from Table 4 of this Decision Document (60.7 µg/L for zinc, 500 mg/L for chloride) were used to calculate the loading capacities.

Flow data from a nearby USGS gage (5439000) on the South Branch of the Kishwaukee River in DeKalb County were used to develop the Load Duration Curves (LDCs). IEPA chose this gage as a surrogate as no USGS gage is present on the Little Vermilion River. The watersheds are of similar size and land use, and flow data was available from 1925 to 2016 (Section 7.2.1.1 of the TMDL). Daily stream flows are necessary to implement the LDC approach.

The LDCs were created by multiplying individual flow values by the WQS and then multiplying that value by a conversion factor. The resulting points are plotted onto a load duration curve graph. The LDC graphs for Little Vermilion River have flow duration interval (percentage of time flow exceeded) on the X-axis and pollutant loads (number of bacteria or pollutant mass per unit time) on the Y-axis. The fecal coliform LDC used fecal coliform measurements in millions of bacteria per day, while the zinc and chloride LDCs used pounds per day. The curved line on a LDC graph represents the TMDL for the respective flow conditions observed at that location.

Pollutant values from the monitoring sites were converted to individual sampling loads by multiplying the sample concentration by the instantaneous flow measurement observed/estimated at the time of sample collection. The individual sampling loads were plotted on the same figure with the LDC (Figures 7-2 to 7-4 of the TMDL).

The LDC plot was subdivided into five flow regimes; very high flows (exceeded 0–10% of the time), high conditions (exceeded 10–40% of the time), mid-range flows (exceeded 40–60% of the time), low conditions (exceeded 60–90% of the time), and very low flows (exceeded 90–100% of the time). LDC plots can be organized to display individual sampling loads and the

calculated LDC. Watershed managers can interpret these plots (individual sampling points plotted with the LDC) to understand the relationship between flow conditions and water quality exceedances within the watershed. Individual sampling loads which plot above the LDC represent violations of the WQS and the allowable load under those flow conditions at those locations. The difference between individual sampling loads plotting above the LDC and the LDC, measured at the same flow, is the amount of reduction necessary to meet WQS.

The strengths of using the LDC method are that critical conditions and seasonal variation are considered in the creation of the LDC by plotting hydrologic conditions over the flows measured during the recreation season. Additionally, the LDC methodology is relatively easy to use and cost-effective. The weaknesses of the LDC method are that nonpoint source allocations cannot be assigned to specific sources, and specific source reductions are not quantified. Overall, IEPA believes and EPA concurs that the strengths outweigh the weaknesses for the LDC method.

Implementing the results shown by the LDC requires watershed managers to understand the sources contributing to the water quality impairment and which Best Management Practices (BMPs) may be the most effective for reducing pollutant loads based on flow magnitudes. Different sources will contribute pollutant loads under varying flow conditions. For example, if exceedances are significant during high flow events this would suggest storm events are the cause and implementation efforts can target BMPs that will reduce stormwater runoff and consequently pollutant loading into surface waters. This allows for a more efficient implementation effort.

The TMDLs for the Little Vermilion River were calculated as appropriate. The regulated permittees discharging fecal coliform, zinc, and chloride have allocations determined for them (Table 6-8 of this Decision Document). The load allocations were calculated after the determination of the Margin of Safety. Other load allocations (ex. non-regulated stormwater runoff, wildlife inputs, etc.) were not divided amongst individual nonpoint contributors. Instead, load allocations were combined together into a generalized loading.

Review of the LDC for zinc indicates that exceedances are occurring under all flow conditions, but are more significant during lower flows, suggesting precipitation events are not the main cause of zinc loading. The LDC for chlorides has only two exceedances, of which one is anomalously high (9,880 mg/L), and the other barely exceeds the WQS (532 mg/L). Both of these exceedances occurred under lower flow conditions, and were from 2003 and 2005, respectively. IEPA noted that more recent monitoring since 2013 does not indicate chloride exceedances. The LDC for fecal coliform shows exceedances under all flow conditions, and in similar magnitudes, indicating a variety of sources are contributing to the impairment.

Tables 6-8 of this Decision Document calculates ten points (the midpoints of the designated flow regime) on the loading capacity curves. However, it should be understood that the components of the TMDL equation could be illustrated for any point on the entire loading capacity curve. The load duration curve method can be used to display collected pollutant monitoring data and allows for the estimation of load reductions necessary for attainment of the appropriate water quality standards. Using this method, daily loads were developed based upon the flow in the water body. Loading capacities were determined for the segment for multiple flow regimes. This allows the

TMDLs to be represented by an allowable daily load across all flow conditions. Although there are numeric loads for each flow regime, the LDC is what is being approved for these TMDLs.

Table 6: Zinc TMDL summary for Little Vermilion River (DR-01)

Zone	Flow Exceedance Range (%)	LC (lbs/day)	LA (lbs/day)	WLA (lbs/day)	MOS (lbs/day)	RC* (lbs/day)	Actual Load (lbs/day)	Percent LA Reduction Needed
High	0 - 10	136	121	1.4	13.6	0	771	84%
Moist	10 - 20	63	56	0.64	6.3	0	122	54%
	20 - 30	39	35	0.40	3.9	0	84	59%
	30 - 40	27	24	0.28	2.7	0	62	61%

	80 - 90	3.5	3.2	0	0.35	0	33	90%
Low	90 - 100	2.5	2.2	0	0.25	0	17	87%

* - Reserve Capacity

During the review of the zinc TMDL, EPA determined that there were errors in the RC, Actual Load, and Percent Reduction columns of Table 6. IEPA confirmed the errors, and what the correct values should be (email and phone record with Abel Haile, IEPA, dated 04/18/2018).

Table 6 of this Decision Document represents the correct values. Since these columns are not required elements of a TMDL, the corrections do not affect the approval of the TMDL.

Table 7: Fecal coliform TMDL summary for Little Vermilion River (DR-01)

Zone	Flow Exceedance Range (%)	LC (mil col/day)	LA (mil col/day)	WLA ¹ (mil col/day)	MOS	RC	Actual Load (mil col/day)	Percent Reduction Needed
High	0 - 10	1906400	1858704	47696	implicit	0	184062854	99%

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this third element.

4. Load Allocations (LAs)

EPA regulations require that a TMDL include LAs, which identify the portion of the loading capacity attributed to existing and future nonpoint sources and to natural background. Load allocations may range from reasonably accurate estimates to gross allotments (40 C.F.R. §130.2(g)). Where possible, load allocations should be described separately for natural background and nonpoint sources.

Comment:

The LAs for the waterbodies are found Tables 6-8 of this Decision Document. The nonpoint sources of fecal coliform in the watershed are nonpoint source runoff from row crop agricultural fields, failing septics, unregulated suburban/urban runoff, and animal operations. For zinc, the source is from erosion of zinc slag and material from the former zinc-smelting site. For chlorides, runoff from road and impermeable surface deicing was noted as the source of chlorides. As discussed in Sections 8 and 10 of this Decision Document, IEPA did provide further analysis of how reductions from the various pollutant sources could be attained.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this fourth element.

5. Wasteload Allocations (WLAs)

EPA regulations require that a TMDL include WLAs, which identify the portion of the loading capacity allocated to individual existing and future point source(s) (40 C.F.R. §130.2(h), 40 C.F.R. §130.2(i)). In some cases, WLAs may cover more than one discharger, e.g., if the source is contained within a general permit.

The individual WLAs may take the form of uniform percentage reductions or individual mass based limitations for dischargers where it can be shown that this solution meets WQSs and does not result in localized impairments. These individual WLAs may be adjusted during the NPDES permitting process. If the WLAs are adjusted, the individual effluent limits for each permit issued to a discharger on the impaired water must be consistent with the assumptions and requirements of the adjusted WLAs in the TMDL. If the WLAs are not adjusted, effluent limits contained in the permit must be consistent with the individual WLAs specified in the TMDL. If a draft permit provides for a higher load for a discharger than the corresponding individual WLA in the TMDL, the State/Tribe must demonstrate that the total WLA in the TMDL will be achieved through reductions in the remaining individual WLAs and that localized impairments will not result. All permittees should be notified of any deviations from the initial individual

WLAs contained in the TMDL. EPA does not require the establishment of a new TMDL to reflect these revised allocations as long as the total WLA, as expressed in the TMDL, remains the same or decreases, and there is no reallocation between the total WLA and the total LA.

Comment:

Fecal coliform: IEPA determined loads for fecal coliform for the eight dischargers in the Little Vermilion watershed (Table 9 of this Decision Document; Table 8-11 of the TMDL). Five of the dischargers are industrial wastewater dischargers, and are not expected to discharge fecal coliform. Two dischargers are municipal wastewater treatment facilities, and the WLAs are based upon two flow conditions; IEPA used the design average flow (DAF) of the facilities for the lower streamflow regimes (30%-100%) and the design maximum flow (DMF) of the facilities for the higher streamflow regimes (0%-30%). The appropriate flow was multiplied by the WQS of 200 cfu/100 mL for the facilities noted in Table 9 of this Decision Document (Section 8.3.3.4 of the TMDL)

IEPA identified one CSO discharger in the watershed. For the fecal coliform TMDL, IEPA set the WLA at 0. IEPA noted that while the WLA = 0 for fecal coliform, this does not mean CSO discharges are proscribed. The City of LaSalle is working to implement a Long Term Control Plan (LTCP) that was approved on June 25, 2013 to address the long-term control of CSO discharges to the Little Vermilion River. IEPA expects LaSalle to comply with the terms of its LTCP.

Zinc: IEPA identified one point source potentially discharging zinc (Table 10 of this Decision Document). The Illinois Department of Transportation (IDOT) has an NPDES stormwater permit regulating runoff from roadways in the watershed. IEPA calculated that the roadways cover 1.1% of the watershed. Therefore, IEPA assumed that 1.1% of the zinc load could be coming from the roadways under higher flow events (0%-50%). IEPA noted that the CSO discharges could contain zinc. For the zinc TMDL, IEPA set the WLA at 0. IEPA noted that while the WLA = 0 for zinc, this does not mean CSO discharges are proscribed. The City of LaSalle is working to implement a Long Term Control Plan (LTCP) that was approved on June 25, 2013 to address the long-term control of CSO discharges to the Little Vermilion River.

Chloride: IEPA identified two permitted dischargers of chlorides; the Carus Corporation and the IDOT stormwater permit (Table 10 of this Decision Document). The Carus Corporation has a monitoring requirement for chlorides, but does not have an effluent limit. To determine the WLA, IEPA used the water quality criterion of 500 mg/L times the facility's maximum design flow to determine the WLA. IEPA followed the same process for IDOT as discussed in the zinc section above.

IEPA did not identify any other point sources for the three pollutants.

Table 9: Fecal coliform WLAs in the Little Vermilion River TMDL

Permit Number	Facility Name	Design Average Flow (MGD)	WLA – DAF (million col/day)**	Design Maximum Flow MGD	WLA – DMF (million col/day)**
IL0023221	City of Mendota WWTF	2.4	18170	4.8	36340
IL0078336	City of LaSalle East WWTF	0.5	3785	1.5	11356

IL0029424	City of LaSalle CSOs	***	0***	***	0***
ILG8401233*	Illinois Cement Co. – Dimmick		0		0
IL00202623*	Carus Corp. LaSalle Site		0		0
IL0003115*	Del Monte Corp.		0		0
IL0038296*	IL Cement Co. – LaSalle		0		0
IL0078336*	Riverstone Group – Troy Grove		0		0
Total			47696		21955

* - Industrial dischargers; not expected to discharge fecal coliform

** - DAF applies in the lower 30-100% flows, DMF applies in the higher 0-30% flows

*** - CSOs only discharge during extreme precipitation events and the allocation of zero is not intended to translate into an immediate requirement for zero discharge, but rather, continued compliance with long term control plans

Table 10: Zinc and Chloride WLAs in the Little Vermilion River Watershed

Permit Number	Facility Name	Pollutant	WLA* (lbs/day)
ILR00493	IDOT	Zinc	1.4
ILR00493	IDOT	Chloride	11372
IL0002623	Carus Corp.	Chloride	6973

* - at the highest flow

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this fifth element.

6. Margin of Safety (MOS)

The statute and regulations require that a TMDL include a margin of safety (MOS) to account for any lack of knowledge concerning the relationship between load and wasteload allocations and water quality (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)). EPA’s 1991 TMDL Guidance explains that the MOS may be implicit, i.e., incorporated into the TMDL through conservative assumptions in the analysis, or explicit, i.e., expressed in the TMDL as loadings set aside for the MOS. If the MOS is implicit, the conservative assumptions in the analysis that account for the MOS must be described. If the MOS is explicit, the loading set aside for the MOS must be identified.

Comment:

Fecal coliform: The Little Vermilion River bacteria TMDL incorporates an implicit MOS in the TMDL calculations (Table 7 of this Decision Document). The WLA is based upon the 200 cfu/100 mL as a 30-day geometric mean portion of the WQS to determine the daily load. This essentially sets the monthly geometric mean portion of the WQS as a daily not-to-exceed value (i.e., no averaging), significantly overestimating the bacteria reductions needed to attain WQSs in the Little Vermilion River.

An additional conservative assumption is that IEPA did not use a rate of decay, or die-off rate of pathogen species, in the TMDL calculations or in the creation of the load duration curve for fecal coliform. Bacteria have a limited capability of surviving outside their hosts, and normally a rate

of decay would be incorporated. IEPA determined that it was more conservative to use the WQS (200 cfu/100 mL) and not to apply a rate of decay, which could result in a discharge limit greater than the WQS.

As stated in *EPA's Protocol for Developing Pathogen TMDLs* (EPA 841-R-00-002), many different factors affect the survival of pathogens, including the physical condition of the water. These factors include, but are not limited to sunlight, temperature, salinity, and nutrient deficiencies. These factors vary depending on the environmental condition/circumstances of the water, and therefore it would be difficult to assert that the rate of decay caused by any given combination of these environmental variables was sufficient to meet the WQS of 200 cfu/100 mL. Thus, it is more conservative to apply the State's WQS as the MOS, because this standard must be met at all times under all environmental conditions.

Zinc and Chloride: The Little Vermilion River zinc and chloride TMDLs incorporate an explicit MOS of 10% of the total loading capacity. The MOS reserved 10% of the loading capacity and allocated the remaining loads to point and nonpoint sources (Tables 7 and 8 of this Decision Document). The use of the LDC approach minimized variability associated with the development of the chloride and zinc TMDLs because the calculation of the loading capacity was a function of flow multiplied by the target value. The MOS was set at 10% to account for uncertainty due to field sampling error and assumptions made during the TMDL development process.

EPA finds that the TMDL document submitted by IEPA has an appropriate MOS satisfying all requirements concerning this sixth element.

7. Seasonal Variation

The statute and regulations require that a TMDL be established with consideration of seasonal variations. The TMDL must describe the method chosen for including seasonal variations. (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)).

Comment:

The LDC process accounts for seasonal variation by utilizing streamflows over a wide range. For the three pollutants, runoff carries the pollutants into the streams. The LDC graphs can be used to determine under which conditions exceedences are occurring, and any seasonal component (i.e., spring melt).

Bacterial loads vary by season, typically reaching higher values in the dry summer months when low flows and warm water contribute to bacteria abundance, and reaching relatively lower values in colder months when bacterial growth rates attenuate. Bacterial WQS need to be met between May 1st to October 31st, regardless of the flow condition. The development of the LDC utilized flow measurements from local flow gages. These flow measurements were collected over a variety of flow conditions observed during the recreation season. The LDC developed from these flow records represents a range of flow conditions within the impaired watersheds and thereby accounted for seasonal variability over the recreation season.

For zinc and chloride, the development of the LDC utilized flow measurements from local flow

gages. These flow measurements were collected over a variety of flow conditions observed during the year. The LDC developed from these flow records represents a range of flow conditions within the impaired watersheds and thereby accounted for seasonal variability over the year.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this seventh element.

8. Reasonable Assurances

When a TMDL is developed for waters impaired by point sources only, the issuance of a National Pollutant Discharge Elimination System (NPDES) permit(s) provides the reasonable assurance that the wasteload allocations contained in the TMDL will be achieved. This is because 40 C.F.R. 122.44(d)(1)(vii)(B) requires that effluent limits in permits be consistent with “the assumptions and requirements of any available wasteload allocation” in an approved TMDL.

When a TMDL is developed for waters impaired by both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur, EPA’s 1991 TMDL Guidance states that the TMDL should provide reasonable assurances that nonpoint source control measures will achieve expected load reductions in order for the TMDL to be approvable. This information is necessary for EPA to determine that the TMDL, including the load and wasteload allocations, has been established at a level necessary to implement water quality standards.

EPA’s August 1997 TMDL Guidance also directs Regions to work with States to achieve TMDL load allocations in waters impaired only by nonpoint sources. However, EPA cannot disapprove a TMDL for nonpoint source-only impaired waters, which do not have a demonstration of reasonable assurance that LAs will be achieved, because such a showing is not required by current regulations.

Comment:

Section 9 of the TMDL discusses reasonable assurance for the Little Vermilion River watershed TMDLs. IEPA provided information on controls of fecal coliform, chlorides, and zinc that will be targeted to the watershed.

Reasonable assurance that the WLAs will be implemented are through the NPDES program. IEPA listed two WWTPs that discharge fecal coliform in the Little Vermilion River watershed. Section 9.3.1 of the TMDL addresses the discharges of fecal coliform from permitted facilities. At this time, point sources do not discharge a significant amount of zinc or chloride, and the current NPDES permit process will continue to control zinc and chloride discharges in the future.

Fecal coliform: Section 9 of the TMDL discusses various BMPs that, when implemented, will significantly reduce fecal coliform loadings to attain WQS. For most of these BMPs, IEPA provided some watershed analysis on the impacts these BMPs may have on fecal coliform loads. For example, the effectiveness of filter strips along streambanks was discussed in Section 9.3.2 of the TMDL. IEPA analyzed land use in the watershed, and noted the areas where filter strips

could be useful in reducing bacteria loads. Figure 9-1 of the TMDL presents a map locating areas in the watershed where buffer strips could have an impact on bacteria loadings. These are primarily agricultural land uses. IEPA determined the estimated amount of filter strips (in acres) that would improve water quality in the watershed (Table 9-2 of the TMDL).

In Section 9.10 of the TMDL, IEPA also investigated the general BMP costs for actions in the watershed, such as fencing costs to exclude livestock from waterways, riparian buffers, conservation tillage, etc. These costs are noted in Table 9-6 of the TMDL, and include programs that can implement these actions as well as potential sponsors.

Zinc: The reasonable assurance for the zinc TMDL is the Superfund action underway in for the Matthiessen and Hegler Zinc Company former smelting site (Section 9.9 of the TMDL). The Record of Decision was recently approved for the site, and remediation is underway. Most of the work will focus on removal and/or capping of existing slag and waste piles on-site, and improving efforts to prevent zinc from migrating into the Little Vermilion River.

Chlorides: To control chloride loads into the Little Vermilion Rive, IEPA will focus on controlling road salt runoff in the watershed (Section 9.8 of the TMDL). IEPA noted that the data shows two exceedences, one very anomalously high value (9880 mg/L) and one exceedence just over the chloride criteria of 500 mg/L (at 532 mg/L). To control chlorides, IEPA will focus on operator training for both municipal salting operations as well as private contractors.

IEPA has also developed Load Reduction Strategies (LRS) for various pollutants in the watershed. These LRSs address impairments where numeric criteria have not been developed (such as for TSS, or TP in stream). Although these are not TMDLs, the LRSs discuss sources and reductions needed for the various pollutants that have either a direct (TP) or indirect (TSS) impact on waterbodies in the Little Vermilion River watershed. IEPA has concluded that reducing these pollutants by implementing additional BMPs in the watershed will also reduce bacteria loads and possibly zinc and chloride loads in the watershed.

EPA finds that this criterion has been adequately addressed.

9. Monitoring Plan to Track TMDL Effectiveness

EPA's 1991 document, *Guidance for Water Quality-Based Decisions: The TMDL Process* (EPA 440/4-91-001), recommends a monitoring plan to track the effectiveness of a TMDL, particularly when a TMDL involves both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur. Such a TMDL should provide assurances that nonpoint source controls will achieve expected load reductions and, such TMDL should include a monitoring plan that describes the additional data to be collected to determine if the load reductions provided for in the TMDL are occurring and leading to attainment of water quality standards.

Comment:

The TMDL contains discussion on future monitoring and milestones (Section 9.15.2 of the TMDL). There were several monitoring sites used to gather data for the Little Vermilion River.

The Little Vermilion River sites are part of the Illinois Ambient Water Quality Monitoring System, and will continue to be monitored quarterly. IEPA also performs intensive basin surveys every 5 years on a rotating basins process. Detailed monitoring of the Little Vermilion River and associated tributaries will be performed during these surveys. IEPA also noted that students and staff from the Illinois Valley Community college have been monitoring the water quality of the Little Vermilion River for several years, and providing the data to IEPA. During the stakeholder meetings, several stakeholders suggested adding addition monitoring sites in the watershed to continue gathering water quality data. The EPA Superfund program also performs water quality monitoring as part of the remediation process.

EPA finds that this criterion has been adequately addressed.

10. Implementation

EPA policy encourages Regions to work in partnership with States/Tribes to achieve nonpoint source load allocations established for 303(d)-listed waters impaired by nonpoint sources. Regions may assist States/Tribes in developing implementation plans that include reasonable assurances that nonpoint source LAs established in TMDLs for waters impaired solely or primarily by nonpoint sources will in fact be achieved. In addition, EPA policy recognizes that other relevant watershed management processes may be used in the TMDL process. EPA is not required to and does not approve TMDL implementation plans.

Comment:

Numerous implementation options are discussed in Section 9 of the TMDL. These options are directed for reductions in sediment and total phosphorus as well as fecal coliform.

The potential BMPs are:

- Cover crops
- No-till/strip till
- Water and Sediment Control Basins (WASCB)
- Grassed waterways
- Filter strip, grass conversion, and field borders
- Streambank stabilization
- Shoreline stabilization
- Detention basin/pond
- Septic Systems
- Nutrient management

For most of these BMPs, IEPA provided some watershed analysis on the impacts these BMPs may have on TP and TSS loads that are discussed under LRSs.

Chlorides are expected to be addressed through:

- Public education and training
- Improved storage and handling
- Proper application
- Use of alternatives

For zinc, the Superfund remediation effort is expected to be the primary implementation action in the watershed.

EPA reviews, but does not approve, implementation plans. EPA finds that this criterion has been adequately addressed.

11. Public Participation

EPA policy is that there should be full and meaningful public participation in the TMDL development process. The TMDL regulations require that each State/Tribe must subject calculations to establish TMDLs to public review consistent with its own continuing planning process (40 C.F.R. §130.7(c)(1)(ii)). In guidance, EPA has explained that final TMDLs submitted to EPA for review and approval should describe the State's/Tribe's public participation process, including a summary of significant comments and the State's/Tribe's responses to those comments. When EPA establishes a TMDL, EPA regulations require EPA to publish a notice seeking public comment (40 C.F.R. §130.7(d)(2)).

Provision of inadequate public participation may be a basis for disapproving a TMDL. If EPA determines that a State/Tribe has not provided adequate public participation, EPA may defer its approval action until adequate public participation has been provided for, either by the State/Tribe or by EPA.

Comment:

An initial public meeting was held on September 11, 2014, to describe the watershed plan and TMDL process. The public comment period for the draft TMDL opened on September 27, 2017 and closed on October 27, 2017. A public meeting was held on September 27, 2017, in LaSalle, Illinois.

The public notices were published in the local newspaper and interested individuals and organizations received copies of the public notice. A hard copy of the TMDL was made available at the LaSalle Public Library and Mendota City Hall. The draft TMDL was also made available at the website <http://www.epa.illinois.gov/public-notices/index>. Two public comments were received.

IEPA developed a response summary to address the comments submitted. EPA reviewed the comments and responses, and has determined that IEPA responded appropriately to the comments. A brief overview is provided below.

The LaSalle County Soil and Water Conservation District submitted comments on expanding the monitoring locations on the river, and had numerous suggestions on improvements to the BMPs discussed in Section 9 of the TMDL, the Implementation Plan. Another commenter requested increased monitoring locations in the watershed, noted several other locations of zinc slag piles, and has additional suggestions regarding BMPs in the watershed. IEPA updated Section 9 of the TMDL to include additional language and clarification regarding the various BMPs.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this eleventh element.

12. Submittal Letter

A submittal letter should be included with the TMDL submittal, and should specify whether the TMDL is being submitted for a *technical review* or *final review and approval*. Each final TMDL submitted to EPA should be accompanied by a submittal letter that explicitly states that the submittal is a final TMDL submitted under Section 303(d) of the Clean Water Act for EPA review and approval. This clearly establishes the State's/Tribe's intent to submit, and EPA's duty to review, the TMDL under the statute. The submittal letter, whether for technical review or final review and approval, should contain such identifying information as the name and location of the waterbody, and the pollutant(s) of concern.

Comment:

On March 5, 2018, EPA received the Little Vermilion River watershed TMDL, and a submittal letter from Sanjay Sofat, IEPA to Chris Korleski, EPA. In the submittal letter, IEPA stated it was submitting the TMDL report for EPA's final approval. The submittal letter included the name and location of the waterbodies and the pollutants of concern.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this twelfth element.

Conclusion

After a full and complete review, EPA finds that the TMDLs for the Little Vermilion River watershed satisfy all of the elements of an approvable TMDL. This approval is for three TMDLs; one for fecal coliform, one for chlorides, and one for zinc, as noted in Table 1 of this Decision Document.

EPA's approval of this TMDL does not extend to those waters that are within Indian Country, as defined in 18 U.S.C. Section 1151. EPA is taking no action to approve or disapprove TMDLs for those waters at this time. EPA, or eligible Indian Tribes, as appropriate, will retain responsibilities under the CWA Section 303(d) for those waters.

Section 1

Goals and Objectives for the Little Vermilion River (LaSalle County) Watershed

1.1 Total Maximum Daily Load Overview

A total maximum daily load, or TMDL, is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify waterbodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA develops a list known as the "303(d) list" of waterbodies not meeting water quality standards every 2 years, and it is included in the Integrated Water Quality Report. Waterbodies on the 303(d) list are then targeted for TMDL development. The Illinois EPA's most recent Integrated Water Quality Report was submitted to the United States Environmental Protection Agency (USEPA) in July 2016. In accordance with USEPA's guidance, the report assigns all waters of the state to one of five categories. 303(d) listed waterbodies make up category five in the integrated report (Appendix A of the Integrated Report).

In general, a TMDL is a quantitative assessment of water quality impairments, contributing sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a waterbody.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters; and
- Where attainable, to achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water.

Water quality standards consist of three elements:

- The designated beneficial use or uses of a waterbody or segment of a waterbody
- The water quality criteria necessary to protect the use or uses of that particular waterbody
- An antidegradation policy

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 TMDL Goals and Objectives for the Little Vermilion River (LaSalle County) Watershed

Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

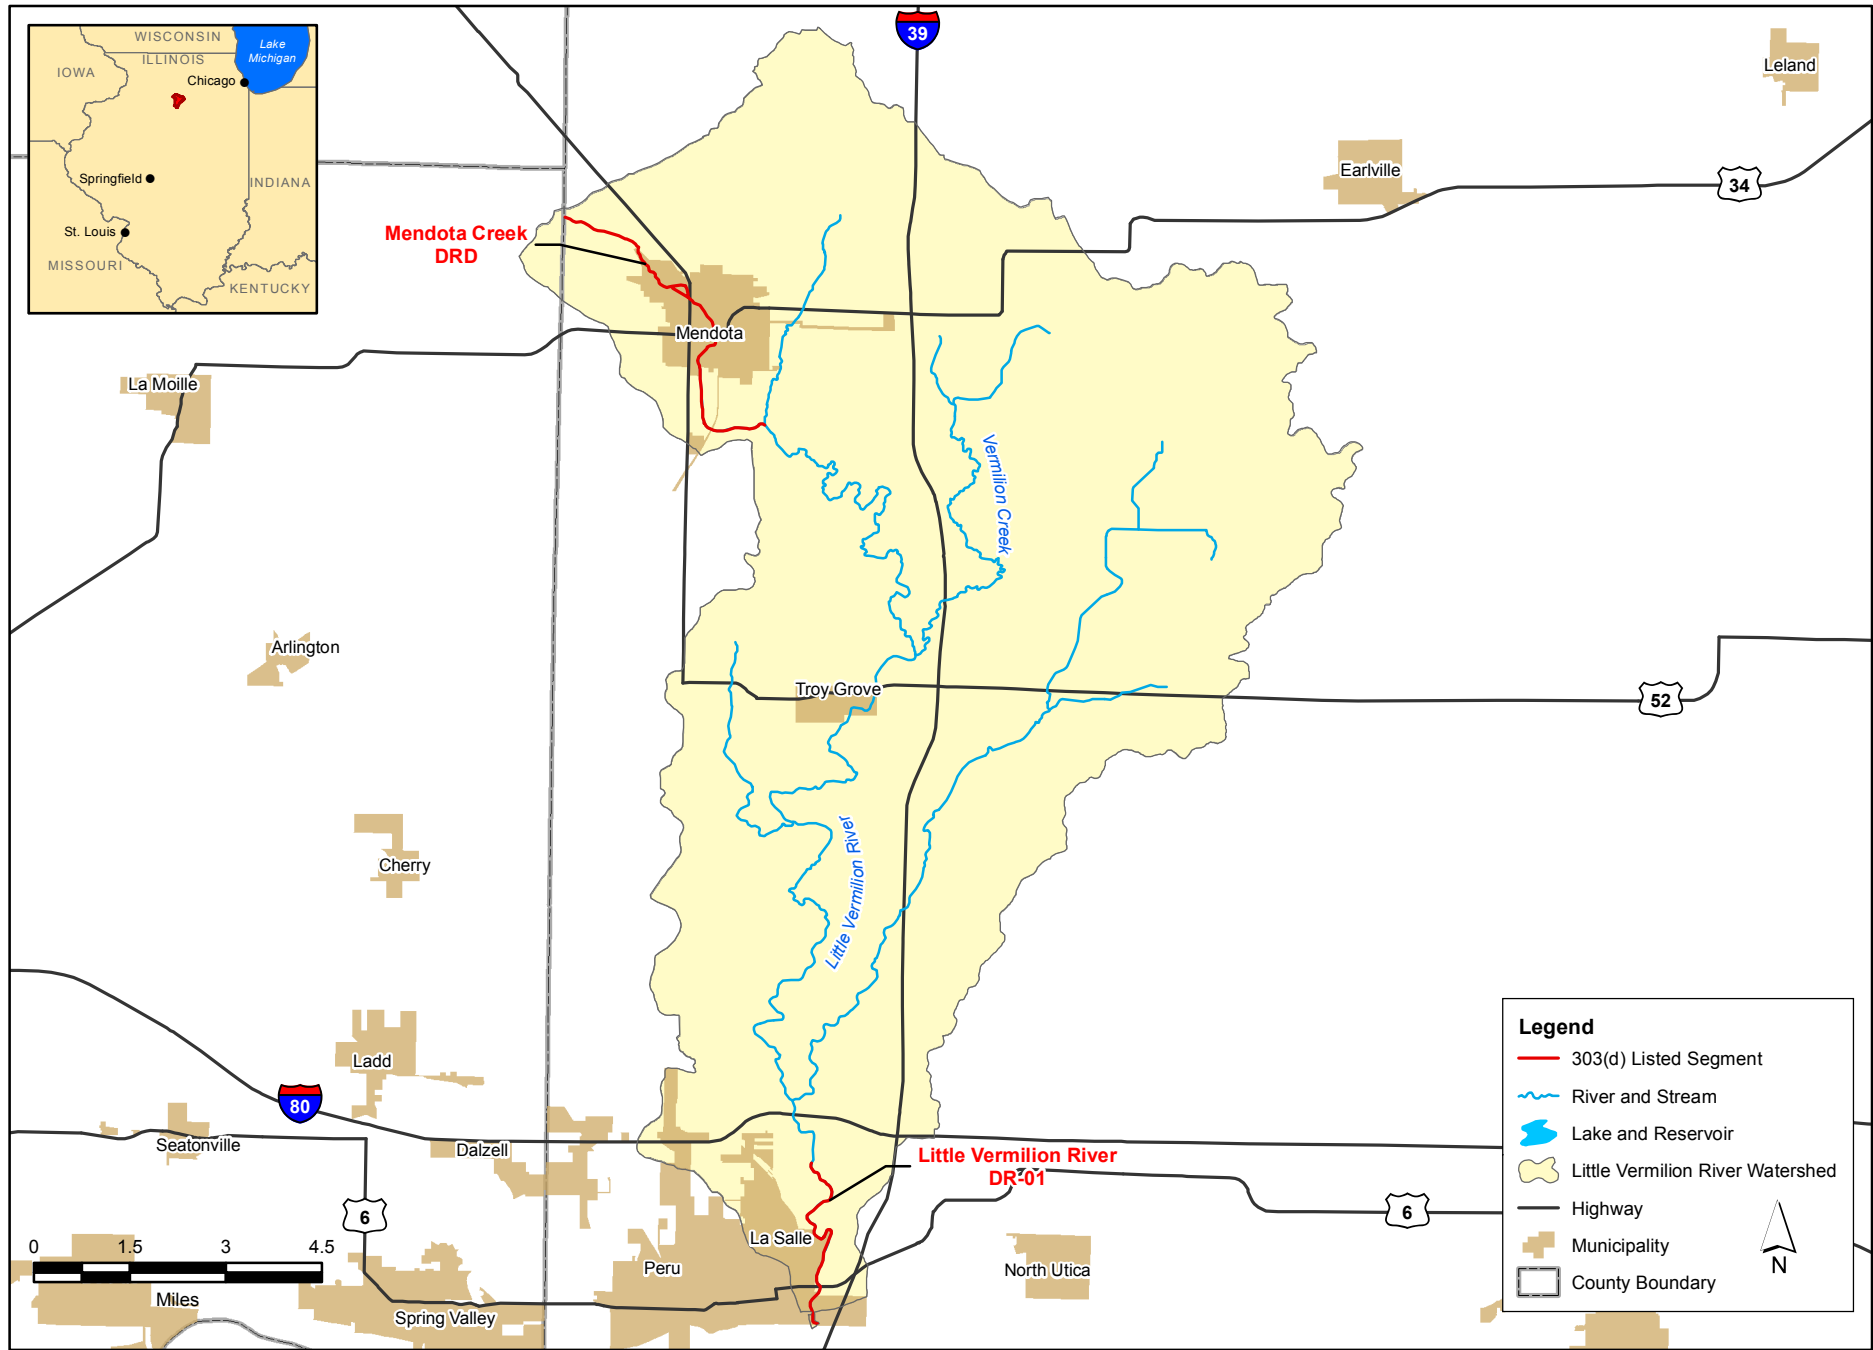

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

This report presents all stages of TMDL development for the Little Vermilion River Watershed. Stage 1 was completed in 2014. Data collection under Stage 2 was performed in 2015. Stage 3 documentation was completed in 2017.

Following are the impaired waterbody segments in the Little Vermilion River (LaSalle County) watershed:

- Little Vermilion River (DR-01)
- Mendota Creek (DRD)

These impaired waterbody segments are shown on **Figure 1-1**. There are two impaired waterbody segments within the Little Vermilion River (LaSalle County) watershed that have TMDLs and/or load reduction strategies (LRSs) addressed in this report. **Table 1-1** lists the waterbody segment, and potential causes and sources of impairment for the waterbody.

**Little Vermilion River
TMDL Watershed**

FIGURE 1-1

This page intentionally left blank.

Table 1-1 Impaired Waterbodies in Little Vermilion River (LaSalle County) Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2016 303(d) list)
DR-01	Little Vermilion River	Chloride	Aquatic Life	Combined Sewer Overflows, Urban Runoff/Storm Sewers
		<i>Total Phosphorus</i>	Aquatic Life	Combined Sewer Overflows, Crop Production
		Zinc	Aquatic Life	Combined Sewer Overflows, Contaminated Sediments, Industrial Land Treatment, Sanitary Sewer Overflows (Collection System Failures)
		pH*	Aquatic Life	Combined Sewer Overflows
		<i>Total Suspended Solids</i>	Aquatic Life	Combined Sewer Overflows, Crop Production
		Fecal Coliform	Primary Contact Recreation	Combined Sewer Overflows, Source Unknown
DRD	Mendota Creek	Dissolved Oxygen*	Aquatic Life	Combined Sewer Overflows, Municipal Point Source Discharges
		<i>Total Phosphorus</i>	Aquatic Life	Combined Sewer Overflows, Municipal Point Source Discharges

Bold Potential Causes of Impairment have numeric water quality standards and the TMDL data collection and review process was initiated during Stage 1. Parameter noted with a * have since been recommended for delisting in 2018 after recently collected data show that impairment no longer exists and further TMDL development did not occur. *Italicized Potential Causes of Impairment* do not have numeric water quality standards and an LRS was developed.

Illinois EPA has previously only developed TMDLs for parameters that have numeric water quality standards while deferring development of TMDLs for parameters without numeric water quality standards until those criteria have been developed and adopted. For potential causes that do not have numeric water quality standards as noted in **Table 1-1**, TMDLs were not developed. However, LRSs (similar to TMDLs) were developed for these impairments based on target values established by Illinois EPA.

The TMDLs for the segments listed above specify the following elements:

- **Loading Capacity (LC)** or the maximum amount of pollutant loading a waterbody can receive without violating water quality standards
- **Waste Load Allocation (WLA)** or the portion of the TMDL allocated to existing or future point sources
- **Load Allocation (LA)** or the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- **Margin of Safety (MOS)** or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality

- **Reserve Capacity (RC)** or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\text{TMDL} = \text{LC} = \Sigma\text{WLA} + \Sigma\text{LA} + \text{MOS} + \text{RC}$$

As part of the TMDL development process, Illinois EPA started to include LRSs in TMDL watershed projects in 2012 for those pollutants that do not currently have a numeric water quality standard. Developing a LRS involves determining the LC and load reduction that is needed in order for the waterbody to meet “Full Use Support” for its designated uses. In a LRS, the LC is not divided into WLA, LA, or MOS. These TMDL components are represented by one number as a target concentration for load reduction within each unique watershed. The LRS provides guidance (with no regulatory requirements) for voluntary nonpoint source reduction efforts by implementing agricultural and urban stormwater best management practices (BMPs).

TMDL and LRS development also takes into account the seasonal variability of pollutant loads so that water quality standards are met during all seasons of the year. Also, reasonable assurance that the TMDL and LRS targets will be achieved is described in the implementation plan. The implementation plan for the Little Vermilion River watershed describes how water quality standards and targets will be met and attained. This implementation plan includes recommendations for implementing BMPs, cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completion of implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Little Vermilion River (LaSalle County) Watershed Description** provides a description of the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Little Vermilion River (LaSalle County) Watershed Public Participation** discusses public participation activities that will occur throughout TMDL development.
- **Section 4 Little Vermilion River (LaSalle County) Watershed Water Quality Standards** defines the water quality standards for the impaired waterbodies.
- **Section 5 Little Vermilion River (LaSalle County) Watershed Characterization** presents the available water quality data needed to develop TMDLs, discusses the characteristics of the impaired stream segments in the watershed, and also describes the point and nonpoint sources with potential to contribute to the watershed load.
- **Section 6 Approach to Developing TMDLs and Identification of Data Needs** makes recommendations for the models and analysis that are needed for TMDL development and also suggests segments for Stage 2 data collection.

- **Section 7 Methodology Development for the Little Vermilion River Watershed** details the development of the TMDLs and LRSs for each impaired stream segment.
- **Section 8 Total Maximum Daily Load for the Little Vermilion River Watershed** provides the results of the TMDL and LRS analyses for each impaired stream segment.
- **Section 9 Implementation Plan for the Little Vermilion River Watershed** makes recommendations for implementation actions, point source controls, management measures, and BMPs that can be used to address water quality issues in the watershed.

This page intentionally left blank.

Section 2

Little Vermilion River (LaSalle County) Watershed Description

2.1 Little Vermilion River (LaSalle County) Watershed Location

The Little Vermilion River (LaSalle County) watershed (**Figure 1-1**) is located in north-central Illinois, flows in a southerly direction, and drains just over 80,000 acres. The majority of the watershed (99.5 percent of land area or 80,054 acres) lies within La Salle County. A very small portion of the watershed (362 acres) lies within Bureau County.

2.2 Topography

Topography is an important factor in watershed management because stream types, precipitation, and soil types can vary dramatically by elevation. National Elevation Dataset (NED) coverages containing 30-meter grid resolution elevation data are available from the U.S. Geological Survey (USGS) for each 1:24,000-topographic quadrangle in the United States. Elevation data for the Little Vermilion River (LaSalle County) watershed were obtained by overlaying the NED grid onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed.

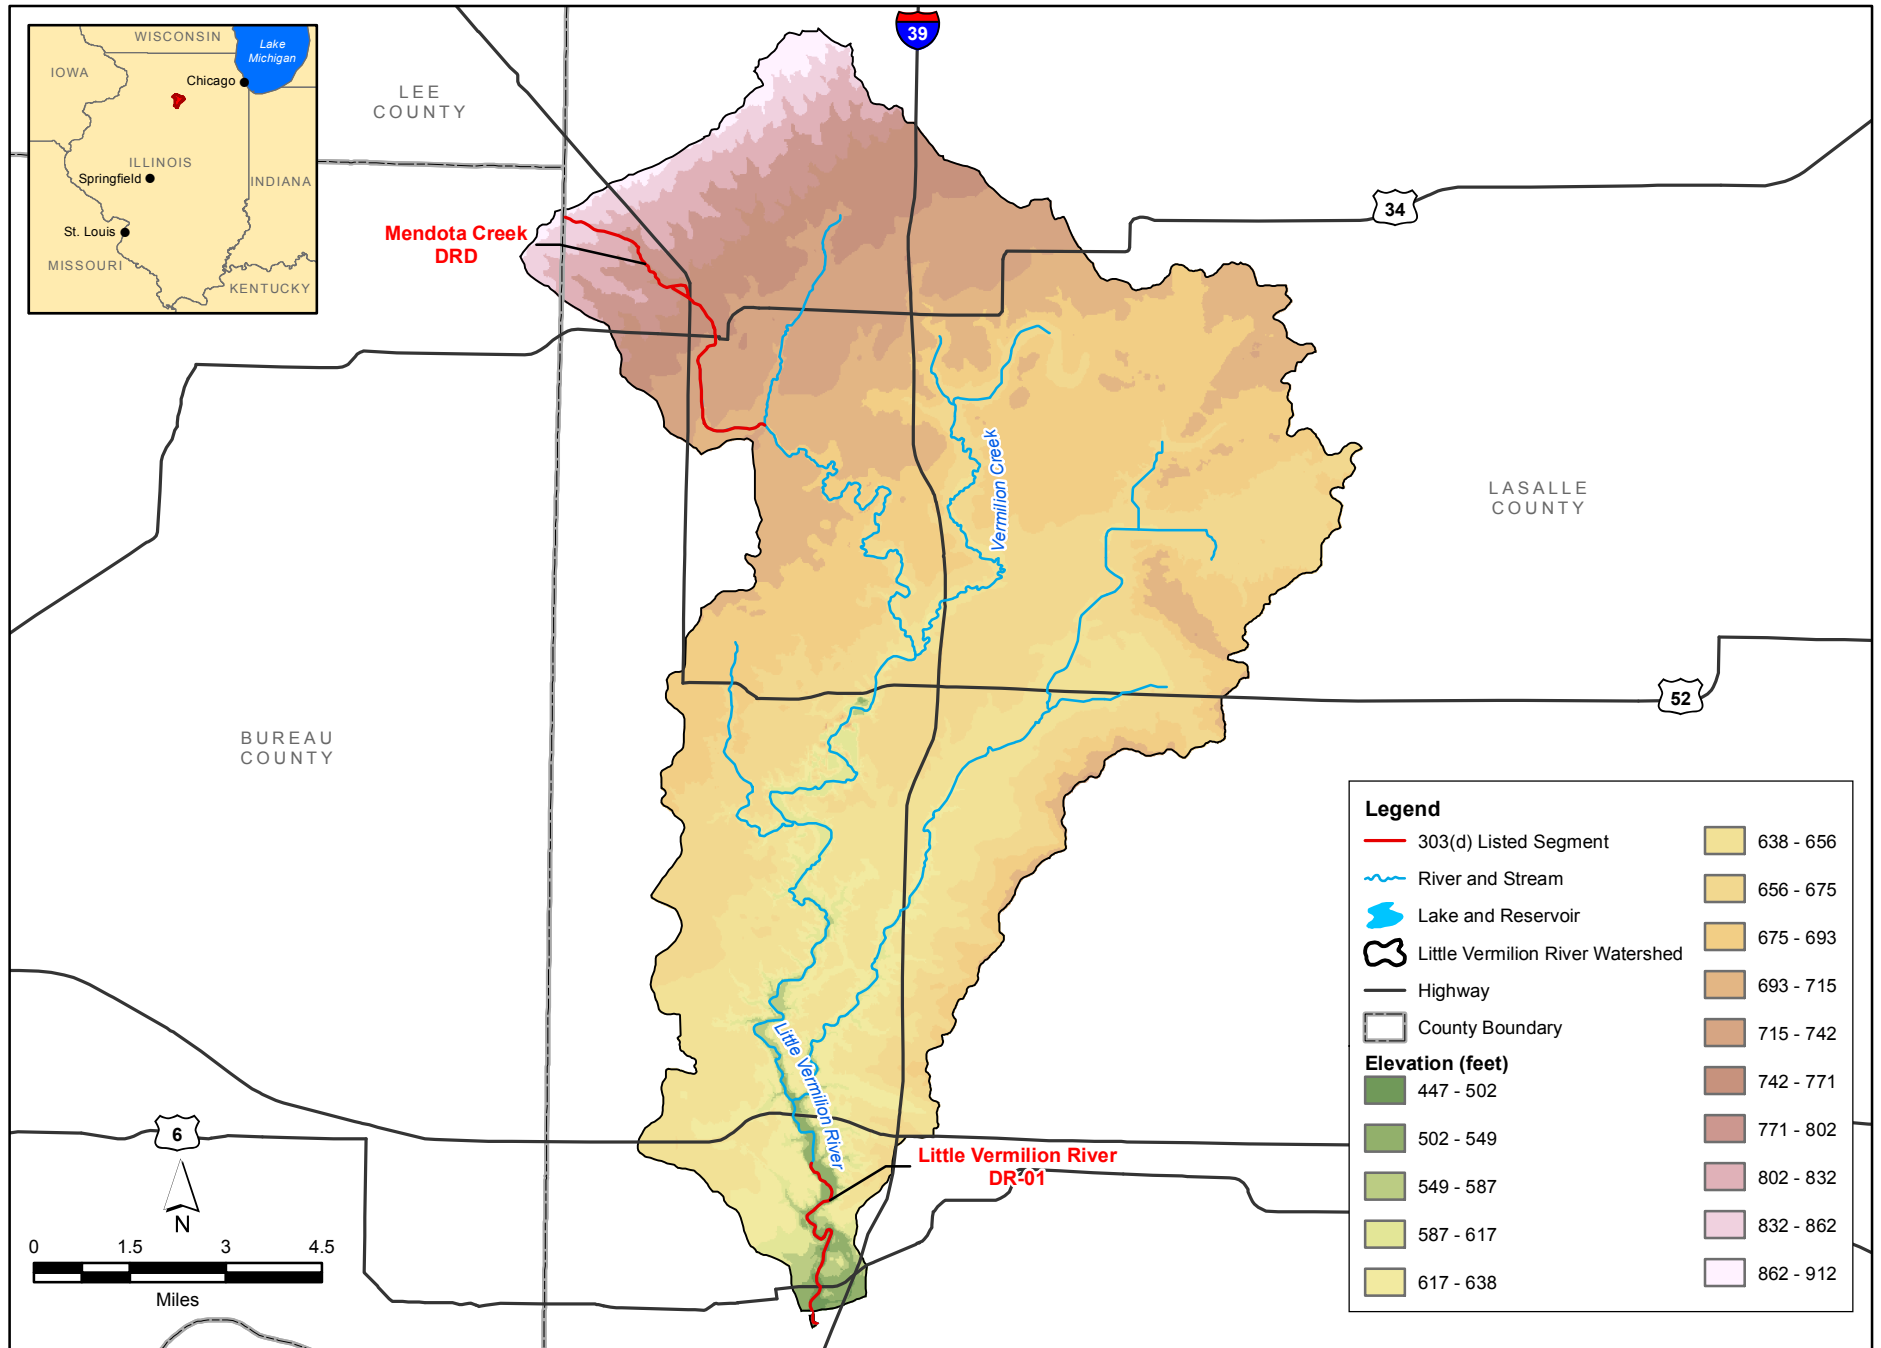

Elevation in the Little Vermilion River (LaSalle County) watershed ranges from 912 feet above sea level in the northwestern portion of the watershed (at the headwaters of Mendota Creek) to 447 feet at the southern extent of the watershed.

2.3 Land Use

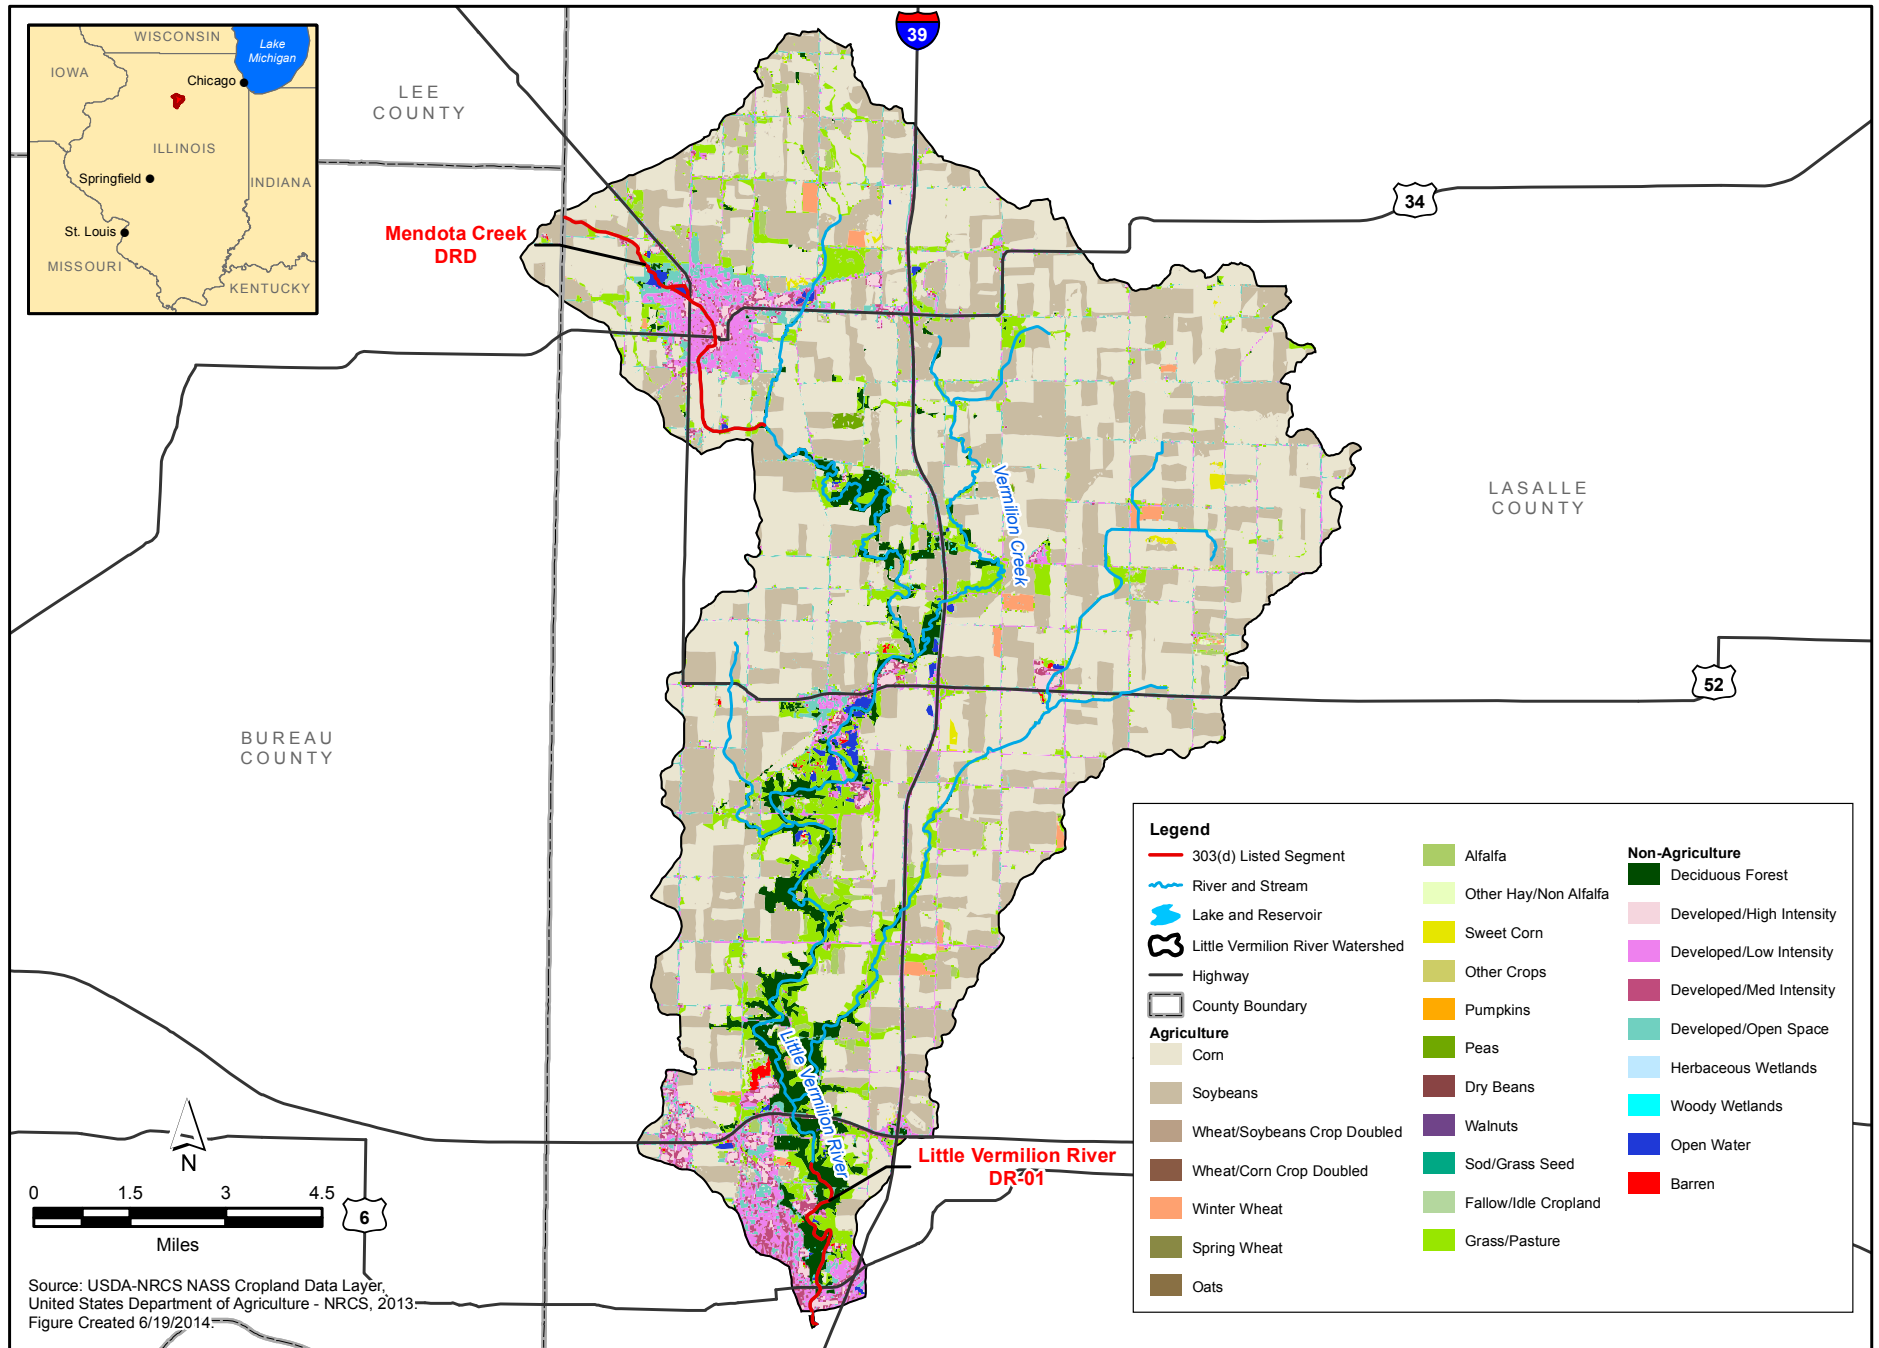

Land use data for the Little Vermilion River watershed were extracted from the U.S. Department of Agriculture's (USDA) National Agriculture Statistics Service (NASS) 2013 Cropland Data Layer (CDL). The CDL is a raster based, geo-referenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities and to produce digital, crop-specific, categorized geo-referenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2013 and includes 28 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters. The 2013 CDL and extensive metadata are available at https://www.nass.usda.gov/Research_and_Science/Cropland/metadata/meta.php.

Land use characteristics of the watershed were determined by overlaying the statewide 2013 CDL data layer onto the GIS-delineated watershed. **Table 2-1** contains the land uses contributing to the Little Vermilion River watershed, based on the 2013 CDL land cover categories and also includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed.

Little Vermilion River Watershed Land Use

FIGURE 2-2

This page intentionally left blank.

Table 2-1 Land Cover and Land Use in Little Vermilion River (LaSalle County) Watershed

Land Cover Category	Area (Acres)	Percentage
Corn	36,943	45.9%
Soybeans	22,332	27.8%
Grass/Pasture	5,858	7.3%
Developed/Low Intensity	4,199	5.2%
Developed/Open Space	3,565	4.4%
Deciduous Forest	3,525	4.4%
Developed/Med Intensity	1,432	1.8%
Developed/High Intensity	704	0.88%
Winter Wheat	516	0.64%
Alfalfa	461	0.57%
Open Water	397	0.49%
Sweet Corn	124	0.15%
Barren	121	0.15%
Peas	110	0.14%
Other Crops	44	<0.1%
Woody Wetlands	34	<0.1%
Fallow/Idle Cropland	13	<0.1%
Other Hay/Non Alfalfa	12	<0.1%
Winter Wheat & Soybeans	9.3	<0.1%
Spring Wheat	8.9	<0.1%
Herbaceous Wetlands	3.3	<0.1%
Dry Beans	3.3	<0.1%
Walnuts	1.8	<0.1%
Pumpkins	1.3	<0.1%
Oats	1.1	<0.1%
Sod/Grass Seed	0.22	<0.1%
Winter Wheat & Corn	0.22	<0.1%
Grand Total	80,420	100%

The land cover data reveal that over 60,580 acres, representing approximately 75 percent of the total watershed area, are devoted to agricultural activities. Corn and soybean farming account for 46 percent and 28 percent of the watershed area, respectively. Rural grassland and upland areas represent a total of 11.8 percent of the watershed (9,505 acres). Approximately 12.3 percent of the watershed area (9,900 acres) is developed, urbanized land. Marshes and open water make up 0.5 percent (434 acres) of the Little Vermilion River (LaSalle County) watershed. In addition to the land use categories provided in the 2013 CDL, data from the Illinois Department of Natural Resources (IDNR) indicates that underground mining operations cover approximately 1,090 acres of land within the watershed. Public comments from watershed stakeholders indicated that a number of mining and quarrying operations are currently active in the area with reserve acres owned for future growth.

2.4 Soils

Soils data are available through the Soil Survey Geographic (SSURGO) database. For SSURGO data, field mapping methods using national standards are used to construct the soil maps. Mapping scales generally range from 1:12,000 to 1:63,360 making SSURGO the most detailed level of soil mapping done by the Natural Resources Conservation Service (NRCS).

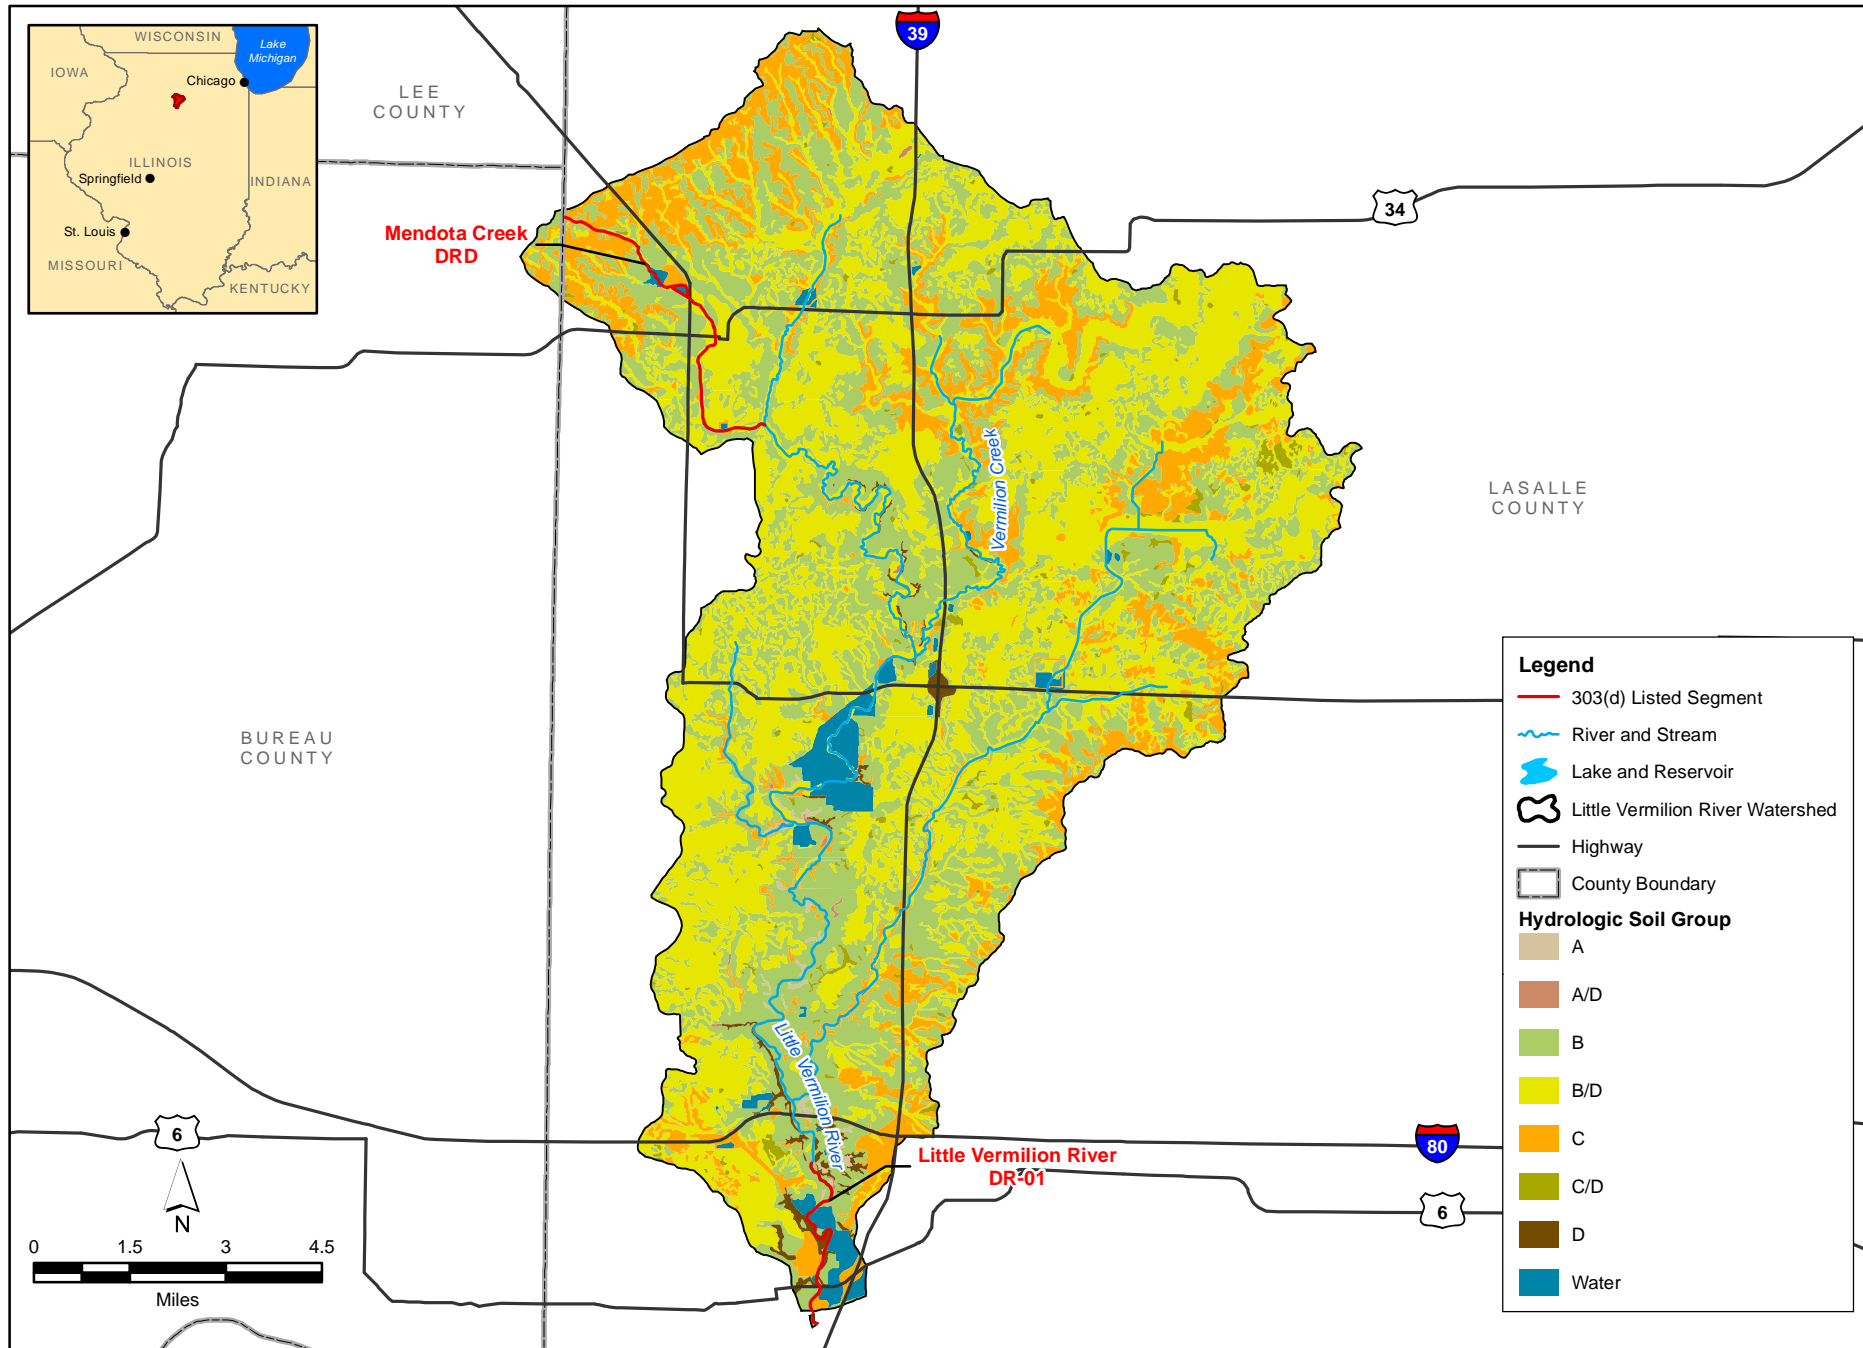

Attributes of the spatial coverage can be linked to the SSURGO databases, which provide information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups as well as the K-factor of the Universal Soil Loss Equation (USLE). The following sections describe and summarize the specified soil characteristics for the Little Vermilion River (LaSalle County) watershed.

2.4.1 Little Vermilion River (LaSalle County) Watershed Soil Characteristics

Appendix B contains a table of the SSURGO soil series for the Little Vermilion River (LaSalle County) watershed. A total of 128 soil types exist in the watershed. The three most common types—Muscatine-Buckhart silt loams (0-3 percent slopes), Sable silty clay loam (0-2 percent slopes, frequently flooded), and Muscatine silt loam (0-2 percent slopes)—each cover a small percentage of the overall watershed (14.4, 13.2, and 9.9 percent, respectively). All other soil types each represent less than 7 percent of the total watershed area. The table in Appendix B also contains the area, dominant hydrologic soil group, and k-factor range. Each of these characteristics is described in more detail in the following paragraphs.

Figure 2-3 shows the hydrologic soils groups found within the Little Vermilion River (LaSalle County) watershed. Hydrologic soil groups are used to estimate runoff from precipitation. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

Little Vermilion River Watershed Soils

FIGURE 2-3

This page intentionally left blank.

While hydrologic soil groups A, B, C, D, B/D, A/D, and C/D are all found within the Little Vermilion River (LaSalle County) watershed, groups B/D, B, and C are the most common types and represent 42.3, 39.0, and 14.4 percent of the watershed, respectively. The remaining groups cover less than 2 percent of the watershed area. The most common type, Group B/D, is a dual hydrologic soil group. Dual hydrologic soil groups can be adequately drained. The first letter applies to the drained condition and the second to the undrained condition. For the purpose of hydrologic soil group, adequately drained means that the seasonal high water table is kept 24 inches below the surface in a soil where it would be higher in a natural state (NRCS 2007a).

A commonly used soil attribute is the soil erodibility factor (K-factor). The K-factor indicates the susceptibility of a soil to sheet and rill erosion by water. The K-factor is one of the factors used in the Revised Universal Soil Loss Equation to predict the average annual rate of soil loss by sheet and rill erosion. Losses are expressed in tons per acre per year. These estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of K range from 0.02 to 0.69. The higher the value, the more susceptible the soil is to sheet and rill erosion by water (NRCS 2007b). The distribution of K-factor values in the Little Vermilion River (LaSalle County) watershed range from 0.02 to 0.43.

2.5 Population

The Census 2010 TIGER/Line data from the U.S. Census Bureau were retrieved. Geographic shapefiles of census blocks were downloaded for the entire state of Illinois. All census blocks that have geographic center points (centroids) within the watershed were selected and tallied in order to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Approximately 14,600 people reside in the Little Vermilion River (LaSalle County) watershed. The major municipalities in the watershed are shown in **Figure 1-1** (refer to Section 1). The largest urban development within the watershed is the city of Mendota, with a population of approximately 7,200. A portion of the city of La Salle is also located in the southern edge of the watershed.

2.6 Climate, Pan Evaporation, and Streamflow

2.6.1 Climate

North central Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly precipitation data from Peru, Illinois (station ids. 114922 and 116753, which share the same location but have different periods of record) in La Salle County were extracted from the National Climatic Data Center (NCDC) database for the years 1901 through 1916 and 1919 through 2013. The data station in Peru, Illinois is near the southern edge of the Little Vermilion River (LaSalle County) watershed and is expected to be representative of precipitation throughout the watershed.

Table 2-2 contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is 34.8 inches. May and June are historically the wettest months while January and February are the driest.

Table 2-2 Average Monthly Climate Data in Peru, Illinois

Month	Total Precipitation (inches)	Maximum Temperature (degrees F)	Minimum Temperature (degrees F)
January	1.6	52.0	-8.1
February	1.5	56.1	-2.6
March	2.6	71.6	9.8
April	3.5	83.0	23.7
May	4.0	89.7	34.1
June	3.8	95.2	44.5
July	3.7	97.2	50.4
August	3.7	95.6	48.6
September	3.6	91.8	36.6
October	2.6	84.3	26.4
November	2.3	70.6	13.9
December	1.9	56.1	-1.8
Total	34.8		

2.6.2 Pan Evaporation

Through the Illinois State Water Survey (ISWS) website, pan evaporation data are available from nine locations across Illinois (ISWS 2009). The Hennepin, Illinois station was chosen to be representative of pan evaporation conditions for the Little Vermilion River (LaSalle County) watershed. The Hennepin station is located approximately 22 miles west-southwest of the Little Vermilion River (LaSalle County) watershed. This station was chosen for its proximity to the Little Vermilion River (LaSalle County) watershed. The average annual pan evaporation at the Hennepin station for the years 1980 to 2005 is 37.9 inches. Actual evaporation is typically less than pan evaporation, so the average annual pan evaporation was multiplied by 0.75 to calculate an average annual evaporation of 28.4 inches (ISWS 2009).

2.6.3 Streamflow

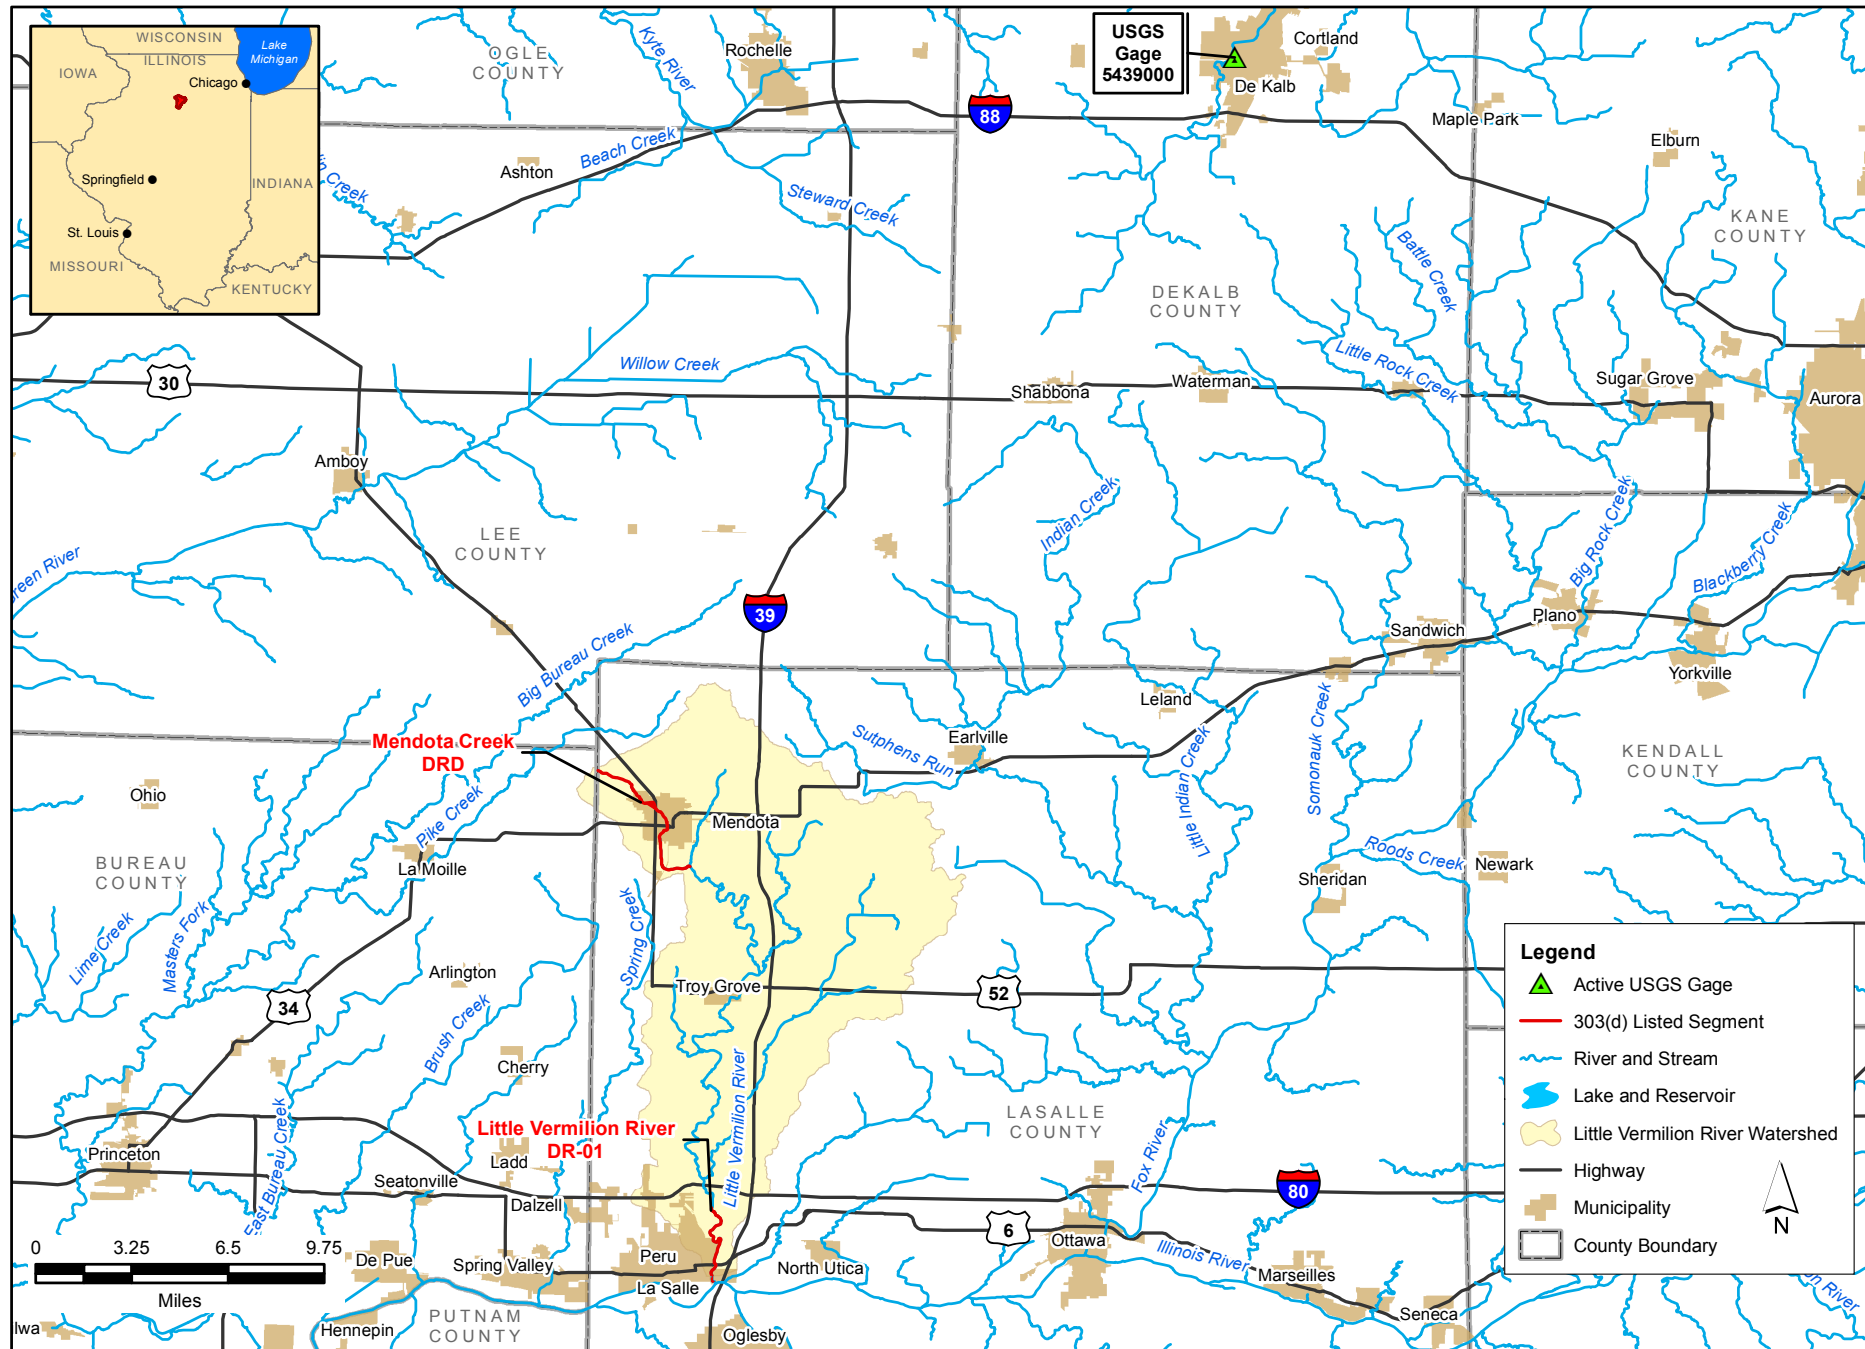

Analysis of the Little Vermilion River (LaSalle County) watershed requires an understanding of flow throughout the drainage area. The USGS National Water Information System (NWIS) stream gage network is a reliable source of stream flow information that will be utilized for this report. However, there are no active USGS gages within the Little Vermilion River watershed and it will be necessary to estimate flow data using data from alternate stream gages. Data from a surrogate gage will be processed to produce estimates of stream flow at a given time and location within the Little Vermilion River watershed using the drainage area ratio method, represented by the following equation:

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where Q_{gaged} = Streamflow of the gaged basin
 Q_{ungaged} = Streamflow of the ungaged basin
 $\text{Area}_{\text{gaged}}$ = Area of the gaged basin
 $\text{Area}_{\text{ungaged}}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed. USGS gage 5439000 (South Branch Kishwaukee River at Dekalb, Illinois) was selected as a suitable surrogate gage for estimates of stream flow in the Little Vermilion River watershed (**Figure 2-4**). Gage 5439000 is located approximately 25 miles northeast of the watershed and has a drainage area of 78 square miles. The gage was selected over a closer gage (05556500 Big Bureau Creek near Princeton, Illinois) because it is not influenced by point sources. Daily discharge data are available from 1925 to 2016 and average monthly stream flows in the South Branch Kishwaukee River range from 21 cubic feet per second (cfs) in October to 110 cfs in March. South Branch Kishwaukee River drainage consists of similar land uses and levels of development as the Little Vermilion River watershed. Due to their relative proximity, climatological data are also very similar for each watershed.

Section 3

Little Vermilion River (LaSalle County) Watershed Public Participation

3.1 Little Vermilion River (LaSalle County) Watershed Public Participation and Involvement

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet recommended TMDLs. It is important to involve the public as early in the process as possible to achieve maximum cooperation and identify and alleviate concerns as to the purpose of the process and the regulatory authority to implement any recommendations.

The Stage 1 public meeting was held in LaSalle, Illinois on September 11, 2014. An additional public meeting was held in LaSalle on September 27, 2017 prior to completion of the final TMDL report. Comments received at both meetings, or following the meetings during the 30-day comment periods, have been incorporated into this document and are available in **Appendix E**.

This page intentionally left blank.

Section 4

Little Vermilion River (LaSalle County) Watershed Water Quality Standards

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the "designated uses" of the state's waterways. In the state of Illinois, setting the water quality standards is the responsibility of the Illinois Pollution Control Board (IPCB). Illinois is required to update water quality standards every three years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA, in conjunction with USEPA. New standards are then developed or revised during the three-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to the IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards.

4.2 Designated Uses

The waters of Illinois are classified by designated uses, which include: General Use, Public and Food Processing Water Supplies, Primary Contact, Aesthetic Quality, Fish Consumption, Lake Michigan, and Secondary Contact and Indigenous Aquatic Life Use (Illinois EPA 2016). The designated use applicable to impaired waterbodies in the Little Vermilion River (LaSalle County) watershed is the General Use.

4.2.1 General Use

The General Use classification is defined by IPCB as standards that "will protect the state's water for aquatic life, wildlife, agricultural use, secondary contact use and most industrial uses, and ensure the aesthetic quality of the state's aquatic environment." Primary contact uses are protected for all General Use waters whose physical configuration permits such use.

4.3 Water Quality Standards for the Little Vermilion River Watershed

Table 4-1 presents the numeric water quality standards of the potential causes of impairment for streams in the Little Vermilion River watershed.

According to the Illinois EPA Integrated Report, aquatic life use assessments in streams are typically based on the interpretation of biological information, physicochemical water data, and physical-habitat. The primary biological measures used are the fish Index of Biotic Integrity (fIBI), the macroinvertebrate Index of Biotic Integrity (mIBI) and the Macroinvertebrate Biotic Index (MBI). Physical-habitat information used in assessments includes quantitative or qualitative

measures of stream-bottom composition and qualitative descriptors of channel and riparian conditions. Physicochemical water data used include measures of “conventional” parameters (e.g., dissolved oxygen [DO], pH, and temperature), priority pollutants, non-priority pollutants, and other pollutants. For public and food processing water supply waters, Illinois EPA compares available data with water quality standards to make impairment determinations. To assess primary contact use, Illinois EPA uses all fecal coliform bacteria from water samples collected in May through October, over the most recent five-year period (i.e., 2009 through 2013 for the 2016 Integrated Report). Based on these water samples, geometric means and individual measurements of fecal coliform bacteria are compared to the concentration thresholds.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of Stream Impairments (as identified in the 2016 303(d) list) in Little Vermilion River (LaSalle County) Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Chloride	mg/L	<i>Total</i> :500	302.208(g)
Zinc	µg/L	<i>Dissolved</i> : Acute = $e^{A+B\ln(H)} \times 0.978^*$ where A = 0.9035 and B = 0.8473 Chronic = $e^{A+B\ln(H)} \times 0.986^*$ where A = -0.4456 and B = 0.8473	302.208(e)
Dissolved Oxygen	mg/L	<i>March through July</i> ≥5.0 minimum & ≥6.0 7-day daily mean averaged over 7 days; <i>August through February</i> ≥3.5 minimum, ≥4.0 7-day minimum averaged over 7 days & ≥5.5 30-day daily mean	302.206(b)
Total Fecal Coliform	Count/100 mL	<i>May through October</i> 200 ⁽¹⁾ , 400 ⁽²⁾	302.209
pH	s.u.	6.5-9.0	302.204

µg/L = micrograms per liter

mg/L = milligrams per liter

s.u. = standard units

H = hardness

* = Conversion factor multiplier for dissolved metals

(1) Geometric mean based on a minimum of five samples taken over not more than a 30-day period.

(2) Standard shall not be exceeded by more than 10 percent of the samples collected during any 30-day period.

4.4 Water Quality Targets

As mentioned in Section 1.2, Illinois EPA began including LRSs in TMDL watershed projects in 2012 for pollutants that do not currently have a numeric water quality standard. Developing an LRS involves determining the loading capacity and load reduction necessary that is needed in order for the waterbody to meet “Full Use Support” for its designated uses. The load capacity is not divided into WLA, LA, or MOS, these are represented by one number as a target concentration for load reduction within each unique watershed. The LRS provides guidance (with no regulatory requirements) for voluntary nonpoint source reduction efforts by implementing agricultural and urban stormwater BMPs.

The current LRS targets are based on data from all stream segments within the HUC-10 basins of the watershed, as well as stream segments or lakes which closely border the watershed in neighboring HUC-10 basins, in order to best represent the land use, hydrologic, and geologic conditions unique to the watershed. Load reduction targets were calculated by Illinois EPA using data from stream segments whose most current assessment shows full support for aquatic life and data that have passed quality assurance and quality checks within Illinois EPA and are in accordance with state and federal laws. LRS target values have been developed by Illinois EPA for the Little Vermilion River (LaSalle County) watershed to address impairments caused by total suspended solids (TSS) and total phosphorus in streams. The LRS target value for TSS in this watershed is 25.3 mg/L and the LRS target value for total phosphorus is 0.289 mg/L.

4.5 Potential Pollutant Sources

In order to properly address the conditions within the Little Vermilion River (LaSalle County) watershed, potential pollutant sources must be investigated for the pollutants where TMDLs or LRSs will be developed. **Table 4-2** contains a summary of the potential sources associated with the listed potential causes for the 303(d) listed segments in this watershed. The sources provided below were identified in the 2016 303(d) list by the state. Additional investigation and documentation of sources beyond the potential sources identified in the 303(d) list are provided in Sections 5, 7 and 8.

Table 4-2 Potential Pollutant Sources for Impaired Waterbodies in Little Vermilion River (LaSalle County) Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2016 303(d) list)
DR-01	Little Vermilion River	Chloride	Aquatic Life	Combined Sewer Overflows, Urban Runoff/Storm Sewers
		<i>Total Phosphorus</i>	Aquatic Life	Combined Sewer Overflows, Crop Production
		Zinc	Aquatic Life	Combined Sewer Overflows, Contaminated Sediments, Industrial Land Treatment, Sanitary Sewer Overflows (Collection System Failures)
		pH	Aquatic Life	Combined Sewer Overflows
		<i>Total Suspended Solids (TSS)</i>	Aquatic Life	Combined Sewer Overflows, Crop Production
		Fecal Coliform	Primary Contact Recreation	Combined Sewer Overflows, Source Unknown
DRD	Mendota Creek	Dissolved Oxygen	Aquatic Life	Combined Sewer Overflows, Municipal Point Source Discharges
		<i>Total Phosphorus</i>	Aquatic Life	Combined Sewer Overflows, Municipal Point Source Discharges, Crop Production

Bold Causes of Impairment have numeric water quality standards. **It should be noted that TMDLs were not developed for pH or Dissolved Oxygen based on more recent data (see discussion in Sections 5 and 6).** Italicized Causes of Impairment do not have numeric water quality standards and LRSs were developed

This page intentionally left blank.

Section 5

Little Vermilion River (LaSalle County) Watershed Characterization

In order to further characterize the Little Vermilion River (LaSalle County) watershed, a wide range of pertinent data were collected and reviewed. Water quality data for impaired stream segments, as well as information on potential point and nonpoint sources within the watershed, were compiled from a variety of data sources. This information is presented and discussed in further detail in the remainder of this section.

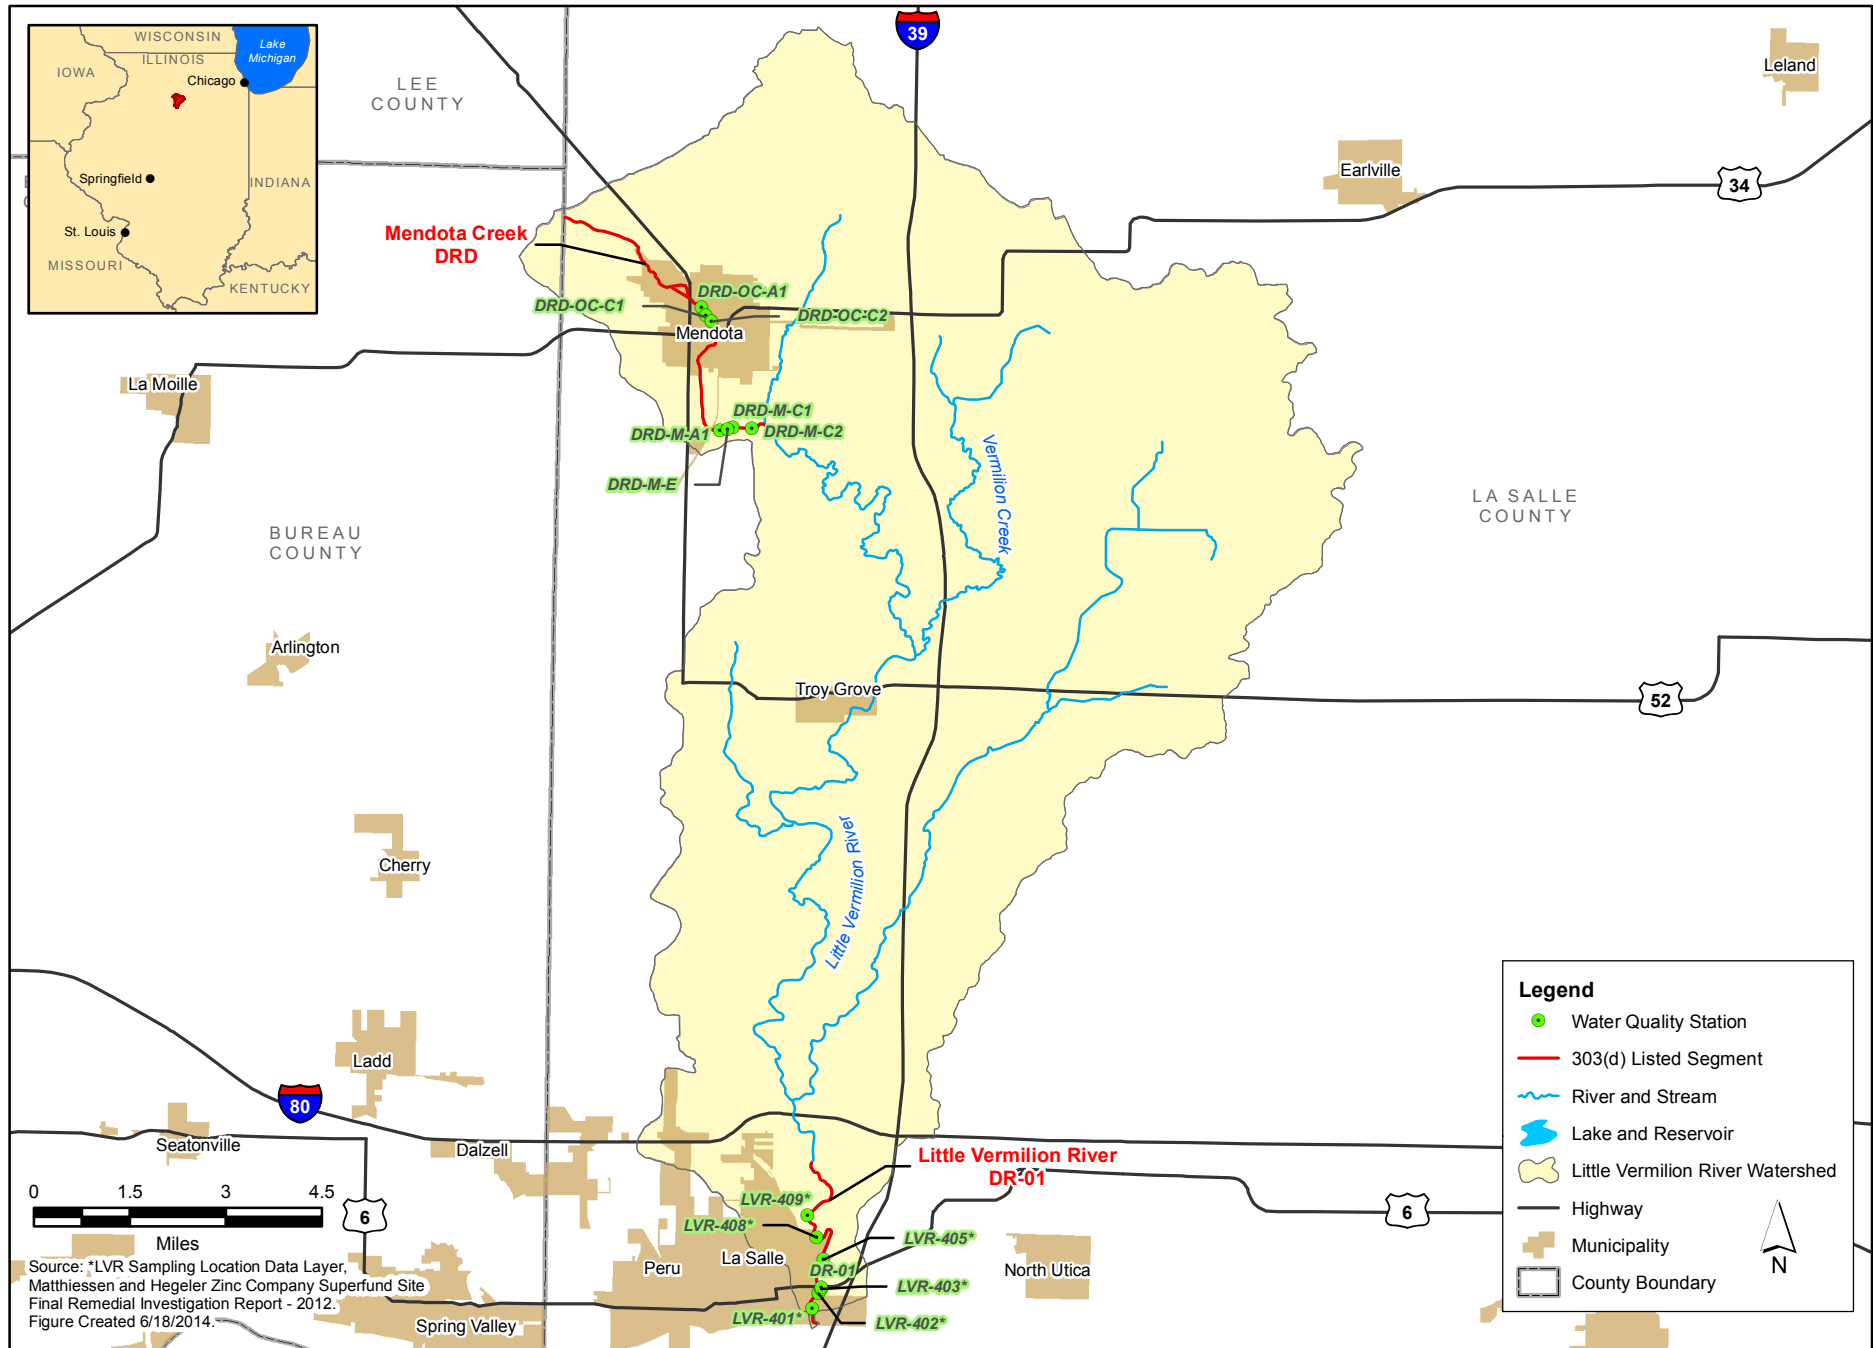

5.1 Water Quality Data

Illinois EPA monitoring programs that contribute data to the assessment of streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program. The majority of data used for this report came from the Ambient Water Quality and Intensive Basin Surveys. The Ambient Water Quality Network includes 213 fixed stream stations statewide that are sampled every six weeks. Additional data are collected during Intensive Basin Surveys, which typically include approximately 100 basin-specific stations per year and are conducted on a five-year cycle. Additional information on Illinois EPA's monitoring programs can be found in the "Illinois Water Monitoring Strategy" (<http://www.epa.state.il.us/water/water-quality/monitoring-strategy/>).

Data from a total of 14 relevant historical water quality stations within the Little Vermilion River (LaSalle County) watershed were located and reviewed for this report. These water quality data were primarily provided by the Illinois EPA; however, additional water quality data were queried from the USEPA's Storage and Retrieval (STORET) database. Additional water quality data were available for a number of locations along Little Vermilion River Segment DR-01 as a result of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) investigations conducted by the USEPA, Geosyntec, SulTRAC, and the Carus Corporation as part of the Final Remedial Investigation report for the Matthiessen and Hegeler Zinc Company Site (USEPA 2012). **Figure 5-1** shows the relevant water quality data stations within the watershed for this TMDL/LRS investigation.

The impaired waterbody segments in the Little Vermilion River (LaSalle County) watershed were presented in Section 1. Refer to **Table 1-1** for impairment information specific to each segment. Data are summarized by impairment and are discussed in relation to the relevant Illinois numeric water quality standard in the following sections. Data summaries provided in this section include all available date ranges of collected data.

5.1.1 Stream Water Quality Data

There are two impaired stream segments within the Little Vermilion River (LaSalle County) watershed (Little Vermilion River, DR-01; Mendota Creek, DRD). There is one Illinois EPA Ambient Water Quality Monitoring Network monitoring station on the impaired segment of the Little Vermilion River: DR-01. DR-01 has a substantial set of historical data. Additional sample collection was performed at seven separate locations along DR-01 in 2009 as part of the Matthiessen and Hegeler Zinc Company Site Remedial Investigation and are included in the summaries below. The historical Mendota Creek (DRD) dataset is limited to one Facility Related Stream Survey (FRSS) event that occurred in August 1988 as part of a routine assessment of point source impacts. Data were also collected in Mendota Creek in 2012 during an intensive basin survey performed by Illinois EPA and, based on recommendation in the Stage 1 report, additional data were also collected in 2015 specifically to address the TMDL and LRS data gaps identified during the Stage 1 assessment. The data summarized in this section include water quality data for impaired constituents as well as parameters that may be useful for Stage 3 modeling and analysis efforts. All historical water quality data for the impaired segments of the Little Vermilion River (LaSalle County) watershed are available in Appendix C.

5.1.1.1 Zinc

Little Vermilion River (LaSalle County) segment DR-01 is listed for impairment caused by elevated dissolved zinc concentrations. **Table 5-1** summarizes available historical zinc data for this segment. The available dataset for this segment includes Illinois EPA stream sampling data as well as an additional 18 data points collected at seven locations along the reach in 2009 as part of the Matthiessen and Hegeler Zinc Company Site Remedial Investigation performed under the supervision of USEPA. The current general use water quality standard includes both an acute and a chronic limit for dissolved zinc concentrations. A total of 53 zinc samples exceed the currently applicable chronic standard for protection of aquatic life while six samples exceed the acute aquatic life criteria. Both criteria are hardness dependent (refer to **Table 4-1**). Exceedances of the chronic standard for dissolved zinc occurred in nearly every year in the record and exceedances of the acute standard occurred in 2000, 2003, 2004, and 2006 (**Figure 5-2**).

Table 5-1 Existing Zinc Data for Little Vermilion River Segment DR-01

Sample Location and Parameter	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Acute Exceedances	Number of Chronic Exceedances
Zinc, Dissolved (µg/L)	1999 - 2009; 65	192	910	6.5	6	53

Note: Acute and chronic standards for dissolved zinc in streams are hardness-dependent

This page intentionally left blank.

Figure 5-2
Dissolved Zinc
Little Vermilion River Segment DR-01

This page intentionally left blank.

5.1.1.2 Chloride

Little Vermilion River (LaSalle County) segment DR-01 is listed for impairment caused by elevated chloride concentrations. **Table 5-2** summarized available historical chloride data for this segment. The current general use water quality standards for total chloride is 500 mg/L. The summary of data presented in **Table 5-2** reflects all available chloride data for segment DR-01. A total of two chloride samples collected during this time period exceed the current water quality standards. The highest reported value (9,880 mg/L) occurred in March 2003. The only other exceedance was reported in November 2005 at a considerably lower concentration (532 mg/L). **Figure 5-3** shows the timing and magnitude of the exceedances.

It should be noted that station DR-01 was dropped as an ambient water quality monitoring station in 2008. Since then, the state monitoring unit has collected water quality samples only twice at this station (9/30/2009 and 8/5/2011). An additional five samples were collected in 2012 by Illinois EPA which ranged from 75 mg/L to 397 mg/L, with the maximum concentration found in December. The remaining samples were all collected June through October. Because chloride can spike in response to road salting, and the majority of recent data were not collected during peak road salting months, the segment has remained on the impaired waterbodies list.

Table 5-2 Existing Chloride Data for Little Vermilion River Segment DR-01

Sample Location and Parameter	Illinois WQ Standard	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances
Chloride (mg/L)	500	1999 - 2011; 65	275	9,880	24	2
		2012*; 5	175	397	129	0

*Additional data collected in 2012 not published at the time of the Stage 1 TMDL report.

This page intentionally left blank

Figure 5-3
Chloride
Little Vermilion River Segment DR-01

This page intentionally left blank.

5.1.1.3 Fecal Coliform

Little Vermilion River segment DR-01 is listed for impairment caused by total fecal coliform. **Table 5-3** summarizes available historical fecal coliform data on this segment. The general use water quality standard for fecal coliform states that the standard of 200 colony forming units (cfu) per 100 milliliters (mL) shall not be exceeded by the geometric mean of at least five samples, nor can 10 percent of the samples collected exceed 400 cfu per 100 mL in protected waters, except as provided in 35 Ill. Adm. Code 302.209(b). Samples must be collected over a 30-day period or less during the months of May through October. More recent data were not available for fecal coliform on this segment at the time of Stage 1 report publication, and additional data collection was suggested to assess the segment's current compliance with the applicable fecal coliform standards. As a result, Illinois EPA collected additional samples for fecal coliform from this segment in 2015. Potential exceedances of the 200 cfu/100 mL geometric mean (based on single sample comparisons to the geometric mean standard due to data limitations) and 400 cfu/100 mL daily maximum standards occur regularly at DR-01 (9 and 8 times out of the 30 samples, respectively) from 1999 to 2015. Potential exceedances have occurred in both the historical data set (1999-2006) as well as the recently collected data (2015).

The summary of data presented in **Table 5-3** reflects single samples collected in May-October compared to the threshold values, for reference, during the appropriate months. **Figure 5-4** shows the total fecal coliform samples collected over time at segment DR-01.

Table 5-3 Existing Fecal Coliform Data for Little Vermilion River Segment DR-01

Sample Location and Parameter	Period of Record and Number of Data Points ⁽¹⁾	Geometric Mean of all samples	Maximum	Minimum	Number of samples > 200(1)	Number of samples > 400(1)
Total Fecal Coliform (cfu/100 mL)	1999-2015; 30	288	28,000	33	9	8

(1) Samples collected during the months of May through October

Figure 5-4
Fecal Coliform
Little Vermilion River Segment DR-01

This page intentionally left blank.

5.1.1.4 pH

Segment DR-01 of the Little Vermilion River is listed for impairment caused by pH. A sample is considered an exceedance if it is below 6.5 or above 9.0 s.u. at any time. A total of 89 samples have been collected since 1999 from the impaired segment, 3 of which were above the allowable range of pH (**Table 5-4**). All three exceedances of the standard reported in the DS-01 dataset were reported in 2002-2005 at levels above the maximum acceptable value of 9.0 s.u. (**Figure 5-5**). Recent pH data were not available for this segment at the time of the Stage 1 report's publication and additional data collection was recommended to confirm whether or not impairment still exists. Illinois EPA collected additional data in 2015 that did not include additional exceedances of the applicable standards and as a result, this segment has been recommended for delisting for impairment caused by pH.

Table 5-4 Existing pH Data for Little Vermilion River Segment DR-01

Sample Location and Parameter	Illinois WQ Standard	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances
pH (s.u.)	6.5 - 9.0	1999 - 2007; 80	8.3	11.4	7.4	3
		2015; 9	8.2	8.5	7.5	0

s.u. = standard units

This page intentionally left blank.

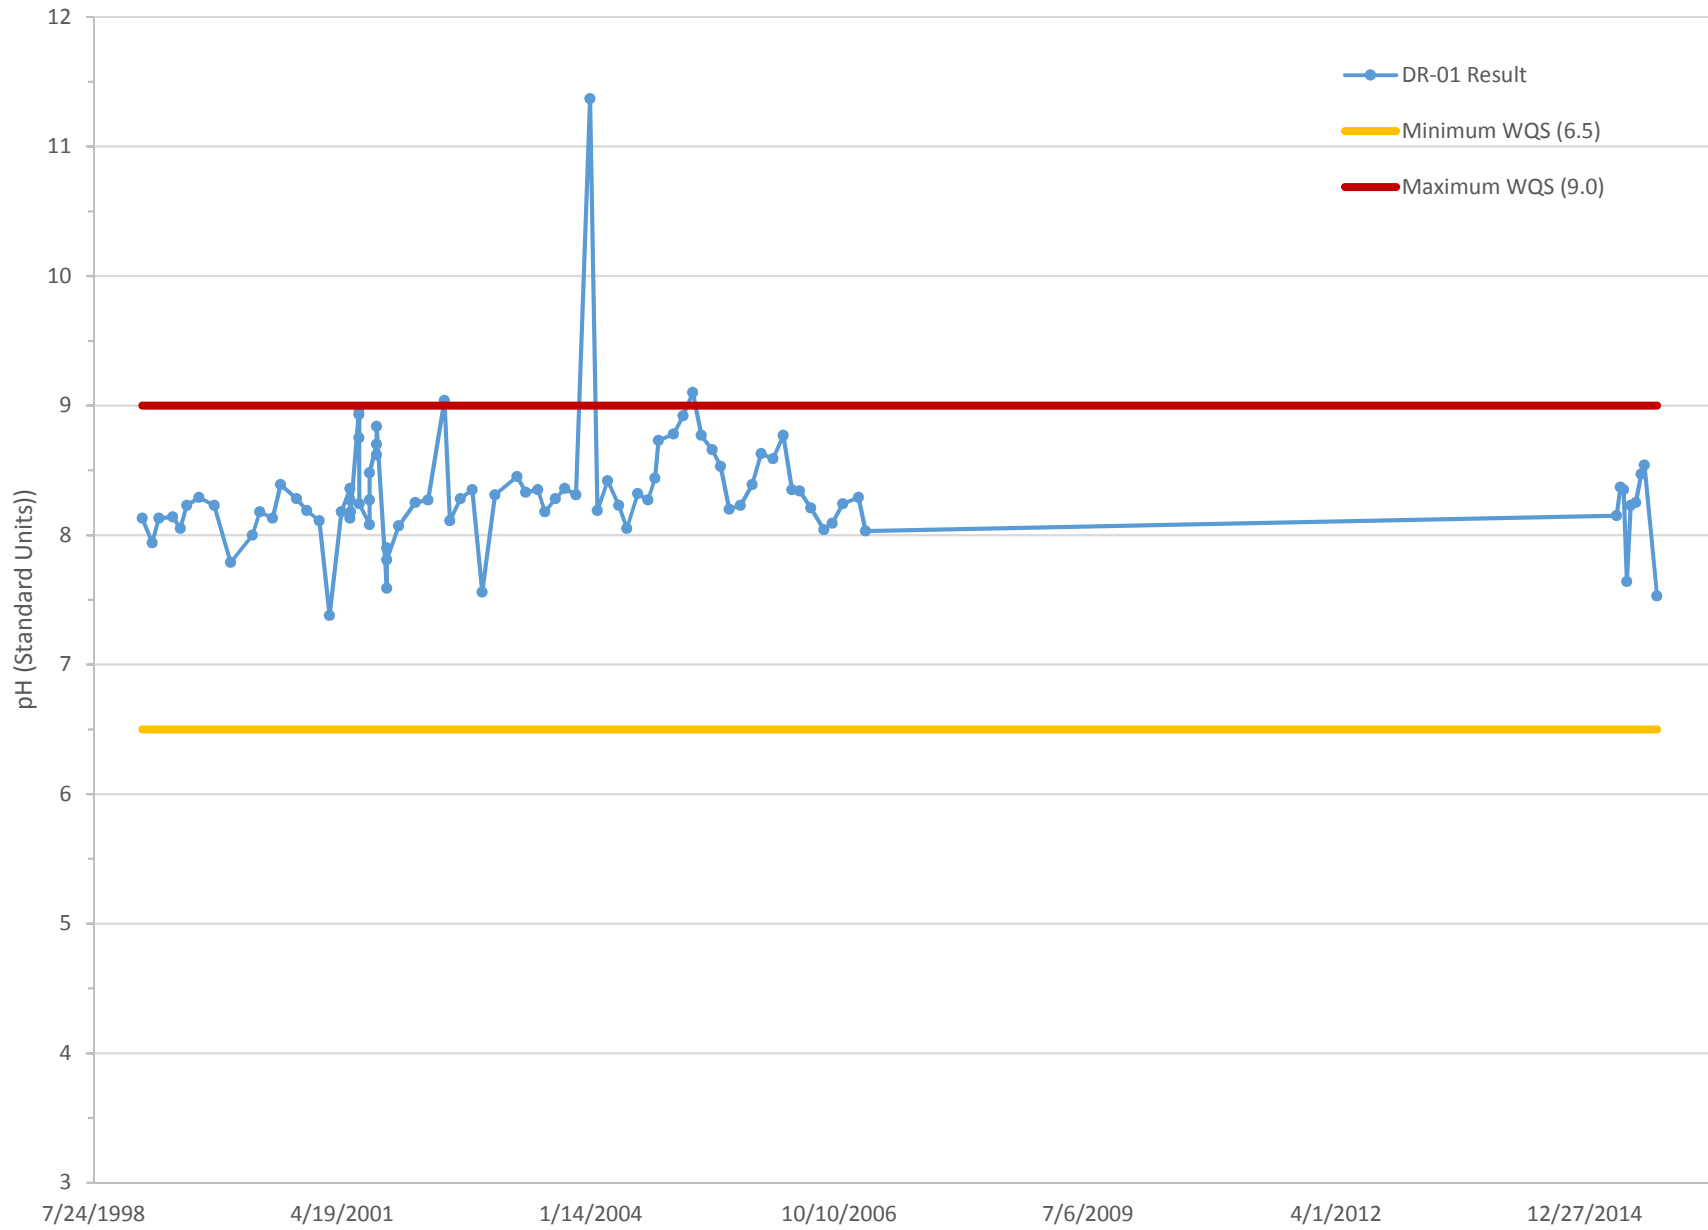

Figure 5-5

pH

Little Vermilion River Segment DR-01

This page intentionally left blank.

5.1.1.5 Dissolved Oxygen

Mendota Creek (segment DRD) is listed for impairment caused by low dissolved oxygen (DO) concentrations. The available dataset for this segment at the time of Stage 1 report development was limited and consisted of single samples collected at each of six stations along the reach that occurred during a single FRSS monitoring event conducted on August 3-4, 1988. As a result, a recommendation for additional data collection was included in the Stage 1 report to confirm whether or not impairment still exists. Illinois EPA subsequently collected nine additional DO measurements at one station on Mendota Creek (DRD-M-C2) in 2015.

The general use water quality standard for DO provides seasonal instantaneous minimum and minimum weekly (7-day) average concentrations for DO in streams. Due to the limited dataset, only the instantaneous minimum standards of 5.0 mg/L for March through July and 3.5 mg/L for August through February were used to identify exceedances of the standard in this section of the report. A single exceedance of the seasonal minimum DO standard applicable to the sample collection period (3.5 mg/L) was reported at one of the six sampling locations (DRD-M-A1) on August 3, 1988 **Table 5-5**. This sampling station is located approximately 0.7 miles upstream of the confluence of Mendota Creek and the Little Vermilion River. No additional exceedances were reported for the other monitoring locations on this stream segment **Figure 5-6**. Additional measurements collected as part of the Stage 2 effort in 2015 did not result in additional exceedances being reported. As a result, this segment is recommended for delisting for impairment caused by low DO.

Table 5-5 Existing DO Data for Mendota Creek Segment DRD

Sample Location and Parameter	Illinois WQ Standard	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances
Dissolved Oxygen (mg/L)	5.0 ⁽¹⁾ , 3.5 ⁽²⁾	1988; 6	5.9	9.6	2.4	1
		2015; 9	10.3	12.7	8.2	0

(2) Instantaneous Minimum August-February

This page intentionally left blank.

Figure 5-6
Dissolved Oxygen
Mendota Creek (DRD)

This page intentionally left blank.

5.1.1.6 Total Phosphorus

Little Vermilion River Segment DR-01 and Mendota Creek (DRD) are both listed for impairment caused by total phosphorus. The current water quality standards for instream phosphorus are narrative in nature and do not include any state-wide numerical target concentrations. Illinois EPA has developed a watershed-specific LRS target value for total phosphorus in streams of the Little Vermilion River watershed of 0.289 mg/L. The available total phosphorus data for these segments are presented in **Table 5-6** below. Graphical comparison of the available total phosphorus datasets relative to the LRS target value is also provided for the Little Vermilion River (DR-01) and Mendota Creek (DRD) in **Figures 5-7** and **5-8**, respectively.

Exceedances of the LRS target value occur in three of 63 total samples collected from the Little Vermilion River (DR-01), all of which occurred between 2002 and 2006. Exceedances of the LRS target value were more common in Mendota Creek, with 21 exceedances out of 26 total samples evenly distributed across the entire period of record. Mean total phosphorus concentrations in Mendota Creek are more than five times greater than the LRS target value.

Table 5-6 Existing Total Phosphorus Data for Little Vermilion River

Sample Location and Parameter	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Exceedances of the LRS Target Value
Little Vermilion River DR-01; Sample Location DR-01					
Phosphorus, Total (mg/L)	1999-2012; 63	0.152	0.870	0.010	3
Mendota Creek DRD; Sample Locations DRD-M-A1, DRD-M-C1, DRD-M-C2, DRD-OC-A1, DRD-OC-C1, DRD-OC-C2					
Phosphorus, Total (mg/L)	1998-2015; 26	1.693	6.78	0.071	21

This page intentionally left blank.

This page intentionally left blank.

Figure 5-8
Total Phosphorus
Mendota Creek Segment DR-01

This page intentionally left blank.

5.1.1.7 TSS

Segment DR-01 of the Little Vermilion River is listed for impairment caused by TSS. The applicable water quality standard for TSS in streams is narrative in nature and does not include any state-wide numerical target concentrations. Illinois EPA has developed a watershed-specific LRS target value for TSS in streams of the Little Vermilion River watershed of 25.3 mg/L. A total of 71 samples have been collected since 1999 from the impaired segment, 24 of which were reported at concentrations greater than the LRS target value (**Table 5-7**). Exceedances have been reported at relatively regular intervals across the entire period of record, although the most recent data suggest some improvement in conditions may have occurred over the past 10 years **Figure 5-9**. Additional data collection could be valuable for confirming any potential trends in TSS concentrations over time.

Table 5-7 Existing TSS Data for the Little Vermilion River Segment DR-01

Sample Location and Parameter	LRS Target Value	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances
TSS (mg/L)	25.3	1999-2012; 71	35.7	571	1.0	24

This page intentionally left blank.

Figure 5-9

TSS

Little Vermilion River Segment DR-01

5.2 Point Sources

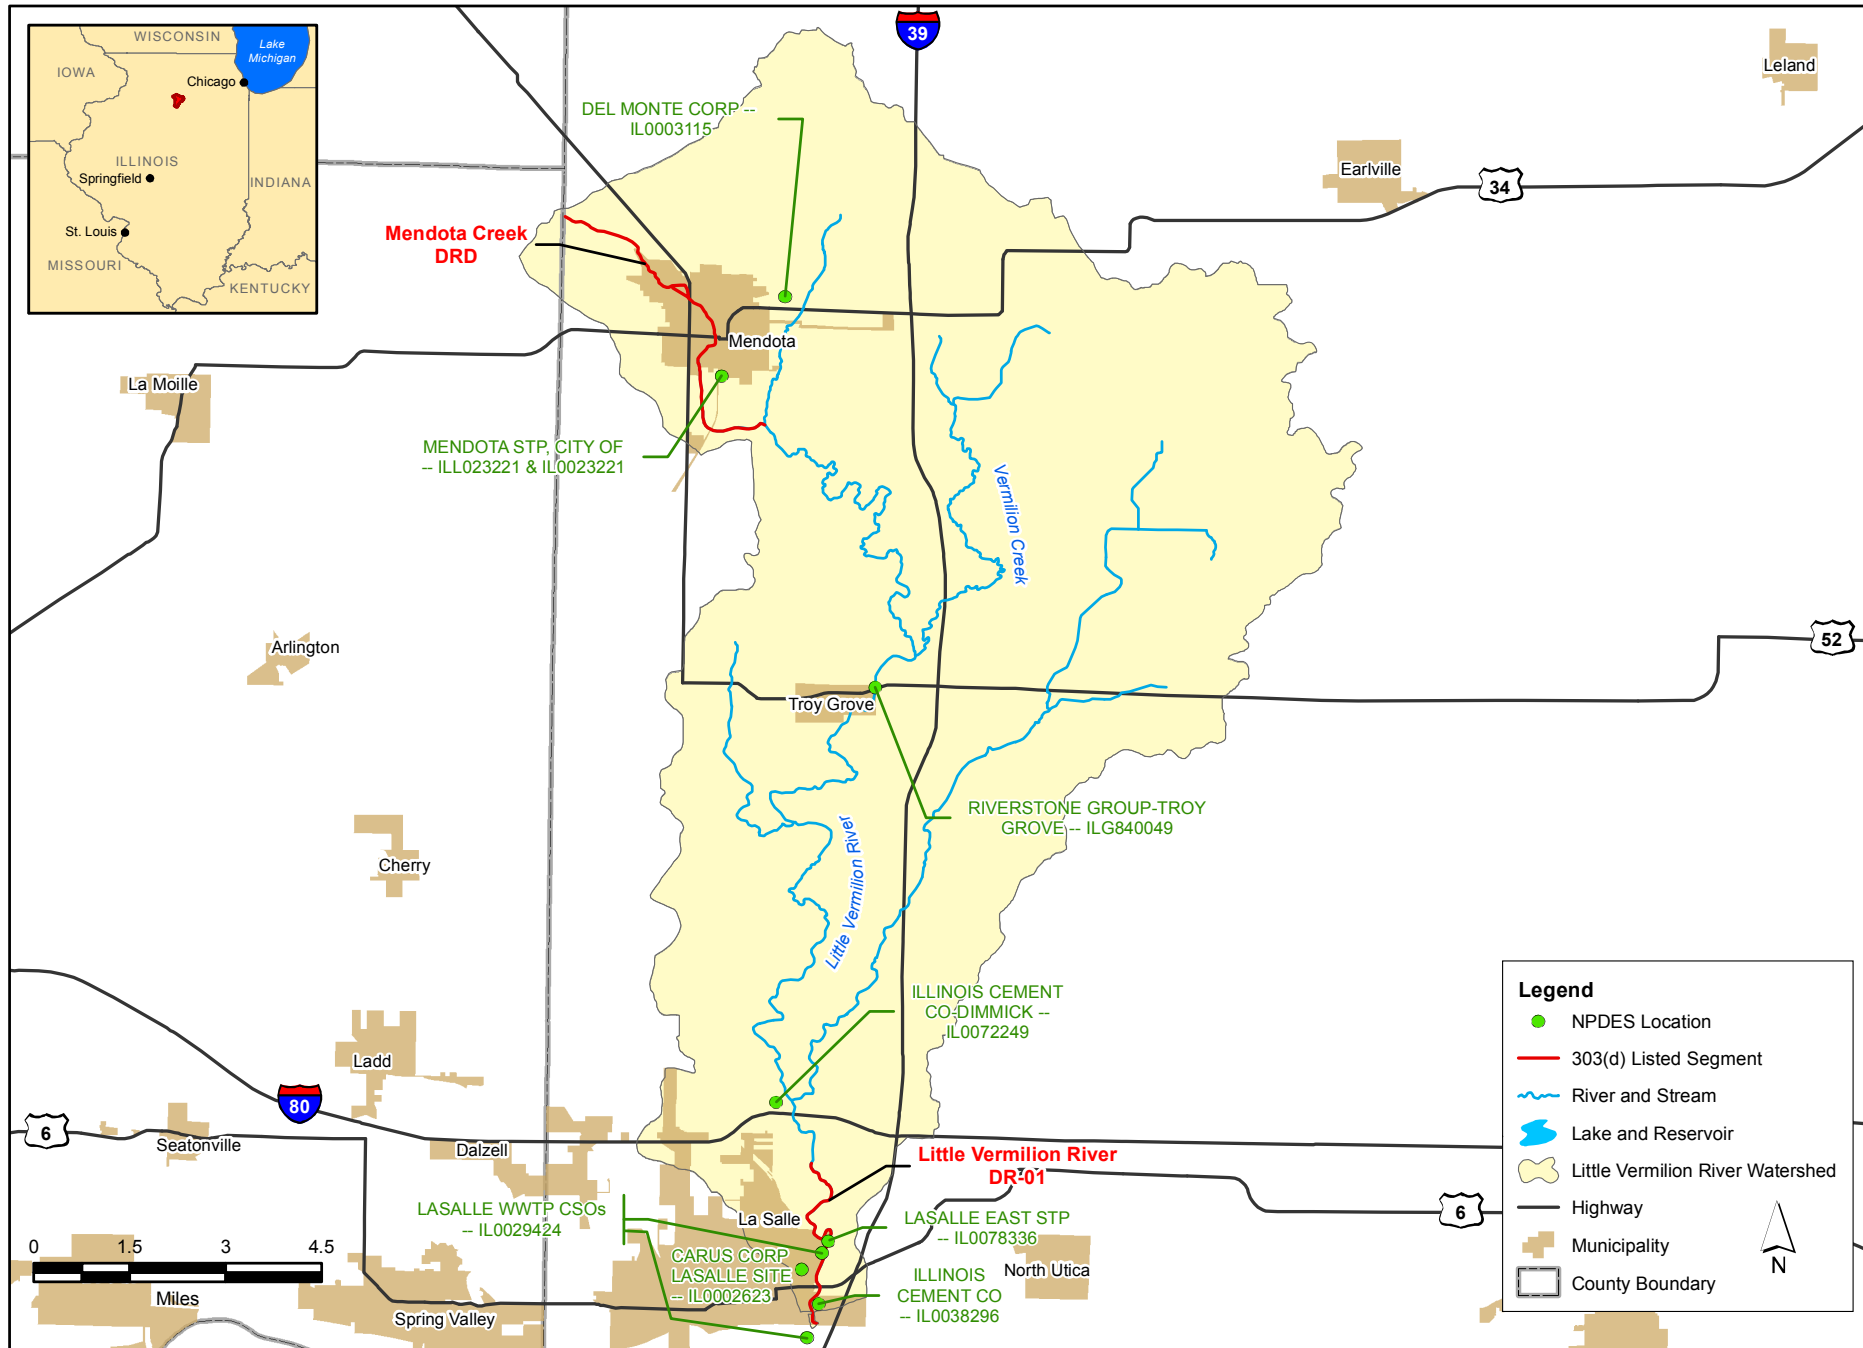

There are eight NPDES permitted point sources that discharge to waterbodies within the Little Vermilion River (LaSalle County) watershed. **Table 5-8** contains permit information for these point sources while **Figure 5-10** shows the locations of outfalls for each facility. Facilities discharging treated domestic wastewater have the potential to affect dissolved oxygen concentrations (through the discharge of nutrients and other oxygen-demanding materials) and fecal coliform counts in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain metals, but industry is typically less likely to impact nutrient concentrations and fecal coliform counts. Permit limits and discharge monitoring reports were analyzed and further detailed as applicable during Stage 3 TMDL development (see Sections 7 and 8).

In addition, a number of general no-discharge/stormwater NPDES permits exist within the watershed. Stormwater discharges can contribute sediment loads to receiving waters during high precipitation events. There are currently no municipal separate storm sewer system (MS4) permits applicable to this watershed. The 2016 303(d) list identified combined sewer overflows (CSOs) and sanitary sewer overflows (SSOs) as potential pollutant sources. The LaSalle South Wastewater Treatment Plant (WWTP) has three CSOs, of which two have historically discharged above the water quality monitoring station on the impaired segment of the Little Vermilion River. CSOs occur during high flow events when treatment capacity is exceeded and can discharge untreated or partially treated human and industrial waste, debris and stormwater to receiving waters. It should be noted that the main outfall for new LaSalle South WWTP discharges to the Illinois River downstream of this watershed, however, through public comment it was noted that an old/abandoned sewer line runs under the Matthiessen and Hegeler Zinc Company Site. Local stakeholders indicated this could be a potential source for fecal coliform.

Table 5-8 Permitted Facilities Discharging to or Upstream of Impaired Segments in the Little Vermilion River (LaSalle County) Watershed

5.3 Nonpoint Sources

There are many potential nonpoint sources of pollutant loading to the impaired segments in the Little Vermilion River (LaSalle County) watershed. This section will discuss site-specific cropping practices, animal operations, and area septic systems. These are important nonpoint sources to consider in TMDL development because of their potential to contribute sediments and metals through soil loss and erosion, nutrients through fertilization, nutrients and bacteria through failing septic systems, and bacteria from wildlife and manure to area waterbodies. Data were collected when available through communications with the local NRCS, Illinois Soil and Water Conservation Districts, and public health departments.

5.3.1 Crop Information

Approximately 78 percent of the land within the Little Vermilion River (LaSalle County) watershed is devoted to agriculture. Corn and soybean farming account for 40 and 37 percent of the agricultural land in the watershed area, respectively.

Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. Each tillage practice leaves varying levels of crop residue after planting (see detailed discussion in Section 9). Tillage practices directly relate to water quality through their effects on soil loss. Soil can be an instream pollutant (sedimentation/siltation and TSS) and can also carry pollutants (metals, nutrients, et al) to receiving waters.

The percentage of each tillage practice for corn, soybeans, and small grains are generated by county in the Illinois Soil Conservation Transect Surveys conducted by the Illinois Department of Agriculture. Data specific to the Little Vermilion River (LaSalle County) watershed were not available; however, data from the 2013 survey for the entirety of LaSalle County are presented in the following **Table 5-9**.

Table 5-9 Tillage Practices in LaSalle County

Tillage System	Corn	Soybean
Conventional	77%	23%
Reduced - Till	8%	19%
Mulch - Till	4%	7%
No - Till	11%	51%

According to officials from the LaSalle County NRCS office, the use of drain tiling is widespread and dates back to the 1860s. NRCS officials estimated that all farms in the county have some sort of drain tile installed. Tile drainage can exacerbate runoff making storm events more intense instream leading to increased streambank erosion. Tile drains can also allow bacteria to grow or enter waterbodies more quickly and can be a path for increased dissolved nutrient loss from fields. Without more precise local information, soils data may be reviewed for information on hydrologic soil group in order to provide a basis for the drain tile estimates.

5.3.2 Animal Operations

Information on commercial animal operations is available from the NASS. Data for LaSalle County, Illinois, are presented in the following **Table 5-10**. Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals have the potential to increase erosion and contribute fecal coliform through manure. Attempts were made to determine or estimate watershed-specific information regarding animal operations located near impaired waters and/or manure spreading practices throughout the Little Vermilion River (LaSalle County) watershed. The table below represents the best information available. Public comments indicated that herd grazing does occur in the watershed and could be a contributor to fecal coliform (through manure) and TSS (through over-grazing and streambank erosion).

Table 5-10 LaSalle County Animal Population (2007 & 2013 Census of Agriculture)

	2007	2013	Percent Change
Cattle and calves	19,123	12,497	-35%
Beef	7,330	3,580	-51%
Dairy	87	8	-91%
Hogs and Pigs	13,079	2,224	-83%
Poultry	3,767	5,772	53%
Sheep and Lambs	1,745	1,450	-17%
Horses and Ponies	813	1,099	35%

5.3.3 Septic Systems

Approximately 6 percent of the Little Vermilion River (LaSalle County) watershed consists of developed or urbanized land, primarily in and around the cities of Mendota and LaSalle. A majority of businesses, residences, and other structures in the developed areas are served by a municipal sewer district and septic systems are uncommon in these areas. The remainder of the watershed is rural and primarily devoted to agricultural purposes.

Many households in rural areas of Illinois that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. There are many types of septic systems, but the most common septic system is composed of a septic tank draining to a septic field, where nutrient removal occurs. However, the degree of nutrient removal is limited by the types of soils and system upkeep and maintenance.

Throughout the U.S., septic systems have been found to be a significant source of phosphorus pollution. Failing or leaking septic systems contribute to fecal coliform pollution, although animal waste, urban runoff, and permitted point sources can also contribute.

Information on the extent of sewerred and non-sewerred municipalities in the Little Vermilion River (LaSalle County) watershed was obtained from the LaSalle County Department of Health. County health officials reported that residents of the largest municipalities in the watershed (Mendota and LaSalle) generally were on public sewer systems, while residents in the rural parts of the county used private septic systems. Section 2.5 indicated that approximately 14,600 people reside in the Little Vermilion River watershed and about 7,200 of those reside in Mendota. A portion of the city of La Salle is also located in the southern edge of the watershed. Based on

Figure 1-1, the portion of La Salle within the watershed appears to be less than the size of Mendota, and is estimated to be one-half of the Mendota population (therefore, approximately 3,600). It was noted during the public comment period that the community of Troy Grove is not served by sewer. Based on these assumptions, up to 3,800 people remain that may be served by private septic systems. If a typical household is assumed to consist of four people, an estimated 950 households rely on septic systems to treat waste in this watershed.

5.3.4 Historical Smelting Operations

Although the Matthiessen and Hegeler Zinc Company Site has been identified as the primary contributor of zinc within the watershed, potential nonpoint sources of zinc include runoff from historical smelting operations. For example, the June 2012 Remedial Investigation Report for the Matthiessen and Hegeler Zinc Company Site, LaSalle, Illinois (prepared by Geosyntec and SulTRAC) indicates that there is a partially submerged slag pile in the area which contains zinc compounds that leach to groundwater, surface runoff, and stream water and sediment. Additional sources of metals may be from naturally-occurring high background levels of some metals in soils which can then migrate to surface water through overland runoff, soil erosion, and groundwater.

5.3.5 Urban Nonpoint Sources

Although much of the Little Vermilion River (LaSalle County) watershed is rural, the land use contributing directly to segment DR-01 is developed within the City of LaSalle. LaSalle does not have a MS4 permit so urban stormwater from the city is considered nonpoint source. The nonpoint source urban stormwater can contribute sediment and chloride (associated with road salting during winter months) to area waterbodies.

5.4 Watershed Studies and Other Watershed Information

The extent of previous planning efforts within the Little Vermilion River (LaSalle County) watershed is currently unknown. A wide range of additional environmental data have been collected in the watershed in relation to the CERCLA investigations conducted by USEPA, Geosyntec, SulTRAC, and the Carus Corporation as part of the Final Remedial Investigation report for the Matthiessen and Hegeler Zinc Company Site (USEPA 2012). Previously published data from this report have been incorporated into the TMDL development process.

Additional data sources known to exist for this watershed include sampling and field work conducted by the Illinois Valley Community College Chemistry Club (IVCC Chem Club) (<http://www.ivcc.edu/chemclub>). While it may not be possible to incorporate this data directly into the TMDL development process, information from this and other sources may be beneficial for future watershed and BMP planning efforts.

This page intentionally left blank.

Section 6

Approach to Developing TMDLs and Identification of Data Needs

Illinois EPA is currently developing TMDLs for pollutants that have numeric water quality standards. Pollutants without numeric water quality standards are addressed through the development of an LRS at this time. Of the pollutants causing impairment to stream segments in the Little Vermilion River (LaSalle County) watershed, chloride, zinc, pH, fecal coliform, and DO are all of the parameters with numeric water quality standards. Impairments caused by TSS and total phosphorus in streams are based on narrative standards. Refer to **Table 1-1** for a full list of potential causes of impairment. Illinois EPA believes that addressing the parameters with numeric standards through TMDLs should lead to an overall improvement in water quality due to the interrelated nature of the other listed pollutants. Recommended technical approaches for developing TMDLs and LRSs are presented in this section. Additional data needs are also discussed.

6.1 Simple and Detailed Approaches for Developing TMDLs

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass-balance, load-duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches. Therefore, these are the analyses recommended for the Little Vermilion River (LaSalle County) watershed. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL. As discussed above, this link can be established through a variety of techniques. The objective of the remainder of this section is to recommend approaches for establishing these links for the constituents of concern in the Little Vermilion River (LaSalle County) watershed.

6.2 Additional Data Needs for TMDL and LRS Development in the Little Vermilion River (LaSalle County) Watershed

Table 6-1 contains summary information regarding data availability for all impairments addressed by TMDLs in the Little Vermilion River (LaSalle County) watershed.

Although there are a reasonable number of fecal coliform sample data points available for the Little Vermilion River to support TMDL calculation, the segment was last sampled for fecal coliform in 2006. In order to better assess the current fecal coliform concentration, additional sample collection was recommended and subsequently performed in 2015, prior to development of this Stage 3 report. Sample collection at various times of year and over a range of flow conditions is most beneficial for assessing the entire range of conditions that may occur within the river and provides for a more accurate depiction of potential factors influencing the fecal coliform impairments in the Little Vermilion River.

Table 6-1 Data Availability and Data Needs for TMDL Development in the Little Vermilion River (LaSalle County) Watershed

Waterbody Name	Impairment Parameter	Period of Record	Data Count	Additional Data Needs
Little Vermilion River (DR-01)	Fecal Coliform	1999-2006	26	Additional fecal coliform data collection was recommended to assess current condition and was performed as part of Stage 2 efforts
		2015	4 ¹	
	Chloride	1999 - 2012	70	Recent data do not suggest impairment; additional data collected during months when road de-icing occurs may be valuable to confirm that impairment still exists
	Zinc	1999 - 2009	65	None
	pH	1999 - 2007	80	Additional pH data collection was recommended to assess current condition and was performed as part of Stage 2 efforts
2015		9		
Mendota Creek (DRD)	Dissolved Oxygen	1988	6	Additional DO data collection was recommended to assess current condition and was performed as part of Stage 2 efforts
		2015	9	

¹ Note that 5 samples were collected but one was disqualified by an error at the laboratory

The available datasets for chloride, zinc, and pH on the Little Vermilion River are generally sufficient for basic TMDL calculations and model development. Prior to completion of the Stage 2 effort, the latest pH data available was collected in 2007, and the last reported exceedance occurred in 2005. Additional pH data collection was recommended in Stage 1 and performed in 2015 prior to development of this Stage 3 report. The 2015 data did not include any exceedances and this segment is recommended for removal from the 303(d) list for this impairment.

At the time of Stage 1 reporting, the available dataset for chloride was very limited in recent years with only three samples collected since 2006. Few exceedances for chloride in the Little Vermilion River existed in the initial dataset, suggesting that further data collection was necessary to determine if the segment is currently in compliance with the applicable chloride standards and if it may be a candidate for delisting. Additional data were collected in 2012 but were not publicly available at the time of the Stage 1 TMDL report’s publication. These data have since been published and are included in this Stage 3 report. The majority of chloride data collected in 2012 were not collected in winter months. Because chloride concentrations can spike in response to road salting, a TMDL was completed in Stage 3 (Sections 7 and 8).

At the time of Stage 1 report publication (2014), the available DO and total phosphorus dataset for Mendota Creek consisted of only six measurements for each parameter collected on a single date in 1988 (August 3) and was not sufficient to support TMDL development. Further data collection was recommended for verification of impairment and, if needed, for development of a water quality model for Mendota Creek. Additional data collection was performed by Illinois EPA in 2015 as part of the Stage 2 effort and is included in this report (Refer to Appendix C). The available total phosphorus and TSS datasets for the impaired segments are sufficient for LRS development. None of the more recently collected dissolved oxygen data indicate that impairment

caused by low DO is ongoing in Mendota Creek, and this segment is recommended for removal from the 303(d) list for this impairment.

6.3 Approaches for Developing TMDLs and LRSs in Little Vermilion River (LaSalle County) Watershed

6.3.1 Recommended Approach for Metals, Fecal Coliform, and Chloride TMDLs in the Little Vermilion River

The recommended approach for developing TMDLs for these segments and parameters is the load-duration curve method. The load-duration methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a waterbody.

6.3.2 Recommended Approach for TSS and Total Phosphorus LRS Development

Illinois EPA developed a watershed-specific target to address impairment caused by total phosphorus in the Little Vermilion River and Mendota Creek and by TSS in the Little Vermilion River. These reduction goals are included in the Stage 3 TMDL/LRS report. The load duration curve method is recommended for TSS and TP LRSs using the watershed-specific targets to calculate allowable loads. Potential sources of TSS and total phosphorus have been identified as agriculture, livestock, and urban runoff in the watershed. The implementation plan presented in Section 9 includes BMPs to address these sources.

Section 7

Methodology Development for the Little Vermilion River (LaSalle County) Watershed

7.1 Methodology Overview

Table 7-1 contains information on the methodologies selected and used to develop TMDLs and LRSs for impaired waterbodies within the Little Vermilion River (LaSalle County) watershed. Segment DR-01 of the Little Vermilion River and segment DRD of Mendota Creek are recommended for removal from 303(d) list for pH and DO, respectively, based on a review of the historical datasets as well as additional data collected in 2015 as part of Stage 2 of the TMDL development process.

Table 7-1 Methodologies Used to Develop TMDLs in the Little Vermilion River (LaSalle County) Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Assessment Type	Methodology
DR-01	Little Vermilion River	Zinc	TMDL	Load Duration Curve
		Chloride	TMDL	Load Duration Curve
		Fecal Coliform	TMDL	Load Duration Curve
		pH *	No TMDL Developed	No longer impaired – recommended for delisting
		Total Suspended Solids (TSS)	LRS	Load Duration Curve
		Phosphorus (Total)	LRS	Load Duration Curve
DRD	Mendota Creek	Dissolved Oxygen *	No TMDL Developed	No longer impaired – recommended for delisting
		Phosphorus (Total)	LRS	Load Duration Curve

*Parameters recommended for removal from the 303(d) list based on historical data review, changes to applicable water quality standards, or recent data that no longer show water quality impairment

7.1.1 Load-Duration Curve Overview

Loading capacity analyses were performed for stream impairments caused by zinc, chloride, fecal coliform, TSS, and total phosphorus through the development of a series of load-duration curves. A load-duration curve is a graphical representation of the maximum load of a pollutant that a stream segment can assimilate over a range of flow scenarios while still meeting the instream water quality standard. The load-duration curve approach utilizes historical flow data and observed water quality data to assess the magnitude and frequency of exceedances as well as to determine the flow scenarios when exceedances occur most.

7.2 Methodology Development

The following sections further discuss and describe the methodologies utilized to examine zinc, chloride, TSS, dissolved oxygen, and total phosphorus concentrations in the impaired stream segments of the Little Vermilion River (LaSalle County) watershed.

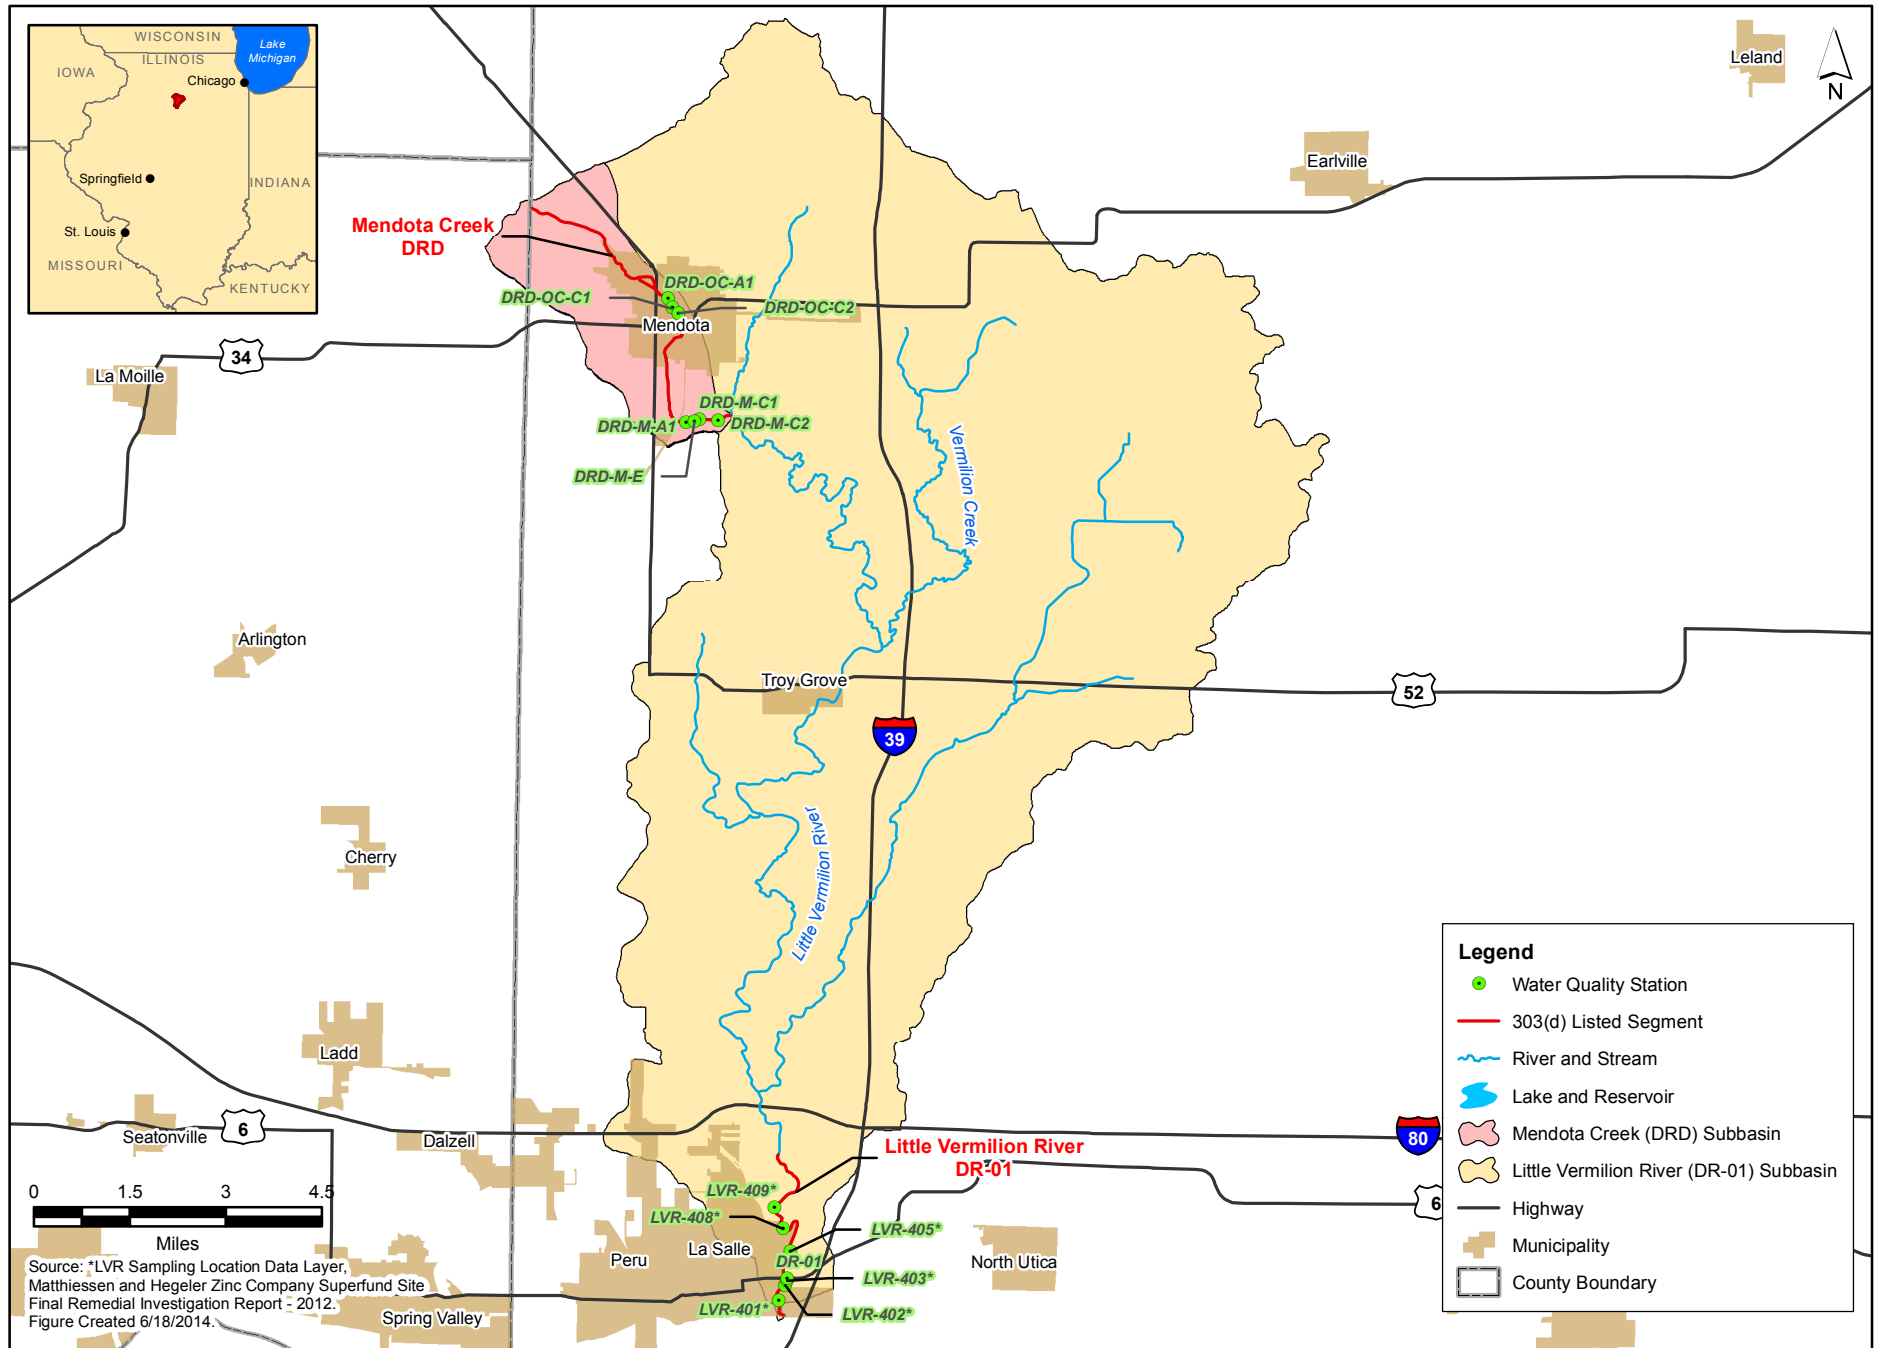

7.2.1 Load Duration Curve Development

Load duration curves are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. This approach was used to characterize the current loading of zinc, chloride, fecal coliform, TSS, and total phosphorus to impaired segment of the Little Vermilion River (DR-01) and total phosphorus in Mendota Creek (DRD).

7.2.1.1 Watershed Delineation and Flow Estimation

Watersheds for the areas contributing directly to the impaired stream segments were delineated using GIS analyses of data layers provided in the NED. The watershed delineation shows that segment DR-01 captures flows from a directly contributing watershed of approximately 126 square miles while Mendota Creek (DRD) captures flows from a directly contributing watershed of 7.4 square miles. **Figure 7-1** shows the location of the water quality stations on each segment as well as the boundary of the GIS-delineated watersheds.

Flow data corresponding to each water quality sample is required for development of a load duration curve. No active USGS stream gages currently exist in the Little Vermilion River (LaSalle County) watershed; therefore, as discussed in Section 2.6.3 of this report, a surrogate gage was selected for use in estimating flows in the Little Vermilion River (LaSalle County) watershed. USGS gage 5439000 South Branch Kishwaukee River at Dekalb, Illinois was selected as a surrogate gage for this watershed. This gage is located approximately 27 miles northeast of the Little Vermilion River (LaSalle County) watershed in a basin of similar size and with similar land-use characteristics and was also chosen because it has no point source discharges upstream of the gage location. The period of record for flow measurements at this gage extends from 1925 through the present with average monthly flows ranging from 22 cfs in October to 110 cfs in March. The drainage area to this gage is approximately 78 square miles. Data from this gage were used to estimate flow values at all locations in the Little Vermilion River (LaSalle County) watershed using the drainage area ratio method represented by the following equation:

**Little Vermilion River
Water Quality Stations and Subbasin Delineation**

FIGURE 7-1

This page intentionally left blank.

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where Q_{gaged}	=	Streamflow of the gaged basin
Q_{ungaged}	=	Streamflow of the ungaged basin
$\text{Area}_{\text{gaged}}$	=	Area of the gaged basin
$\text{Area}_{\text{ungaged}}$	=	Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Data downloaded through the USGS for the surrogate gage for the available period of record were adjusted to account for point source influence in the watershed upstream of the gaging station. Average daily flows from all NPDES permitted facilities upstream of the surrogate USGS gages are typically subtracted from the gaged flow prior to flow-per unit-area calculations; however, in this case no permitted point sources exist upstream of the surrogate gage. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Little Vermilion River (LaSalle County) watershed were then added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment.

7.2.1.2 Zinc in Little Vermilion River Segment DR-01

A load duration curve for zinc in impaired segment DR-01 was generated by ranking the estimated daily flow data generated through the area ratio method discussed above, determining the percent of days these flows were exceeded, and then graphically plotting the results. The flows in the duration curve were then multiplied by the lowest calculated chronic water quality standard to generate a load duration curve. Water quality standards for zinc that have been established to protect the aquatic life include both chronic and acute standards that are calculated based on the existing total hardness concentration in stream at the time of sampling. As a conservative measure, the allowable load calculations for this TMDL are based on the lowest calculated chronic water quality standard in the available dataset for segment DR-01 of 60.7 µg/L (calculated using the lowest reported in-stream hardness of 219 mg/L).

Water quality data collected during Stage 1 of TMDL development from USEPA STORET and Illinois EPA databases, as well as those made available by USEPA from the Matthiessen and Hegeler Zinc Company Site Remedial Investigation Report, were paired with the corresponding flow for the sampling dates and plotted against the allowable load duration curves. **Figure 7-2** shows the load duration curve developed for zinc in segment DR-01. The load duration curve is depicted as a solid line and the historically observed pollutant loads for zinc as points on each graph.

This page intentionally left blank.

Figure 7-2
 Little Vermilion River DR-01
 Zinc Load Duration Curve

This page intentionally left blank.

A relatively robust dataset exists for zinc for this segment, largely as a result of ongoing remediation efforts associated with the Matthiessen and Hegeler Zinc Company Superfund Site located on the west bank of the Little Vermilion River. The load duration curve constructed shows that, based on the lowest calculated chronic standard, potential exceedances for zinc occur for the majority of samples collected under all flow conditions. While the load duration chart uses a conservative estimate of the chronic standard, the results correspond well with the high proportion of exceedances of the chronic standards calculated for each individual sample (53 of 65 samples collected since 1999 exceed the corresponding chronic standard).

The Spreadsheet used for the calculation of the load duration curve for zinc at DR-01 is provided in Appendix D.

7.2.1.3 Chloride in Little Vermilion River Segment DR-01

A load duration curve was developed for chloride in segment DR-01 by determining the percent of days each estimated flow was exceeded, and then multiplying the estimated flows by the water quality standard of 500 mg/L to generate a load duration curve. Chloride data compiled during Stage 1 of TMDL development were supplemented with additional data collected or published since 2013. All available data were then paired with the corresponding flows for the sampling dates and plotted against the flow duration curve **Figure 7-3**.

Two of the 65 samples collected on this segment have exceeded the water quality standard for chloride at segment DR-01. Exceedances occurred under dry conditions in both 2003 and 2005. Of the two reported exceedances, the one reported in 2003 appears to be an anomalously high concentration of 9,880 mg/L that is more than 18 times the second highest concentration, and only other exceedance, reported in the segment of 532 mg/L in 2005. No exceedances were reported in samples collected from 2005-2015. As discussed in Section 6, the majority of chloride data collected in 2012 were not collected in winter months. Because chloride concentrations can spike in response to road salting, a TMDL was completed to provide load capacity information. Appendix D contains the spreadsheet used for the calculation of the load duration curve for chloride at segment DR-01.

This page intentionally left blank.

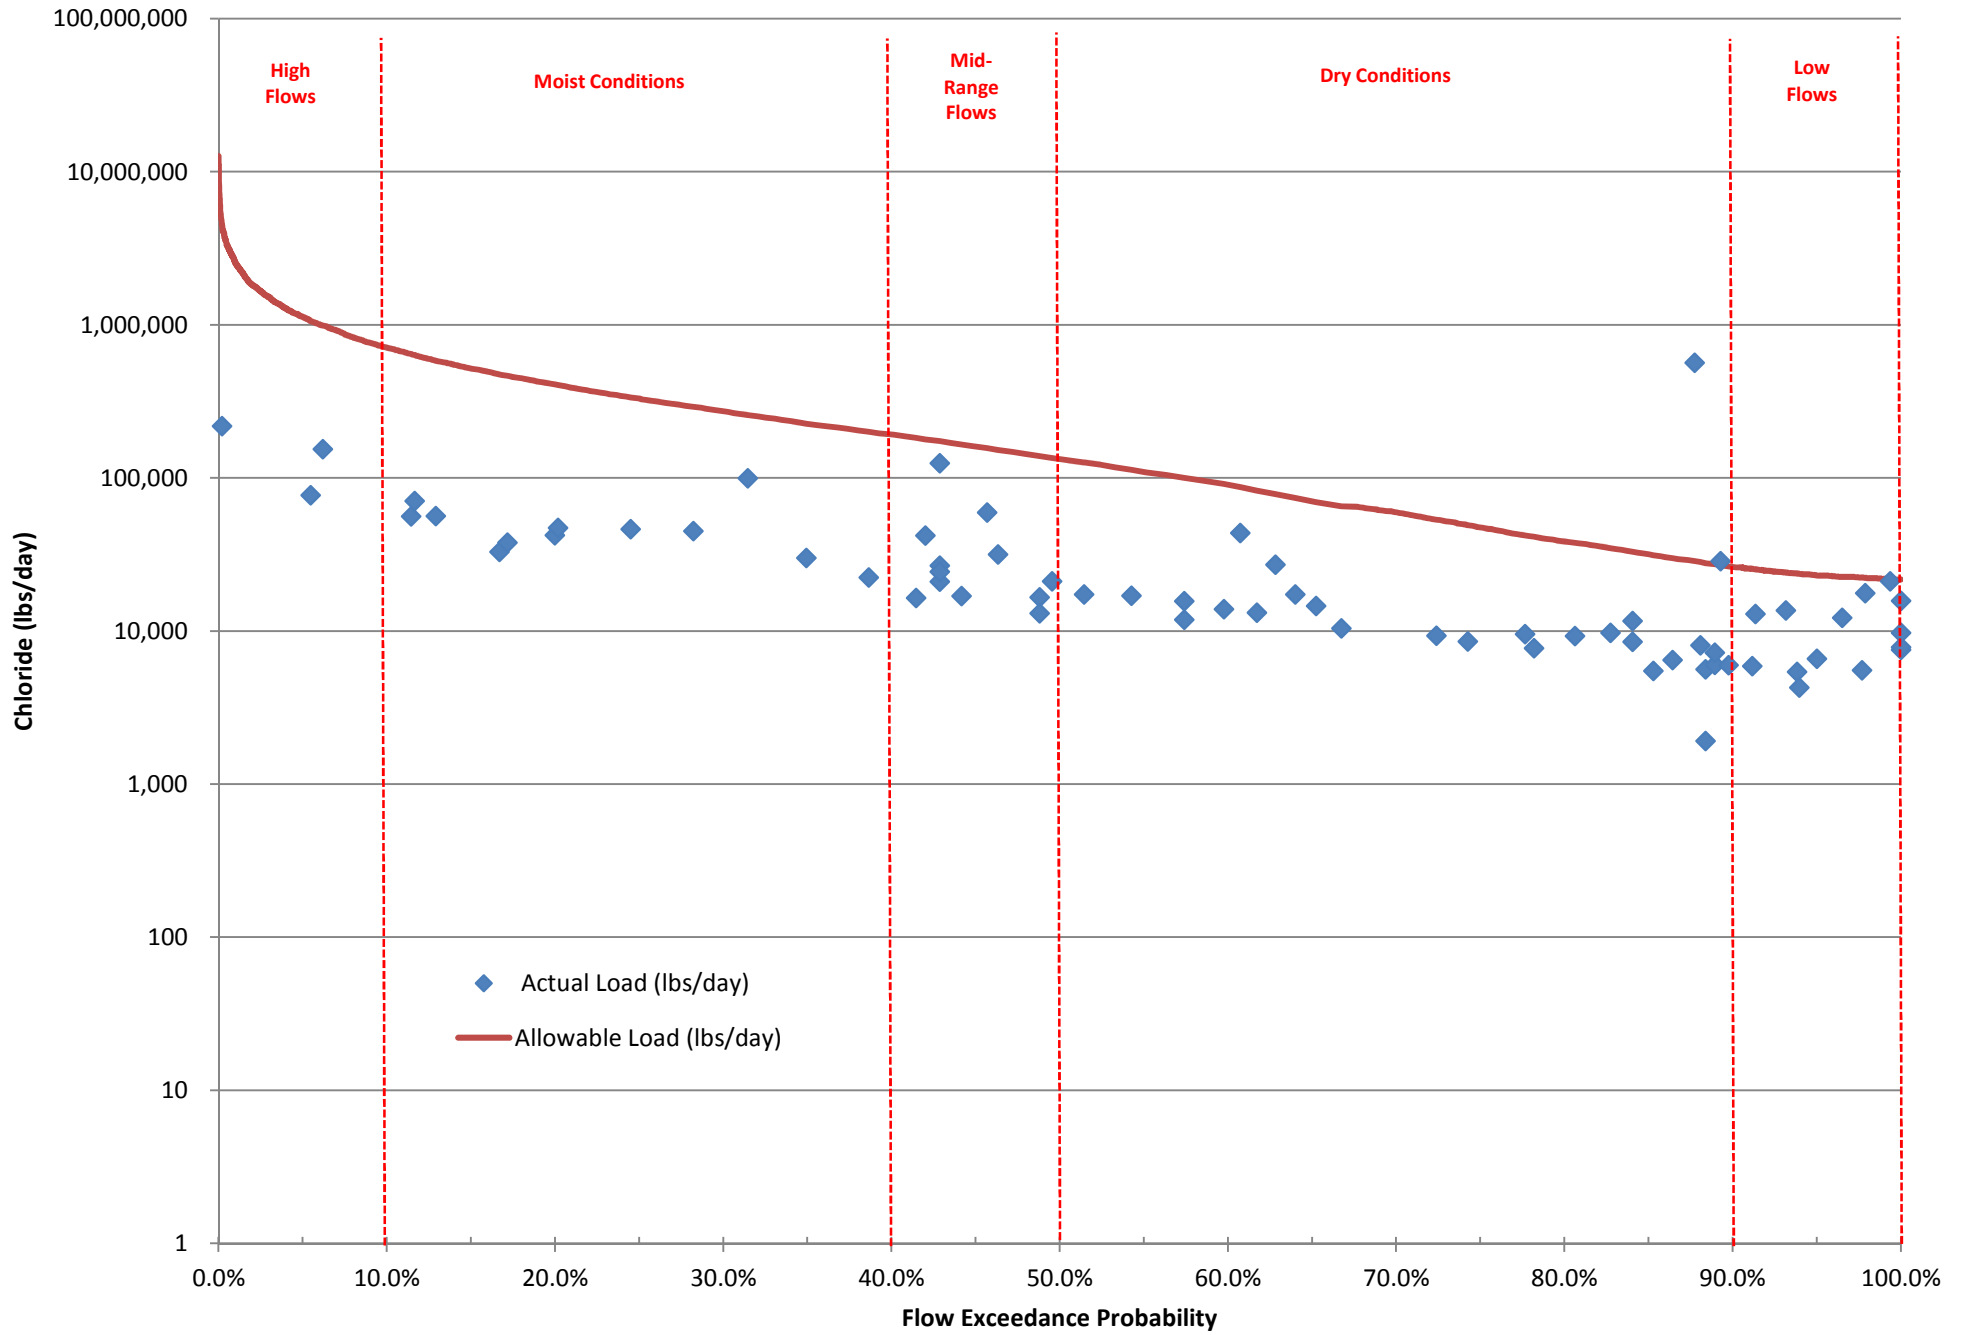

Figure 7-3
 Little Vermilion River DR-01
 Chloride Load Duration Curve

This page intentionally left blank.

7.2.1.4 Fecal Coliform in Little Vermilion River Segment DR-01

A load duration curve for fecal coliform in Little Vermilion River segment DR-01 was developed by determining the percent of days each estimated flow was exceeded, and then graphically plotting the results. Because the fecal coliform standard is seasonal and is applicable between the months of May and October, only flows recorded during this time period were used in the analysis. The flows in the duration curve were then multiplied by the chronic water quality standard of 200 cfu/100mL to generate a load duration curve. Fecal coliform data collected between May and October were compiled from data amassed during Stage 1 of TMDL development and additional data collected as part of a Stage 2 data collection effort performed by Illinois EPA in 2015. These data were then paired with the corresponding flows for the sampling dates and plotted against the load duration curve **Figure 7-4**.

Nine of the 30 fecal coliform samples collected in this segment between the months of May and October since 1999 exceed the chronic standard of 200 cfu/100mL. Two of the four samples collected in 2015 as part of Stage 2 of the TMDL process exceeded the 200 cfu/100ml standard. Although the available sample data spanned all flow conditions, the proportion of samples exceeding the allowable load was greater at higher flows. In total, six of the nine exceedances occurred at mid to high flow levels and just one exceedance occurred under the lowest flow conditions. Appendix D contains spreadsheets used for the calculation of the load duration curve for fecal coliform at DR-01.

This page intentionally left blank.

Figure 7-4
 Little Vermilion River DR-01
 Fecal Coliform Duration Curve

This page intentionally left blank.

7.2.1.5 TSS in Little Vermilion River Segment DR-01

A load duration curve for TSS was developed for segment DR-01 using Illinois EPA's watershed-specific LRS target value for TSS in streams of 25.3 mg/L. TSS data compiled during Stage 1 of TMDL were paired with the corresponding flows for the sampling dates and plotted against the flow duration curve **Figure 7-5**.

The resulting load duration curve for TSS at segment DR-01 indicates that 24 of the 71 samples collected on this segment represent loads greater than the allowable load established by the LRS target value. Exceedances occur under a full range of flow conditions although exceedances do occur with greater frequency at higher flows. Appendix D contains spreadsheets used for the calculation of the load duration curve for TSS at segment DR-01.

7.2.1.6 Total Phosphorus in Little Vermilion River Segment DR-01 and Mendota Creek (DRD)

Load duration curves were developed to address total phosphorus impairment in Mendota Creek segment DRD and Little Vermilion River segment DR-01. The flows used to develop the load duration curves were multiplied by the LRS target value developed by Illinois EPA for total phosphorus in streams in this watershed to generate a load duration curve representing the allowable load. The LRS target value provided by Illinois EPA for total phosphorus in the Little Vermilion River (LaSalle County) watershed is 0.289 mg/L.

A total of 63 samples for total phosphorus have been collected on segment DR-01 of the Little Vermilion River over a full range of flow conditions. Of these samples, three samples exceed the watershed-specific LRS target value. One sample was collected under high flow conditions (top 0.2% of calculated flow estimates), suggesting significant runoff was occurring and high concentrations of suspended sediment were likely present at the time of sample collection **Figure 7-6**. The remaining two exceedances were collected during low flow conditions.

Historical in-stream phosphorus data for Mendota Creek segment DRD identified during Stage 1 of the TMDL were combined with additional data collected by Illinois EPA during Stage 2 efforts in 2015. In total, 21 of the 26 unique total phosphorus samples in the DRD dataset exceed the target load value, some by a considerably wide margin **Figure 7-7**. While exceedances were common at all flow levels, the greatest proportional exceedances appear to occur in dry and low flow conditions.

Spreadsheets used for the calculation of load duration curves are provided in Appendix D.

Section 8

Total Maximum Daily Loads for the Little Vermilion River (LaSalle County) Watershed

8.1 TMDL Endpoints for the Little Vermilion River (LaSalle County) Watershed

The TMDL endpoints and LRS target values for impairments in the Little Vermilion River (LaSalle County) watershed are summarized in **Table 8-1**. All of the endpoints listed are based on protection of all designated uses in the impaired stream segments. Parameters with numeric water quality standards (zinc, chloride, fecal coliform, and dissolved oxygen) are assessed via the TMDL process and the TMDL endpoints directly correlate to the lowest applicable water quality standard established for a given parameter. Parameters without numeric water quality standards (TSS and total phosphorus) are assigned a watershed-specific LRS target value by Illinois EPA. These target values are voluntary measures and are intended to serve as planning tools for overall water quality improvement strategies in the watershed.

Table 8-1 TMDL Endpoints and Average Observed Concentrations for Impaired Constituents in the Little Vermilion River (LaSalle County) Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Assessment Type	TMDL Endpoint or Target Value
DR-01	Little Vermilion River	Zinc	TMDL	60.7 µg/L ¹
		Chloride	TMDL	500 mg/L
		Fecal Coliform	TMDL	200 cfu/100 ml
		pH	No TMDL developed ²	
		Total Suspended Solids (TSS)	LRS	25.3 mg/L
		Phosphorus (Total)	LRS	0.289 mg/L
DRD	Mendota Creek	Dissolved Oxygen	No TMDL developed ²	
		Phosphorus (Total)	LRS	0.289 mg/L

¹ WQ standard is hardness dependent, lowest calculated chronic standard shown

² Additional sample collection as part of Stage 2 efforts confirmed that stream segment is no longer impaired for listed parameter and impairment will be submitted for removal from the 303(d) list.

8.2 Pollutant Sources and Linkages

Potential pollutant sources for impaired streams in the Little Vermilion River (LaSalle County) watershed include both point and nonpoint sources as described in Section 5 of this report. The sources identified for each parameter of concern, based on data gathered and documented during Stage 1 and modeling completed in Stage 3, are presented in **Table 8-2**.

Table 8-2 Pollutant Sources for Impaired Water Bodies in Little Vermilion River (LaSalle County) Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Potential Sources (as identified by the 2016 303(d) list, data collection, and stakeholder comments)
DR-01	Little Vermilion River	Chloride	Road De-Icing (Combined Sewer Overflows, Urban Runoff/Storm Sewers)
		Total Phosphorus	Combined Sewer Overflows, Agriculture, Septic Systems
		Zinc	Industrial Land Treatment, Contaminated Sediments/Historical Smelting
		Total Suspended Solids (TSS)	Combined Sewer Overflows, Agriculture (including grazing)
		Fecal Coliform	Combined Sewer Overflows, Urban Runoff/Storm Sewers, Agriculture/Livestock, Septic Systems
DRD	Mendota Creek	Total Phosphorus	Municipal Point Source Discharges, Agriculture, Septic Systems

Load duration curves developed for the zinc and chloride TMDLs and the TSS and total phosphorus LRS assessments are discussed in this section. Load duration curves are useful in that they provide a link between historic sampling values and hydrologic condition. **Table 8-3** shows the example source area relationship to hydrologic condition consideration developed by USEPA.

Table 8-3 Example Source Area/Hydrologic Condition Considerations (USEPA 2007)

Contributing Source Area	Duration Curve Zone				
	High Flow	Moist	Mid-Range	Dry	Low Flow
Point Source				M	H
Onsite Wastewater System			H	M	
Riparian Areas		H	H	H	
Stormwater: Impervious Areas		H	H	H	
Combined sewer overflows	H	H	H		
Stormwater: Upland	H	H	M		
Bank Erosion	H	M			

Note: potential relative importance of source area to contribute loads under given hydrologic conditions (H: High, M: Medium)

Further discussion regarding pollutant sources is provided throughout this section. Implementation activities designed to reduce loading from the potential sources are outlined in Section 9.

8.3 TMDL Allocation

As explained in the Section 1 of this report, the TMDLs for impaired segments in the Little Vermilion River (LaSalle County) watershed will address the following equation:

$$\text{TMDL} = \text{LC} = \Sigma \text{WLA} + \Sigma \text{LA} + \text{MOS} + \text{RC}$$

where: LC = Loading capacity - the maximum amount of pollutant loading a water body can receive without violating water quality standards
 WLA = Waste load allocation - the portion of the TMDL allocated to

- LA = existing or future point sources
- LA = Load allocation – the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- MOS = Margin of safety - an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- RC = Reserve capacity – the portion of the load explicitly set aside for future population growth and additional development in the watershed

Each of these elements will be discussed in this section as well as consideration of seasonal variation in the TMDL calculation.

8.3.1 TMDL for Total Zinc in the Little Vermilion River (DR-01)

Little Vermilion River segment DR-01 is listed for impairment of the aquatic life use caused by dissolved zinc. Chronic and acute water quality standards developed for dissolved zinc are calculated based on total hardness concentrations in the water body at the time of sample collection (see Section 4.3 of this report). While counts of exceedances are based on sample-specific calculations of acute and chronic standards, the load duration curves developed to determine load reductions needed to meet the standards at varying flow scenarios used the lowest calculated chronic standard based on the available hardness dataset (see Section 7).

8.3.1.1 Loading Capacity

The LC is the maximum amount of dissolved zinc the impaired waterbody segment can receive and still meet the lowest applicable water quality standard for this watershed. For the purpose of TMDL development the lowest calculated chronic standard based on the lowest reported total hardness value in the watershed was used to establish the loading capacity. This represents a conservative measure designed to reduce the potential for overestimation of loading capacity in the stream. The loading capacity over a range of applicable flow values in this segment is presented in **Table 8-4**.

Table 8-4 Dissolved Zinc Loading Capacities under Various Flow Conditions in the Little Vermilion River

Estimated Mean Daily Flow (cfs)	Allowable Load (lbs/day)
1	0.3
5	1.6
10	3.3
50	16
100	33
500	167
1,000	327
2,000	654
5,000	1,636

8.3.1.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the TMDL has been calculated to meet the standard during all flow conditions.

There is not one critical flow condition during the year for zinc in this segment. The target value is intended to be met under all flow scenarios. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.1.3 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings) or a combination of both. The MOS for the zinc TMDL in DR-01 is both implicit, as the analysis used the most conservative calculated chronic standard, and explicit as an additional 10% MOS was included in the TMDL calculations. The explicit MOS of 10 percent is employed to compensate for uncertainty in the TMDLs developed using the load duration curve methodology. This MOS is adequate given that the fundamental calculation of the loading capacity is simply a function of flow multiplied by the target value, an approach which minimizes a great deal of uncertainty inherent to other modeling methodology. Most of the uncertainty is therefore associated with the estimation of flows in the assessed segment calculated by extrapolating flows from a surrogate USGS gage. The methodology employed in estimating watershed flows was discussed in Section 7.4 of this document.

8.3.1.4 Waste Load Allocation

There are seven NPDES permitted discharges, two permitted CSO outfalls, and a small area of roadways covered by the Illinois Department of Transportation (IDOT) MS4 permit within the modeled portion of the Little Vermilion River (LaSalle County) watershed upstream of the DR-01 sampling location (**Table 8-5**). There are currently no permitted effluent limits for zinc at any of the facilities. As a result, DMR data does not include concentrations of zinc in effluent from any of these facilities. The lack of discharge and monitoring requirements indicates that zinc is not considered a parameter of concern for these facilities and loading from these discharges is not expected to be an issue. Therefore, WLAs for dissolved zinc have not been set for each of the facilities. Should Illinois EPA determine that a facility requires zinc limits in the future, limits should be calculated using the water quality standard and the facility's design average/maximum flow.

The contributing land area that is categorized as road surface was calculated to determine a WLA for IDOT within the watershed. Road surface covers 1.1% of the contributing watershed. This percentage of the LA was then converted to a WLA for IDOT during high flow events.

Table 8-5 WLAs for Zinc from Permitted Discharges in the Little Vermilion River (LaSalle County) Watershed

Facility	NPDES Permit Number	Design Average Flow (MGD)	WLA (lbs/Day)
CARUS CORP LASALLE SITE	IL0002623	1.672	n/a ¹
DEL MONTE CORP	IL0003115	0.42	n/a ¹

IDOT	ILR400493	**	1.4

¹ Monitoring for zinc is not currently a permit requirement for these facilities.

² Intermittent stormwater discharge under general non-coal mining permit. * CSOs only discharge during extreme precipitation events **IDOT permit is an MS4 permit covering stormwater runoff from roadways

8.3.1.5 Reserve Capacity

A portion of a TMDL's loading capacity may be set as a RC to allow for future population growth and development. In the case of the DR-01 TMDL for zinc, an explicit RC was not included in the TMDL because zinc loads are not expected to increase as population or development increases in the area over time. The primary sources of zinc loading into the Little Vermilion River are runoff and discharges associated with the Matthiessen and Hegeler Zinc Company Superfund Site located on the west bank of the Little Vermilion River. Remediation activities at this site are currently in development through the RCRA process, and once completed, will lead to significant reductions in zinc loading to the Little Vermilion River. As a result, future loads of zinc into the river are expected to be a fraction of past and current loads and additional RC is not appropriate.

8.3.1.6 Load Allocation and TMDL Summary

Table 8-6 shows a summary of the zinc TMDL for Little Vermilion River segment DR-01. An explicit 10% MOS was included. In order to retain the explicit 10% margin of safety, the percent reduction presented below was calculated as the percent reduction in LA. Reductions in zinc loading are necessary under all flow conditions to meet the LC. Required reductions in zinc loads range from 54-90%.

Table 8-6 Zinc TMDL for Little Vermilion River (DR-01)

Zone	Flow Exceedance Range (%)	LC (lbs/day)	LA (lbs/day)	WLA (lbs/day)	Explicit MOS at 10% (lbs/day)	RC (lbs/day)	Actual Load ¹ (lbs/day)	Percent LA Reduction Needed (%)
High	0 - 10	136	121	1.4	13.6	n/a	771	84%
Moist	10 - 20	63	56	0.64	6.3	n/a	122	54%
	20 - 30	39	35	0.40	3.9	n/a	84	59%
	30 - 40	27	24	0.28	2.7	n/a	62	61%
Mid-Range	40 - 50	19	17	0.20	1.9	n/a	52	67%
Dry	50 - 60	13	12	0.00	1.3	n/a	49	76%
	60 - 70	8.2	7.3	0.00	0.82	n/a	54	86%
	70 - 80	5.5	5.0	0.00	0.55	n/a	26	81%

¹ Actual Load was calculated using the 90th percentile of observed zinc concentrations in a given flow range (EPA 2007)

8.3.2 TMDL for Chloride in the Little Vermilion River (DR-01)

Little Vermilion River segment DR-01 is also listed for impairment of the primary aquatic life use caused by chloride. A load duration curve was developed (see Section 7) to determine load reductions needed to meet the instream water quality standards at varying flow scenarios.

8.3.2.1 Target Loading Capacity

The LC for chloride under various flow regimes were determined using watershed-specific flow estimates and the instream standard of 500 mg/L as described in Section 7. The allowable load as a function of flow is presented in Table 8-7.

8.3.2.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the TMDL has been calculated to meet the standard during all flow conditions.

Table 8-7 Chloride Loading Capacities under Various Flow Conditions in the Little Vermilion River

Estimated Mean Daily Flow (cfs)	Allowable Load (lbs/day)
1	2,695
5	13,476
10	26,953
50	134,764
100	269,529
500	1,347,643
1,000	2,695,286
5,000	13,476,428

As with the zinc impairment discussed previously, there is not one critical flow condition during the year for chloride in this segment although the highest chloride concentrations are likely to correspond with winter precipitation events when road salting occurs. The target value is intended to be met under all flow scenarios which include times when road salting is likely. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.2.3 Margin of Safety

The MOS for the chloride TMDL in DR-01 is explicitly set at an additional 10% of the LC in the TMDL calculations. Ten percent is generally considered adequate to compensate for any uncertainty in the TMDLs developed using this methodology because the use of the load duration curve approach minimizes a great deal of uncertainty as the calculation of the loading capacity is simply a function of flow multiplied by the target value. Most of the uncertainty is therefore associated with the estimated flows in the assessed segment which were based on extrapolating flows from a surrogate USGS gage. The methodology employed in estimating watershed flows is discussed in Section 7.2 of this document.

8.3.2.4 Waste Load Allocation

Only one of the NPDES permitted entities upstream DR-01 currently has a monitoring requirement for chloride; the Carus Corps LaSalle Site (IL0002623). This facility does not currently have an explicit effluent limit for chloride, but the NPDES permit does include a monitoring requirement for chloride. Therefore, the lowest applicable instream water quality standard of 500 mg/L was used in combination with facility's maximum design flow to assign a WLA for this TMDL calculation. Although the LaSalle CSOs may contribute chloride during discharge events, a WLA of zero was assigned to these outfalls. The allocation of zero is not intended to translate into an immediate requirement for zero discharge, but rather, continued compliance with long term control plans, which are ultimately aimed at future goals for CSO abatement. A summary of WLAs for the chloride TMDL is provided in **Table 8-8**.

The contributing land area that is categorized as road surface was calculated to determine a WLA for IDOT within the watershed. Road surface covers 1.1% of the contributing watershed. This percentage of the LA was then converted to a WLA for IDOT during high flow events.

Table 8-8 WLAs for Chloride from Permitted Discharges in the Little Vermilion River (LaSalle County) Watershed

Facility	NPDES Permit Number	Design Maximum Flow (MGD)	WLA (lbs/day)
ILLINOIS CEMENT CO - DIMMICK ²	ILG840123	0	n/a ¹
CARUS CORP LASALLE SITE	IL0002623	1.672	6,973
DEL MONTE CORP	IL0003115	0.42	n/a ¹
ILLINOIS CEMENT CO - LASALLE	IL0038296	0.04	n/a ¹
MENDOTA STP, CITY OF	IL0023221	4.0	n/a ¹
RIVERSTONE GROUP-TROY GROVE ²	ILG840049	0	n/a ¹
LASALLE EAST STP	IL0078336	1.5	n/a ¹
LASALLE CSO OUTFALLS 006A and 007	IL0029424	*	0*
IDOT	ILR400493	**	11,372

¹ Monitoring for chloride is not currently a permit requirement for these facilities and chloride contribution is assumed to be minimal.

² Intermittent stormwater discharge. * CSOs only discharge during extreme precipitation events and the wasteload allocation of "zero" is not intended to translate into an immediate requirement for zero discharge, but rather, continued compliance with long term control plans. **IDOT permit is an MS4 permit covering stormwater runoff from roadways

8.3.2.5 Reserve Capacity

A portion of a TMDL's LC can be set as a RC to allow for future population growth and development. An explicit RC was not included in the TMDL for chloride on this segment because the primary sources of chloride loading into the Little Vermilion River are not expected to significantly increase in the near future as a result of projected of land use and population changes in the area.

8.3.2.6 Load Allocation and TMDL Summary

Table 8-9 shows a summary of the chloride TMDL for Little Vermilion River segment DR-01. In order to retain the explicit 10% margin of safety, the percent reduction presented below was calculated as the percent reduction in LA. Reductions in chloride loads are necessary during low flow conditions. Required reductions in chloride loads range from 8-24% of the available LA.

Table 8-9 Chloride TMDL for Little Vermilion River (DR-01)

Zone	Flow Exceedance Range (%)	LC (lbs/day)	LA (lbs/day)	WLA (lbs/day)	MOS	RC (lbs/day)	Actual Load ¹ (lbs/day)	Percent LA Reduction Needed (%)

¹ Actual Load was calculated using the 90th percentile of observed chloride concentrations in a given flow range (EPA 2007)

8.3.3 TMDL for Fecal Coliform in the Little Vermilion River (DR-01)

Little Vermilion River segment DR-01 is listed for impairment of the primary contact recreation use caused by fecal coliform bacteria. A load duration curve was developed (see Section 7) to determine load reductions needed to meet the instream water quality standards at varying flow scenarios.

8.3.3.1 Target Loading Capacity

The LC is the maximum amount of fecal coliform bacteria the impaired waters can receive and still meet the lowest applicable water quality standard for this watershed. The allowable fecal coliform loads that can be generated in the watershed and still maintain the geometric mean chronic standard of 200 cfu/100mL were determined with the methodology discussed in Section 7. The fecal coliform loading capacity according to flow is presented in **Table 8-10**.

8.3.3.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the TMDL has been calculated to meet the standard during all flow conditions.

The critical period for fecal coliform is the primary contact recreation season which is May through October each year. There is no one critical flow condition during the recreation season. The fecal coliform standard must be met under all flow scenarios and standard exceedances have occurred during the majority of flow scenarios. By

Table 8-10 Fecal Coliform Loading Capacities under Various Flow Conditions in the Little Vermilion River

Estimated Mean Daily Flow (cfs)	Allowable Load (million colonies/day)
1	4,894
5	24,466
10	48,932
50	244,663
100	489,332
500	2,446,689
1,000	4,893,434
5,000	24,467,455

using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.3.3 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings) or a combination of both. The MOS for the DR-01 TMDL is implicit as the analysis used the more conservative 200 cfu/100mL chronic standard for developing the loading capacity as opposed to the single-sample, acute maximum standard of 400 cfu/100mL. In addition, the TMDL does not account for die-off of bacteria which occurs at an unquantified rate as bacteria move downstream in the system.

8.3.3.4 Waste Load Allocation

There are seven NPDES permitted discharges and two permitted CSO outfalls within the modeled portion of the Little Vermilion River (LaSalle County) watershed upstream of the DR-01 sampling location in addition to two CSO outfalls for the City of LaSalle - South Plant (IL0029424 outfalls 006 and 007). The LaSalle WWTP's main outfall discharges to the Illinois River below the Little Vermilion River (LaSalle County) watershed. CSO discharges occur only during extreme wet weather, when receiving water flows are high. For this TMDL study, CSO wasteload allocations for fecal coliform are set at zero. The allocation of zero is not intended to translate into an immediate requirement for zero discharge, but rather are aimed at long-term goals for CSO abatement. The only other permitted facilities with potential to discharge significant quantities of fecal coliform bacteria are the City of Mendota's POTW and the LaSalle East STP.

The Mendota POTW currently has a daily maximum permit limit for fecal coliform of 400 cfu/100ml. However, the 200 cfu/100ml (based on the geometric mean) is the most restrictive applicable standard and was therefore the target used to assign WLAs this facility. All POTW facilities in Illinois are currently being assigned effluent limits based on the 200 cfu/100ml standard upon permit renewal. The permit limit for the LaSalle East STP is 200 cfu/100ml and was used for this TMDL. The WLA for this assessment was determined to be 21,955 million colonies/day using the DAF and 47,696 million colonies/day when calculated using the facility's DMF. A summary of WLA for this fecal coliform TMDL is shown in **Table 8-11**.

Table 8-11 WLAs for Fecal Coliform from Permitted Discharges in the Little Vermilion River (LaSalle County) Watershed

Facility	NPDES Permit Number	Design Average Flow (MGD)	Design Maximum Flow (MGD)	WLA at DAF (mil col/day)	WLA at DMF (lbs/Day)
ILLINOIS CEMENT CO – DIMMICK ¹	ILG840123	0	0	n/a ²	n/a ²

LASALLE EAST STP	IL0078336	0.5	1.5	3,785	11,356
LASALLE CSO OUTFALLS 006A and 007	IL0029424	*	*	0*	0*

¹ Intermittent stormwater discharge. ² Monitoring for bacteria is not currently a permit requirement for these industrial facilities. * CSOs only discharge during extreme precipitation events and the allocation of zero is not intended to translate into an immediate requirement for zero discharge, but rather, continued compliance with long term control plans

8.3.3.5 Reserve Capacity

No Reserve Capacity was included in the TMDL. Large future growth is not anticipated in the area, however, because the WLA is set at the water quality standard, a future TMDL modification would be easily calculated.

8.3.3.6 Load Allocation and TMDL Summary

Table 8-12 shows a summary of the fecal coliform TMDL for Little Vermilion River segment DR-01. Significant reductions in fecal coliform loading from non-point sources are required to meet the water quality standard under both high and low flow conditions suggesting that fecal coliform loads in the watershed originate from a variety of sources.

Due to existing permit limits currently in place to minimize domestic wastewater loading of fecal coliform in the watershed, the percent reduction presented below assumes no change to NPDES permit limits and is calculated as the percent reduction in LA.

Table 8-12 Fecal Coliform TMDL for Little Vermilion River (DR-01)

Zone	Flow Exceedance Range (%)	LC (mil. Col./day)	LA (mil. Col./day)	WLA (mil. Col./day)	MOS	RC (mil. Col./day)	Actual Load ¹ (mil. Col./day)	Percent LA Reduction Needed (%)
High	0 - 10	1,906,400	1,858,704	47,696	Implicit	0	184,062,854	99%
Moist	10 - 20	834,114	786,418	47,696	Implicit	0	7,855,762	90%
	20 - 30	485,917	438,221	47,696	Implicit	0	525,485	17%
	30 - 40	311,819	264,123	47,696	Implicit	0	3,462,629	92%
Mid-Range	40 - 50	201,029	179,074	21,955	Implicit	0	no data	--
Dry	50 - 60	129,807	107,852	21,955	Implicit	0	109,636	2%
	60 - 70	85,492	63,537	21,955	Implicit	0	2,406,576	97%

	80 - 90	43,550	21,595	21,955	Implicit	0	421,049	95%
Low Flow	90 - 100	36,428	14,473	21,955	Implicit	0	1,637,479	99%

¹ Actual Load was calculated using the 90th percentile of observed fecal coliform concentrations in a given flow range (EPA 2007)

8.3.4 LRS for TSS in Streams

Little Vermilion segment DR-01 is listed for impairment of the aquatic life use caused by excess TSS. As no numeric water quality standard exists for TSS in streams in Illinois, a watershed-specific numeric target value of 25.3 mg/L of TSS was developed by Illinois EPA for incorporation into the LRS calculation. A load duration curve was developed to determine load reductions needed to meet the instream water quality target during varying flow scenarios.

8.3.4.1 Target Loading Capacity

The LC is the maximum amount of suspended solids the impaired segment can receive and still meet the LRS target value for this watershed. The allowable TSS loads that may be generated in the watershed were determined using estimated flow conditions and the numeric LRS target, as discussed in Section 7. The TSS loading capacities as a function of flow are presented in **Table 8-13**.

8.3.4.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the LRS has been calculated to meet the target during all flow conditions.

Table 8-13 TSS Loading Capacities in Streams under Various Flow Conditions in the Little Vermilion River (LaSalle County) Watershed

Estimated Mean Daily Flow (cfs)	Target Load Capacity (lbs/day of TSS)
1	136
5	682
10	1,364
50	6,819
100	13,638
500	68,191
1,000	136,381
5,000	681,907

There is not one critical flow condition during the year for TSS in the Little Vermilion River. The target value is intended to be met under all flow scenarios. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.4.3 Percent Reduction and LRS Summary

Table 8-14 provides a summary of the percent reductions from current conditions needed to meet the LRS target under various flow conditions for the impaired segment of the Little Vermilion River. Instream TSS loads in this reach exceed the target under a broad range of flow conditions. Required reductions are greatest at the highest flow categories. Overall TSS load reduction needs range from 9-99%.

Table 8-14 LRS Targets for TSS in Little Vermilion River Segment DR-01

Zone	Flow Exceedance Range (%)	Target Loading Capacity (lbs/day)	Actual Load ¹ (lbs/day)	Percent Reduction Needed (%)
High	0 - 10	56,674	4,185,613	99%
Moist	10-20	26,239	176,833	85%
	20 - 30	16,536	23,145	29%
	30 - 40	11,463	17,702	35%
Mid-range	40 - 50	8,155	16,500	51%
	50 - 60	5,509	5,601	2%
Dry	60 - 70	3,524	3,830	8%
	70 - 80	2,421	4,583	47%
	80 - 90	1,605	1,763	9%
Low Flow	90 - 100	1,166	4,023	71%

¹ Actual Load was calculated using the 90th percentile of observed TSS concentrations in a given flow range (EPA 2007)

8.3.5 LRS for Total Phosphorus in Streams

Mendota Creek (DRD) and Little Vermilion segment DR-01 are listed for impairment of the aquatic life use caused by excess total phosphorus. As no numeric water quality standard exists for total phosphorus in streams in Illinois, a watershed-specific numeric target value of 0.289 mg/L was developed by Illinois EPA for use in LRS calculations for total phosphorus in these segments. Load duration curves were developed (see Section 7) to determine load reductions needed to meet the instream water quality target at varying flow scenarios.

Table 8-15 Total Phosphorus Loading Capacities in Streams under Various Flow Conditions in the Little Vermilion River (LaSalle County) Watershed

Estimated Mean Daily Flow (cfs)	Target Load Capacity (lbs/day of Total Phosphorus)
1	1.6
5	7.8

8.3.5.1 Target Loading Capacity

The LC is the maximum amount of total phosphorus the impaired waters can receive and still meet the LRS target value for this watershed. The allowable phosphorus loads that may be

generated in the watershed were determined using estimated flow conditions and the numeric LRS target, as discussed in Section 7. The total phosphorus loading capacity according to flow is presented in **Table 8-15**.

8.3.5.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the LRS has been calculated to meet the target during all flow conditions.

There is not one critical flow condition during the year for total phosphorus. The target value is intended to be met under all flow scenarios. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.5.3 Percent Reduction and LRS Summary

Tables 8-16 and **8-17** provide a summary of percent reductions from current conditions needed to meet the LRS target under various flow conditions for the impaired segments of Mendota Creek and the Little Vermilion River, respectively. Instream phosphorus loads in Mendota Creek exceed the target value during all flow conditions for which data are available. Based on the available data, overall reduction needs range from 53-96%.

Table 8-16 LRS Targets for Total Phosphorus in Mendota Creek (DRD)

Zone	Flow Exceedance Range (%)	Target Loading Capacity (lbs/day)	Actual Load ¹ (lbs/day)	Percent Reduction Needed (%)
High	0 - 10	43	250	83%
Moist	10 - 20	23	49	53%
	20 - 30	16	69	76%
	30 - 40	13	39	68%
Mid-Range	40 - 50	11	35	70%
Dry	50 - 60	8.8	50	83%
	60 - 70	7.4	81	91%
	70 - 80	6.7	no data	-
	80 - 90	6.1	139	96%
Low Flow	90 - 100	5.8	85	93%

¹ Actual Load was calculated using the 90th percentile of observed concentrations in a given flow range (EPA 2007).

The available dataset for total phosphorus in segment DR-01 of the Little Vermilion River includes samples collected over a wide range of flow conditions in the river. One sample collected during a period of high flow and two samples collected during low flows exceed the target value. Based on the LRS target calculations, a reduction of total phosphorus loads of approximately 87% is needed for segment DR-01 to meet the watershed-specific LRS target value during the highest flow conditions **Table 8-17**. A reduction of approximately 28% is needed during low flow conditions.

Table 8-17 LRS Targets for Total Phosphorus in Little Vermilion River Segment DR-01

Zone	Flow Exceedance Range (%)	Target Loading Capacity (lbs/day)	Actual Load ¹ (lbs/day)	Percent Reduction Needed (%)
High	0 - 10	647	5,138	87%
Moist	10 - 20	300	190	0%
	20 - 30	189	85	0%
	30 - 40	131	84	0%
Mid-Range	40 - 50	93	63	0%
Dry	50 - 60	63	44	0%
	60 - 70	40	33	0%
	70 - 80	28	24	0%
	80 - 90	18.3	15.6	0%
Low Flow	90 - 100	13.3	18.5	28%

Section 9

Implementation Plan for the Little Vermilion River (LaSalle County) Watershed

9.1 Implementation Overview

The goal of this watershed plan is to identify BMPs to be implemented in the Little Vermilion River (LaSalle County) watershed that will provide reasonable assurance that impaired waters in the watershed will meet water quality criteria developed to ensure waterbodies are able to support their designated uses.

The USEPA has identified nine minimum elements that a watershed plan for impaired waters is expected to include. These components are:

1. Identify causes and sources of pollution that will need to be controlled to achieve the pollutant load reduction requirements estimated within the watershed plan.
2. Estimate pollutant load reductions expected as a result of implementing the management measures described in #3 below.
3. Describe the nonpoint source management measures that will need to be implemented to achieve load reduction estimates and identify the critical areas where measures need to be implemented.
4. Estimate the level of technical assistance, associated costs, potential funding sources and parties that will be relied upon to implement the prescribed measures.
5. Include a public information/education component designed to change social behavior.
6. Develop an implementation schedule for the plan.
7. Develop a description of interim, measureable milestones.
8. Identify indicators that can be used to determine whether pollutant loading reductions are being achieved over time.
9. Develop a monitoring component to evaluate the effectiveness of the implementation efforts over time.

For Element 1, the causes and sources of pollution were described in Section 5 of this report.

9.2 Adaptive Management

An adaptive management or phased approach is recommended for the implementation of management practices designed to meet the TMDLs and LRSs developed for the Little Vermilion

River (LaSalle County) watershed. Adaptive management conforms to the USEPA guidelines outlined above because it is a systematic process for continually improving management policies and practices through learning from the outcomes of operational programs. Some of the defining characteristics of adaptive management include:

- Acknowledgement of uncertainty about what policy or practice is "best" for the particular management issue
- Thoughtful selection of the policies or practices to be applied (the assessment and design stages of the cycle)
- Careful implementation of a plan of action designed to reveal the critical knowledge that is currently lacking
- Monitoring of key response indicators
- Analysis of the management outcomes in consideration of the original objectives and incorporation of the results into future decisions (British Columbia Ministry of Forests 2000)

Implementation actions, point source controls, management measures, and/or BMPs are used to control the generation or distribution of pollutants within a watershed. BMPs are either structural, such as wetlands, sediment basins, fencing, or filter strips; or managerial, such as conservation tillage practices, nutrient management plans, or crop rotation. Both structural and managerial BMPs require effective management to be successful in reducing pollutant loading to water resources (Osmond et al. 1995).

It is typically most effective to install a combination of point source controls and BMPs or a BMP system. A BMP system is a combination of two or more individual BMPs that are used to control pollutants from a single critical source. If the watershed has more than one identified pollutant, but the transport mechanism is the same, a BMP system that establishes controls for the transport mechanism can be employed (Osmond et al. 1995).

To assist in development of an adaptive management program, implementation actions, management measures, available assistance programs, and recommended continued monitoring are all discussed throughout the remainder of this section. The point source BMPs described below are generally required and typically already being implemented although some modifications may be appropriate. The nonpoint source BMPs are entirely voluntary based on the landowner's preference.

9.3 BMP Recommendations for Reducing Fecal Coliform in Streams in the Little Vermilion River (LaSalle County) Watershed

Results for nearly 80% of the fecal coliform single samples were above the 200 cfu per 100 mL geometric mean water quality standard and approximately 57% of the samples exceeded 400 cfu per 100 mL maximum standard (as indicated in **Table 5-3**). Loading calculations discussed in

Section 7.2.1.4 indicate that exceedances were reported under all flow conditions. Potential sources of fecal coliform include wastewater treatment plant and/or failed septic system discharges/leaks, MS4 discharges, general non-point source runoff, and animal-related runoff (as discussed in Section 5 of this report). Animal impacts often consist of livestock, where present, but may also include other animals such as resident and migratory waterfowl and other wildlife such as deer.

9.3.1 NPDES Permitted Point Sources of Fecal Coliform

Table 5-8 of this report listed the NPDES permitted point sources and CSO outfalls present within and upstream of the Little Vermilion River (LaSalle County) watershed. In general, domestic wastewater treatment facilities have the potential to contribute fecal coliform to receiving waters while industrial facilities do not. The domestic wastewater treatment facilities in the watershed include the Mendota STP (IL0023221), the LaSalle East STP (IL0078336), and two CSO outfalls associated with the LaSalle WWTP (IL0029424). Both the Mendota STP and LaSalle East STP have fecal coliform limits in their permits.

The two CSO outfalls (outfalls 006A and 007 under permit IL0029424 for the LaSalle WWTP) located upstream of the monitoring site on the Little Vermilion River discharge in response to extreme weather events. When these events occur, it is likely that the CSO outfalls contribute fecal coliform to the receiving water. The outfalls were assigned zero for the WLA because the State of Illinois has a Long-Term Control Plan (LTCP) for eliminating CSO discharges. As the permittee works with the state towards CSO abatement, this source of fecal coliform will be eliminated.

Average daily discharge rates for permitted wastewater treatment plants and other facilities discharging into the Little Vermilion River (LaSalle County) watershed are shown in **Table 8-10**. WLAs for fecal coliform were calculated for each facility based on the 200 cfu/100ml geometric mean water quality standard and the facility's design average and design maximum flows (DAFs and DMFs, respectively). The TMDL uses the WLA calculated using the DMFs for high flow conditions and the DAFs under dry to midrange flow conditions.

9.3.2 Nonpoint Sources of Fecal Coliform

Several BMPs have been identified to help reduce fecal coliform counts in the impaired segments of the Little Vermilion River (LaSalle County) watershed. These management options focus on the most likely sources of fecal coliform within the basin. These include reduction of soil loss associated with agricultural runoff. Soil erosion is the process of moving soil particles or sediment by flowing water or wind. Additionally, eroding soil transports pollutants, including fecal coliform, that can potentially degrade water quality. Additional sources of nonpoint source fecal coliform include septic systems, and livestock. As noted in Section 2.3, approximately 75 percent of the watershed is agricultural in nature.

Filter Strips: Filter strips are strips or areas of permanent herbaceous vegetation situated between cropland, grazing land, or disturbed land and environmentally sensitive areas, such as waterways. Filter strips serve as controls to reduce sediment, particulate organic matter, and sediment-absorbed contaminant and pollutant loading in runoff. The filter strips are permanently designated plantings to treat runoff and are not part of an adjacent cropland's rotation. Grass

filter strips have been shown to remove as much as 65 percent of sediment from runoff (USEPA 2003).

The filter strip vegetation may consist of a single species or a mixture of grasses, legumes, and/or other forbs that are appropriately adapted to the soil and climate, as well as to the farm chemicals used in the adjacent land. Approved seed listings are provided in the Illinois NRCS Conservation Practice Standard (CPS) 393 (June 2003). Applicable maintenance shall be performed as needed to ensure the strips continue to function properly, including removal of state-listed noxious weeds, gully repair, removal of excess sediment, and re-seeding. Overland flow entering the filter strip should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the filter strip. Harvesting of the filter strip vegetation, where appropriate, will help to encourage dense growth, maintain an upright growth habit, and remove contaminants and unwanted nutrients contained in the plant tissue. Prescribed burning may be used to manage and maintain the filter strip when an approved burn plan has been developed.

The installation of filter strips adjacent to the impaired stream segments, as well as any contributing tributaries, can result in considerable reduction of overland contributions of sediments and suspended solids to an impaired waterbody. Filter strips implemented along stream segments slow and filter runoff and provide bank stabilization thereby decreasing erosion and re-sedimentation; however, they should not be installed on unstable channel banks already eroding due to undercutting of the bank toe. In some cases, riparian vegetation also provides bank stability that further reduces sediment loading to the stream. When used in support of a riparian forest buffer, filter strips can also restore or maintain sheet flow.

The Illinois NRCS Conservation Practice Standard 393 (June 2003) describes filter strip requirements based on land slope; the requirements are designed to achieve a minimum flow through time of 15 to 30 minutes at a one-half inch depth. **Table 9-1** provides a summary of the guidance for filter strip width, or flow length, as a function of slope (NRCS 1996).

Table 9-1 Filter Strip Flow Lengths Based on Land Slope

Percent Slope	0.5%	1.0%	2.0%	3.0%	4.0%	5.0% or greater
Minimum (feet)	36	54	72	90	108	117
Maximum (feet)	72	108	144	180	216	234

GIS land use and topographic data, described in Section 2 of this report, were used in conjunction with soil slope data to provide an estimate of acreage where filter strips could be installed. As discussed in Section 2.4.1, a total of 128 soil types exist within the watershed. The three most common types show 0-2 percent slopes suggesting that the maximum values associated with 2 percent or less slopes could be used for this analysis; however, there does still remain some considerable variability in soil type and corresponding slope values across the watershed.

In conjunction with the available land use, topography, and soil information discussed in Section 2, mapping software was used to buffer impaired stream segments, and their major tributaries, to determine the total area found within the appropriate footages of the stream segments. Due to the wide range of soil types and slopes found in the watershed, the appropriate buffer widths were estimated in GIS based on the average slope of land within the maximum buffer areas of

each impaired segment's major tributaries. These average slopes were then used to calculate approximate buffer distances based on the NRCS guidance using a best-fit equation to interpolate between the slope percentages to buffer width relationships provided in the NRCS guidance.

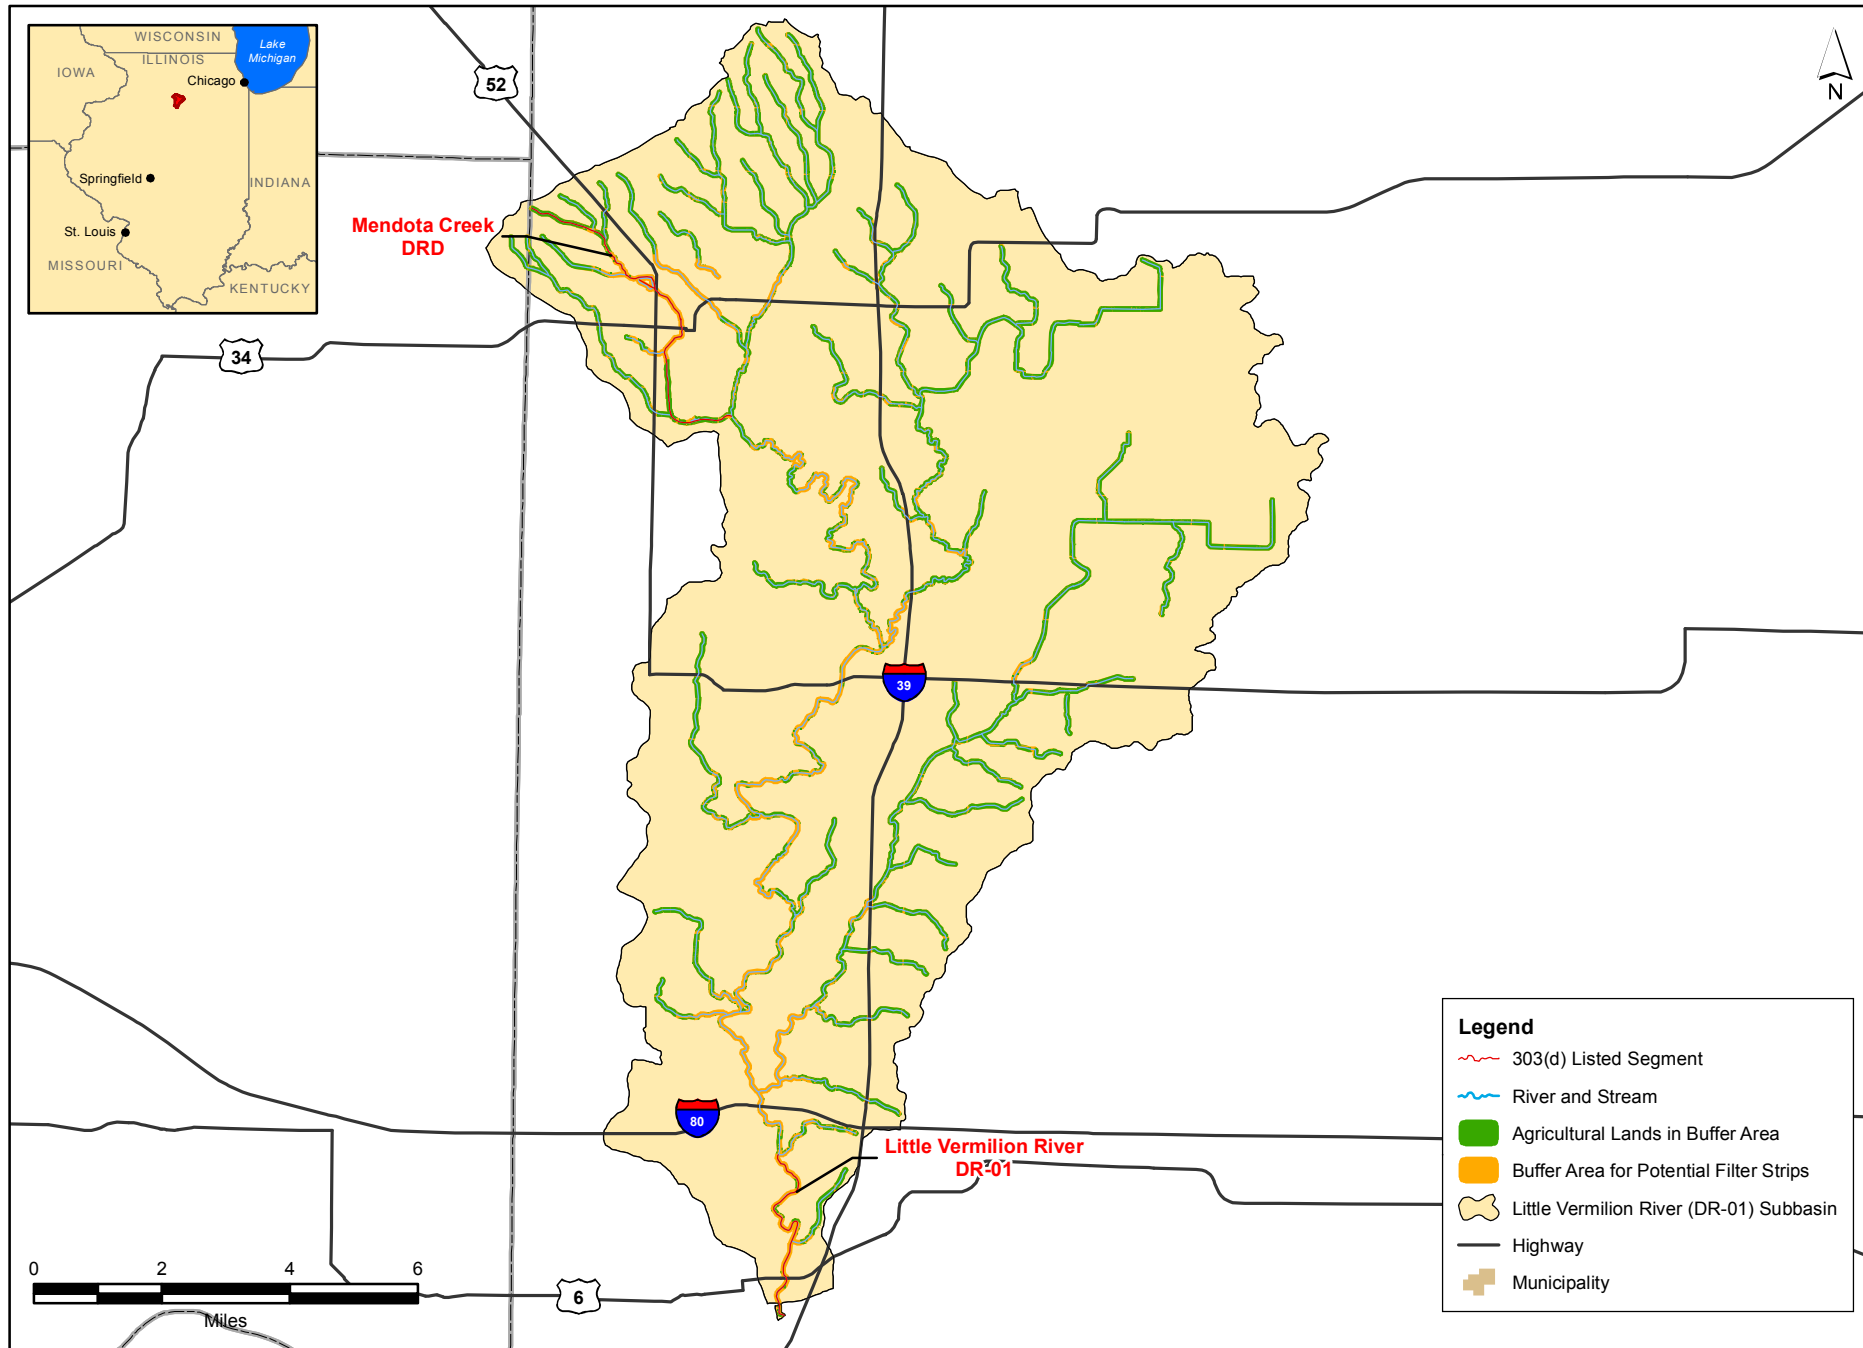

Not all land use types within the buffer areas are candidates for conversion to buffer strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of developed residential or commercial lands is often infeasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips. Therefore, GIS software was used to extract the approximate acreage of agricultural lands within the appropriate buffer area for each impaired stream segment and its tributaries. The calculated overall buffer areas and acreage of agricultural land within the buffer distances for each impaired stream segment and its tributaries are provided in **Table 9-2**. These data represent an approximation of the maximum acreage of land potentially available for conversion to filter strips. The Mendota Creek (DRD) segment is not impaired for fecal coliform; however, information for the segment is included in **Table 9-2** for use later in this Section 9. More detailed assessment of a given property is necessary to determine the exact size and extent of convertible lands likely to provide the greatest benefit to in-stream water quality following conversion to filter strips.

There are approximately 8,418 total acres within the various buffer distances for fecal coliform impaired segment (DR-01), with an estimated 4,499 acres of agricultural land where filter strips could potentially be installed. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table 9-1**. Figures depicting the buffered areas and agricultural lands suitable for conversion to filter strips in the DR-01 and DRD segments are provided as **Figures 9-1** and **9-2**.

Table 9-2 Average Slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land Buffers Potentially Suitable for Conversion for Filter Strips

Stream Name	Segment ID	Average Slope Adjacent to Streams (%)	Filter Strip Flow Length (feet)	Total Area in Buffer (Acres)	Agricultural Land Buffer (Acres)
Little Vermilion River	DR-01	10.8	234	8,418	4,499

Field Borders: A field border is a strip of permanent vegetation established at the edge or around the perimeter of a field to reduce erosion from wind and water and protect soil and water quality. This practice applies to cropland and grazing lands which are often farmed to the extent possible, sometimes even into adjacent road ditches and to creek banks. Leaving a field border will reduce erosion and transportation of sediment, including contaminant-impacted materials, to nearby environmentally sensitive areas. The Little Vermilion River is listed for both fecal coliform and TSS and expanded use of field borders within the subbasin will help reduce loading of both constituents.

As a minimum, field borders should be located along the edge(s) of fields where runoff enters or leaves the field. The minimum width shall be 30 feet; wider if needed to meet the resource needs. When determining the border width, consideration should be given to factors such as equipment turning, parking, loading/unloading, grain harvest operations, and other related activities. For example, field borders planned to be used for turn strips shall be at least twice as wide as the widest equipment to be used. Border widths should also comply with all applicable state and local manure and chemical application setbacks. The field border shall not be used as a hay yard or machinery parking lot for any extended period of time, especially if doing so will damage or impair the function of the field border. When crossing the border, sprayers should be shut off and tillage equipment raised to avoid damage to the borders.

The field border shall be established using permanent stiff-stemmed, upright grasses; grass/legumes; forbs; and/or shrubs to trap wind- or water-borne soil particles. These plants should be appropriately adapted to the soil and climate, have the physical characteristics necessary to control wind and water erosion to tolerable levels in the field border area, be tolerant to sediment deposition and the chemicals planned for application in the cropfield, be tolerant to equipment traffic, and shall not include any state-listed noxious plant. For water quality purposes in particular (adsorbed, dissolved and suspended contaminants), the field border should have a vegetation stem density/retardance of moderate to high (e.g., equivalent to a good stand of wheat). Field border establishment shall be timed so that the soil will be adequately protected during the critical erosion period(s). Seedbed preparation, seeding rates, dates, depths, fertility requirements, and planting methods will be consistent with approved local criteria and site conditions.

Applicable maintenance shall be performed as needed to ensure the borders continue to function properly, including removal of state-listed noxious weeds and excess accumulated sediment. Overland flow entering the border should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the border. Any area damaged by animals, chemicals, tillage, or equipment traffic should be repaired as soon as possible. Use of contour buffer, no-till, or other conservation practices on adjacent upland areas will help to reduce surface runoff and excessive sedimentation of field borders.

If this BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 386.

Private Septic System Inspection and Maintenance Program: As indicated in Section 2.3, approximately 12.3 percent of the Little Vermilion River (LaSalle County) watershed consists of

developed or urbanized land, primarily in the LaSalle metropolitan area. A majority of businesses, residences, and other structures in the developed areas are served by a municipal sewer district and septic systems are uncommon in these areas. The remainder of the watershed is rural and primarily devoted to agricultural purposes. Many households in rural areas of Illinois that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. The degree of nutrient removal in these systems is limited by soils and system upkeep and maintenance.

Failing or leaking septic systems can be a significant source of fecal coliform pollution. A program that actively manages functioning systems and addresses non-functioning systems could be implemented to reduce the potential bacteria loads from septic systems in the watershed.- USEPA has developed guidance for managing septic systems, which includes assessing the functionality of systems, public health, and environmental risks (USEPA 2005). It also introduces procedures for selecting and implementing a management plan.

To reduce the discharge of excessive amounts of contaminants from a faulty septic system, a scheduled maintenance plan that includes regular pumping and maintenance of the septic system should be followed. The majority of failures originate from excessive suspended solids, nutrients, and biochemical oxygen demand (BOD) loading to the septic system. Reduction of solids entering the tank can be achieved by limiting the use of garbage disposals.

Septic system management practices can extend the life and maintain the efficiency of a septic system. Water conservation practices, such as limiting daily water use or using low flow toilets and faucets, are the most effective methods to maintain a properly functioning septic system. Additionally, septic systems should not be used for the disposal of solids, such as cigarette butts, cat litter, cotton swabs, coffee grounds, disposable diapers, etc. Physical damage to the drain field can be prevented by:

- Maintaining a vegetative cover over the drain field to prevent erosion
- Avoiding construction over the system
- Protecting the area down slope of the system from excavation
- Landscaping the area to divert surface flow away from the drain field (Bedinger et al., 1997)

The cost of each management measure is highly variable, and site-specific data on septic systems and management practices do not exist for the watershed; therefore, homeowners with septic systems should contact their county health department for septic system management costs.

Current protocols for addressing failing septic systems in the rural areas are to be performed in accordance with the Illinois Private Sewage Disposal Licensing Act and Code "to prevent the transmission of disease organisms, environmental contamination and nuisances resulting from improper handling, storage, transportation and disposal from private sewage disposal systems." Any new, replaced, or renovated system must be installed by a licensed contractor or the homeowner and permitted through the county health department. The department must receive both an application for permit and the appropriate fee from the contractor/homeowner. Once

reviewed and approved, a permit is issued and an inspection of the system is conducted during and after construction. The county health department also investigates private sewage disposal system complaints.

A long-range solution to failing septic systems is connection to a municipal sanitary sewer system. Connection to a sanitary sewer line would reduce existing fecal coliform sources by replacing failing septic systems with municipal treatment and will allow communities to develop without further contribution of pathogens to the Little Vermilion River. Costs for the installation are generally paid over a period of several years (average of 20 years) and help to avoid forcing homeowners to shoulder the entire initial cost of installing a new septic system. In addition, costs are sometimes shared between the community and the utility responsible for treating the wastewater generated from replacing the septic tanks. The planning process is involved and requires participation from townships, cities, counties, businesses, and citizens/homeowners.

It is unknown at this time how many septic systems are present within the watershed. However, as discussed in Section 5.3.3, LaSalle County Department of Health officials have reported that residents of the largest municipalities in the watershed (Mendota and LaSalle) were generally on public sewer systems, while residents in the rural parts of the county used private septic systems. Section 2.5 indicates that approximately 14,600 people reside in the Little Vermilion River (LaSalle County) watershed and about 7,200 of those reside in Mendota. A portion of the City of LaSalle is also located in the southern edge of the watershed; however, population information for the city was not included in Section 2.5. Based on **Figure 1-1**, the portion of LaSalle within the watershed appears to be less than the size of Mendota, and is assumed to be one-half of the Mendota population (therefore, approximately 3,600). The township of Troy Grove is assumed to be served by private septic systems. Based on these assumptions, up to 3,800 people remain and are likely served by private septic systems. If a typical household is assumed to consist of four people, there may be around 950 households which have septic systems.

Restrict Livestock Access to the Little Vermilion River: As discussed in Section 5 of this report, significant quantities of livestock are present within the Little Vermilion River (LaSalle County) watershed. Data from NASS states there were more than 10,000 head of cattle within LaSalle County in 2013; these animals are presumed to be primarily pastured with no known high concentration feed operations within the watershed.

It is unknown to what extent livestock have access to the Little Vermilion River or its tributaries. Reduction of livestock access to streams, however, is recommended to reduce bacteria loads and limit damage to streambanks. Access of livestock and other animals to streams can increase bank erosion, trample filter strips and riparian buffers causing short circuiting of pollutant treatment, and provide direct input of manure to the waterbody. Exclusion of or restricting pet, livestock, and wildlife access to streams with fencing helps reduce pollutant loads. USEPA found that livestock exclusion from waterways and other grazing management measures were successful in reducing fecal coliform counts by 29 to 46 percent (2003).

Fencing and alternate watering systems are effective ways to restrict livestock from streams; however, fencing emplacement is not always feasible from either a cost or animal management viewpoint. If used, fencing should be placed outside of the filter strip/riparian area to prevent manure from being entrained during flooding. Another option is to limit access of people to areas

of the waterbody; this indirectly keeps a large percentage of pet waste at a distance from the waterbody. Waterfowl are an issue for phosphorus and fecal coliform loading at lakes and slow moving streams. Acoustic devices and other repellants can be used to stress nuisance waterfowl so they avoid congregating in select areas.

Pasture Management/Fencing: As discussed above, livestock are present within the watershed, but these animals are primarily pastured and no high concentration feed operations exist in the watershed. Some basic pasture management strategies can be implemented to improve soil and reduce erosion, in turn reducing fecal coliform migration from fields. For example, pasture fencing can greatly enhance the efficiency of farming operations. When livestock are penned up in the same field or paddock for the entire grazing season, the plants in that area are grazed too short or even down to bare earth which increases the likelihood of soil loss. Guidance for rotation suggests livestock be moved into a grazing enclosure when the forage is around six inches high and moved off again when it is two inches high. This will also encourage the growth of the forage and will sometimes break the life cycle of parasites. As more pasture is divided into smaller paddocks, the utilization of forages by grazing livestock can increase. As utilization of forages is increased and cattle are moved more frequently, the ungrazed paddocks will have fresh forage available for grazing and the previously grazed paddocks will have time to rest. Rest periods from grazing allow forage regrowth and prevent overgrazing, which can lead to increased stormwater runoff and unnecessary sediment and nutrient loss.

In addition to aiding in healthy pastures, fencing can also be an effective way to restrict livestock from streams. It is unknown to what extent livestock have access to the impaired segments or contributing tributaries. Reduction of livestock access to streams, however, is recommended to limit damage to streambanks. Access of livestock and other animals to streams can increase bank erosion, trample filter strips and riparian buffers causing short circuiting of pollutant treatment. Exclusion or restricting pet, livestock, and wildlife access to streams with fencing helps reduce pollutant loads (fecal coliform and phosphorus).

9.4 BMP Recommendations for Reducing Total Phosphorus in Streams in the Little Vermilion River (LaSalle County) Watershed

Phosphorus is a nutrient critical to healthy ecosystems at low concentrations; however, over enrichment of phosphorus can result in aquatic ecosystem degradation when nitrogen is also available in sufficient quantities. Nutrient enrichment can result in rapid algal growth as available nutrients and carbon dioxide are consumed. This response can alter pH, decrease DO (which is critical to other aquatic biota), alter the diurnal DO pattern, and even create anoxic conditions. In addition, nutrient enrichment can reduce water clarity and light penetration and is aesthetically displeasing. Oxygen levels must be considered when evaluating BMPs for phosphorus because phosphorus is released from sediment at higher rates under anoxic conditions; increased water temperature and photosynthesis decrease DO levels and create anoxic conditions.

Inputs of phosphorus can originate from both point and nonpoint sources. Most of the phosphorus discharged by point sources is soluble. Phosphorus from point sources also typically has a continuous impact and is human in origin; for example, effluents from municipal sewage

treatment plants and permitted industrial discharges. However, total phosphorus impairments in stream segments are based on narrative standards and addressed through the development of an LRS rather than a traditional TMDL. Therefore, WLAs for phosphorus were not calculated for facilities in this watershed. The contribution from failed onsite wastewater treatment (septic) systems can also be significant (nonpoint sources), especially if they are concentrated in a small area.

Phosphorus from nonpoint sources is generally insoluble or particulate. Most of this phosphorus is bound tightly to soil particles and enters streams from erosion although some comes from tile drainage in the dissolved fraction. As discussed in Section 5.3.1 of this report, the use of drain tiling within the watershed is widespread with most if not all farms in LaSalle County having some sort of drain tile installed. The impact from phosphorus discharged by nonpoint sources is typically intermittent and is most often associated with stormwater runoff. Sedimentation can impact the physical attributes of the stream and act as a transport mechanism for phosphorus. It should be noted that the majority of BMPs recommended in this section for reduction of phosphorus load are also applicable to reduction of TSS (discussed further in Section 9.7).

The Little Vermilion River DR-01 and the Mendota Creek DRD stream segments of the watershed are listed for impairment of aquatic life use due to total phosphorus. As discussed in Section 7.2.1.6, these listings were made because total phosphorus in three of the 63 DR-01 samples and 21 of the 26 DRD samples exceeded the watershed-specific LRS target value. Reductions of total phosphorus loads needed to meet the LRS target values for the Little Vermilion River (LaSalle County) watershed are discussed in Section 8.3.5.3.

9.4.1 Nonpoint Sources for Phosphorus

Possible nonpoint sources of phosphorus to the DR-01 and DRD impaired stream segments include septic systems and both urban and rural land runoff. No MS4s are present within the watershed area. Phosphorus adsorbs to soil particles and, under increased velocities, water has an increased soil carrying capacity and erosion becomes an issue. This is exacerbated during activities where soil has been exposed and can be easily transported out of the disturbed area. Therefore, to achieve a reduction of phosphorus for the watershed, management measures should address both surface runoff controls and loading through sediment. BMPs that could be used for treatment of the Little Vermilion River (DR-01) and Mendota Creek (DRD) nonpoint sources are described below.

Conservation Tillage Practices: Conservation tillage practices could help reduce nutrient and sediment loads into the impaired stream segments by reducing erosion of soils. **Table 9-3**, shows the areas (acres) in each watershed that are under cultivation, along with the percent of the corresponding watershed area which is cultivated. Crop residuals or living vegetation cover on the soil surface protects against soil detachment from water and wind erosion.

Table 9-3 Cultivated Areas for Impaired Stream Segments in the Little Vermilion River (LaSalle County) Watershed

Waterbody Name	Segment ID	Land Cover Area (Acres)	Cultivated Area (Acres)	Percent Cultivated
Little Vermilion River	DR-01	80,420	60,581	75%
Mendota Creek	DRD	4,719	2,957	63%

Conservation tillage practices are no-till and reduced-till. No-till is the practice of limiting soil disturbance in order to manage the amount, orientation, and distribution of crop and plant residue on the soil surface year-round (Illinois NRCS CPS 329). Reduced-till is managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year-round while limiting the soil-disturbing activities used to grow and harvest crops in systems where the field surface is tilled prior to planting (Illinois NRCS CPS 345).

The no-till practice consists only of an in-row soil tillage operation during the planting activities and a seed row/furrow closing device. No full-width tillage is performed from the time of harvest or termination of one cash crop to the time of harvest/termination of the next cash crop in the rotation regardless of the depth of the tillage operation. Limited tillage is allowed to close or level ruts from harvesting equipment; however, no more than 25 percent of the field may be tilled for this purpose.

As noted above, the reduced-till practice consists of managing plant residue on the soil surface while limiting soil-disturbing activities. The practice includes tillage methods commonly referred to as mulch tillage or conservation tillage where the entire soil surface is disturbed by tillage operations such as chisel plowing, field cultivating, tandem disking, or vertical tillage. It also includes tillage/planting systems with few tillage operations (e.g., ridge till) but which do not meet the criteria for the no-till practice as described above and in Illinois NRCS CPS 329.

In both the no-till and reduced-till practices, removal of residue from the row area prior to or as part of the planting operation is acceptable. In the no-till practice, however, the disturbed portion of the row width should not exceed one third of the crop row width. In either practice, none of the residue should be burned. To reduce erosion to the targeted level, the current approved water and/or wind erosion prediction technology should be used to determine the amount of randomly distributed surface residue needed, the period of the year the residue needs to be present in the field, and the amount of surface soil disturbance allowed. All residues shall be uniformly distributed over the entire field. Residue should not be shredded after harvest because shredding makes it susceptible to movement by wind or water, and areas where the shredded residue accumulates may interfere with planting of the next crop.

If the no-till BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 329. Similarly, if the reduced-till BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 345.

Conservation tillage practices can remove up to 45 percent of the dissolved and total phosphorus from runoff and approximately 75 percent of the sediment. Additionally, studies have found around 93 percent less erosion occurred from no-till acreage compared to acreage subject to moldboard plowing (USEPA 2003). Tillage practices in the Little Vermilion River DR-01 and Mendota Creek DRD impaired segment areas should be assessed and possibly improved upon to reduce sediment loads.

Stripcropping: Stripcropping is the practice of growing planned rotations of erosion-resistant and erosion-susceptible crops or fallow in a systematic arrangement of approximately equal strips (two or more) across a field. This practice reduces sheet, rill, and wind erosion as well as the transport of sediment and other water- and wind-borne contaminants. Stripcropping can be applicable on steeper slopes but is less effective on slopes exceeding 12 percent. The practice has the greatest impact where cropped or fallow strips having less than 10 percent cover are alternated with close grown and/or grass/legume strips or crop strips with 75 percent or greater surface cover. Stripcropping is not well suited to rolling topography and does not apply to situations where the widths of alternating strips cannot be made generally equal.

Vegetation in a stripcropping arrangement consists of crops and/or forages grown in a planned rotation. No two adjacent strips should be in an erosion-susceptible condition at the same time during the year although two adjacent strips may be in erosion-resistant cover at the same time. Erosion-resistant strips should be crops or crop residues that provide the needed protective cover during those periods when erosion is expected to occur. Acceptable protective cover is tolerant of the anticipated depth of sediment deposition and includes a growing crop, including grasses, legumes, or grass-legume mixtures, standing stubble, residue with enough surface cover to provide protection, or surface roughness sufficient to provide protection. When the erosion-resistant strip is in permanent vegetation, the species established shall either be tolerant to herbicides used on the cropped strips or protected from damage by herbicides used on the cropped strips.

All tillage and planting operations will follow an established strip line. Strip boundaries shall run parallel to each other and follow as close to the contour as practical. Strips widths shall be determined using currently approved erosion prediction technologies but shall not exceed 50 percent of the slope length used for erosion prediction or 150 feet, whichever is less. Strips susceptible to erosion shall be alternated down the slope with strips of erosion-resistant cover.

When using stripcropping, a separate plan shall be prepared for each field which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 585, including arrangement and vegetative condition of strips, minimum and maximum row grades, minimum ridge height, critical slope length, headlands and end rows, and establishment of stable outlets to control runoff. Sediment accumulations along strip edges should be smoothed or removed and re-distributed over the field as necessary to maintain practice effectiveness. When headlands are in permanent cover, they should be renovated as needed to keep ground cover above 65 percent. No-till renovation of headlands is recommended, but in any case should only include the immediate seedbed preparation and reseeding to a sod-forming crop with or without a nurse crop. Full headland width should be maintained to allow turning of farm implements at the end of a tilled strip to double back on the same strip.

Conservation Crop Rotation: Conservation crop rotation is a planned sequence of at least two different crops grown on the same ground over a period of time (i.e., the rotation cycle), and applies to all cropland where at least one annually-planted crop is included in the crop rotation. This practice can reduce sheet, rill, and wind erosion as well as reduce water quality degradation due to excess nutrients. For the purposes of the practice, a cover crop is considered a different crop. Where applicable, suitable crop substitutions may be planted when the planned crop cannot be planted due to weather, soil conditions, or other local situations. Acceptable substitutes are crops having similar properties that will accomplish the purpose of the original crop.

For reducing sheet, rill, and wind erosion, the crops, a tillage system, and cropping sequences should be selected that will produce sufficient and timely quantities of biomass or crop residue which will reduce erosion to the planned soil loss objective, as calculated using current approved erosion prediction technology. Selection of high-residue producing crops and varieties, use of cover crops, and adjustment of plant density and row spacing can enhance production of the kind, amount, and distribution of residue needed, especially when used in combination with Illinois NRCS CPSs for Residue and Tillage Management (Codes 329 and 345, discussed above under “Conservation Tillage”). Crop damage by wind erosion can be reduced by selecting crops tolerant to abrasion from windblown soil or high wind velocity. Alternatively, if crops sensitive to wind erosion damage are grown, the potential for plant damage can be reduced by crop residue management, field windbreaks, herbaceous wind barriers, intercropping, or other methods of wind erosion control.

To recover excess nutrients from the soil profile in order to reduce water quality degradation, crops with the following qualities should be used: quick germination and root system formation, a rooting depth sufficient to reach the nutrients not removed by the previous crop, and nutrient requirements that readily utilize the excess nutrients. In addition, including perennial or annual legume crops in the rotation can help provide nitrogen for the non-legume crops, especially in fields where manure applications are restricted by high or excessive soil phosphorus or potassium levels.

When using conservation crop rotation, a separate plan shall be prepared for each field or treatment unit which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 328.

Conservation Cover: Conservation cover is the practice of establishing and maintaining permanent vegetative cover in order to: reduce sheet, rill, and wind erosion and sedimentation; and reduce ground and surface water quality degradation by nutrients and surface water quality degradation by sediment. This practice applies on all lands needing permanent herbaceous vegetative cover and can be applied on only a portion of a field; however, it does not apply to plantings for forage production or to critical area plantings.

When using conservation cover, the amount of plant biomass and cover needed to reduce wind and water erosion to the planned soil loss objective should be calculated using the current approved wind and/or water erosion prediction technology. The selected plant species should be suitable for the planned purpose as well as adapted to the soil, ecological, and climatic conditions of the area. Planting dates, planting methods, and care in handling and planting of the seed or planting stock shall ensure that planted materials have an acceptable rate of survival. No-till

seeding methods are preferred where erosion concerns are present. Periodic removal of some products such as high value trees, medicinal herbs, nuts, and fruits is permitted provided the conservation purpose is not compromised by the loss of vegetation or harvesting disturbance.

When using conservation cover, a separate plan shall be prepared for each field which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 327, including seeding periods; seed quality; seedbed preparation and seeding; use of temporary and/or nurse crops (if necessary); native species; seed mixtures; soil testing; fertilizer, lime, and pesticide requirements; weed and companion crop control; and maintenance of the vegetative cover. Mowing after the establishment period (except for noxious weed control) shall be done prior to April 15 or after August 1 to protect nesting wildlife. Exceptions can be made to allow mowing, burning, and/or chemical treatments when necessary to maintain the health and diversity of the plant community.

Cover Crop: A cover crop consists of grasses, legumes, and forbs planted for seasonal vegetative cover. This practice can help reduce wind and water erosion as well as reduce water quality degradation by utilizing excessive soil nutrients. Cover crops may either be established between successive production crops, or companion-planted or relay-planted into production crops. Species and planting dates should be selected that will not compete with the production crop yield or harvest. Cover crops should not be harvested for seed, nor should the residue be burned.

As discussed in Illinois NRCS CPS 340, plant species, seeding rates, seeding dates, and seeding depths should be determined using the Illinois Cover Crop Selection Tool (<http://www.mccc.msu.edu/selectorINTRO.html>). Cover crops should be selected based on having the physical characteristics necessary to provide adequate erosion protection, their ability to effectively utilize the nutrients of concern, and their ability to produce higher volumes of organic material and root mass in order to maintain or increase soil organic matter. Use of deep-rooted species will help maximize nutrient recovery. The cover crop should be established as soon as practical prior to or after harvest of the production crop, and terminated as late as practical to maximize plant biomass production and nutrient uptake, while allowing time to prepare the field for the next production crop.

When using a cover crop, a separate plan shall be prepared for each field which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 340. The cover crop should be evaluated periodically to determine if the cover crop is meeting the planned purpose. If not, changes to the crop species, management, or technology should be implemented.

Filter Strips: As discussed in Section 9.3.2, filter strips can be used as a control to reduce both pollutant loads from runoff, such as phosphorus, and sedimentation to impaired stream segments. Filter strip areas are calculated as described in Section 9.3.2. Based on those calculations and as noted in **Table 9-2**, there are approximately 4,499 acres of agricultural land within the 234-foot buffer delineated for DR-01 and its tributaries, and approximately 485 acres of agricultural land within the 234-foot buffer delineated for DRD and its tributaries.

Riparian Buffers: Riparian corridors, including both the stream channel and adjacent land areas, are important components of watershed ecology. Riparian vegetation, specifically the shade-

producing variety, plays a significant role in controlling stream temperature change. The shade provided will reduce both solar radiation loading to the stream and peak temperatures during the growing season which can in turn increase the waterbody DO saturation level. Furthermore, preserving natural vegetation along stream corridors can effectively reduce water quality degradation associated with development. The root structure of the vegetation in a buffer enhances infiltration of runoff and subsequent trapping of nonpoint source pollutants, such as phosphorus. The buffers are only effective in this manner, however, when the runoff enters the buffer as a slow moving, shallow sheet. Concentrated flow in a ditch or gully will quickly pass through the buffer offering minimal opportunity for retention and uptake of pollutants.

Even more important than the filtering capacity of the buffers is the protection they provide to streambanks. The rooting systems of the vegetation serve as reinforcements in streambank soils, which help to hold streambank materials in place and minimize erosion. Due to the increase in stormwater runoff volume and peak rates of runoff associated with agriculture and other land development, stream channels are subject to greater erosional forces during stormflow events. Thus, preserving natural vegetation along stream channels minimizes the potential for water quality and habitat degradation due to streambank erosion as well as that additional pollutant or sediment load entering the stream.

Converting land adjacent to streams for the creation of riparian buffers will provide stream bank stabilization, stream shading, and nutrient uptake and trapping from adjacent areas. Minimum buffer widths of 25 feet are required for water quality benefits. Higher removal rates are provided with greater buffer widths. The NCSU (2000) reports phosphorus removal rates of approximately 25 to 30 percent for 30-foot-wide buffers and 70 to 80 percent for 60-to 90-foot-wide buffers. The report also states that riparian corridors typically treat a maximum of 300 feet of adjacent land before runoff forms small channels that short circuit treatment. In addition to the treated area, the land converted from agricultural land to buffer strip will generate up to a 90 percent lower nutrient load based on data presented in Haith et al. (1992).

Land use data were clipped to a 25-foot buffer zones created around the Little Vermilion River (DR-01) and Mendota Creek (DRD) impaired stream segments and their tributaries. Grassland, forest, and agricultural areas within the 12-foot buffer zones are shown in **Table 9-4** by segment. There are 909 acres within 25 feet of DR-01 and its tributaries; approximately 391 of these acres are existing grassland or forest while 421 acres are currently classified as agricultural and may be candidates for riparian buffers. There are 94 acres within 25 feet of DRD and its tributaries; approximately 18 of these acres are existing grassland or forest while 47 acres are currently classified as agricultural and may be candidates for riparian buffers. Landowners should be encouraged to assess parcels adjacent to the stream channels and maintain or improve existing riparian areas or potentially convert cultivated lands.

Table 9-4 Total Area and Area of Grassland, Forest, and Agricultural Land Within 25-Foot Buffer, by Stream Segment

Stream Name	Segment ID	Area in 25 ft Buffer (Acres)	Grassland in 25 ft Buffer (Acres)	Forest in 25 ft Buffer (Acres)	Agricultural Land in 25 ft Buffer (Acres)
Little Vermilion River	DR-01	909	191	200	421
Mendota Creek	DRD	94	16	2	47

Nutrient Management: Nutrient management programs could result in reduced nutrient loads to the impaired stream segments in the Little Vermilion River (LaSalle County) watershed. Crop management of nitrogen and phosphorus originating in the agricultural portions of the watershed can be accomplished through Nutrient Management Plans (NMPs) that focus on increasing the efficiency with which applied nutrients are used by crops, thereby reducing the amount available to be transported to both surface water and groundwater. As indicated in **Table 9-3**, approximately 60,581 acres in the Little Vermilion River (LaSalle County) watershed are under cultivation; these areas may benefit from NMPs.

The overall goal of nutrient reduction from agriculture should be to increase the efficiency of nutrient use by balancing nutrient inputs in feed and fertilizer with outputs in crops and animal produce as well as to manage the concentration of nutrients in the soil. The four “Rs” of nutrient management are applying the right fertilizer source at the right rate at the right time and in the right place. It is not unusual for crops in fields or portions of fields to show nutrient deficiencies during periods of the growing season, even where an adequate NMP is followed. The fact that nutrients are applied does not necessarily mean they are available. Plants obtain most of their nutrients and water from the soil through their root system. Any factor that restricts root growth and activity has the potential to restrict nutrient availability and result in increased nutrient runoff.

Reducing nutrient loss in agricultural runoff may be brought about by source and transport control measures, such as filter strips or grassed waterways. The NMPs account for all inputs and outputs of nutrients to determine reductions. NMPs typically include the following measures:

- A review of aerial photography and soil maps
- Recommendation for regular soil testing – Traditionally, soil testing has been used to decide how much lime and fertilizer to apply to a field. With increased emphasis on precision agriculture, economics, and the environment, soil tests have become a logical tool to determine areas where adequate or excessive fertilization has taken place. Additionally, they can be used to monitor nutrient buildup in soils due to past fertility practices and aid in determining maintenance fertilization requirements. Appropriate soil sampling and analysis techniques are described in the ([Illinois Agronomy Handbook](#)).
- A review of current and/or planned crop rotation practices
- Establishment of yield goals and associated nutrient application rates – Matching nutrient applications to crop needs will minimize the potential for excessive buildup of phosphorus soil tests and reallocate phosphorus sources to fields or areas where they can produce agronomic benefits.
- Development of nutrient budgets with planned application rates (which may be variable), application methods, and timing and form of nutrient application
- Identification of sensitive areas and restrictions on application when land is snow covered, frozen or saturated

Phosphorus is listed as a potential cause of impairment in some areas of the Little Vermilion River (LaSalle County) watershed. Regional differences in phosphorus-supplying power are shown in **Figure 8-4** of the ([Illinois Agronomy Handbook](#)). The differences were broadly defined primarily based on variability in parent material, degree of weathering, native vegetation, and natural drainages. For example, soils developed under forest cover appear to have more available subsoil phosphorus than those developed under grass. In the Little Vermilion River (LaSalle County) watershed in northern Illinois, soils are generally considered to have low to medium phosphorus-supplying power; therefore, buildup and maintenance of phosphorus levels are sometimes needed in this area. Application amounts should be determined by periodic soil testing. Subsoil levels of phosphorus in the northern Illinois region may be rather high by soil test in some soils, but this is partially offset by conditions that restrict rooting ([Illinois Agronomy Handbook](#)).

It should be noted, however, that excessively high-phosphorus soil test levels should not be maintained. While soil test procedures were designed to predict where phosphorus was needed, not to predict environmental problems, the likelihood of phosphorus loss increases with high-phosphorus test levels. Environmental decisions regarding phosphorus applications should include such factors as distance from a significant waterbody, infiltration rate, slope, and residue cover. One possible problem with using soil test values to predict environmental problems is in sample depth. Normally samples are collected to a 7-inch depth for predicting nutritional needs. For environmental purposes, it would often be better to collect the samples from a 1- or 2-inch depth, which is the depth that will influence phosphorus runoff. Another potential problem is variability in soil test levels within fields in relation to the dominant runoff and sediment-producing zones. Several fertilizer placement recommendations are described in the ([Illinois Agronomy Handbook](#)). However, given the propensity of phosphorus to bind tightly to soil particles and subsequently enter streams through erosion, the deep fertilizer placement technique may be most appropriate in phosphorus impaired areas such as the Little Vermilion River (LaSalle County) watershed. Under the deep placement technique, the fertilizer is placed 4 to 8 inches deep into the soil rather than being spread near the surface.

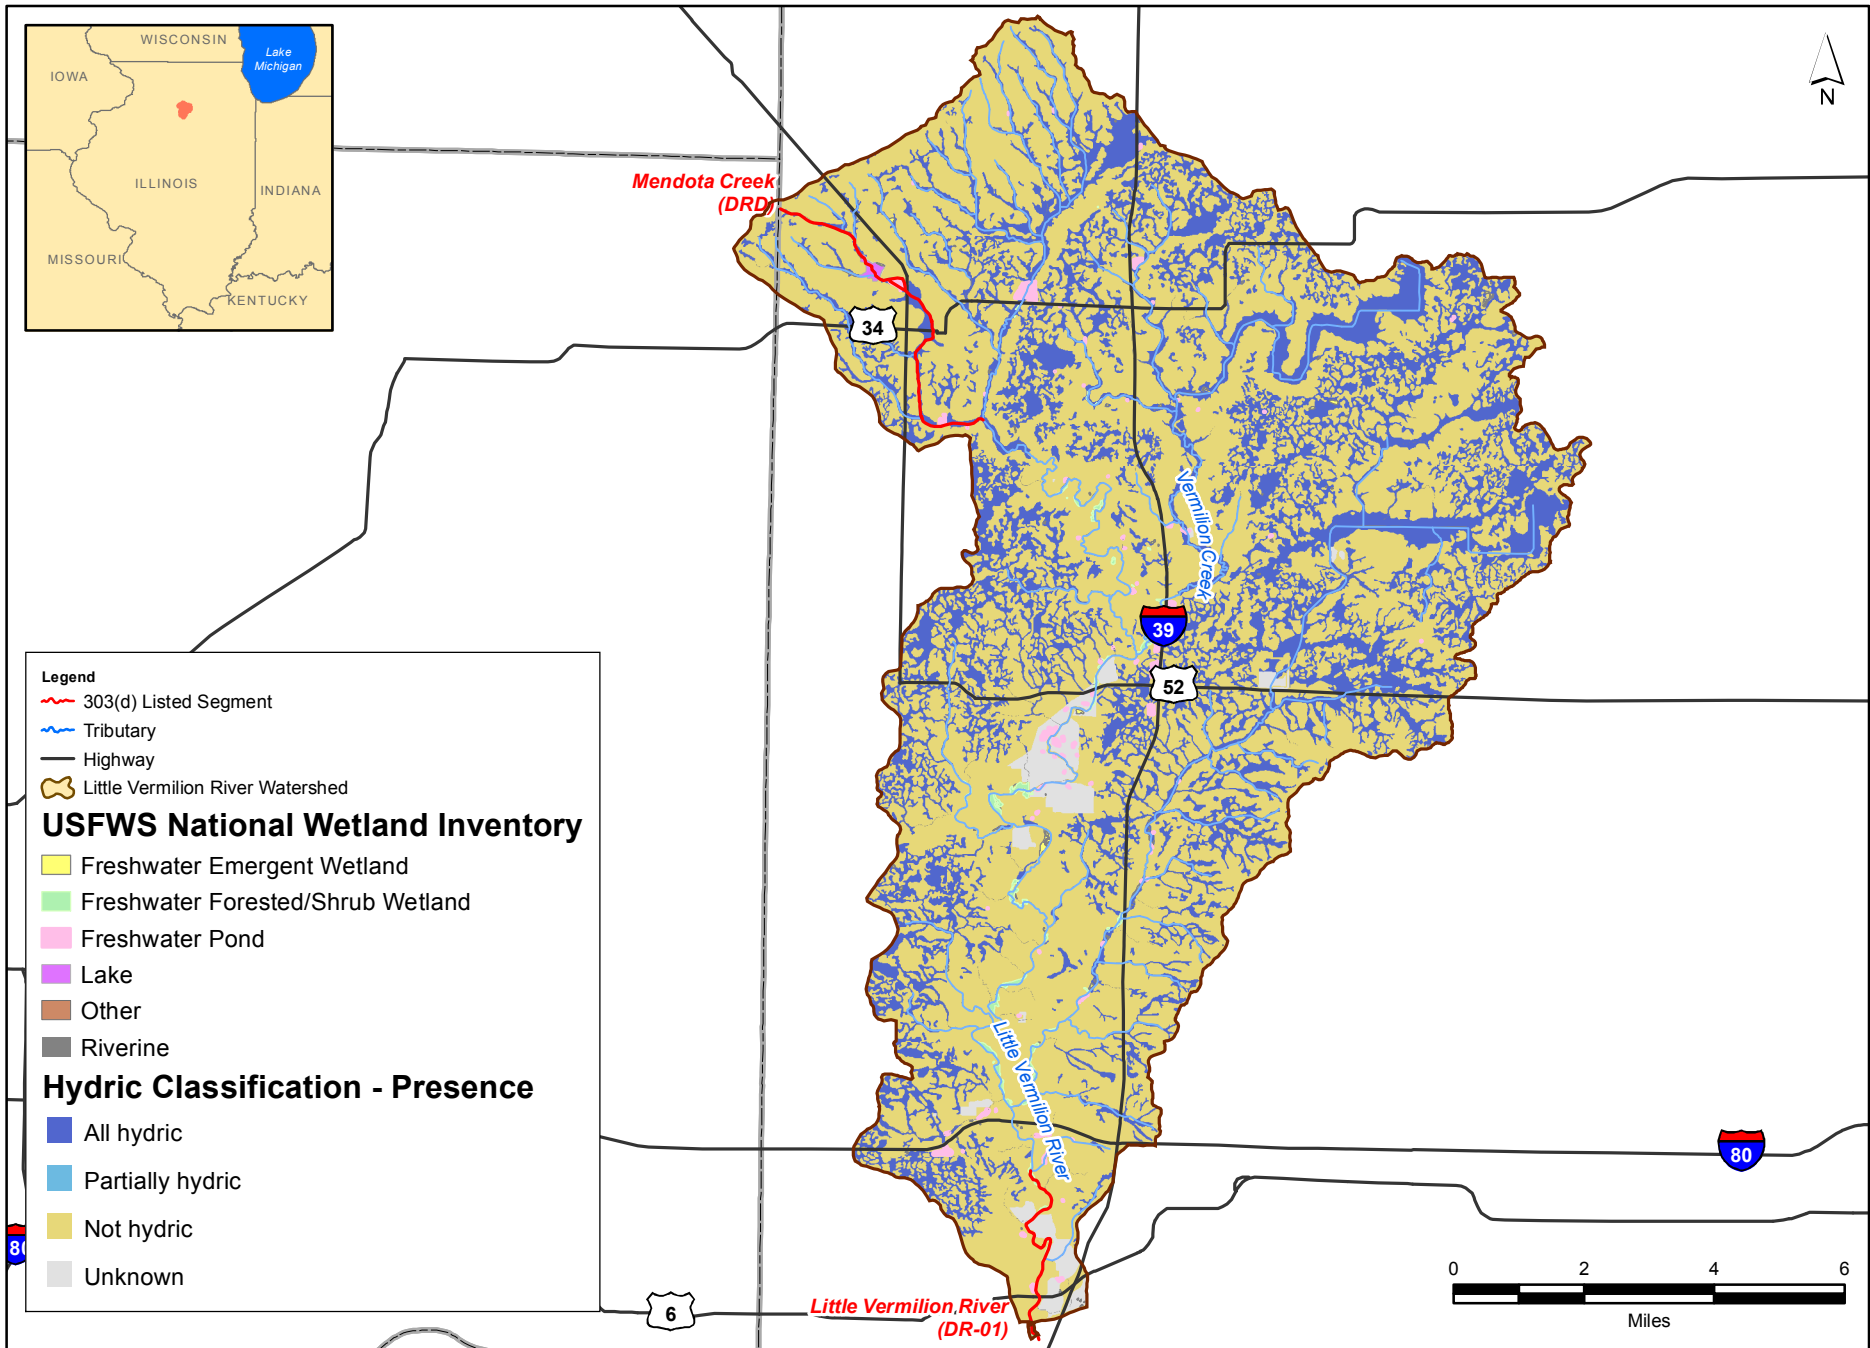

Wetlands: The use of wetlands as a structural control is applicable to nutrient reduction. To treat loads from agricultural runoff, such as phosphorus, wetlands could potentially be constructed at select locations where more focused runoff from fields occurs; e.g., downstream of a tile drainage system. Wetlands are effective BMPs for phosphorus and sediment control because they:

- Prevent floods by temporarily storing water, allowing the water to evaporate or percolate into the ground
- Improve water quality through natural pollution control such as plant nutrient uptake
- Filter sediment
- Slow overland flow of water thereby reducing soil erosion (NRCS 2014)

A properly designed and functioning wetland can provide very efficient treatment of pollutants, such as phosphorus. Design of wetland systems is critical to the sustainable functionality of the system and should consider soils in the proposed location, hydraulic retention time, and space

requirements. In general, soils classified as hydric are most suitable for wetland construction. The current extent of soils classified as “hydric” by the NRCS as well the current extent of existing USFWS classified wetlands in the Little Vermilion River (LaSalle County) watershed are shown in **Figure 9-3**. These data layers are developed on a large-scale and onsite soil investigation and wetland delineation is typically necessary for verification of the suitability of a given area for wetland construction.

This page intentionally left blank.

This page intentionally left blank.

Constructed wetlands, which comprise the second or third stage of a nonpoint source treatment system, can be remarkably effective at improving water quality. Studies have shown that artificial wetlands designed and constructed specifically to remove pollutants from surface water runoff have removal rates of greater than 90 percent for suspended solids, 0 to 90 percent for total phosphorus, 20 to 80 percent of orthophosphate, and 10 to 75 percent for nitrogen species (Johnson et al. 1996; Moore 1993; USEPA 2003; Kovosic et al. 2000). Although the removal rate for phosphorus is low in long-term studies, the rate can be improved if sheet flow is maintained to the wetland and vegetation and substrate are monitored to ensure the wetland is operation optimally. Sediment or vegetation removal may be necessary if the wetland removal efficiency is lessened over time (USEPA 2003). Guidelines for wetland design suggest a wetland to watershed ratio of 0.6 percent for nutrient and sediment removal from agricultural runoff.

Water and Sediment Control Basins (WASCOBs): WASCOBs are earth embankments or combination ridge and channel systems constructed across the slopes of minor watercourses to reduce watercourse and gully erosion. These basins act as water detention basins and trap sediments (and the pollutants bound to the sediment) prior to them reaching a receiving water. The WASCOB reduces gully erosion by controlling flow within the drainage area, and the basins may be installed singly or in series as part of a system. The practice applies to sites where the topography is generally irregular, runoff and sediment damage land and improvements, and watercourse or gully erosion is a problem. Adequate and stable outlets from the basin are required to convey runoff water to a point where it will not cause damage. Additionally, sheet and rill erosion should be controlled by other conservation practices; i.e., the WASCOB would be part of another conservation system that adequately addresses resource concerns both above and below the basin. However, if land ownership or physical conditions preclude treatment of the upper portion of a slope, a WASCOB may be used to separate the upper area from, and permit treatment of, the lower slope.

WASCOBs should, at a minimum, be designed to be large enough to control runoff from at least a 10-year, 24-hour storm using a combination of flood storage and discharge through the outlet. Additionally, the WASCOB must be designed to have the capacity to store at least the anticipated 10-year sediment accumulation. Otherwise, periodic sediment removal is required as part of the maintenance activities in order to maintain the required capacity. Locations are determined based on slopes, erosion areas, crop management, and soil survey data.

When using a WASCOB, a separate plan shall be prepared for each treatment unit which will use this practice. Local NRCS personnel can often provide information and advice for design and installation. Illinois NRCS CPS 638 also provides additional information on the design and maintenance requirements for WASCOBs, as well as information on cropping activity recommendations and requirements around the basin. Maintenance includes reseeding or planting the basins in order to maintain vegetation, where specified, and periodically checking them, especially after large storms, to determine the need for embankment repairs or mechanical removal of excess sediment. Inlets and outlets should be cleaned regularly. Damaged components should be replaced promptly.

Phosphorus-Based Lawn Fertilizer Restrictions: Runoff from urban areas may include phosphorus-based fertilizers applied to residential lawns, golf courses, and other surfaces. If used too close to a receiving waterbody, phosphorus present in stormwater runoff, if any, will enter the waterbody. Illinois has a statute in place which governs the use of phosphorus-based fertilizers in urban areas: Lawn Care Products Application and Notice Act (415 ILCS 65/). This act includes the following prohibitions for phosphorus-based fertilizers (see act for limited exceptions):

- They shall not be applied to lawns unless it can be demonstrated by soil test that the lawn is lacking in phosphorus when compared against the standard established by the University of Illinois; see the act for exceptions
- They shall not be applied to impervious surfaces
- They shall not be applied within 3 feet of any waterbody if a spray, drop, or rotary spreader is used. If other equipment is used, the fertilizer may not be applied within 15 feet of a waterbody.
- They shall not be applied when the ground is frozen or saturated
- Appropriate lawn markers for the application event and notifications to potentially affected adjacent properties are required

Private Septic System Inspection and Maintenance Program: Failing or leaking septic systems can be a source of phosphorus pollution. A program that actively manages functioning systems and addresses non-functioning systems could be implemented to reduce the potential phosphorus loads from septic systems in the watershed. Guidance for managing septic systems was described in Section 9.3.2 of this document.

9.5 BMP Recommendations for Improving DO in Mendota Creek

The Mendota Creek DRD segment of the Little Vermilion River (LaSalle County) watershed was listed for impairment of aquatic life use due to a single low DO concentration which occurred in 1988. As discussed in Section 5 of this report, this exceedance occurred at one of the six water quality stations located in this segment; however, additional Stage 2 sampling conducted by the Illinois EPA in 2015 showed that low DO is no longer an issue on this segment. The DO impairment in Mendota Creek is therefore recommended for delisting and no TMDLs or BMPs for improving DO were included.

9.6 BMP Recommendations for Improving pH in the Little Vermilion River Impaired Segment

The DR-01 segment of the Little Vermilion River (LaSalle County) watershed was listed for impairment of aquatic life use due to exceedances of pH in three of 89 historical samples; the exceedances occurred in samples collected between 2002 and 2005. However, additional Stage 2 sampling conducted by the Illinois EPA in 2015 showed that pH values are now within the

acceptable range. The pH impairment in the DR-01 segment is therefore recommended for delisting and no TMDLs or BMPs for improving pH were included.

9.7 BMP Recommendations for Reducing Total Suspended Solids in the Little Vermilion River Impaired Segment

The DR-01 segment of the Little Vermilion River is listed for impairment of aquatic life use due to excess TSS. As discussed in Section 7.2.1.5 of this report, 24 of the 71 samples collected within this segment represent loads greater than the allowable load limit established by the watershed-specific LRS target value. Exceedances have occurred under a full range of flow conditions although the exceedances do appear to occur with greater consistency at higher flows. Reductions of TSS loads needed to meet the LRS target values for the Little Vermilion River (LaSalle County) watershed are discussed in Section 8.3.4.

9.7.1 Nonpoint Sources for TSS

Nonpoint source runoff from agricultural areas, unstable streambanks, and increased mining operations are potentially the main contributors to high sediment/TSS loads in the DR-01 impaired stream segment. Under increased velocities, water has an increased soil carrying capacity and erosion becomes an issue. This is exacerbated during activities where soil has been exposed and can be easily transported out of the disturbed area. Additionally, grime accumulation on areas such as city streets may be washed into nearby waterbodies. Therefore, to achieve a reduction of TSS for the impaired segment, management measures should address surface runoff and erosion controls and loading through sediment. These types of controls also provide the secondary benefit of reducing other contaminants, such as phosphorus and fecal coliform, that may be entering waterways via erosive and runoff processes. BMPs that could be utilized to treat the DR-01 nonpoint TSS sources are described below.

Filter Strips, Field Borders and Riparian Buffers: As discussed above, filter strips and field borders can be used as a control to reduce both pollutant loads from runoff and sedimentation to impaired stream segments. Grass filter strips have been shown to remove as much as 65 percent of sediment. Riparian vegetation also provides bank stability that further reduces pollutant and sediment loading to the stream (described in Section 9.4.1). Filter strip and riparian buffer areas are calculated as described in Sections 9.3.2 and 9.4.1, respectively. Potential areas are shown in **Table 9-2** for filter strips and **Table 9-4** for riparian buffers. Landowners should be encouraged to evaluate their land adjacent to the stream and its tributaries to determine the practicality of installing or extending filter strips and/or riparian buffers.

Terracing: Terracing is a soil conservation practice that can prevent runoff of precipitation falling on high gradient lands from causing serious erosion. Terraces may consist of an earthen embankment, a channel, or a combination of ridges and channels constructed across the slope. They can be narrow based (grass on both sides), grass backed, or farmable (no grass), and have an outlet to convey runoff water to a point where it will not cause damage. Terraces reduce both the volume and velocity of water moving across the soil surface, which greatly reduces soil erosion. Terracing reduces peak discharge rates by temporarily storing runoff, allowing the associated sediment and other contaminants to settle out behind the terrace ridge rather than directly entering a receiving stream. Terrace systems have been shown to remove as much as 85

percent of sediment and 70 percent of total phosphorus from runoff (USEPA 2003). See Illinois NRCS CPS 600 for additional guidance, including information on spacing, alignment, capacity, cross-sections, channel grades, and outlets.

If this BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Minimum elements for each plan are discussed in Illinois NRCS CPS 600. The terraces should be inspected periodically and repaired as needed, including maintaining terrace ridge heights, channel profiles, terrace cross-sections, and outlet elevations. Accumulated sediment should be removed regularly to maintain terrace capacity and grade. For terraces where vegetation is specified, seasonal mowing, control of trees and brush, reseeding, and fertilizing should be completed as needed.

Grassed Waterways: A grassed waterway is a shaped or graded channel, established with suitable vegetation, used to convey surface water at a non-erosive velocity by way of a broad and shallow cross-section to a stable outlet. The vegetative cover within the waterway reduces peak discharge and protects the channel surface from rill and gully erosion. Waterways are often constructed in naturally-occurring depressions where the water collects and flows to an outlet but can be constructed in any area where added water conveyance capacity and vegetative protection are needed to prevent erosion resulting from concentrated surface flow. In addition to reducing erosion, grassed waterways can positively affect water quality through uptake of other pollutants attached to soils such as nutrients. Criteria for constructing grassed waterways are discussed in Illinois NRCS CPS 412, including capacity, stability, width, depth, side slopes, drainage and outlets, and establishment of vegetation.

When using a grassed waterway, a separate plan shall be prepared for each treatment unit which will use this practice and which describes how the practice requirements will be applied to that particular area. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 342, The NRCS recommends these maintenance measures for grassed waterways:

- Plant a good quality NRCS-approved seed mixture. Fertilization of the vegetation should not be necessary unless the waterway is proven to lack proper nutrients. Avoid spraying herbicides in or adjacent to the waterway. Mowing or periodic grazing of the vegetation may be appropriate to maintain waterway capacity and reduce sediment deposition. Noxious weeds should be controlled.
- Inspect the area frequently for eroding areas, places needing reseeding, and damaged caused by machinery, herbicides, or livestock. Repair all areas as needed; e.g., minor rills or gullies may be repaired by reshaping and reseeding. Outlets should also be maintained to prevent gullies from forming. This may include reshaping and reseeding the outlet, or repairing components of structural outlets.
- Maintain the width of the grass area when tilling and planting adjacent fields. If possible, bring row crop patterns up to (but not into) the waterway nearly on the contour. Do not plant end rows along the side of the waterway. Do not use the waterway as a turn area because this can result in damage to the vegetation.

- Avoid driving up and down, or crossing, grassed waterways, especially during wet conditions. This can damage the vegetation and the ruts caused by tire tracks can lead to gullies.
- When crossing grassed waterways, lift tillage equipment off of the waterway and turn off chemical application equipment.

Wetlands: As discussed in Section 9.4.1, wetlands are effective BMPs for sediment and some pollutant control. Studies have shown that artificial wetlands designed and constructed specifically to remove pollutants from surface water runoff have removal rates of greater than 90 percent for suspended solids. To treat TSS loads generated from agricultural runoff within the Little Vermilion DR-01 segment, wetlands could be constructed at select locations where more focused runoff occurs; e.g., downstream of a tile drainage system. The current extent of soils classified as “hydric” by the NRCS as well the current extent of existing USFWS classified wetlands in the Little Vermilion River (LaSalle County) watershed were shown in **Figure 9-3**.

WASCOBs: As discussed in Section 9.4.1, WASCOBs are designed to trap sediments prior to reaching a receiving water. WASCOBs can therefore be effective in reducing phosphorus loads to waterbodies by capturing pollutant-laden water and sediment before it reaches the waterbody and allowing the contaminants to settle out. As with wetlands, WASCOBs could potentially be constructed at select locations where more focused runoff from fields occurs; e.g., downstream of a tile drainage system.

Streambank Stabilization/Erosion Control: Treatments used to stabilize and protect banks of streams or constructed channels, and shorelines of lakes, reservoirs, or estuaries, are discussed in Illinois NRCS CPS 580. This practice can be used to help maintain the flow capacity of streams or channels, and to reduce the offsite or downstream effects of sediment resulting from bank erosion.

Prior to implementation of the practice, an assessment of the unstable streambank or shoreline sites should be conducted in sufficient detail to identify the causes contributing to the instability (e.g., livestock access, watershed alterations resulting in significant modifications of discharge or sediment production, and in channel modifications such as water level fluctuations and boat-generated waves). Protective treatments need to be compatible with the bank or shoreline materials, water chemistry, channel or lake hydraulics, and slope characteristics above and below the water line.

Treatment area designs should provide for protection of installed treatments from overbank flows resulting from upslope runoff and flood return flows, and from bank seepage. The designs should also account for any anticipated ice action, wave action, and fluctuating water levels. End sections of treatment areas shall be adequately anchored to existing treatments, terminate in stable areas, or be otherwise stabilized to prevent flanking of the treatment. Livestock traffic along treated streambanks and shorelines shall be limited to stable access points. All disturbed areas around protective treatments shall be protected from erosion through cultivation or selected vegetation suitable for the site conditions and intended purposes.

Streambanks should be assessed to determine if the causes of instability are local (e.g., poor soils, high water table in banks, alignment, obstructions deflecting flows into the bank, etc.) or systemic (e.g., aggradation due to increased sediment from the watershed, increased runoff due to urban development in the watershed, degradation due to channel modifications, etc.). Bank protection treatment should not be installed in channel systems undergoing rapid and extensive changes in bottom grade and/or alignment unless the treatment is designed to control or accommodate the changes. Bank treatment shall be constructed to a depth at or below the anticipated lowest depth of streambed scour. When appropriate, a buffer strip and/or diversion may be established at the top of the bank or shoreline protection zone to help maintain and protect installed treatments; improve their function; and filter out sediments, nutrients, and pollutants from runoff.

Some available approaches to potentially decrease nonpoint TSS, sedimentation/siltation, and/or pollutant source loads, as well as helping to stabilize eroding banks include the following:

- **Rock Riffle Grade Control:** Naturally stable stream systems typically have an alternating riffle-pool sequence that helps to dissipate stream energy. Riffle rock grade control places loose rock grade control structures at locations where natural riffles would occur to create and enhance the riffle-pool flow sequence of stable streams. By installing riffle rock in an incised channel, the riffles will raise the water surface elevation resulting in lower effective bank heights, which increases the bank stability by reducing the tractive force on the banks (Kinney 2005).
- **Stone Toe Protection:** Non-erodible materials are used to protect the eroding banks of a stream. Meandering bends found in the watershed could potentially be stabilized by placing the hard armor only on the toe of the bank. Stone toe protection is most commonly implemented "using stone quarry stone that is sized to resist movement and is placed on the lower one third of the bank in a windrow fashion" (Kinney 2005).
- **Floodplain Excavation:** Rather than raising the water level, Floodplain Excavation lowers the floodplain to create a more stable stream. Floodplain Excavation uses mechanical means to restore the floodplain by excavating and utilizing the soil that would eventually be eroded away and deposited in the stream (Kinney 2005).
- **Rock chutes:** Rock chutes are riprap lined water conveyance structures used to move water down a slope in a non-erosive manner. The main purpose of a rock chute is to reduce channel flow velocity by dissipating energy and to provide a stable grade at the outlet to prevent erosion.

The extent of streambank erosion within and upstream of the Little Vermilion DR-01 impaired segment is unknown. Further investigation is recommended to determine the extent that erosion control measures could help manage TSS loads in the reaches.

Native Planting: The local SWCD provided comment encouraging the use of stabilization cover in areas with open-pit mining. Local stakeholders indicated that mining operations near the impaired waterbody have increased in recent years. According to the NRCS, "this approach takes advantage of the deep-rooted native species that historically stabilized the soil, slowed runoff, facilitated infiltration, and decreased erosion prior to development of the area. These species may

also offer a more aesthetically pleasing solution to the stormwater and erosion challenges, while providing better wildlife habitat.”

9.8 BMP Recommendations for Reducing Chloride in the Little Vermilion River Impaired Segment

Chloride is a conservative ion, does not degrade, and has the potential to accumulate within waterbodies over time. Chloride is toxic to aquatic organisms at high concentrations and, even at lower concentrations, chloride may impact biological community structure, diversity, and productivity. Chloride salts can also affect soil stability and permeability and increase the potential for erosion. The Little Vermilion River DR-01 segment was listed for impairment of aquatic life use due to water quality standard exceedances in two of the 65 samples collected in the segment. As described in Section 7.2.1.3, the exceedances occurred under dry/low flow conditions in 2003 and 2005. Reductions of chloride loads needed to meet the TMDL for the Little Vermilion River are discussed in Section 8.3.2.

9.8.1 Point Sources of Chloride

Table 5-8 of this document lists the NPDES permitted point sources present within and upstream of the impaired segment of the Little Vermilion River. Only one of the facilities, Carus Chemical Company (IL0002623), has discharge monitoring requirements for chloride. A WLA was calculated for this facility based on the instream standard of 500 mg/L as shown in **Table 8-7**. Continued and/or future monitoring of chloride concentrations in effluent from each of the facilities within the watershed will help provide greater certainty on the relative impact of dischargers to the chloride concentrations in the impaired segment.

An additional WLA was calculated for the IDOT MS4 permit. Roadways can contribute chloride from winter deicing. IDOT is required to follow the BMPs included in the MS4 permit to minimize the impact of road runoff to area receiving waters.

9.8.2 Nonpoint Sources of Chloride

Land use around the DR-01 impaired segment is predominantly urban. Nonpoint chloride sources may therefore originate from road de-icing activities using chloride salts. The following BMPs will provide a basis for management of chloride salt application to roadways.

Public Education and Staff Training: Educating the public is generally the first step in any water quality improvement campaign. Increased awareness about the application of road salt and the effects of excessive loading to waterbodies can increase community support for chloride use reduction. Information about what homeowners and businesses can do to limit chloride salt application in addition to municipal leadership should be included. The following elements could be included in the public education program:

- Informative fact sheets for public distribution. Environmental group outreach lists can be useful and the information could be in a general, adaptive form.
- Presentation or fact sheets targeted to municipal government officials.

- Public access television.
- Newspaper articles or advertisements.
- Declaration of “Limited Salt Use Areas” to highlight water quality protection and increase awareness.

Staff training is critical to reduce the quantity of road salt used as operators responsible for salt handling and application can have the largest impact on overuse and product loss. Elements of a staff training program could include:

- Initial training for new employees, including on-the-job training from experienced personnel. Alternatively, programs are offered by the American Public Works Association and Northeastern Illinois Public Safety Training Academy.
- Routine annual refresher training for salt handling and application with operators highlighting the impacts of road salt on water quality, infrastructure, and associated costs to the public. Proper storage and handling and application equipment and techniques should be covered as well, including record keeping and a review of the salt quantities required for each situation.
- Required training for private snow removal contractors generally involved in parking lot and private road snow removal. This could be done through a licensing or permitting process.

Storage and Handling: Proper storage and handling of road salt limits loss of salt to the environment and provides cost savings. The Salt Institute has published a Salt Storage Handbook (Salt Institute 2006) with recommended practices and design criteria for storage facilities. Additionally, the Transportation Association of Canada has published detailed BMPs for salt storage (TAC 2013). The Illinois Department of Transportation already has standard designs which can be adopted by municipalities. Existing facilities should be evaluated for improvement and bulk handling practices reviewed. Areas on which to focus evaluation should include protection from environmental conditions like wind and rain, storage on an impervious pad, and controlled offsite drainage. Training on proper handling and equipment inspection practices should include:

- Salt should be handled as little as possible to avoid particle breakdown and loss of material.
- Spillage should be minimized and cleaned up as soon as practicable.

Application: Proper application of salt for snow and ice control is fundamental to obtaining the desired effect of public road safety while minimizing product loss to the environment. Several guidelines and recommendations have been published including the Salt Spreading, Maintenance, Application, Rates & Timing (SMART) Learning Guide BMPs by Transportation Association of Canada (TAC 2005) and the Minnesota Department of Transportation handbook for snowplow operators (MDOT 2005). Records should be kept of salt use for each route, during each storm, by each vehicle, and by each operator. The records should be examined regularly to confirm that the target salt application rates are being met. Plowing snow just prior to salt application is good

practice and if side-cast snow accumulation interferes with continued plowing, it should be removed to an offsite disposal facility. There are two alternative application methods which could increase the effectiveness of traditional rock salt application during and after snow events described below.

- Use of a pre-wetting agent has been shown to reduce wasted salt during application by traffic scatter or wind by about 25% (Fay et al. 2005). Pre-wetted salt also acts more than dry salt because there is no delay waiting for a brine to form. Pre-wetting can be done onboard spreader trucks or by pre-treating salt stockpiles before loading trucks.
- Anti-icing programs should strongly be considered in conjunction with deicing programs. This involves the application of deicing agents on roads prior to ice or snow events. Correct timing for application involves use of accurate weather forecasts or weather information systems. These systems may require purchase or equipment modification and employee training. Programs can take advantage of the Illinois state-wide Road Weather Information Systems or provide their own means of weather condition monitoring. The Minnesota Department of Transportation Field handbook reports that anti-icing uses about 25% of the material at a tenth of the cost of conventional deicing (MDOT 2005).

Alternative Products: Non-chloride deicing products are available for purchase and agencies have well documented their use. It is recommended that a long-term pilot study be done within the watershed to determine effectiveness for this application. Acetate deicers do not contain chloride but can be relatively expensive. Organic deicers are also somewhat expensive, but can be used in select areas or in combination with other deicing liquids. More detailed information can be found in the Chloride Usage Education and Reduction Program Study (DRSCW 2007) by the DuPage River Salt Creek Workgroup, posted at <http://www.drscw.org/>.

9.9 BMP Recommendations for Reducing Total Zinc in the Little Vermilion River Impaired Segment

Little Vermilion River segment DR-01 is listed for impairment of aquatic life use due to elevated dissolved zinc concentrations that have historically exceeded both the chronic and acute standards. Zinc can combine with other elements, such as chlorine, oxygen, and sulfur, to form zinc compounds. Most zinc found naturally in the environment is in the form of zinc sulfide. Note that historic zinc smelting that occurred at the Matthiessen and Hegeler Zinc Company Site converted imported zinc sulfide to zinc oxide and elemental zinc.

Zinc mobility and bioavailability is mainly governed by pH. As with many trace metals, zinc solubility is higher under more acidic conditions. Alkaline conditions favor adsorption of zinc to oxides and oxyhydroxides of iron, manganese, and aluminum; and to clay minerals and organic matter; and sorption and/or precipitation with carbonate minerals. Organic matter appears to play a more important role on zinc adsorption as compared to the hydroxides. Under low reduction-oxidation conditions, zinc may form insoluble sulfides. Naturally-occurring chelating agents, such as many organic acids, can increase the solubility and mobility of zinc. The TMDL calculated for zinc is discussed in Section 8.3.1.

9.9.1 Point Sources of Zinc

As discussed in Sections 5.1.1.1, 7.2.1.2, and 8.3.1 of this document, the zinc loading in the DR-01 segment appears to be primarily sourced to the Matthiessen and Hegeler Zinc Company Site located in LaSalle, Illinois. Operable Unit 1 of the Site consists of Carus Company operations while Operable Unit 2 comprises the former production area of the Matthiessen and Hegeler Zinc Company, which included zinc smelting, a rolling mill, and ancillary operations. As noted in Section 8.3.1.5, remedial activities for the Matthiessen and Hegeler Zinc Company Site are currently in development through the RCRA process, and once implemented, should lead to significant reductions in zinc loads into the stream.

9.9.2 Nonpoint Sources of Zinc

Potential nonpoint sources of zinc include runoff from historic smelting operations in the watershed. For example, the June 2012 Remedial Investigation Report for the Matthiessen and Hegeler Zinc Company Site, LaSalle, Illinois (prepared by Geosyntec and SulTRAC) indicates that there is a partially submerged slag pile in the area which contains zinc compounds that leach to groundwater, surface runoff, and stream water and sediment. Additional sources of some metals contamination may be from naturally-occurring high background levels of some metals in soils which can then impact overland runoff, soil erosion, and groundwater. BMPs evaluated in this plan that could be utilized to treat nonpoint sources are described below. Because remedial activities are expected to be conducted for the Matthiessen and Hegeler Zinc Company Site, and, once implemented, should lead to significant reductions in zinc loads into the stream, costs for the BMPs described in this Section 9.9.2 are not included in Section 9.10.

For naturally-occurring nonpoint sources, filter strips, WASCObS, and streambank stabilization/erosion control practices may provide the secondary benefit of reducing any contaminants that may be attached to the soil, primarily by limiting the amount of zinc-enriched sediment or water flowing into the stream segment. These control practices were described in Sections 9.3.2, 9.4.1, and 9.7.1.

Additional BMPs for zinc include chemical or passive treatment methods and other mining-related reclamation methods. Active chemical treatment typically involves the addition of other chemicals, such as calcium carbonate, sodium hydroxide, sodium bicarbonate, and anhydrous ammonia, to create a reaction, decrease the solubility of dissolved metals, and precipitate metal salts which then settle out of solution. Active chemical treatment is not likely to be a viable option for the DR-01 stream segment because the chemicals are expensive and the treatment system requires additional costs associated with operation and maintenance, as well as the disposal of metal-laden sludge. Reclamation of abandoned land involves clearing site vegetation, removing contaminated topsoil and other materials, and restoring functionality of the area for recreational, agricultural, or wildlife habitat purposes. The environmental benefits realized from abandoned industrial land reclamation projects are numerous and significant, including restoring land for future use and improving water quality. Restoration of the land can result in increased and enhanced pasture land, recreational areas, or wildlife habitat. However, reclamation projects tend to be costly and resource intensive and may not be appropriate for all sites in the Little Vermilion River (LaSalle County) watershed. Passive methods could be utilized until full reclamation of an area occurs. Chemical addition and energy consuming treatment processes are virtually eliminated with passive treatment systems, and the operation and maintenance requirements of

passive systems are considerably less than active treatment systems. Examples of passive treatment technologies include the following:

Aerobic Wetland: An aerobic wetland consists of a large surface area pond with horizontal surface flow. These wetlands can only effectively treat water that is not alkaline (pH greater than 7). In aerobic wetland systems, metals are precipitated through oxidation reactions to form oxides and hydroxides. A typical aerobic wetland will have a water depth of 6 to 18 inches and can be planted with cattails and other wetland species (Zipper et al. 2011).

Compost or Anaerobic Wetland: Compost, or anaerobic, wetlands, consist of a large pond with a lower layer of organic substrate. A typical compost wetland will have 12 to 24 inches of organic substrate and be planted with cattails or other emergent vegetation (Zipper et al. 2011). Typically, the compost layer consists of spent mushroom compost that contains about 10 percent calcium carbonate. Other compost materials include peat moss, wood chips, sawdust, or hay. The flow is horizontal within the substrate layer of the basin. Piling the compost a little higher than the free water surface can encourage the flow within the substrate.

Open Limestone Channels: Open limestone channels may be the simplest passive treatment method available. These channels are constructed in two ways. The first method collects contaminated drainage water within a drainage ditch constructed of limestone while the second method consists of placing limestone fragments directly in a contaminated stream. In either case, dissolution of the limestone adds alkalinity to the water and raises the pH causing precipitation of the metals. This treatment requires large quantities of limestone for long-term success (Zipper et al. 2011).

Diversion Wells: Diversion wells are another simple way to increase the alkalinity of contaminated waters. Acidic water is conveyed by a pipe to a downstream "well," which contains crushed limestone aggregate. The hydraulic force of the pipe flow causes the limestone to turbidly mix and abrade into fine particles preventing armoring (Zipper et al. 2011).

Anoxic Limestone Drains: An anoxic limestone drain is a buried bed of limestone constructed to intercept subsurface water flow and prevent contact with atmospheric oxygen. Keeping oxygen out of the water prevents oxidation of metals and armoring of the limestone. An anoxic limestone drain can be considered a pre-treatment step to increase alkalinity and raise pH before the water enters a constructed aerobic wetland (Zipper et al. 2011).

Vertical Flow Reactors: Vertical flow reactors were conceived as a way to overcome the alkalinity producing limitations of anoxic limestone drains and the large area requirements of compost wetlands. The vertical flow reactor consists of a treatment cell with an under-drained limestone base topped with a layer of organic substrate and standing water. The water flows vertically through the compost and limestone and is collected and discharged through a system of pipes. The vertical flow reactor increases alkalinity by limestone dissolution and bacterial sulfate reduction (Zipper et al. 2011).

9.10 Cost Estimates of BMPs

Cost estimates for a number of suggested BMPs are discussed in the following subsections. This information was taken from the 2016 Illinois EQIP “Payment Scenario Descriptions” (NRCS 2016).

9.10.1 Filter Strips and Riparian Buffers

Several types of filter strip practices are available, including areas for native herbaceous vegetation with or without fertility measures required and areas of introduced species, also with or without fertility measures required. Filter strip implementation that includes seedbed preparation and native seed application ranges from \$520/acre to \$639/acre depending on the type used, with an average of approximately \$594/acre.

Riparian buffers consisting of bare-root shrubs cost approximately \$1.10 to \$1.65 each while direct seeding of trees and/or shrubs costs approximately \$741/acre. The direct seeding scenario includes a planting rate of approximately 3,000 to 4,800 seeds per acre as well as the foregone income for the land taken out of crop production. Land preparation, including removing undesirable vegetation and improving site conditions, is estimated at \$38/acre. For cases where an herbaceous cover is preferable, such as native grass or certain species of forbs and/or shrubs, costs average \$642/acre.

9.10.2 Nutrient Management Plan – NRCS

Costs for nutrient management range from \$13/acre (basic) to \$45/acre (enhanced nutrient management with deep placement [at least 4 inches below surface] of manure and/or phosphorus fertilizer). The cost for developing a NMP ranges from \$1,741 to \$2,902/plan depending on the acreage to be managed under the plan and assuming that a comprehensive NMP is not required. NMP preparation includes soil testing, manure analysis, scaled maps, and site-specific recommendations for fertilizer management.

9.10.3 Nutrient Management Plan – Illinois Department of Agriculture and Illinois EPA

The costs associated with development of a NMP co-sponsored by the Illinois Department of Agriculture (IDA) and the Illinois EPA is estimated at \$10/acre paid to the producer and \$3/acre for the third party vendor who develops the plan. There is a 200 acre cap per producer. The total plan development cost is estimated at \$13/acre.

9.10.4 Livestock and Wildlife Exclusion

Costs for livestock and/or wildlife exclusion depend on the type of fencing used. For example, permanent high tensile electric fencing is approximately \$0.79/foot for a single strand, \$1.16/foot for 2 to 3 strands, \$1.42/foot for 4 to 6 strands (with fence post centers no more than 30 feet apart), and \$1.78/foot for 7 or more strands (with double H bracing and fence post centers no more than 30 feet apart). A permanent, multi-strand barbed wire fence averages \$1.62/foot, and a permanent woven wire fence averages \$1.96/foot.

The cost for providing an alternate water supply will vary depending on the supply system used. For example, in areas frequently used by livestock for limited access to drinking water from a

pond or stream, an access ramp may be constructed to provide a stable, non-eroding surface and is approximately \$1.44/square foot. This includes earthwork, geotextile, gravel, and other surfacing materials that might be part of the design, as well as a small diversion berm to protect the ramp from concentrated overland flow. If vegetation should be established near the access ramp, costs for a dozer for grading and shaping of small gullies, seedbed preparation with typical tillage implements, grass/legume seed, companion crop, and fertilizer and lime with application are \$716.03/acre. Straw mulch or other approved natural material may be applied where needed to facilitate establishment of vegetative cover. The cost for mulching averages \$238/acre.

Several tank types may be used in areas where lower capacity water supplies are needed and only a backup supply is required for peak demand periods. Above ground tanks vary from \$2,220 for a 1,000 to 3,000 gallon tank and \$3,717 for a tank greater than 3,000 gallons. A large, permanent water tank (500 to 1,000 gallons) or fountain averages \$975, a small permanent tank (less than 500 gallons) is approximately \$400, a frost-free waterer is approximately \$1,011, and a portable tank is \$153. Heavy use protection should be established around these tanks and costs range from \$0.86 to \$4.91/square foot for gravel beds up to a 12 foot width. An underground storage tank may also be used, \$3,600 each, with a livestock pipeline for overflow. A plastic, buried pipeline, less than 2 inches diameter, averages \$1.94/foot. If a bedded pipeline is needed due to special considerations, such as rocky soil, the cost is \$3.38/foot. A non-electric livestock pump is approximately \$961.

9.10.5 Pasture Management/Livestock Fencing

Costs for livestock fencing for pasture management and/or exclusion from waterways depend on the type of fencing used. For example, permanent high tensile electric fencing is approximately \$0.79/foot for a single strand, \$1.16/foot for 2 to 3 strands, \$1.42/foot for 4 to 6 strands (with fence post centers no more than 30 feet apart), and \$1.78/foot for 7 or more strands (with double H bracing and fence post centers no more than 30 feet apart). A permanent, multi-strand barbed wire fence averages \$1.62/foot, and a permanent woven wire fence averages \$1.96/foot.

9.10.6 Water and Sediment Control Basins

The average cost for a water and sediment basin is approximately \$2.70/cubic yard depending on height (greater than or less than 5 ft) and if topsoil stockpiling is necessary. Installation of an underground outlet, plastic conduit, averages \$2.27/foot.

If vegetation should be established, costs for a dozer for grading and shaping of small gullies, seedbed preparation with typical tillage implements, grass/legume seed, companion crop, and fertilizer and lime with application are \$716.03/acre. Straw mulch or other approved natural material may be applied where needed to facilitate establishment of vegetative cover. The cost for mulching is \$238/acre.

9.10.7 Terraces

Costs for terraces range from \$1.66 to \$5.39/foot depending on the width (broadbase or narrowbase), slope width (less than or greater than 9 percent), whether topsoil stockpiling is needed, and timing of construction (if crop season).

9.10.8 Bank Stabilization/Erosion Controls

Streambank and shoreline protection features include weirs/rock riffles, stream barbs, and bank armor. Weirs/rock riffles range from \$2,448 to \$6,305 each depending on the size. A stream barb or bendway weir along with a longitudinal peaked stone toe ranges from \$27.27 to \$52.50/foot. Full bank armor (rip rap) may be use where typical techniques such as stone toe protection or stream barbs are not feasible. The armor is \$37.55/cubic yard.

Several types of grade stabilization structures may be used depending on the site-specific conditions and include the following: concrete block chutes, \$7.81/square foot, and riprap-lined (rock) chutes, \$48.73/cubic yard. A pipe structure, \$5.20/cubic yard, may be used to stabilize a classic gully with very erodible soils in a wooded area where vegetative establishment is not possible on most of the backslope. A straight overfall grade stabilization structure may be used to control erosion. The overfall structure may be implemented as a toewall, or any other type of straight overfall including concrete, sheet pile, or gabions. Where the height from the inlet to outlet is less than 5 feet, the cost is \$119.11/square foot, and where the height is equal to or greater than 5 feet, the cost is \$194.01/square foot. A pipe drop grade stabilization structure, \$10.24/square foot, includes earthwork and a principal spillway outlet structure.

9.10.9 Grassed Waterways

Costs for grassed waterways range from \$2,568 to \$4,916/acre depending on the width, timing of construction (if crop season), and whether checks (fabric or rock) are used.

9.10.10 Conservation Tillage

Conservation tillage is assumed to include tillage practices that preserve at least 30 percent residual cover of the soil after crops are planted. Costs associated with converting to conservation tillage will depend on the extent and degree of conservation tillage practices implemented. A no-till/strip-till system, organic or non-organic, involves managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year-round while limiting soil-disturbing activities used to grow and harvest crops. These systems average approximately \$16/acre. Incorporating mulch till in place of conventional till costs \$4.21/acre, and applies to both organic and conventional fields. A full-width ridge-till system costs approximately \$30/acre. Contour farming is a practice in which row orientation is changed from up and down hill orientation to nearly perpendicular to the flow of runoff. Costs for this practice are \$6.06/acre.

9.10.11 Wetlands

The price to establish a wetland is very site specific and depends on factors such as size and type of vegetation used. Examples of costs associated with constructed wetlands include excavation costs, vegetation removal, and revegetation costs. Costs for wetlands created on a flat mineral uplands where surface runoff may be intercepted and ponded by excavation range from \$3,186 (no embankment) to \$3,680 (with embankment). Some areas may favor a wetlands setting which just needs to be enhanced or restored. In an area of natural depression fed by surface runoff, enhancement/restoration is approximately \$2,557/acre. Enhancing or restoring a wetland on a floodplain site that has existing levees and/or ditches may consist of regrading or shaping the land, potentially including levee removal, for \$1,167/acre. Constructed wetlands to reduce the pollution potential of runoff and wastewater average \$7,725/acre where natural regeneration of

wetland plants will be a major contributor to the working vegetation and \$10,286/acre where wetland vegetation in the pool area is planted at a denser grid (3-foot by 3-foot or closer). As needed, embankments, water control and grade stabilization structures, and filter strips should be added.

9.10.12 Septic System Maintenance

Septic tanks are designed to accumulate sludge in the bottom portion of the tank while allowing water to pass into the drain field. If the tank is not pumped out regularly, the sludge can accumulate and eventually become deep enough to allow for flow into the drain field. Pumping the tank every three to five years prolongs the life of the system by protecting the drain field from solid material that may cause clogs and system back-ups. In addition, septic systems should not be connected to field tile lines.

The cost to pump a typical septic tank ranges from \$250 to \$350 depending on how many gallons are pumped out and the disposal fee for the area. If a system is pumped once every three to five years, this expense averages out to less than \$100 per year.

The cost of developing and maintaining a watershed-wide database of the onsite wastewater treatment systems in the Little Vermilion River (LaSalle County) watershed depends on the number of systems that need to be inspected and the means by which the systems are inventoried. Education of home and business owners that use onsite wastewater treatment systems should occur periodically. Public meetings; mass mailings; and radio, newspaper, and TV announcements can all be used to remind and inform owners of their responsibility to maintain their systems. The costs associated with education and inspection programs will vary depending on the level of effort required to communicate the importance of proper maintenance and the number of systems in the area. Grand scale estimates of watershed-specific septic systems were included in Section 9.3.2.

9.11 Site-Specific BMPs

Illinois EPA met with local watershed stakeholders in March 2017. Attendees indicated that practices identified and discussed throughout this section have been successfully implemented within the watershed prior to development of this TMDL. Practices currently implemented within the watershed include terraces, grassed waterways, filter strips, cover crops, conservation tillage, no-till, strip-till, nutrient management (split application of fertilizers, grid soil sampling, utilize variable rate technology), edge of field practices, stream bank stabilization and restoration, rotational grazing, and crop rotation. Other examples of known local efforts include a local farmer that has previously partnered with the University of Illinois on nutrient management/split application trials.

For the Matthiessen and Hegeler Zinc Company Site in LaSalle, Illinois, the USEPA has conducted immediate actions to protect human health and the environment; however, site investigations and cleanup planning remain ongoing. The USEPA's website regarding this Site (<https://cumulis.epa.gov/supercpad/cursites/csinfo.cfm?id=0507364>) indicates that, pending the Record of Decision document and public meeting, the USEPA expects to remove contaminated soil and place it into a "containment cell" on the former smelter site.

9.12 Information and Education

As discussed in Section 3, public education and participation is a key factor for TMDL and watershed plan implementation. Increased public awareness can increase implementation of BMPs. Small incremental improvements and individual adoption of BMPs can be achieved at a much lower cost compared to the large-scale BMPs identified above. Outreach and education efforts should focus on activities that support the watershed plan goals, including:

- Biological and water quality monitoring
- Encouraging native landscaping including buffers along streambanks
- Buffer strips
- Reducing the use of chemicals (pesticides and phosphorus fertilizers)
- Nutrient management
- Water conservation
- Green infrastructure
- Soil testing
- Field visit days with demonstrations of agricultural conservation practices

An additional public meeting was held within the watershed to present the final TMDL results and the implementation plan. Additional recommended activities to support public outreach and education include:

- Websites and social media to publicize meetings, upcoming events, and links to resources
- E-mail updates
- Brochures with information on rain gardens, fertilizer use, and septic tanks
- Educational signs to educate viewers on water quality issues, purpose of BMPs, and environmental stewardship
- Public service announcements
- Informational meetings on State and Federal cost share programs

Local watershed stakeholders indicated that several programs currently exist for education at the local grade and junior high school level. Throughout the years, students have participated in a storm drain marking program in LaSalle and Mendota, natural history bus tours, and tours of watershed lakes amongst other educational stations related to natural resources and water quality.

9.13 Project Funding

Cost-share and incentive programs at the state and federal level are available to landowners, homeowners, and farmers in the watershed to help offset costs of implementing many of the BMPs recommended in this report. Some of these programs are discussed below. When reviewing the programs, it should be noted that some of the programs are only meant to provide incentives to encourage operators or landowners to try the practice. These incentive programs are not intended to cover the entire cost associated with implementing a practice. Additionally, some practices have many variables to consider that will affect both the cost of the program and the incentive or cost-share amount to be received; e.g., NMPs.

9.13.1 Available State-Level Programs for Nonpoint Sources

State-level programs to encourage landowners to implement resource-conserving practices for water quality and erosion control purposes are discussed in the following paragraphs.

9.13.1.1 Illinois Department of Agriculture and Illinois EPA Nutrient Management Plan Project

The IDA and Illinois EPA co-sponsor a cropland Nutrient Management Plan project in watersheds that have developed or are developing TMDLs. This voluntary project supplies incentive payments to producers to have NMPs developed and implemented. Additionally, watersheds that have sediment or phosphorus identified as a cause for impairment (as is the case in this watershed), are eligible for cost-share assistance in implementing traditional erosion control practices through the Nutrient Management Plan project.

9.13.1.2 Partners for Conservation Program

The Partners for Conservation Program (PFC) provides cost sharing on a variety of practices such as no-till systems, WASCOb, cover crops, filter strips, terrace systems, NMPs, and grade stabilization structures. The PFC is funded through the IDA and administered by the local SWCDs. Life/maintenance contracts can be 1 to 10 years depending on the practice and costs per acre vary significantly from project to project.

9.13.1.3 Streambank Stabilization and Restoration Program

The Streambank Stabilization and Restoration Program (SSRP) was established to address problems associated with streambank erosion, such as loss or damage to valuable farmland, wildlife habitat, and roads; stream capacity reduction through sediment deposition; and degraded water quality, fish, and wildlife habitat. The primary goals of the SSRP are to develop and demonstrate vegetative, stone structure, and other low cost bio-engineering techniques for stabilizing streambanks and to encourage the adoption of low-cost streambank stabilization practices by making available financial incentives, technical assistance, and educational information to landowners with critically eroding streambanks. A cost share of 75 percent is available for approved project components such as willow post installation, bendway weirs, rock riffles, stream barbs/rock, vanes, lunker structures, gabion baskets, and stone toe protection techniques. There is no limit on the total program payment for cost-share projects that a landowner can receive in a fiscal year. However, maximum cost per foot of bank treated is used to cap the payment assistance on a per foot basis and maintain the program's objectives of funding

low-cost techniques (IDA 2000). All project proposals must be sponsored and submitted by the local SWCD.

9.13.2 Available Federal-Level Programs for Nonpoint Sources

There are several voluntary conservation programs established by various federal agencies that encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs apply to crop fields as well as rural grasslands that are presently used for livestock grazing. Federal-level programs are discussed in the following paragraphs. The USEPA manages the Clean Water Act Section 319 Grants. The Farm Service Agency (FSA) oversees the Conservation Reserve Program (CRP) and the Grasslands Reserve Program (GRP). Voluntary conservation programs established through the 2014 U.S. Farm Bill, and managed by the NRCS, include the Agricultural Conservation Easement Program (ACEP), the Conservation Stewardship Program (CSP), and the Environmental Quality Incentives Program (EQIP).

9.13.2.1 Clean Water Act Section 319 Grants

Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive USEPA 319(b) grants upon the USEPA's approval of the state's Nonpoint Source Assessment Report and Nonpoint Source Management Program. States may reallocate funds through sub-awards (e.g., contracts, sub-grants) to both public and private entities, including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

USEPA designates incremental funds, a \$163-million award in 2016, for the restoration of impaired water through the development and implementation of watershed-based plans and TMDLs for impaired waters. Base funds, funds other than incremental funds, are used to provide staffing and support to manage and implement the state Nonpoint Source Management Program. Section 319 funding can be used to implement activities which improve water quality, such as filter strips, streambank stabilization, etc. (USEPA 2003).

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement Illinois' Nonpoint Source Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling nonpoint source pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale; funding is also available for BMPs on a non-watershed scale and the development of information/education nonpoint source pollution control programs.

The maximum Federal funding available is 60 percent of the total cost, with the remaining 40 percent coming from local match. The program period is two years unless otherwise approved. This is a reimbursement program.

Section 319(h) funds are awarded for the purpose of implementing approved nonpoint source management projects. The funding will be directed toward activities that result in the implementation of appropriate BMPs for the control of nonpoint source pollution or to enhance the public's awareness of nonpoint source pollution. Applications are accepted June 1 through August 1.

9.13.2.2 Conservation Reserve Program

The CRP is a voluntary program, administered through the FSA, which encourages landowners to agree to remove environmentally sensitive land from agricultural production and plant long-term resource-conserving cover to improve water quality, prevent soil erosion, and reduce loss of wildlife habitat. The program was initially established in the Food & Security Act of 1985 and is the largest private-lands conservation program in the United States.

Participants can enroll in CRP in two ways and the duration of the contracts under CRP range from 10 to 15 years. The first enrollment method is through a competitive process known as the CRP General Sign-up. These are announced on a periodic basis by the Secretary of Agriculture but do not occur on any fixed schedule. The second enrollment method is through CRP Continuous Sign-up, which is offered on a continuous basis. Continuous sign-up provides management flexibility to farmers and ranchers to implement certain high-priority conservation practices on eligible land. All enrollment offers are processed through the local FSA office.

Certain conditions must be met in order for land to be eligible for CRP enrollment. These conditions include the following:

1. The farmer applying for enrollment must have owned or operated the land for at least 12 months prior to the previous CRP sign-up period (except in cases of a change in ownership due to the previous owner's death, foreclosure, or land purchase by the new owner without the sole intention of placing it in the CRP).
2. Cropland that is planted or considered planted to an agricultural commodity for four of the six most recent crop years (including field margins) and must be physically and legally capable of being planted in a normal manner to an agricultural commodity.
3. Certain marginal pastureland suitable for use as any of the following conservation practices: buffer for wildlife habitat, wetlands buffer or restoration, filter strips, riparian buffer, grass waterway, shelter belt, living snow fence, contour grass strip, salt tolerant vegetation, or shallow water area for wildlife.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted average erosion index of 8 or higher
- Be expiring CRP acreage
- Be located in a national or state CRP conservation priority area.

The FSA bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or cash-rent equivalent. The maximum rental rate for each offer is

calculated in advance of enrollment. Producers may offer land at the maximum rate or at a lower rental rate to increase likelihood of offer acceptance. In addition, the FSA provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation practices (USDA 2016: <https://www.fsa.usda.gov/programs-and-services/conservation-programs/prospective-participants/index>). CRP annual rental payments may include an additional amount up to \$2 per acre per year as an incentive to perform certain maintenance obligations (up to \$7 for certain continuous sign-up practice).

Finally, the FSA offers additional financial incentives for certain continuous sign-up practices. Signing Incentive Payment is a one-time incentive payment of \$10/acre for each acre enrolled for each full year of the contract. Eligible practices include field windbreaks; grassed waterways; shelter belts; living snow fences; filter strips; riparian buffers; marginal pastureland wildlife and wetland buffers; bottom timber establishment; field borders; longleaf pine establishment; duck nesting habitat; SAFE buffers, wetlands, trees, longleaf pine, and grass; pollinator habitat; and several wetlands practices. The Performance Incentive Payment is a one-time incentive payment made to participants who enroll land in CRP to be devoted to all continuous sign up practices except establishment of permanent vegetative cover on terraces, wetland restoration (including non-floodplain), bottomland timber establishment, and duck nesting habitat.

The maximum annual non-cost share payment that an eligible "person" can receive under the CRP is \$50,000 per fiscal year. This is a separate payment limitation applying only to CRP non-cost share payment.

The current extent of land enrolled in CRP within the Little Vermilion River (LaSalle County) watershed is unknown.

9.13.2.3 Conservation Stewardship Program

The CSP helps agricultural producers maintain and improve their existing conservation systems and adopt additional conservation activities to address priority resources concerns. Participants earn CSP payments for conservation performance—the higher the performance, the higher the payment.

Through CSP, participants take additional steps to improve resource conditions including soil quality, water quality and quantity, air quality, habitat quality, and energy. CSP provides two types of payments through 5-year contracts: annual payments for installing new conservation activities and maintaining existing practices; and supplemental payments for adopting a resource-conserving crop rotation. Producers may be able to renew a contract if they have successfully fulfilled the initial contract and agree to achieve additional conservation objectives. Payments are made soon as practical after October 1 of each fiscal year for contract activities installed and maintained in the previous year. In fiscal year 2016, NRCS made \$150 million available for producers through the CSP.

Eligible lands include private and Tribal agricultural lands, cropland, grassland, pastureland, rangeland and non-industrial private forest land. CSP is available to all producers, regardless of operation size or type of crops produced, in all 50 states, the District of Columbia, and the Caribbean and Pacific Island areas. Applicants may include individuals, legal entities, joint operations, or Indian tribes that meet the stewardship threshold for at least two priority resource

concerns when they apply. They must also agree to meet or exceed the stewardship threshold for at least one additional priority resource concern by the end of the contract. Producers must have effective control of the land for the term of the proposed contract, which include all eligible land in the agricultural operation. Some additional restrictions and program requirements may apply and interested applicants should contact the local NRCS office for more information.

9.13.2.4 Grassland Reserve Program

The purpose of the GRP, administered by the FSA, is to prevent grazing and pasture land from being converted into cropland, used for urban development, or developed for other non-grazing uses. Participants in the program voluntarily limit future development of the land while still being able to use the land for livestock grazing and activities related to forage and seed production. Some restrictions on activities may apply during the nesting season of certain bird species that are in decline or protected under federal or state law.

The GRP has several enrollment options, including a rental contract for 10, 15, or 20 years, or enrollment of the land in a conservation easement for an indefinite period of time. Applications are accepted any time and are processed through the local FSA office.

To be eligible for a rental agreement, the applicant must own or have control of the land for the length of the contract. To enroll in a conservation easement, the applicant must own and be willing to restrict use of the land either in perpetuity or under the maximum length of time under state law. Persons enrolled in GRP receive an annual rental payment for their enrolled acres. Rental payments were not available on the USDA website as of June 2016 (<https://www.fsa.usda.gov/programs-and-services/conservation-programs/grassland-reserve/index>); however, further information about the program, including payment amounts, eligibility and maintenance criteria, and land requirements may be obtained from the local FSA office.

9.13.2.5 Agricultural Conservation Easement Program

ACEP provides financial and technical assistance to help conserve agricultural lands and wetlands and their related benefits. Under the Agricultural Land Easements component, NRCS helps American Indian tribes, state and local governments, and non-governmental organizations protect working agricultural lands and limit non-agricultural uses of the land. Land protected by agricultural land easements provides additional public benefits, including environmental quality, historic preservation, wildlife habitat, and protection of open space. Under the Wetlands Reserve Easements component, NRCS helps to restore, protect, and enhance enrolled wetlands. Wetland Reserve Easements provide habitat for fish and wildlife, including threatened and endangered species, improve water quality by filtering sediments and chemicals, reduce flooding, recharge groundwater, protect biological diversity and provide opportunities for educational, scientific and limited recreational activities.

Agricultural Land Easements: NRCS provides financial assistance to eligible partners purchase Agricultural Land Easements that protect the agricultural use and conservation values of eligible land. In the case of working farms, the program helps farmers and ranchers keep their land in agriculture. The program also protects grazing uses and related conservation values by conserving grassland, including rangeland, pastureland and shrubland. Land eligible for

agricultural easements includes cropland, rangeland, grassland, pastureland and non-industrial private forest land. NRCS will prioritize applications that protect agricultural uses and related conservation values of the land and those that maximize the protection of contiguous acres devoted to agricultural use.

To enroll land through agricultural land easements, NRCS enters into cooperative agreements with eligible partners. Each easement is required to have an agricultural land easement plan that promotes the long-term viability of the land. Under the Agricultural Land component, NRCS may contribute up to 50 percent of the fair market value of the agricultural land easement. Where NRCS determines that grasslands of special environmental significance will be protected, NRCS may contribute up to 75 percent of the fair market value of the agricultural land easement.

Wetland Reserve Easements: NRCS also provides technical and financial assistance to restore, protect, and enhance wetlands through the purchase of a wetland reserve easement. These agreements include the right for NRCS to develop and implement a wetland reserve restoration easement plan to restore, protect, and enhance the wetland's functions and values. Land eligible for wetland reserve easements includes farmed or converted wetland that can be successfully and cost-effectively restored. NRCS will prioritize applications based the easement's potential for protecting and enhancing habitat for migratory birds and other wildlife. For acreage owned by an Indian tribe, there is an additional enrollment option of a 30-year contract. Through the wetland reserve enrollment options, NRCS may enroll eligible land through one of the following:

- **Permanent Easements** – These are conservation easements in perpetuity. NRCS pays 100 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 75 to 100 percent of the restoration costs.
- **30-year Easements** – These expire after 30 years. Under 30-year easements, NRCS pays 50 to 75 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- **Term Easements** – Term easements are easements made for the maximum duration allowed under applicable State laws. NRCS pays 50 to 75 percent of the easement value for the purchase of the term easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- **30-year Contracts** – 30-year contracts are only available to enroll acreage owned by Indian tribes, and program payment rates are commensurate with 30-year easements.

For wetland reserve easements, NRCS pays all costs associated with recording the easement in the local land records office, including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Wetland Reserve Enhancement Partnership – The 2014 Farm Bill replaced the Wetland Reserve Enhancement Program with the Wetland Reserve Enhancement Partnership (WREP) as an enrollment option under ACEP. WREP continues to be a voluntary program through which NRCS signs agreements with eligible partners to leverage resources to carry out high priority wetland protection, restoration, and enhancement and to improve wildlife habitat.

- Partner benefits through WREP agreements include:
 - Wetland restoration and protection in critical areas
 - Ability to cost-share restoration or enhancement beyond NRCS requirements through leveraging
 - Able to participate in the management or monitoring of selected project locations
 - Ability to use innovative restoration methods and practices

In 2016, NRCS made \$15 million in financial and technical assistance available to help eligible conservation partners leverage local resources to voluntarily protect, restore, and enhance critical wetlands on private and tribal agricultural land nationwide. The funding is provided through the WREP, a special enrollment option under the Agricultural Conservation Easement Program. Proposals were due to the local NRCS offices by May 16, 2016; however, landowners should check with the NRCS to see about applying in future years. To enroll land eligible partners may submit proposals to the local NRCS office.

9.13.2.6 Environmental Quality Incentive Program

EQIP is a voluntary program that provides financial and technical assistance to agricultural producers to plan and implement conservation practices that improve soil, water, plant, animal, air, and related natural resources on agricultural land and non-industrial private forestland. Through EQIP, the NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Persons engaged in livestock or agricultural production and owners of non-industrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private non-industrial forestland, and other farm or ranch lands. Eligible applicants must, at a minimum, meet the following criteria; additional program requirements may apply:

- Be agricultural producer (person, legal entity, or joint operation who has an interest in the agricultural operation, or who is engaged in agricultural production or forestry management).
- Control or own eligible land.
- Comply with adjusted gross income for less than \$900,000. Note: Federally recognized Native American Indian Tribes or Alaska Native corporations are exempt from the adjusted gross income payment limitations.
- Be in compliance with the highly erodible land and wetland conservation requirements.
- Develop an NRCS EQIP plan of operations that addresses at least one natural resource concern

Persons interested in entering into a cost-share agreement with the NRCS for EQIP assistance may file an application at any time; however, each state may establish deadlines for one or more application periods in which to consider eligible applications for funding. Applications submitted

after the deadlines will be evaluated and considered for funding during later funding opportunities.

As part of the program, a Conservation Activity Plan (can be developed for producers to address a specific natural resource concern on their agricultural operation. Each plan is developed by a certified Technical Service Provider, who is selected by the EQIP participant. Technical assistance payments for Technical Service Providers do not count against the financial assistance aggregate payment limitation or the contract financial assistance payment limitation. The plan becomes the basis of the EQIP contract between NRCS and the participant, and the contracts can be up to 10 years in duration. Financial assistance payments are made to eligible producers once conservation practices are completed according to NRCS requirements. Payment rates are set for each fiscal year and are attached to the EQIP contract when it is approved.

Historically underserved producers (limited resource farmers/ranchers, beginning farmers/ranchers, socially disadvantaged producers, Indian Tribes, and veteran farmer or ranchers) who self-certify on Form NRCS-CPA-1200, Conservation Program Application are eligible for a higher practice payment rate to support implementation of contracted conservation practices and activities. Historically underserved producers may also be issued advance payments up to 50 percent of the established payment rate to go toward purchasing materials or contracting services to begin installation of approved conservation practices. Self-certified socially disadvantaged farmer/rancher, beginning farmer/rancher, and veteran farmer/rancher producers may elect to be evaluated in special EQIP funding pools. More information can be obtained from the local NRCS office.

EQIP provides payments up to 75 percent of the incurred costs and 100 percent estimated income foregone of certain conservation practices and activities. Payments received by producers through EQIP contracts after February 7, 2014 may not exceed \$450,000 for all EQIP contracts entered into during the period from 2014 to 2018. Payment limitations for organic production may not exceed an aggregate \$20,000 per fiscal year or \$80,000 during any 6-year period for installing conservation practices.

Conservation practices eligible for EQIP funding which are recommended BMPs for this watershed TMDL include filter strips, conservation tillage, grade stabilization structures, grass waterways, riparian buffers, streambank/shoreline protection, terraces, and wetland restoration. More information regarding state and local EQIP implementation can be found at <http://www.nrcs.usda.gov/wps/portal/nrcs/main/il/programs/financial/eqip/>.

9.13.3 Local Program Contact Information

The FSA administers the CRP and GRP. NRCS administers the ACEP, CSP, and EQIP. IDA administers the CPP and SSRP. Local contact information for counties containing some portion of the Little Vermilion River (LaSalle County) watershed are listed in the **Table 9-5**.

Table 9-5 Local FSA, NRCS, and IDA Contact Information

County	Address	Phone
State FSA Office		
	Illinois State FSA Office 3500 Wabash Avenue Springfield, IL 62711	(217) 241-6600
Local NRCS/SWCD Office		
LaSalle County	1691 N. 31st Road Ottawa, IL 61350	(815) 433-0551
Bureau County	312 E. Backbone Road, Suite A Princeton, IL 61356	(815) 875-8732
Local IDA Office		
	P.O. Box 19281, State Fairgrounds Springfield, IL 62794-9281	(217) 782-6297

9.14 Planning Level Cost Estimates for Implementation Measures

Cost estimates for different implementation measures are presented in **Table 9-6**. The column labeled "Program" or "Sponsor" lists the financial assistance program or sponsor available for various BMPs (as discussed in Section 9.13). IEPA 319 Grants are applicable to all of the practices.

Table 9-6 Cost Estimates of Various BMP Measures

BMP	Units	Installation Cost	Program	Sponsor(s)
Filter strip (seeded)	per ac	\$520 - \$639, avg \$594	CRP	NRCS, IDA
Riparian buffer – bare-root shrubs	each	\$1.10 - \$1.65	CRP	NRCS, IDA
– forested	per ac	\$741		
– herbaceous cover	per ac	\$642		
– land preparation	per ac	\$38		
Nutrient management	per ac	\$13 - \$45	EQIP	NRCS
Nutrient management plan – federal	per ac	\$1,741 - \$2,902	EQIP	NRCS
– state	per plan	\$13	NMP Project	IDA, Illinois EPA
Livestock exclusion			EQIP	NRCS
Fencing – permanent high-tensile, 1 strand	per ft	\$0.79		
– permanent high-tensile, 2-3 strands	per ft	\$1.16		
– permanent high-tensile, 4-6 strands	per ft	\$1.42		
– permanent high-tensile, 7 or more strands	per ft	\$1.78		
– barbed wire, multi-strand	per ft	\$1.62		
– woven wire	per ft	\$1.96		
Alternate water			EQIP	NRCS
– access ramp	per SF	\$1.44		
– tanks, at or above ground	each	\$153 - \$3,717;		

BMP	Units	Installation Cost	Program	Sponsor(s)
– tanks, at or above ground, heavy use protection	per SF	\$0.86 - \$4.91		
– tanks, frost-free waterer	each	\$1,011		
– tank, below ground	each	\$3,600		
– tank, below ground, pipeline and pump	per ft each	\$1.94 - \$3.38/ft for pipeline, \$961/pump		
Water and sediment control basin	per CY	avg \$2.70	CPP	IDA
– underground outlet, plastic	per ft	\$2.27		
Terraces	per ft	\$1.66 - \$5.39	CPP	IDA
Bank stabilization			SSRP	IDA
– weirs/rock riffles	each	\$2,448 - \$6,305		
– stream barb/bendway weir with longitudinal peaked stone toe	per ft	\$27.27 - \$52.50		
– bank armor	per CY	\$37.55		
Grade stabilization			CPP, SSRP	IDA
– concrete block chutes	per SF	\$7.81		
– rip rap-lined (rock) chute	per CY	\$48.73		
– gully pipe structure	per CY	\$5.20		
– overfall structure	per SF	\$119.11 - \$194.01		
– pipe drop grade structure	per SF	\$10.24		
Grassed waterway	per ac	\$2,568 - \$4,916	CPP CRP	IDA NRCS
Conservation tillage			EQIP	NRCS, IDA
– no-till/strip-till	per ac	\$16		
– mulch-till	per ac	\$4.21		
– ridge-till	per ac	\$30		
Contour farming	per ac	\$6.06	EQIP	NRCS
Wetland – enhancement/restoration	per ac	\$1,167 - \$3,680	ACEP	NRCS
– constructed	per ac	\$7,725 - \$10,286		
Vegetation and mulch as needed for various BMPs, such as alternate water access ramp and WASCObS	per ac	\$716 for vegetation, \$238 for mulch	See corresponding program and sponsor listed above	
Septic system maintenance	per event	\$250 - \$350	Private system owner	

ac = acre
ft = foot

CY = cubic yard
SF = square foot

9.15 Milestones and Monitoring

9.15.1 Interim Measurable Milestones and Schedule

Successful plan implementation relies on establishing and tracking milestones to measure progress. **Table 9-7** proposes a schedule for meeting general milestones. Stakeholders should evaluate milestone progress on an annual basis and implement adaptive management to modify the management measures, milestones, and schedule as necessary.

Table 9-7 Implementation Milestones

Milestones	Description	Estimated Schedule
Funding	Develop grant application(s)	Short term: by end of 2020
Implement Short-term Projects	Identify and implement short-term pilot projects that can be completed (i.e., willing landowners and available funding)	Mid-term: 2-5 years
Monitoring	Implement monitoring plan	Continuous: 1-20 years
Annual Stakeholder meetings	Stakeholders will convene once a year to gauge progress and discuss evolving needs and planned activities	Annually
Implement Larger Projects	Identify and implement larger projects. These projects are more likely to have multiple funding sources and stakeholders.	Mid- Term: 5-10 years
Education and outreach	Prepare and implement and education and outreach plan. Conduct at least two public meetings annually.	Immediate: 1-2 years

Implementation of the management actions outlined in this section should occur in phases, often over the course of several years, with effectiveness assessments made as improvements are completed. The process of obtaining funding, and developing and implementing projects designed to improve water quality, can take months or years to complete and once in place, improvements in water quality as a result of BMPs may not be detectable for several years. Continued monitoring and reevaluation of the implementation measures during this time will allow for more expedient adjustment to BMP implementation measures that may result in earlier attainment of water quality targets.

More specific implementation milestones for waste load reductions correspond with permitting updates and continued RCRA work in the watershed. Measurable milestones currently established in the watershed include:

- The Long Term Control Plan for LaSalle CSOs – interim dates and milestones can be found in Special Condition 15 (Item O) of permit IL0029424 with a final construction/implementation deadline of December 31, 2025.
- The Record of Decision for the Matthiessen and Hegeler Company is due from the USEPA in 2017 which will document and establish the cleanup plan at the site.

9.15.2 Monitoring Plan

The purpose of the monitoring plan for the Little Vermilion River (LaSalle County) watershed is to assess the overall implementation of the management actions outlined in this section. This can be accomplished by conducting the monitoring programs designed to:

- Track implementation of BMPs in the watershed – maintain log of projects as funding is secured and construction/implementation occurs
- Estimate effectiveness of BMPs – complete targeted monitoring pre and post implementation as well as upstream and downstream of installed BMP to calculate percent reduction of parameter of concern

- Further monitor point source discharges in the watershed – add monitoring requirements for all facilities for impairment parameters in receiving waters
- Continue low-flow and visual monitoring of impaired stream segments and tributaries for total phosphorus, total zinc, chloride, fecal coliform, and TSS
- Monitor storm-based high flow events – including instream measurements as well as stormwater and CSO outfalls.

Tracking the implementation of the management measures can be used to:

- Determine the extent to which the management measures and practices have been implemented compared to the actions needed to meet the TMDL endpoints
- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support the work-load and costing analyses for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

Estimating the effectiveness of the BMPs implemented in the watershed could be completed by monitoring before and after the BMP is incorporated into the watershed. Additional monitoring could be conducted on specific structural systems such as a sediment control basin. Inflow and outflow measurements could be conducted to determine site-specific removal efficiency.

Illinois EPA conducts Intensive Basin Surveys every 5 years. Additionally, select ambient sites are monitored nine times a year. Continuation of this state monitoring program will assess stream water quality as improvements in the watershed are completed. This data will also be used to assess whether water quality standards in the impaired segments are being attained.

Students and staff members from the Illinois Valley Community College (IVCC) have been monitoring the water in the Little Vermilion River and sending results to the EPA for a number of years. The IVCC river testing is sponsored by the Chem Club and is a part of the nationwide Rivers Project. While the river testing is not directly associated with Illinois EPA's TMDL development program, the test results do reveal the quality of the water and how that quality is changing. Retired chemistry instructor Robert Byrne organizes the river testing.

Multiple stakeholders expressed the desire to add additional permanent monitoring stations along the Little Vermilion River to continue to monitor zinc concentrations and bacteria counts. Targeted monitoring could be focused on areas upstream and downstream of suspected contributors such as the known slag pile for zinc and unsewered areas and/or areas known to be used for grazing for fecal coliform.

9.15.3 Success Criteria

Measuring the plan's success depends largely on tracking the milestones outlined above. Implementing BMPs should equate to improved water quality and attainment of designated uses and water quality standards. Monitoring pollutant-load reductions will be the primary success criteria. Key components include:

- Securing funding for priority projects within 5 years
- Meeting the identified milestones in **Table 9-7**
- Meeting 25-50% of target reductions within 10 years
- Meeting 100% of target reductions within 20 years
- Utilizing adaptive management to ensure best practices
- Delisting of the impaired waterbodies
