

# **State of Illinois Public Water Supplies Annual Compliance Report Calendar Year 2003**

The purpose of this annual compliance report is to satisfy the requirement of Section 1414(c)(3) of the 1996 Amendments to the Safe Drinking Water Act (SDWA). States with national primary enforcement authority are to prepare, make readily available to the public, and submit to the Administrator of the United States Environmental Protection Agency (USEPA) by July 1 of each year, an annual report on violations occurring during the previous calendar year of national primary drinking water regulations by public water systems (PWSs) in Illinois.

## **Annual Compliance Report Background**

Each quarter, the Illinois EPA Environmental Protection Agency (IEPA) submits data to the Safe Drinking Water Information System (SDWIS/FED), an automated database maintained by USEPA. The data submitted include, but are not limited to, PWS inventory information, the incidence of Maximum Contaminant Level, Maximum Residual Disinfectant Level, monitoring, and treatment technique violations; and information on enforcement activity related to these violations. This report provides the numbers of violations in each of six categories: maximum contaminant levels (MCLs), maximum residual disinfectant level (MRDLs), treatment techniques (TT), variances and exemptions, significant monitoring violations, and significant consumer notification violations.

Attached to this report as Appendix A is a listing for each contaminant regulated by the SDWA, the numbers of maximum contaminant level (MCL), maximum residual disinfectant level (MRDL), treatment technique (TT) and major monitoring and reporting (M/R) violations for each compliance period during CY03, the number of violations that returned to compliance (RTC), and the number of systems incurring violations. Appendix B is a detailed listing of the MCL, MRDL, and TT violations.

In Illinois, oversight of PWSs is divided between the Illinois Environmental Protection Agency (Illinois EPA) and the Illinois Department of Public Health (Illinois DPH). Illinois EPA has been designated as the lead agency for primary enforcement authority and oversees the community water supply program (those supplies that serve 25 or more year round residents). Illinois DPH oversees the non-transient, noncommunity water supplies (NTNC) that serve 25 or more of the same nonresidents at least 60 days out of the year and include facilities such as day care centers, schools and factories. Illinois DPH also oversees the transient non-community (TNC) water supplies that serve 25 or more different nonresidents at least 60 days out of the year and include facilities such as campgrounds and highway rest areas.

The Illinois Safe Drinking Water Goal is for every Illinois Public Water system to provide water that is consistently safe to drink. As a part of its partnership agreement with USEPA, Illinois EPA measures the progress of the drinking water program with environmental indicators consisting of the percentage of persons served by community water supplies that have not incurred violations of any acute MCL, chronic MCL, acute treatment technique, chronic treatment technique or health advisory during the year. The environmental objective of the Illinois EPA is to increase the percentage of population served by community water supplies that receives drinking water with no short-term (acute) or long-term (chronic) adverse health effects to over 95 percent by the year 2005. The progress towards this objective is summarized on the following pages.

## **Common Terms & Definitions**

### **Public Water System**

A Public Water System (PWS) is defined as a system that provides water via piping or other constructed conveyances for human consumption to at least 15 service connections or serves an average of at least 25 people for at least 60 days each year. There are three types of PWSs. PWSs can be community (such as towns), nontransient noncommunity (such as schools or factories), or transient noncommunity systems (such as rest stops or parks). For this report when the acronym "PWS" is used, it means systems of all types unless specified in greater detail.

### **Maximum Contaminant Level (MCL)**

Under the Safe Drinking Water Act (SDWA), the EPA sets national limits on contaminant levels in drinking water to ensure that the water is safe for human consumption. These limits are known as Maximum Contaminant Levels (MCLs).

### **Maximum Residual Disinfectant Level (MRDL)**

The EPA sets national limits on residual disinfectant levels in drinking water to reduce the risk of exposure to disinfection byproducts formed, when public water systems add chemical disinfectant for either primary or residual treatment. These limits are known as Maximum Residual Disinfectant Levels (MRDLs).

### **Treatment Techniques (TT)**

For some regulations, the EPA establishes treatment techniques (TTs) in lieu of an MCL to control unacceptable levels of certain contaminants. For example, treatment techniques have been established for viruses, some bacteria, and turbidity.

### **Significant Monitoring and Reporting (M/R) Violations**

For this report, significant monitoring violations are generally defined as any significant monitoring violation that occurred during the calendar year of the report. A significant monitoring violation, with rare exceptions, occurs when no samples were taken or no results were reported during a compliance period.

### **Significant Consumer Notification Violations**

Every Community Water System is required to deliver to its customers a brief annual water quality report. This report is to include some educational material, and will provide information on the source water, the levels of any detected contaminants, and compliance with drinking water regulations. For this report, a significant public notification violation occurred if a community water system completely failed to provide its customers the required annual water quality report.

### **Variations and Exemptions**

The State of Illinois can grant a PWS a “variance” from a primary drinking water regulation if the characteristics of the raw water sources reasonably available to the PWS do not allow the system to meet the MCL. To obtain a variance, the system must agree to install the best available technology, treatment techniques, or other means of limiting drinking water contamination that the Administrator finds are available (taking costs into account), and the state must find that the variance will not result in an unreasonable risk to public health. The variance shall be reviewed not less than every 5 years to determine if the system remains eligible for the variance. During 2003, Illinois did not grant any variances.

A water system may also petition the state for an “exemption”. An exemption is permission not to meet an MCL or a treatment technique under certain conditions for a period of time. In most cases, an exemption is granted to give a water system additional time to make complicated and expensive modifications and improvements to the water treatment process so that compliance maybe achieved in the shortest period of time. During 2003, three water systems held an exemption from certain requirements of the Interim Enhanced Surface Water Treatment Rule.

<b>Water System</b>	<b>Duration of Exemption</b>	<b>Variance/Requirement</b>
Centralia	03/21/02 through 07/01/03	Turbidity 0.3 NTU Requirement (611.743), Continuous Individual Filter Monitoring (611.744), and Turbidity Monitoring Reporting (611.745)
Salem	03/21/02 through 05/01/03	Continuous Individual Filter Monitoring (611.744) and Turbidity Monitoring Reporting (611.745)
Charleston	12/31/01 through 12/30/03	Turbidity 0.3 NTU Requirement (611.743)

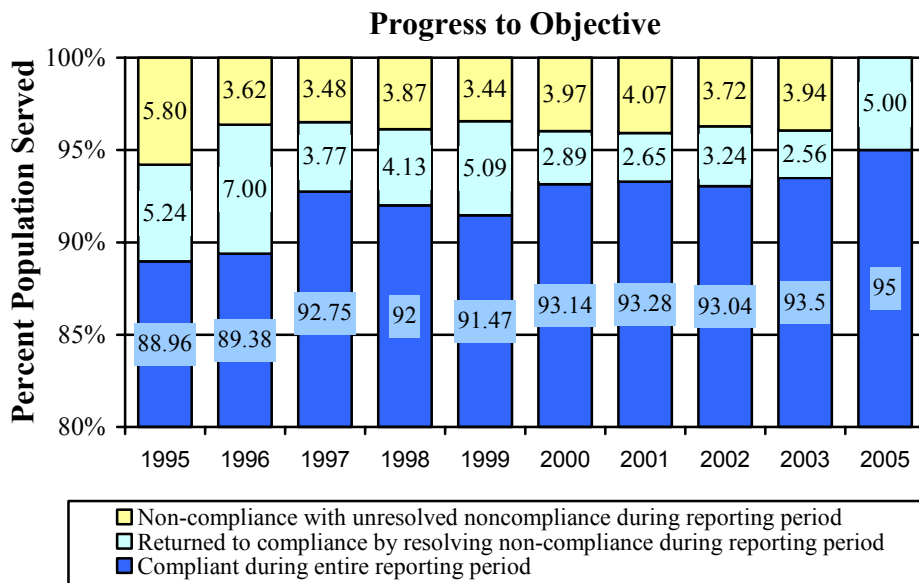

## Environmental Indicator Progress

**Goal:** Every Illinois Public Water Supply will provide water that is consistently safe to drink.

**Objective:** The percentage of the population served by community water supplies receiving drinking water with no short-term (acute) or long-term (chronic) adverse health effects will increase to over 95 percent by the year 2005

### Persons Served by Compliant Water Supplies

Safe drinking water should be free of contaminants that have the potential to cause either short term or long-term health effects. During calendar year 2003, the percentage of persons served by Illinois community water supplies that were compliant with all health requirements (maximum contaminant levels, treatment techniques, or health advisories that have been in effect for more than three years) was 93.5 percent. Community Water Supplies compliant with health requirements as provided in **Figure 1** illustrates progress toward the Year 2005 objective as Percent Population Served. The 2003 compliance percentage is over a four-percentage improvement in compliance from calendar year 1995. Compliance efforts will continue to focus on minimizing the frequency and duration of excursions and the development of enforceable schedules for the implementation of corrective action plan to achieve sustained compliance.

**Figure 1**

The number of water supplies in full compliance with all health requirements during 2003 was 1,632 or 90 percent, of the 1,813 community water supplies in Illinois.

### Persons Served by Compliant Water Supplies

During calendar year 2003, the percentage of persons served by Illinois community water supplies that were compliant with all health requirements was 93 percent. This compliance percentage represents over a four-percentage improvement from calendar year 1995 and reflects continued progress toward the calendar year 2005 goal of 95 percent. It is important that safe drinking water be free of contamination that has the potential to cause either short-term or long-term health effects. The compliance outcome is significant because a total of 10,716,230 persons in Illinois were provided safe drinking water from water supplies compliant with all health requirements during 2003. This represents an additional 910,785 persons served by compliant water supplies when compared to 1995.

**Figure 2** shows that 99.9 percent of the population served by Illinois community water supplies received drinking water in compliance with acute (short-term) health requirements, and 93.6 percent were in compliance with chronic (long-term) health requirements. It is important to note that most non-compliance was short in duration, and the potential for health risk was minimized through prompt corrective action by the water supplies. Supplies with microbial problems (bacterial or turbidity non-compliance) are required to issue boil orders.

**Figure 2**

### Acute and Chronic Requirements (2003 data) Percent of Population Served Compliant with Health Records

ACUTE

CHRONIC

### **Lead and Copper Rule Compliance**

The lead action level (15 parts per billion of lead) when exceeded in more than ten percent of the water samples collected in consumers homes, requires the water supply to implement a optimal corrosion control treatment plan or procedure which would prevent anticipated adverse health effects and insure that lead or copper is controlled in the drinking water.

In 2003, 1,792 water supplies, or approximately 98.8 percent of community water supplies were below the lead action level. These water supplies serve 98 percent of the population.

Generally, non-compliance is for a short period of time because the treatment is adjusted to required ranges.

\*Note: Although a PWS may be out of compliance with more than one contaminant or violation type, when calculating totals, it's counted no more than once within the population being totaled. So, the sum of NUMBER OF PWSs IN VIOLATION, over the various violation types or contaminants, may not add up to the total.

## **Appendix A**

The attached tables summarize the number of maximum contaminant level, treatment technique, and significant monitoring violations that occurred during calendar year 2003 for each contaminant regulated by the Safe Drinking Water Act (SDWA). Also identified is the number of public water supplies responsible for the violations and the number of violations that have returned to compliance.
