Licensed Professional Engineer Affirmation

I attest that all site investigations or remedial activities, including review of laboratory data, that are the subject of this plan or report were reviewed and/or performed under my direction and this document and all attachments were reviewed and/or prepared under my direction or reviewed by me, and, to the best of my knowledge and belief, the work described in the plan or report has been designed or completed in accordance with the Act, 35 Ill. Adm. Code 740, and generally accepted engineering practices, and the information presented, including any qualified laboratory data is accurate and complete.

In addition, I affirm that the documentation of the prior investigations or remedial activities is suitable for use and consideration in evaluating site conditions in connection with this assessment.

EXECUTIVE SUMMARY

Pioneer Engineering & Environmental Services, LLC (Pioneer) was contracted by DLA Piper (Client) on behalf of RMW CRG Quantum Shore Ground Tenant LLC (Remediation Applicant) to provide environmental site closure services for the subject property/Remediation Site located at 8080 South DuSable Lake Shore Drive in Chicago (Cook County), Illinois. The Remediation Site, which consists of 440 acres of mostly vacant land associated with the larger former U.S. Steel South Works steel mill, is bisected by the North Vessel Slip, which historically served as a shipping canal to Lake Michigan. It is bordered to the south by the Calumet River and the southwest by the South Vessel Slip, another shipping canal formerly used by the steel mill. South DuSable Lake Shore Drive runs north-south through the western portion of the site, and East 87th Street runs east-west through the southern portion of the site. Refer to the attached Figure 1 for a Site Diagram. A 2017 Alta Land Title Survey of the subject property with current parcel designations is provided in Appendix A.

The Remediation Applicant acquired the subject property in September 2025 and plans to redevelop it as a technology corridor known as Quantum Shore Chicago. The first development phase, the Illinois Quantum and Microelectronics Park (IQMP), is a proposed 128-acre quantum computing technology campus located on the southern portion of the Remediation Site. Development of the IQMP is scheduled to start in the fall of 2025. The proposed development plan is provided in Appendix A.

The scope of environmental investigation services provided by Pioneer included: (1) a review of numerous historical documents and environmental assessment reports prepared by others; (2) performance of supplemental subsurface investigation activities to refresh the extensive prior testing data; (3) preparation of a Phase I Environmental Site Assessment (ESA); and (4) preparation of this Comprehensive Site Investigation Report/Remediation Objectives Report/Remedial Action Plan (CSIR/ROR/RAP).

Historical information indicates that the subject property was part of an approximately 600-acre steel manufacturing facility from 1880 until 1992, with U.S. Steel taking over operations in the early 1900s. At the commencement of operations in 1880, the Lake Michigan shoreline was located west of the present-day North Vessel Slip. However, between the 1880s and 1920s, steel slag was reportedly landfilled in low-lying areas to the west and in Lake Michigan to create new usable land for expanded operations. In 1993, a 567-acre portion of the South Works site, including the majority of the current subject property, was enrolled into the Illinois Environmental Protection Agency's (Illinois EPA's) Pre-Notice Program, a precursor to the current voluntary Site Remediation Program (SRP). In conjunction with facility decommissioning in the late 1980s and early 1990s, extensive environmental investigations and remedial activities were conducted to address impacts associated with the long-term facility operations. The Illinois EPA issued a comprehensive No Further Remediation (NFR) Letter for the 567-acre site in 1997 with no land use restrictions. Additionally, a separate 3.76-acre portion of the former South Works site and current subject property on Parcel D (former Parcel 22) was issued a comprehensive NFR Letter in 2010 with no land use restrictions. The Illinois EPA also issued comprehensive NFR Letters for the North and South Vessel Slips in 2008, which are not part of the current subject property.

Due to site conditions and regulatory updates since the issuance of the original NFR Letters, a new comprehensive NFR Letter(s) is being sought to support the site and planned redevelopment. The work

outlined herein is being voluntarily conducted to facilitate the eventual issuance of the new NFR Letter(s) in accordance with the current regulations of Title 35 of the Illinois Administrative Code Part 740 [(35 IAC 740) - SRP], and Part 742 [(35 IAC 742) - Tiered Approach to Corrective Action Objectives (TACO)]. The contents of this submittal are intended to satisfy the requirements of 35 IAC Part 740.425, 740.445, and 740.450. Copies of the SRP enrollment and review forms (DRM-1 & DRM-2) associated with this submittal are included in Appendix A.

Pioneer prepared a Phase I ESA for the subject property, dated May 28, 2024, which identified the following recognized environmental conditions (RECs) for the Remediation Site:

- The subject property was improved by a steel manufacturing facility from at least 1890 to the early 1990s and is documented as having extensive underground piping used to transport petroleum/ hazardous substances. Further, between the 1880s and 1922, steel slag was reportedly landfilled to expand the facility's acreage and relocate the shoreline of Lake Michigan to the east. Various past subsurface investigations completed for due diligence purposes from approximately 2004 to 2025 confirmed the presence of contamination on-site at levels above site-specific objectives (per the 1997 NFR Letter), current Tier 1 objectives, and/or the default soil attenuation capacity. Pioneer believes that the more-recently documented on-site contamination associated with the long-time heavy industrial use of the subject property as a steel manufacturing facility and on-site fill represents an REC to the subject property at this time.

- The northwest corner of the subject property (Parcel T) was improved by a gasoline filling station from at least the 1920s until the 1960s. This address is included on the Illinois Register of underground storage tanks (USTs) and the leaking UST (LUST) incident database (#970360). The associated USTs were removed in 1997; however, this LUST incident retains an "open" (i.e., unresolved) status. Pioneer believes that the unresolved status of this LUST incident and past use of Parcel T as a gasoline filling station represent an REC to the subject property at this time. (Note that these USTs are documented as being taken out of service prior to January 2, 1974 and are therefore exempt from the 35 IAC 734 regulations. The Remediation Applicant recently submitted the appropriate Pre-1974 UST Notification Form to satisfy the regulatory reporting requirements for the reported incident.)

Pioneer completed a supplemental investigation on various dates in August 2024 through March 2025 for updated site characterization and due diligence purposes that included 192 soil borings, 44 test pits, installation of 18 monitoring wells, and collection of 425 soil samples, 27 groundwater samples, and three soil gas samples for laboratory analysis. Two prior investigations conducted in 2007 by Conestoga-Rovers & Associates (CRA) and 2017 by GHD, which included the analysis of 168 soil samples, 24 groundwater samples, and 41 soil gas samples, were also utilized in the overall site closure approach herein.

The cumulative investigation activities conducted between 2007 and 2025 identified elevated concentrations of certain metals in soil, along with isolated and limited detections of a volatile organic compound (VOC), select semi-volatile organic compounds (SVOCs), pesticides, and polychlorinated biphenyls (PCBs) exceeding applicable Tier 1 soil remediation objectives (SROs). Groundwater sample results showed vinyl chloride, benzene, and naphthalene (VOCs) above applicable Tier 1 groundwater remediation objectives (GROs) in only two monitoring wells. Additional findings included a single soil sample with polynuclear

aromatic hydrocarbons (PNAs) and extensive total petroleum hydrocarbon (TPH) exceedances of the default soil attenuation capacity, delineated into five hotspots. The cumulative impacts are attributable to the presence of slag fill, historical site operations, and demolition activities.

The proposed remedial approach combines conventional remediation at Hotspots 1 and 2, installation of a hybrid slurry wall encompassing Hotspots 3, 4, and 5 to prevent the potential migration of petroleum to surface waters, demonstration of impractical remediation in limited areas, and use of engineered (site-wide surface cap), institutional, and preventative controls to exclude all exposure routes under a Tier 3 evaluation in accordance with 35 IAC 742.925. The overall approach for managing contaminants identified at the Remediation Site is summarized in the following table.

Proposed Approach for Addressing Identified Exceedances

TCL Parameters	Applicable Tier 1 Exposure Routes							Default Soil Attenuation Capacity
	Soil Ingestion		Outdoor Inhalation		Indoor Inhalation	Class II Groundwater Ingestion		
	Industrial/ Commercial	Construction Worker	Industrial/ Commercial	Construction Worker	Industrial/ Commercial	Soil Component	Groundwater Component	
VOCs	--	--	--	--	--	Tier 3	Tier 3 / GWO	--
SVOCs (excluding PNAs)	--	--	--	--	--	Remediation / Tier 3	--	--
PNAs	Tier 3 / EB	Tier 3 / CWC	--	Tier 3 / CWC	--	Tier 3	Tier 3	Remediation
Pesticides	Tier 3 / EB	--	--	--	--	--	--	--
PCBs	Tier 3 / EB	Tier 3 / CWC	--	--	--	--	--	--
Inorganics	Tier 3 / EB	Tier 3 / CWC	Tier 3 / EB	Tier 3 / CWC	--	Tier 3	Tier 3	--
TPH	NA	NA	NA	NA	NA	NA	NA	Remediation / Tier 3

Notes: -- indicates the Tier 1 exposure route objectives were not exceeded
CWC = exclusion of the exposure route using a Construction Worker Caution
EB = exclusion of the exposure route using an Engineered Barrier
GWO = exclusion of the exposure route using a local GroundWater Ordinance that prohibits the use of groundwater

The cumulative investigation results and Part 742 regulatory framework support bypassing the requirements of Subpart C in favor of a Tier 3 exposure route evaluation, as explicitly permitted under 35 IAC 742.300(c). While TPH concentrations in soil exceed the default soil attenuation capacity, the cumulative evidence demonstrates that the residual hydrocarbons are highly weathered and immobile. The absence of free product in monitoring wells, lack of surface water sheens, and stable groundwater quality indicate that the hydrocarbons do not pose a significant risk of leaching or migration under existing conditions. The Tier 3 exclusion enables a remedy that reflects actual site conditions, protects human health and the environment, and avoids impractical measures that would otherwise further impede brownfield redevelopment.

The proposed remedy not only addresses current site conditions, but also significantly improves upon the limited protections afforded by the existing NFR Letters. The hybrid slurry wall, site-wide surface cap, and institutional controls explicitly mitigate pathways that were not addressed in prior closures. Collectively, these measures will render all potential pathways incomplete, meeting the substantive requirements of Part 742 while greatly exceeding the protections of the existing NFR Letters. Although Subpart C is bypassed, the closure approach is consistent with remedies frequently utilized for impacted sites in the Chicago area, where contamination is effectively managed in-place through engineered, institutional, and preventative controls.

The selected remedy also explicitly accounts for the safety and comfort of the surrounding community. By following the U.S. EPA's Greener Cleanups framework, the remedy minimizes the environmental footprint of

remediation by conserving resources, reducing greenhouse gas emissions, and limiting impacts to land, water, and ecosystems, while reducing noise, dust, and odors during construction when compared to other remedial options. Upon the completion of the conventional remediation, and installation of the hybrid slurry wall and surface cap, a Remedial Action Completion Report(s) will be submitted to the Illinois EPA to provide all documentation required by Section 740.455 and request issuance of a comprehensive NFR Letter(s).

This report has been prepared for the use of the Client and Remediation Applicant, and for evaluation by the Illinois EPA, and cannot be relied upon by other persons or entities without the permission of Pioneer. The observations and conclusions contained herein are limited by the scope and intent of the work mutually agreed upon by the Client and Pioneer and the work actually performed. There are no warranties, implied or expressed, concerning the environmental integrity of areas and/or mediums not analytically tested.

1.0 SITE INVESTIGATION REPORT – COMPREHENSIVE SITE INVESTIGATION

1.1 Introduction

Pioneer Engineering & Environmental Services, LLC (Pioneer) was contracted by DLA Piper (Client) on behalf of RMW CRG Quantum Shore Ground Tenant LLC (Remediation Applicant) to provide environmental site closure services for the subject property/Remediation Site located at 8080 South DuSable Lake Shore Drive in Chicago (Cook County), Illinois. The Remediation Site, which consists of 440 acres of land associated with the larger former U.S. Steel South Works steel mill, maintains a comprehensive No Further Remediation (NFR) Letter issued in 1997. Additionally, a separate 3.76-acre portion (formerly identified as Parcel 22) of the former South Works steel mill and current subject property also maintains a comprehensive NFR Letter issued in 2010. Refer to the attached Figure 1 for a Site Diagram. A 2017 Alta Land Title Survey of the subject property with current parcel designations is provided in Appendix A. (Note that the use of parcel designations herein refers to those specified in the 2017 survey, unless stated otherwise.)

The Remediation Applicant acquired the subject property in September 2025 and plans to redevelop it as a technology corridor known as Quantum Shore Chicago. The first development phase, the Illinois Quantum and Microelectronics Park (IQMP), is a proposed 128-acre quantum computing technology campus located on the southern portion of the Remediation Site. Development of the IQMP is scheduled to start in the fall of 2025. The proposed development plan is provided in Appendix A.

The scope of environmental investigation services provided by Pioneer included: (1) a review of numerous historical documents and environmental assessment reports prepared by others; (2) performance of supplemental subsurface investigation activities to refresh the extensive prior testing data; (3) preparation of a Phase I Environmental Site Assessment (ESA); and (4) preparation of this Comprehensive Site Investigation Report/Remediation Objectives Report/Remedial Action Plan (CSIR/ROR/RAP).

Due to site conditions and regulatory updates since the issuance of the original NFR Letters, a new comprehensive NFR Letter(s) is being sought to support the site and planned redevelopment. The work outlined herein is being voluntarily conducted to facilitate the eventual issuance of this new NFR Letter(s) in accordance with the current regulations of Title 35 of the Illinois Administrative Code Part 740 [(35 IAC 740) - SRP], and Part 742 [(35 IAC 742) - Tiered Approach to Corrective Action Objectives (TACO)]. The contents of this submittal are intended to satisfy the requirements of 35 IAC Part 740.425, 740.445, and 740.450. Copies of the SRP enrollment and review forms (DRM-1 & DRM-2) associated with this submittal are included in Appendix A.

1.2 Site Description

1.2.1 Physical Site Features

The 440-acre Remediation Site is located on the southeast side of Chicago within approximately 200 feet of Lake Michigan (at its closest location) and occupies a major portion of the former U.S. Steel South Works facility, which operated from the late 1800s to the early 1990s. The subject property is

bisected by the North Vessel Slip, which historically served as a shipping canal to Lake Michigan for the steel mill. It is bordered to the south by the Calumet River and the southwest by the South Vessel Slip, another shipping canal formerly used by the steel mill. South DuSable Lake Shore Drive runs north-south through the western portion of the site, and East 87th Street runs east-west through the southern portion of the site.

The Remediation Site comprises mostly vacant land with low-lying vegetation, mature and semi-mature trees, remnant asphalt and gravel roadways, and two large gravel pads constructed on the southern portion of the site in the early 2000s. Remnant concrete ore walls are also located along the North and South Vessel Slips, with a portion of the northern ore wall being converted for recreational rock climbing as part of the east-adjacent Steelworkers Park. While the majority of the Remediation Site is vacant, an approximately 2,000-square-foot single-story structure located at 8555 South Green Bay Avenue (eastern portion of Parcel D) serves as the on-site security office. A dilapidated velodrome bicycle track is also located on the southwestern portion of Parcel D.

It should be noted that direct visual observations (through numerous site visits for Pioneer's investigations) and a review of aerial photographs did not reveal evidence of illegal dumping at any point following the 1997 NFR Letter. The subject property has remained vacant, fenced, and secure.

The topography of the Remediation Site is relatively level, with surface elevations generally ranging from approximately 10 to 20 feet Chicago City Datum (CCD). However, various low-lying areas on the site's southern portion and a linear ridge located on the northern portion result in a total relief of roughly 25 feet. The Remediation Site is separated from the vessel slips by steel sheet piling, and from the Calumet River by (from west) steel gabion baskets, large stone blocks, and a cement wall, with the ground surface elevated approximately 10 to 15 feet above the adjacent surface waters located at approximately 0 feet CCD. Refer to Appendix B for a USGS topographic map and a recent topographic survey of the subject property.

1.2.2 Regional Geology/Hydrogeology

The following table provides a summary of published geological conditions according to Illinois State Geological Survey (ISGS) maps. Copies of the ISGS maps are provided in Appendix B.

Table 1-1 ISGS Map Summary

ISGS Map	Geological Description	
Surficial Geology of the Chicago Region	m:	man-made fill; areas formerly covered by Lake Michigan
	ec:	(Parcels D, G & 26) Carmi Member of Equality Formation (largely quiet-water lake sediments; dominantly well-bedded silt, locally laminated and containing thin beds of clay; local lenses of sand and sandy gravel along beaches) (note: site investigations indicate the presence of shallow slag fill)

ISGS Map	Geological Description
Stack-Unit Mapping of Geological Materials in Illinois to a Depth of 15 Meters	X(5): man-made land overlying discontinuous Silurian and some Devonian bedrock, mainly dolomite (g)(f)l(5): (Parcels D, G & 26) discontinuous Dolton Member of Equality Formation (<20 ft), overlying discontinuous Carmi Member of the Equality Formation (<20 ft), overlying silty and clayey diamictons of the Wedron Formation (>20 ft), overlying discontinuous Silurian and some Devonian bedrock, mainly dolomite
Plate 1, Potential for Contamination of Shallow Aquifers in Illinois	A5: permeable bedrock generally within 20 feet of land surface; overlying materials variable but mostly till (note: site investigations indicate bedrock is present at 21-80 ft below surface grade) B1: (Parcels D, G & 26) sand and gravel less than 20 feet thick overlying relatively impermeable till or bedrock

Based on an interpretation of the general topography of the Remediation Site and surrounding area, regional groundwater is expected to flow primarily in an easterly direction toward Lake Michigan and the Calumet River. However, flow direction varies locally due to geologic heterogeneity, subsurface structures, and proximity to surface water. Site-specific hydrogeology is discussed further in Section 1.4.6.

1.2.3 Current and Former Uses of the Remediation Site

The Remediation Site is predominantly undeveloped land and is within a planned development district (zoned PD1599, pursuant to City of Chicago Ordinance #SO2024-0012887, dated December 11, 2024). While the majority of the site is vacant with overgrown vegetation, a single-story structure located on Parcel D at 8555 South Green Bay Avenue serves as the on-site security office. Historical records indicate that the Remediation Site is largely made land created through the deposition of steel slag into Lake Michigan and adjacent low-lying areas, a process associated with the expansion of the U.S. Steel South Works steel mill. The site supported heavy industrial operations for over a century until the mill ceased operations in the 1990s.

1.2.4 Current Uses of the Adjacent Sites

The following table provides a summary of current and surrounding land uses.

Table 1-2 Current Uses of the Surrounding Sites

Direction	Adjoining Property	Surrounding Sites	Current Zoning Designation
North	Vacant, former South Works	Rainbow Beach, Lake Michigan, E. 79th St., S. DuSable Lake Shore Dr.	M3-3 = Manufacturing District POS-1 = Parks & Open Space
East	Vacant, former South Works (north) Steelworkers Park (south)	Lake Michigan	M3-3 = Manufacturing District POS-1 = Parks & Open Space
South	Army Corps of Eng. (southeast) Calumet River	Illinois International Port District (3600 E. 95th St.) North America Stevedoring Co. (9301 S. Kreiter Ave.)	M3-3 = Manufacturing District PMD-6 = Planned Manufacturing
West	Public rights-of-way, public alleyways	Primarily residential plus auto-body repair, manufacturing and parks	RS-2 & RT-4 = Residential Districts M1-1 Manufacturing District

An aerial photograph of the Remediation Site and vicinity is included as the attached Figure 1, and a zoning map is provided in Appendix B.

1.2.5 Legal Description of the Remediation Site

The Remediation Site legal description and property index numbers are included in the Alta Land Title Survey documents provided in Appendix A.

1.2.6 Prior Environmental Activities

Pioneer reviewed numerous documents associated with the subject property pertaining to historical assessments, subsurface investigations, risk assessments, remediation activities, and Illinois EPA correspondence and NFR determinations. This section summarizes more than 30 key documents dated from 1992 to 2025 that form the basis for the current site closure approach. Any documents cited herein that are not currently available on the Illinois EPA Document Explorer have been included with this submission under separate cover, as noted.

Summary of Site History

Historical information indicates that the subject property was part of an approximately 600-acre steel manufacturing ("South Works") facility from 1880 until 1992, with U.S. Steel taking over operations in the early 1900s. At the commencement of operations in 1880, the Lake Michigan shoreline was located west of the present-day North Vessel Slip. However, between the 1880s and 1920s, steel slag was reportedly landfilled in low-lying areas to the west and in Lake Michigan to create new usable land for expanded operations.

Historical maps, including the 1890 Rascher's Atlas, show early steel-related structures such as engine rooms, boiler houses, and furnace houses primarily on Parcels E, G, 16a, 16b, 17, and 25a. By 1897, the facility had expanded to include blast furnaces, ore and coal dumps, various machine and repair shops, a plate mill, oil and gas facilities, and other supporting industrial infrastructure. Crude oil tanks were also located in the west-central and south-central portions of the site. At that time, Parcel D was occupied by the Chicago Lake Shore and Eastern Railway Car Shops, which included facilities such as a boiler shop, blacksmith shop, and brass foundry.

Between 1923 and 1951, a gasoline station was present on Parcel T in the far northwest corner of the site, adjacent to the South Works facility. As a note, underground storage tanks (USTs) were removed and a leaking UST incident (#970360) was reported for this former gasoline station in 1997. The Remediation Applicant recently submitted the required Pre-1974 UST Notification Form to the Illinois EPA in order to provide the required documentation and satisfy the regulatory requirements for the reported incident.

While detailed Fire Insurance Maps are unavailable for most of the property between 1913 and the early 1970s, an aerial photograph from 1938 shows a major integrated steel plant. The subject property, collectively labeled as "United States Steel Corporation," was depicted on the 1975 Fire Insurance Map with numerous mill and smelter buildings, ore pits and bunkers, boiler and transformer buildings, crane

systems, a roundhouse with a rail turntable, and over 40 storage tanks (containing fuel oil or unlabeled). Much of the site was occupied by tracks and rail infrastructure.

The subject property remained an operating steel mill until 1992 and the majority of the on-site structures were demolished by 1993, with the site remaining largely vacant since that time. Two relatively large gravel pads were installed on Parcel 17 by 2003; however, no related structures were constructed. A velodrome was constructed on Parcel D by 2011 and South DuSable Lake Shore Drive was reconfigured by 2014, bringing the subject property to its general present-day configuration. (Note that the two gravel pads were constructed by Solo Cup for a planned manufacturing facility at that time. The work included geotechnical investigations, removal of shallow subsurface infrastructure, dynamic compaction, and construction of the pads. However, Solo Cup reportedly abandoned the project for business reasons unrelated to site conditions.)

In 1993, a 567-acre portion of the South Works site, including the majority of the current subject property, was enrolled into the Illinois EPA's Pre-Notice Program, a precursor to the current voluntary SRP. In conjunction with facility decommissioning in the late 1980s and early 1990s, extensive environmental investigations and remedial activities were conducted to address impacts associated with the long-term facility operations. The Illinois EPA issued a comprehensive NFR Letter for the 567-acre site in 1997 with no land use restrictions. Additionally, a separate 3.76-acre portion of the former South Works site and current subject property on Parcel D (former Parcel 22) was issued a comprehensive NFR Letter in 2010 with no land use restrictions. The Illinois EPA also issued comprehensive NFR Letters for the North and South Vessel Slips in 2008, which are not part of the current subject property. Various investigations were subsequently conducted at the subject property from the early 2000s to 2017 for due diligence purposes by prospective developers.

Summaries of Key Historical Documents obtained from the Illinois EPA Document Explorer and/or U.S. Steel

- Environmental Assessment of the Former South Works Plant, dated February 1992, prepared by Waste Technology, Inc. (WTI)

  WTI conducted this investigation in 1992 and 1993 in order to evaluate soil and groundwater conditions. The following investigation activities were conducted as part of the assessment:

  - advancement of 26 soil borings and collection of 46 surface soil samples and 35 subsurface soil samples for analysis;
  - installation of 17 monitoring wells and collection of 17 groundwater samples for analysis;
  - collection of 10 sediment samples from sewers and pits, and two wipe samples from transformer pads;
  - inventory of USTs, aboveground storage tanks (ASTs), drums, smaller containers, and railroad ties; and

- verification of former locations and quantities of polychlorinated biphenyl (PCB)-containing transformers and capacitors.

The following contaminants were detected at concentrations above applicable objectives at that time: certain inorganics (cadmium, cyanide, mercury, lead, selenium, silver), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), PCBs, total petroleum hydrocarbons (TPH), as well as characteristically hazardous concentrations of cadmium and lead in soil; and lead, TPH and certain VOCs in groundwater.

- Phase II Environmental Site Assessment (ESA) of the Former South Works Plant, dated September 1993, prepared by WTI

WTI conducted this investigation in 1993 in order to further evaluate contaminant conditions identified in its initial assessment. The following investigation activities were conducted as part of the assessment:

- collection of 12 surface soil samples and 11 groundwater samples from existing monitoring wells;
- collection of 19 sediment samples from one “thickener,” 12 manholes, and four pits; and
- excavation of 32 test trenches.

The following contaminants were detected at concentrations above applicable objectives at that time: certain inorganics (cadmium, cyanide, chromium, lead, mercury, silver), VOCs, SVOCs, TPH, and phenolics in soil; and lead, TPH, and certain VOCs in groundwater.

- Phase III ESA of the Former South Works Plant, dated September 1994, prepared by WTI

WTI conducted this investigation in 1993 in order to further evaluate contaminant conditions identified in its previous assessments. The following investigation activities were conducted as part of the assessment:

- advancement of 23 soil borings and collection of 48 soil samples for analysis;
- installation of three deep monitoring wells (between 45 and 67 feet below grade), and collection of 20 groundwater samples from new and existing wells; and
- collection of five sediment samples from the vessel slips for analysis.

The following contaminants were detected at concentrations above applicable objectives at that time: certain inorganics (antimony, arsenic, beryllium, cadmium, manganese, vanadium) and TPH in soil; and certain inorganics (cadmium, iron, manganese, lead, phenolics, sulfate) in groundwater.

- Illinois EPA Class II Groundwater Letter, dated January 10, 1995 (copy provided in Appendix D)

  The Illinois EPA issued this letter recommending a Class II groundwater classification for groundwater at the site located within the slag fill material and the upper 10 feet of parent material located below the fill.

- Human Health Risk Assessment (HHRA) for the South Works Site, dated August 25, 1995, prepared by ChemRisk

  The purpose of the HHRA was to evaluate potential human health effects of the identified "contaminants of interest" (COIs), based on the results of the prior three investigations in comparison to the U.S. EPA Region III Risk-Based Concentrations (RBCs) for residential sites at that time. Those constituents that were detected at levels above the RBCs and background values were classified as COIs, which included antimony, beryllium, cadmium, lead, manganese, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and indeno(1,2,3-cd)pyrene. Site-specific remedial goals (RGs) were calculated for each COI and reportedly only beryllium and lead exceeded the most stringent RGs for residential property.

- Remediation Activities at the South Works Site, dated September 4, 1996, prepared by WTI

  This report served as a Remedial Action Completion Report and provided documentation for various remedial activities associated with the decommissioning and demolition of the South Works facility.

  - Sediment removal and off-site disposal from the following areas:
    - north lift station;
    - north vessel slip basins;
    - south vessel slip oil/water separator and sewers;
    - K061 hazardous waste (emission control dust/sludge) in sewers;
    - structural mill area and continuous plate mill pits; and
    - cooling tower sump.
  - Blast furnace area fuel oil spill — TPH-impacted soil was excavated and transported for off-site disposal
  - Dorr thickener area — sampling indicated that no remedial action was necessary
  - Storage tanks — six USTs were removed on July 12, 1995 with reportedly no associated contamination identified; 107 ASTs were removed
  - 55-gallon drums and small containers — off-site disposal of drums and containers occurred annually from 1992 to 1996

- Stockpiled railroad ties — approximately 33,100 railroad ties were removed from stockpiles and transported for off-site disposal from 1994 to 1995; approximately 259,950 pounds of railroad ties were removed from the rail yard south of the truck scale and transported for off-site disposal

- PCB transformers and capacitors — 48 transformers were transported off-site from 1993 to 1996; 458 capacitors and approximately 500 pounds of small capacitors were transported off-site from 1992 to 1996

- PCB contaminated soil — approximately 192,000 gallons of oil and 528 tons of impacted soil were transported for off-site disposal from 1993 to 1995

- Electric furnace dust — "K061" (hazardous) electric furnace dust was removed from the No. 4 Electric Furnace building using vacuum trucks and transported for off-site disposal

- Marias Industries, Inc. burn areas — approximately 75 tons of soil from areas where railroad ties were burned were excavated and transported for off-site disposal

- Asbestos — approximately 4,960 cubic yards of asbestos-containing material (ACM) were removed from the site and transported for off-site disposal from 1993 to 1995

- Miscellaneous actions including removal and off-site disposal of the following:

    - flammable liquids;
    - batteries and battery acid;
    - oil/fuel mixed with water;
    - treatment plant sludge;
    - sulfuric acid;
    - blast furnace gas pipelines; and
    - lime spills.

- PCB Supplement to the Remediation Activities Report for the South Works Site, dated October 28, 1996, prepared by WTI

  This report documented the remediation of PCBs in the area of No. 1 Powerhouse Substations 2A and 103. Substation 2A reportedly only required solvent washing of the concrete and did not generate soil requiring off-site disposal. The remediated concrete and liquids generated during the solvent washing were transported for off-site disposal. A total of approximately 135 tons of PCB-impacted concrete were generated from Substation 103 and transported for off-site disposal. Residual PCB concentrations at Substation 103 were less than 10 mg/kg.

- Illinois EPA Comprehensive NFR Letter (for the South Works Site), dated July 31, 1997

  The Illinois EPA issued a comprehensive NFR Letter for the 567-acre South Works site based on site-specific RGs proposed in the 1995 ChemRisk HHRA and specifically referencing the Remediation Activities [Report] and PCB Supplement to the Remediation Activities Report. The NFR Letter did not include any land use restrictions, or preventative or engineering controls, but did include an institutional control prohibiting the installation or use of groundwater wells for potable purposes. An additional term specified the following: "All materials containing PCBs, asbestos, or other regulated substances encountered during the demolition of the No. 5 Powerhouse and other remaining structures must be properly handled, disposed, and remediated according to all applicable State and Federal Regulations." As a note, this larger 567-acre site included the majority of the current subject property, with the exception of Parcels T and 26.

- Environmental Review and Limited Site Characterization (Solo Cup Site), dated December 14, 1999, prepared by STS Consultants Ltd. (STS) (included under separate cover)

  STS conducted a review of prior investigations and conducted a limited investigation for due diligence purposes. The investigation included over 100 test pits and soil borings in the southern portion of the site (Parcel 17) to investigate the following: (1) geophysical anomalies indicative of potential pipelines; (2) prior findings suggestive of potential petroleum contamination; (3) perceived data gaps; and/or (4) geotechnical conditions. Additionally, STS also conducted monitoring for hydrogen sulfide from seven test pits using Draeger Tubes.

  The excavations identified field evidence of petroleum contamination in two test pits (TP-1 & TP-2) at the northern end of the former Machine Shop, in one boring (PMT-3) just south of the former Foundry, and in six test pits throughout the southeast corner of the site. STS estimated that the extent of petroleum impacts in the southeast corner covered approximately 8.5 acres with a thickness of 2 to 3 feet. The hydrogen sulfide monitoring did not reveal any concentrations greater than 0.004 parts per million (ppm).

- TPH Remediation South Works Site, dated December 19, 2000, prepared by WTI

  The 1999 STS investigation documented petroleum contamination in three areas in Parcel 17: TP-1/TP-2 (former Machine Shop); PMT-3 (south of former Foundry); and an 8.5-acre area in the southeast corner of the site adjacent to the Calumet River. The impacts identified in areas TP-1/TP-2 and PMT-3 were reportedly limited to a thickness of 6 inches at or above the water table between 10 to 12 feet below surface grade (BSG), with one area in PMT-3 exhibiting an impacted thickness of 5 feet near an 8-inch pipeline. The 8-inch pipeline reportedly contained a black, tar-like substance and extended to a former basement located in the southeast corner of the site. A total of approximately 818 tons of impacted material were removed and transported for off-site disposal from the areas of TP-1/TP-2 and PMT-3. Additionally, approximately 2,115 feet of the 8-inch pipeline were removed as part of the remediation activities, as well as "oily material" found in the basement (which has since been backfilled). Post-excavation confirmation samples reportedly determined that residual TPH concentrations were below the default soil attenuation capacity of 2,000 mg/kg.

The petroleum encountered in the southeast corner of the site was characterized as Bunker C fuel oil that was suspected of originating from the 8-inch pipeline. This document also implies that a bioremediation system was used to remediate the petroleum impacts in the southeast corner of the site. Based on an April 17, 2000 letter to the Illinois EPA from U.S. Steel, it appears that injection wells were installed and began operation at that time. However, Pioneer has not identified any other documents directly referencing the bioremediation.

- CERCLA Preliminary Assessment for Vessel Slips at the United States Steel Works Site, dated August 2001, prepared by the Illinois EPA

  In response to community members petitioning the U.S. EPA, the Illinois EPA conducted sediment sampling of the North and South Vessel Slips, the Calumet River, and Lake Michigan in areas adjacent to the subject property. A total of 36 sediment samples were collected and analyzed, the results of which revealed "significantly elevated" concentrations of certain metals from all sample areas, as well as visual and olfactory evidence of petroleum contamination.

- No. 5 Powerhouse Demolition, dated 2003, prepared by United States Steel Corporation

  As required by the 1997 NFR Letter, demolition of the No. 5 Powerhouse and supporting buildings on Parcel E was completed from 2001 to 2003. Prior to demolition, material recovery activities were performed to remove asbestos, PCBs, and other materials (e.g., flammable liquids and mercury-containing devices).

- Due Diligence Testing of the South Works Site, reportedly conducted by Conestoga-Rovers & Associates (CRA) in 2004 (documentation not available for review)

  Various documents reviewed by Pioneer referred to site-wide testing conducted by CRA in 2004 on behalf of Southworks Development, LLC, a prospective developer of the subject property at that time. Apparently, a total of 591 surface soil samples were analyzed for lead only, and an additional 14 surface samples were analyzed for a suite of parameters including lead. The analytical results reportedly identified lead in 20 samples at concentrations above the site-specific RG of 932 mg/kg. It is unknown if any other impacts were identified as part of this investigation. (Note that Pioneer was provided CRA monitoring well construction diagrams dated 2004 and presumably associated with this investigation, as well as slug test reports from 2005 for several of these wells, both of which are discussed subsequently herein.)

- Illinois EPA [Comfort] Letter, dated June 27, 2005

  The Illinois EPA issued a letter addressed to Southworks Development, LLC and United States Steel Corporation regarding a request to confirm the validity of the 1997 NFR Letter prior to prospective redevelopment. The Illinois EPA reviewed the NFR Letter (including the 1995 HHRA) and indicated that the remedial objectives originally established for the site continue to be protective of human health and the environment.

- Evaluation of Investigation Data Memorandum, dated March 8, 2006, prepared by URS (included under separate cover)

  Historical railroad operations on former Parcel 22 (part of present-day Parcel D) resulted in diesel fuel contamination of underlying soils, which was reportedly remediated in 2004. At that time, it was determined that diesel fuel may have migrated north of the Parcel 22 property line onto the adjacent East 86th Street right-of-way. In 2005, a two-phase investigation was conducted on that right-of-way and certain vacant residential lots. The first phase included 30 soil borings, with 14 soil samples analyzed for VOCs, SVOCs, and TPH (diesel range organics [DRO] only). The second phase was performed to delineate the impacts identified in the first phase and included soil testing at 30 proposed locations and six groundwater samples analyzed for VOCs, SVOCs, and TPH-DRO.

  Results indicated that certain SVOCs were present in soil and groundwater at concentrations above the most stringent Tier 1 objectives at that time; the affected exposure route included soil migration to groundwater. TPH was also detected in 12 soil samples at concentrations above the default soil attenuation capacity for subsurface soil, ranging from 2,700 mg/kg to 75,000 mg/kg. Most TPH impacts were limited to East 86th Street, although two impacts were identified on vacant residential lots. The memorandum concluded that the off-site TPH impacts were delineated and that residual contamination did not pose adverse risks to human health or the environment because no complete exposure pathways to subsurface soil or groundwater were present.

- US Route 41 Preliminary Site Investigation, dated July 6, 2006, prepared by Ecology and Environment

  This report, which was prepared on behalf of the Illinois Department of Transportation, documented an investigation conducted along the proposed US Route 41 realignment through the site. The investigation identified certain PNAs and metals in soil at concentrations above the applicable Tier 1 objectives, while no contaminants were reportedly detected in groundwater at concentrations above applicable Tier 1 objectives.

- Illinois EPA [Comfort] Letter, dated April 12, 2007

  The Illinois EPA issued a letter addressed to the Illinois Department of Transportation regarding a request to confirm the validity of the 1997 NFR Letter in conjunction with the relocation of US 41 through a portion of the subject property. The Illinois EPA reviewed the NFR Letter (including the 1995 HHRA) and indicated that the remedial objectives originally established for the site continue to be protective of human health and the environment.

- Draft Memorandum: PAH Area Summary of Findings, dated November 15, 2007, prepared by CRA (included under separate cover)

  This memorandum submitted to Westrum Development, a member of Southworks Development, LLC, summarized the delineation of elevated levels of PAHs (i.e., PNAs) identified in three areas on the northern portion of the subject property (Parcels A and B). It is not certain when these elevated PNAs were initially identified, but delineation was conducted through two phases of sampling in 2007 that

included a total of 221 soil samples collected for analysis. Based on the results of the delineation, CRA estimated that up to 95,000 cubic yards of soil would require excavation and off-site disposal to address the PNA impacts. (Note that when the current Chicago background concentrations of PNAs are considered, only limited, marginal impacts remain, with no concentrations above the soil attenuation capacity in these areas.)

- Draft Phase I ESA for Parcel 17, dated December 2007, prepared by CRA (included under separate cover)

  The Draft Phase I ESA, which was prepared on behalf of Southworks Development LLC for Parcel 17, identified the following recognized environmental conditions (RECs):

  - the former U.S. Steel northern and southern parcels and historical operations; despite the various remedial activities and 1997 NFR Letter, contaminant concentrations exceeded the Tier 1 objectives (at that time) and site-specific RGs established in 1995 HHRA and embraced by the NFR Letter;
  - on-site petroleum-impacted soil;
  - potential orphaned USTs;
  - on-site fill material containing slag and demolition debris;
  - current (at that time) and historical railroad operations;
  - western adjacent property (automotive facility; located approximately 40 feet west of present-day Parcel G);
  - western adjacent property (former dry cleaner in 1928; located approximately 140 feet south of present-day Parcel G]); and
  - western adjacent property (rail yard; former Parcel 22, present-day Parcel D).

- Lead Remediation Area Delineation and Remediation Completion Report (Lead ≥ 1,500 mg/kg, dated January 24, 2008, prepared by WTI (included under separate cover), and

- Lead Remediation Area Delineation and Remediation Completion Report for Lead Areas Greater Than or Equal To 932 mg/kg, but Less Than 1,500 mg/kg, dated January 2008, prepared by CRA (included under separate cover)

  The results of the 2004 due diligence testing conducted by CRA identified a total of 20 areas on the approximate northern half of the subject property with lead concentrations above the site-specific RG of 932 mg/kg. Based on an operating agreement at that time between Southworks Development, LLC and Chicago Lakeside Development, LLC, the latter entity was responsible for delineating and remediating lead concentrations greater than 1,500 mg/kg (at eight of the 20 areas), while the former entity was responsible for delineating and remediating lead concentrations greater than 932 mg/kg, but less than 1,500 mg/kg (at the 12 remaining areas). These materials were excavated and sieved

through a vibratory screen. Materials that passed through the screen were less than 1-inch in diameter and transported for off-site disposal; materials greater than 1-inch in diameter remained on-site. A total of approximately 397 tons of soils less than 1-inch in diameter were transported for off-site disposal from the eight areas where lead had been identified above 1,500 mg/kg, and a total of approximately 1,140 tons of soils less than 1-inch in diameter were transported for off-site disposal from the 12 remaining areas. Post-excavation confirmation sampling indicated that residual concentrations were below 932 mg/kg.

- Comprehensive Site Investigation Report, Remediation Objectives Report, Remedial Action Plan, Remedial Action Completion Report (CSIR/ROR/RAP/RACR) [for Former Parcel 22], dated March 2008, prepared by CRA

  The approximately 3.76-acre former Parcel 22 site was operated as a rail yard for the South Works operations from 1896 to 1992 [note: former Parcel 22 is part of present-day Parcel D]. Historical property use, fill material (i.e., slag and demolition debris), and petroleum impacts were noted as RECs. Various investigations and remedial activities were documented from 2003 to 2007, including the following:

  - 2003 WTI Phase II investigation (7 test pits);
  - 2004 WTI diesel area delineation (16 test pits);
  - 2004 WTI excavation of diesel area and off-site disposal of approximately 14,000 tons of impacted material;
  - 2004 CRA investigation related to the adjacent South Works site;
  - 2005 CRA soil sampling and monitoring well installation (17 soil and 12 groundwater samples);
  - 2006 CRA/WTI soil and groundwater investigation (13 soil and four groundwater samples); and
  - 2007 CRA/WTI PNA area excavation and off-site disposal of approximately 2,420 tons of impacted material.

  The cumulative sample results were compared to the applicable Tier 1 objectives or background concentrations, and 95% Upper Confidence Limits were calculated for certain contaminants in order to comply with applicable objectives. Additionally, CRA proposed a Tier 3 exclusion of the soil component of the groundwater ingestion exposure route for certain VOCs, SVOCs and metals; and a Tier 3 impractical remediation for remaining petroleum impacts in soil near 86th Street (due to the risk of undermining the right of way) and at the GP-2, GP-3, GP-11 and GP-12 areas (remaining impacts near residual saturation). CRA requested a comprehensive NFR Letter be issued for the site with no land use restrictions, and no preventative or engineering controls, with the exception of an institutional control prohibiting the use of groundwater for potable purposes.

- Illinois EPA Comprehensive NFR Letter [for the North Vessel Slip], dated June 17, 2008, and
- Illinois EPA Comprehensive NFR Letter [for the South Vessel Slip], dated June 17, 2008

Based on a 2007 HHRA, the Illinois EPA issued comprehensive NFR Letters for the 12.5-acre North Vessel Slip and the 5.6-acre South Vessel Slip, with no land use restrictions, or engineering or institutional controls. A preventive control indicated that fish advisory signage must be maintained at access points to ensure fisherman are aware of maximum intake recommendations for various fish species caught in this area. Note that these areas are not part of the current Remediation Site.

- Focused Phase II ESA [for Parcel 17], dated July 2008, prepared by CRA (included under separate cover)

CRA was retained by Southworks Development, LLC to conduct testing on Parcel 17. The purpose of the testing was to investigate the RECs identified in CRA's December 2007 Phase I ESA and focused on six areas based on previous investigations and historical records:

- blast furnace and ore yards;
- finishing building and billet docks;
- power station and transformer yard;
- open hearth and stock yards;
- water treatment; and
- foundry and support buildings.

The testing included the advancement of 32 soil borings, installation of six monitoring wells, and collection of 47 soil samples and six groundwater samples for the analysis of various combinations of VOCs, SVOCs, Target Compound List (TCL) inorganics, PCBs, and TPH. The analytical results identified certain PNAs and metals in soil, and certain metals in groundwater, at concentrations above the Tier 1 objectives (at that time).

- Illinois EPA Comprehensive NFR Letter [for Former Parcel 22], dated June 15, 2010

The Illinois EPA issued a comprehensive NFR Letter for the 3.76-acre former Parcel 22 site with no land use restrictions, no preventive or engineering controls, and reliance on Chicago's groundwater ordinance as an institutional control prohibiting the use of groundwater for potable purposes.

- Draft Phase II ESA Analytical Summary Tables and Sample Location Diagrams, dated October 2017, prepared by GHD (included under separate cover)

Pioneer reviewed draft analytical summary tables and diagrams pertaining to soil, groundwater, and soil gas testing conducted throughout the subject property in 2017 by GHD. While no other

information is known about this investigation, the following was ascertained from the available documents:

- collection of 121 soil samples and 18 groundwater samples from existing monitoring wells for the analysis of VOCs, SVOCs, TCL metals, or PCBs; and
- collection of 41 soil gas samples for the analysis of VOCs and hydrogen sulfide.

The analytical results indicated the following:

- certain PNAs, metals, and PCBs were detected in soil at concentrations above the site-specific RGs and/or current Tier 1 soil remediation objectives (SROs);
- certain VOCs, SVOCs, and metals were detected in groundwater at concentrations above the Tier 1 groundwater remediation objectives (GROs);
- the impacted exposure routes included soil ingestion for residential and industrial/commercial property and construction worker populations, outdoor inhalation for residential property (chromium only), and the soil and groundwater components of Class I and II groundwater ingestion; and
- the groundwater and soil gas sample results indicated that potential vapor intrusion does not appear to be a concern at the site.

- Sediment Investigation Report, Former South Works Site North Vessel Slip, dated December 27, 2017, prepared by Barr Engineering Co. (Barr) (included under separate cover)

The purpose of this investigation was to determine the potential source of oil sheens observed on the water surface of the North Vessel Slip identified by the U.S. Coast Guard. The North Vessel Slip was historically used for off-loading raw materials and loading steel product during the South Works operations, and subsequently used for miscellaneous barge activity. The North Vessel Slip is constructed of steel sheet pile walls with the western portion containing remnant foundations and sewer outfalls. All outfalls previously discharging into the slip were reportedly abandoned prior to termination of the National Pollutant Discharge Elimination System (NPDES) permit (IL 0002691) by the Illinois EPA in 2004.

The sediment sampling conducted in 2017 included over 100 samples for the analysis of VOCs, SVOCs, TCL metals, PCBs, and TPH. An oily sheen was observed in all sediment samples except for those collected from the far east end of the slip. While numerous samples exhibited elevated levels of certain VOCs, SVOCs, metals, PCBs, and TPH at concentrations above the Tier 1 objectives or soil attenuation capacity, and a sheen was observed in the majority of the samples, the report concluded that “the sediments are stable and no on-going sources of sheen producing sediments in the North Slip were identified from the Site.” It was reported that U.S. Steel would maintain oil sorbent booms and a heavy duty float and silt curtain to contain any potential future sheens within the slip.

- Tier 3 Remediation Goals — Former United States Steel South Works Site, Chicago, Illinois, dated June 6, 2018, prepared by Jacobs (included under separate cover)

  This technical memorandum was prepared for U.S. Steel for the purpose of calculating site-specific RGs for new chemicals of interest (COIs) identified in the 2017 Phase II testing by GHD that were not completed as part of the 1995 ChemRisk HHRA. Jacobs calculated RGs for each new COI using the 1995 ChemRisk approach and a modified ChemRisk approach with updated toxicity data. The following new COIs were detected at concentrations above the RGs for either approach: arsenic, benzo(k)fluoranthene, chromium, copper, chrysene, thallium, vanadium, and zinc. Jacobs did not calculate RGs for vapor intrusion but noted that, due to the low detection frequency of hydrogen sulfide, the site does not appear to have a vapor intrusion problem. The conclusion of this technical memorandum indicated that the new COIs "will need to be delineated in the areas of exceedances and addressed prior to or in conjunction with property development."

- Phase I Environmental Site Assessment, 8080 S. Lake Shore Drive, Chicago, Illinois, dated May 28, 2024, prepared by Pioneer (included under separate cover)

  Pioneer identified the following RECs in connection with the subject property:

  - The subject property was improved by a steel manufacturing facility from at least 1890 to the late 1980s and is documented as having extensive underground piping used to transport petroleum/hazardous substances. Further, between the 1880s and 1922, steel slag was reportedly landfilled to expand the facility's acreage and relocate the shoreline of Lake Michigan to the east. Various past subsurface investigations completed for due diligence purposes from approximately 2004 to 2025 confirmed the presence of contamination on-site at levels above site-specific objectives (per the 1997 NFR letter), current Tier 1 objectives, and/or the default soil attenuation capacity. Pioneer believes that the more-recently documented on-site contamination associated with the long-time heavy industrial use of the subject property as a steel manufacturing facility and on-site fill represents an REC to the subject property at this time.

  - The northwest corner, Parcel T, was improved by a gasoline filling station from at least the 1920s until the 1960s. This address is included on the Illinois Register of USTs and the LUST incident database (#970360). The associated USTs were removed in 1997; however, this LUST incident retains an "open" (i.e., unresolved) status. Pioneer believes that the unresolved status of this LUST incident and past use of Parcel T as a gasoline filling station represent an REC to the subject property at this time. (Note that these USTs are documented as being taken out of service prior to January 2, 1974 and are therefore exempt from the 35 IAC 734 regulations. The Remediation Applicant recently submitted the appropriate Pre-1974 UST Notification Form to satisfy the regulatory reporting requirements for the reported incident.)

- Geotechnical Investigation Report (for Proposed Phase I Building), dated December 18, 2024, prepared by GSG Consultants, Inc. (GSG) (included under separate cover)

  GSG advanced a total of nine soil borings in the area of the proposed IQMP Phase I development in the southeastern portion of the subject property. The borings were advanced to depths of 50 to 91.5 feet BSG and identified slag fill with silt, sand and gravel to depths ranging from 24 to 33 feet BSG. The fill was generally underlain by sand and silty sand to a depth up to 42 feet BSG, followed by silty clay to 56 feet BSG, clayey silt (hardpan) to 81 feet BSG, and limestone bedrock. Groundwater was generally encountered at approximately 15 to 17 feet BSG.

- Remediation Objectives Report, North Vessel Slip of the Former U.S. Steel South Works Plant, dated January 24, 2025, prepared by Barr

  Although the North Vessel Slip received an NFR Letter in 2008, it was re-enrolled in the SRP following the 2017 discovery of a surface water sheen by the U.S. Coast Guard. Subsequent investigations identified petroleum-impacted sediments that produce sheens via ebullition-facilitated transport (EFT), where gas bubbles carry hydrocarbons from sediment to the surface.

  These investigations confirmed elevated concentrations of TPH, PCBs, and PNAs in sediment. Based on these findings, the report proposes Tier 3 remediation objectives, including sediment remediation for areas exceeding 1,000 mg/kg TPH (associated with sheen production) and consensus-based Probable Effect Concentrations (PECs) for ecological risk.

- Soil Gas Investigation [Report], dated February 10, 2025, prepared by GSG (included under separate cover)

  GSG collected five soil gas samples for the analysis of hydrogen sulfide (TO-15) from the southeastern portion of the subject property in November 2024. The soil gas analytical results did not identify hydrogen sulfide in any of the samples at concentrations above the stated detection limits.

- Geotechnical Investigation Report (for Proposed Phase II — Phase IV), dated April 22, 2025, prepared by GSG (included under separate cover)

  GSG advanced a total of 70 soil borings in the area of the proposed IQMP Phase II through IV developments in the southeastern portion of the subject property. The borings were advanced to depths of 20 to 115 feet BSG and identified slag fill with silt, sand and gravel to depths ranging from approximately 13 to 24 feet BSG. The native soil profile consisted of sand and silty sand underlain by silty clay, clayey silt (hardpan) and bedrock, with variable depths but generally consistent with those observed in the 2024 GSG investigation.

- Draft Limited Geotechnical Investigation Report, dated August 6, 2025, prepared by Pioneer (included under separate cover)

  Pioneer advanced 28 soil borings and excavated 22 test pits in the northwestern portion of the subject property. The borings extended to depths ranging from 7.5 to 45 feet BSG, while the test pits

were excavated to depths of 11 to 18 feet BSG. The upper soils consisted of fill with varying amounts of slag, sand, and gravel, extending to a maximum depth of 22 feet BSG, and underlain by native sand. Limestone bedrock was encountered at variable depths ranging from 21 to 34 feet BSG.

1.3 Supplemental Sampling Activities

To support side-wide closure under the current regulations of 35 IAC Parts 740 and 742, Pioneer conducted a detailed review of the extensive historical environmental data specific to testing conducted on and immediately around the subject property. Pioneer's overall intent was to refresh existing data in order to verify conditions from the prior (1997 and 2010) NFR Letters, as well as from the prior due diligence testing documented herein. This investigation approach relied on the following core considerations:

(1) The Remediation Site has been subject to extensive environmental characterization since the early 1990s, including various due diligence efforts during the 2000s, and was previously issued comprehensive NFR Letters.

(2) The Remediation Site has remained vacant, fenced and secured, with no evidence of illegal dumping or new contaminant sources since facility decommissioning.

(3) The objective is to supplement the prior extensive testing data to demonstrate sufficient investigation and justify the issuance of a new comprehensive NFR Letter.

Accordingly, Pioneer's investigation included:

- an initial soil boring grid with approximate 500-foot spacing for general site characterization;
- targeted borings: (a) to confirm notable previous (post-2000) findings, (b) to provide an enhanced evaluation of the proposed IQMP Phase One development area, and (c) for additional site characterization;
- delineation borings and test pits to define soil attenuation "hotspots" (i.e., Hotspots 1 through 5) identified during the initial investigation;
- a full groundwater evaluation to determine the current analytical and hydrogeological conditions of the shallow aquifer; and
- limited soil gas testing to further evaluate the indoor and outdoor inhalation exposure routes at certain locations.

Pioneer completed the supplemental investigation on various dates from August 2024 through March 2025, which included the advancement of 192 soil borings (SB1 through SB144, plus hotspot delineation borings designated with the original boring ID and lower case letters), excavation of 44 test pits for hotspot delineation (also designated with the original boring ID and lower case letters), and installation of 18 new monitoring wells (MW-301 through MW-318). The cumulative laboratory testing included:

- 425 soil samples analyzed:
  - 250 Target Compound List (TCL) and pH (surface and subsurface samples at majority of locations)
  - 172 TPH (if field evidence of impact and/or hotspot delineation sample)
  - 33 total or reactive sulfide
  - Over 2,000 individual toxicity characteristic leaching procedure (TCLP)/synthetic precipitation leaching procedure (SPLP) inorganics
    - TCLP analyses were conducted on samples where a total RCRA 8 metal exceeded the "20 times rule" [based on 40 CFR 261.24 and Subtitle D landfill requirements], and
    - TCLP or SPLP were conducted on samples where a total inorganic exceeded its pH-specific soil migration Tier 1 SRO, or did not have a pH-specific soil migration Tier 1 SRO and also exceeded its background concentration (Note: Due to hold time and other limitations, cyanide and mercury were only selectively evaluated through TCLP/SPLP, with a general focus on locations with higher total concentrations, where possible).
- 27 groundwater samples analyzed
  - 18 samples from new wells; nine samples from existing wells
  - 25 TCL plus total/dissolved PNAs and metals
  - One VOCs, SVOCs, and PNAs
  - One total/dissolved manganese
  - Eight low-flow resamples for total/dissolved SVOCs, PNAs, lead, and/or thallium
- Three soil gas samples analyzed for certain VOCs

Additionally, the available prior due diligence testing conducted by others in 2007 (CRA), 2017 (GHD) and 2025 (GSG)—and not previously submitted to the Illinois EPA—has been incorporated into the overall closure approach for the Remediation Site. This work conducted by others included the collection of 168 soil samples, 24 groundwater samples, and 46 soil gas samples for the analysis of various combinations of the TCL parameters. The recent geotechnical testing has also been relied upon herein to develop a more thorough understanding of the geological conditions at the site, specifically in the southeastern portion where impacts requiring remedial actions were identified. The new cumulative (2007-2025) dataset presented herein, in conjunction with the extensive data associated with the existing NFR Letters, provides a robust basis for updated site characterization pursuant to 35 IAC 740 and 742.

The attached Figure 2 depicts the environmental boring/sample locations from the aforementioned cumulative (2007-2025) investigation activities, as well as the 2000 TPH bioremediation area, the 2007 PNA delineation areas, and the 2008 lead remediation areas. A detailed summary of the cumulative sampling plan is provided in the following table.

Table 1-3 Summary of Cumulative Sampling Plan

Location ID	Total Depth (ft)	Interval Sampled (ft)	Analyses	Investigation Purpose/Notes

Notes: * indicates depth of monitoring well or soil gas monitoring point below surface grade
^ indicates historical monitoring well identified by Pioneer; well depth corrected based on current measurements
-- indicates no sample was submitted for analysis or sample depth not available
(1) SB10 and SB10a, SB21 and SB21a, SB61 and SB61a, and SB70 and SB70a are identified on figures and boring logs as SB10(a), SB21(a), SB61(a) and SB70(a), respectively.
(2) EW-2 is a former extraction well erroneously identified in Pioneer lab reports as NW-2
GW = groundwater sample, interval not applicable
PCBs = polychlorinated biphenyls

PNAs = polynuclear aromatic hydrocarbons
RCRA 8 Metals = total arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver
SG = soil gas sample; interval not applicable
SPLP = synthetic precipitation leaching procedure
SVOCs = semi-volatile organic compounds, including PNAs
TCL = Illinois EPA's Target Compound List parameters
TCLP = toxicity characteristic leaching procedure
TO-15 = Toxic Organics test method for air/soil gas samples
TOC = total organic carbon
TPH = total petroleum hydrocarbon
VOCs = volatile organic compounds

1.4 Documentation of Field Activities

Discussions of field activities performed by others are included in respective documentation provided under separate cover, if available. The following provides a discussion related to field activities performed by Pioneer.

1.4.1 Soil Boring Advancement/Sampling

Pioneer soil borings were advanced utilizing hydraulic percussive GeoProbe® soil probing units with direct-push technology. Soil samples were collected continuously across the sampling intervals from ground surface to boring terminus using stainless steel dual tube samplers lined with dedicated, disposable plastic sleeves. In certain instances due to dense subsurface conditions, hollow-stem augers were utilized with rotary drilling methods and soil was collected with interlocking split spoon samplers. Additionally, test pits were excavated with a CAT 320E hydraulic track-mounted excavator and associated samples were collected directly from the excavator bucket.

Sample collection procedures implemented in the field by Pioneer were performed in accordance with the industry standard ASTM D 6282, and SW-846 Method 5035, and were consistent with generally accepted engineering practices. After the sample from each interval was retrieved, the undisturbed soil sample was immediately field screened within the sample liner using a Mini-Rae 2000 hand-held photoionization detector (PID), a device sensitive to a variety of VOCs, to provide a quantitative indication of the relative concentrations of contaminants in the soil samples.

A sample was then immediately selected from the portion of the interval displaying the highest field screening results (where elevated screening results were observed) and preserved in accordance with Method 5035 using laboratory-provided, pre-labeled, 40-milliliter vials. These subsamples of soil were collected following the single-transfer protocol discussed in the SW-846 Method 5035 guidance using TerraCore® samplers, and directly transferred to the 40-milliliter vials following collection. The subsamples were collected from undisturbed portions of the soil intervals to ensure that volatilization had not occurred. Additional soil samples were subsequently packed directly into unpreserved, pre-labeled, 4-ounce and/or 9-ounce jars as needed. Packed sample containers were immediately placed on ice in laboratory coolers.

The remaining portions of soil from the sample intervals were logged according to their predominant geological characteristics in accordance with the Unified Soil Classification System (USCS), and allowed to equilibrate to ambient temperatures (approximately 15 minutes, depending upon various factors) in an

airtight Ziplock™ bag, for further field screening. The maximum screening results and geological conditions encountered are listed on the soil boring logs provided in Appendix C.

Sample coolers were retained in the possession of Pioneer personnel at all times, and upon completion of the field activities, samples were delivered to Pioneer's office and transferred directly from the cooler into a refrigerator dedicated to storing soil and groundwater samples. The samples were contained within the refrigerator until they were relinquished to a NELAC-certified, independent laboratory under standard chain-of-custody procedures. The temperature within Pioneer's sample storage refrigerator is maintained at 40 to 42ºF. A standard protocol for Pioneer's soil investigation activities is provided in Appendix C.

1.4.2 Groundwater Monitoring Well Installation/Sampling

Pioneer installed 18 groundwater monitoring wells (MW-301 through MW-318) on various dates in October and December 2024, and February 2025 to evaluate the condition of groundwater beneath the Remediation Site. The wells were installed to depths ranging from approximately 14 to 28 feet BSG and screened from intervals that intersected the water table. The boreholes were drilled using a conventional rotary drilling rig with hollow-stem augers, and the wells were constructed of 2-inch internal diameter, schedule 40, flush-joint PVC screen and riser pipes. The annular space surrounding the screen was backfilled with silica sand to a height not less than 1-foot above the top of the screen, followed by an approximate 1-foot seal of hydrated bentonite, topped with bentonite chips to approximately 1-foot BSG. The wells were completed with stick-up or flush-mount (MW-315 only) casings. (Note that one monitoring well [MW-313] was constructed of 1-inch internal diameter PVC screen and riser.)

The wells were developed using a decontaminated 12-volt submersible pump and polyethylene tubing, with approximately five well volumes of water pumped from the wells. Water levels were allowed to recharge prior to the collection of groundwater samples to ensure collection of accurate and representative data. Groundwater was collected using dedicated polyethylene bailers and decanted into laboratory-provided glassware including 40-milliliter vials containing hydrochloric acid preservative, 250-milliliter polyethylene bottles containing nitric acid or sodium hydroxide preservative, and glass amber bottles containing no preservative. Additional samples from each well were collected with a peristaltic pump via dedicated polyethylene tubing and 0.45 micron high-capacity in-line filters for the collection of dissolved PNAs and metals.

Monitoring wells MW-301 through MW-307 were sampled in October 2024, MW-308 through MW-313 in December 2024, and MW-314 through MW-318 in February 2025. Additionally, Pioneer sampled the existing nine monitoring wells (installed by others) in October 2024 (MW-102, MW-102D, MW-204, EW-2 and NMW-4) and February 2025 (MW-101, MW-104D, MW-106 and MW-202).

Pioneer resampled certain wells on February 14, 2025 (MW-307 and MW-309), March 17, 2025 (MW-101, MW-106, MW-315, and MW-316), and March 18, 2025 (MW-202) to obtain more representative groundwater data for SVOCs, PNAs, and/or certain metals with low-flow sampling methods. Low-flow sampling was used where initial groundwater results were suspected of being

artificially elevated due to standard sampling methods inducing increased suspended sediments including ultra-fine and colloidal particles capable of bypassing the filter.

All groundwater sample containers were immediately packed on ice in laboratory coolers. The coolers were retained in the possession of Pioneer personnel at all times, and upon completion of the field activities, the samples were brought to Pioneer's office, and transferred directly from the laboratory coolers into the sample refrigerator as described in Section 1.4.1.

Pioneer monitoring well construction diagrams and a general protocol for Pioneer's groundwater investigation are included in Appendix C. The recorded low-flow field parameters are included in Appendix D.

1.4.3 Soil Gas Sampling

Pioneer collected three soil gas samples (SG-1, SG-2 and SG-3) to further evaluate outdoor inhalation at soil boring SB-2 and indoor inhalation at monitoring wells MW-202 and MW-102D in February and March 2025, respectively. The soil gas sampling was performed in general accordance with 35 IAC 742.227 and standard industry practices using the GeoProbe® and Post-Run Tubing (PRT) system. The soil gas samples were submitted to an independent laboratory under standard chain-of-custody procedures for analysis of certain VOCs using U.S. EPA Test Method TO-15. A detailed protocol for Pioneer's soil gas sampling is included in Appendix C.

1.4.4 Field Observations

Field evidence of contamination (petroleum odors, staining, and/or elevated PID readings greater than 40 ppm) was only observed in 13 of the 144 original grid and targeted borings. Subsequent petroleum delineation borings and test pits also exhibited some degree of field impacts. Except for the SB61 area, field impacts were generally 1 to 7 feet thick and corresponded with the groundwater smear zone. The most severe impacts were observed at four areas on Parcel 17 (in SB21, SB61, SB70, and SB118) and one area on Parcel D (SB141), and consisted of elevated PID readings, strong petroleum odors, and/or visible indications ranging from black staining to a viscous, black liquid residue coating the soil. The field impacts at SB61 (on the far southeastern portion of Parcel 17) extended into the saturated zone to approximately 35 feet BSG, where a native silty clay confining layer was encountered.

Based on soil borings and test pit observations, petroleum contamination, if not encountered near the current water table, was not observed at greater depths. Therefore, all delineation borings and test pits were advanced at least 2 feet into the saturated zone to ensure that any petroleum impacts, if present, would be identified. As such, delineation test pits were sampled for TPH only at or near the water table, where field evidence of contamination was typically most apparent or, if absent, reliably indicated that deeper impacts were unlikely.

Hydrogen sulfide odors were intermittently noted during drilling activities across the site. These odors are consistent with historical observations and are likely attributable to trace off-gassing from the sulfide-bearing slag used as fill material, particularly under saturated and anaerobic conditions. Minor

contributions from petroleum degradation and decaying organic debris may also be a factor in isolated areas. As noted in Section 1.2.6, soil gas sampling completed in 1999, 2017, and 2025 did not identify hydrogen sulfide at concentrations above applicable screening criteria.

None of the monitoring wells exhibited field evidence of contamination with the exception of MW-318 (installed at SB61) and MW-202 (located in the vicinity of SB61/MW-318), where petroleum odors and sheens were observed during groundwater sampling. However, no measurable free product (light non-aqueous phase liquid [LNAPL]) was detected in any of the monitoring wells at the subject property, as evidenced by oil/water interface probe readings and/or visual inspection during sampling. Additionally, there is no indication that free product was observed during previous groundwater investigations performed by CRA (2007) or GHD (2017).

The field impacts observed by Pioneer are summarized in the following table, and a complete listing of the geological conditions and field observations encountered during drilling are provided on the soil boring logs in Appendix C.

Table 1-4 Summary of Pioneer Field Indications of Contamination

Boring/ Test Pit ID	Interval (ft)	Max PID* (ppm)	Observations	Max TPH[1] (mg/kg)
SB21(a)	12-15	3	Viscous petroleum residue coating soil	4,313
SB21b	10-14	9	Petroleum odor, black staining	33,004
SB21c	10-15	6	Petroleum odor, black staining	10,105
SB21d	10-15	8	Petroleum odor, black staining	42,019
SB21e	10-15	7	Viscous petroleum residue coating soil	19,716
SB21f	11-14	36	Petroleum odor, black staining	50,180
SB21i	11-14	3	Minor black staining	36,043

1.4.5 Site Geology

The stratigraphic profile encountered during Pioneer's soil boring activities consisted of an upper heterogeneous fill layer generally composed of historical backfilled slag, followed by layers of native fine sand and silty clay. Slag particle size appeared to most commonly range from sand to gravel, with silt-sized particles and local occurrences of cobbles, and frequent layers of dense hot-poured slag that could not typically be penetrated through standard drilling or excavation techniques. Limited grain-size analysis results from Parcel 17 (at TPH Hotspots 4 and 5) indicated the fill in those areas exhibited approximately 10 to 20 percent fines (defined as particles passing the No. 200 sieve). Additional fill

constituents included crushed concrete, bricks, metal fragments, cinders, wood, and suspected ore, as well as non-slag silt, sand, and gravel likely composed of quartz and limestone.

The fill thickness varied across the subject property with depths on the western portion ranging from approximately 5 to 10 feet BSG, and up to 40 feet BSG on the eastern portion (based on historical and recent geotechnical data). Beneath the fill, native soils typically consisted of dense, wet to saturated, fine sand and silty sand, underlain by stiff silty clay. Silty clay was only encountered in one of Pioneer's soil borings [SB61(a)], at depths from 35 to 40 feet BSG, which was the maximum explored depth and deepest soil boring advanced during Pioneer's Phase II investigation. However, prior geotechnical soil borings indicate that silty clay was first encountered between approximately 21 and 44 feet BSG, underlain by clayey silt (hardpan) and limestone bedrock. Bedrock was encountered at depths ranging from approximately 21 feet (in the northwestern portion of the site) to 80 feet BSG (in the southeastern portion of the site).

Multiple refusal encounters were experienced at the majority of soil boring locations and in most cases, borings were moved several times—from 20 to over 100 feet from original refusal point—in an attempt to obtain the target depths. Subsurface obstructions were extensive and included hot-poured slag, suspected skulls (solidified iron), demolition debris, buried railroad tracks, iron beams and anchors, and remnant concrete footings and foundations (much of it reinforced), which reportedly range in thickness from 1 to 25 feet thick.

Due to the extensive obstructions, certain soil borings and test pits could not be advanced beyond 3 to 10 feet BSG, despite multiple repositioning attempts and prolonged drilling efforts at each location. In many instances, the hot-poured slag was just as difficult to penetrate as the remnant concrete, and concrete was encountered in various locations not depicted on historical foundation plans. In some locations, even with the use of a 25-ton excavator equipped with a concrete breaker, achieving a depth of 15 feet BSG required up to 4 hours—and in other locations, excavation was abandoned when it could not achieve even shallower depths within the same timeframe. The dense subsurface conditions caused prolonged scheduling delays and significant equipment damage.

Groundwater was generally encountered in soil borings between 7 to 15 feet BSG—increasing in depth from west to east—within the fill material or upper 10 feet of native soils below the fill. Groundwater elevation data from monitoring wells identified similar depths to water, indicating unconfined conditions across the site. The deepest observed groundwater levels—approximately 20 feet BSG—were measured in MW-309 and MW-310, both located in areas with the highest surface elevations in which monitoring wells were installed.

A complete listing of the geological conditions encountered during Pioneer's drilling is provided on the soil boring and test pit logs provided in Appendix C. Boring logs associated with CRA's 2008 Phase II ESA are included in that report, and boring logs and stratigraphic cross sections are also available in the 2024 and 2025 geotechnical reports, provided under separate cover.

1.4.5.1 Characteristics of Slag

The fill materials present throughout the subject property include substantial volumes of steel slag, which was historically placed to raise and stabilize low-lying shoreline areas prior to and during the expansion of steel manufacturing operations. Slag deposits are ubiquitous across the site and are a defining subsurface feature. These deposits were likely placed in multiple stages, with much of the initial fill occurring between the 1880s and early 1900s, coinciding with the construction and expansion of the steel plant. Subsequent decades saw continued deposition, including the use of crushed slag as structural fill and grading material for roads, rail spurs and foundations.

The majority of the slag encountered at the Remediation Site is consistent in composition and appearance with blast furnace slag, a byproduct of the iron-making process and the most commonly produced slag material during the South Works' operational history. However, slag from secondary steelmaking processes—such as open hearth furnaces, basic oxygen furnaces, Bessemer converters, and potentially electric arc furnaces—may also be present, particularly in areas formerly occupied by refining infrastructure or slag-handling operations. These materials were likely generated on-site and deposited as part of routine waste management practices during the site's long history of integrated iron and steel production.

Slag is a vitrified material formed during the high-temperature smelting of iron ore and fluxes, whereby impurities are chemically bound into a glassy or crystalline matrix. The specific mineralogy and chemistry of slag varies depending on the smelting and refining processes, but slags generally contain substantial proportions of oxides of calcium, magnesium, silicon, and aluminum. In addition, slag frequently contains elevated concentrations of trace metals associated with steel production, including but not limited to iron, manganese, chromium, vanadium, zinc, lead, arsenic, and molybdenum. The concentrations of these metals vary based on the type of ore and additives used during production.

Blast furnace slags, associated with iron-making, are typically neutral to slightly basic in pH, while slags from steel refining operations (e.g., basic oxygen or electric arc furnaces) tend to be more strongly alkaline due to higher lime content. The co-occurrence of elevated total metals concentrations and alkaline pH in fill material supports the conclusion that slag is widespread across the site, including where fill contents are visually ambiguous.

The site is located within a broader region of southeast Chicago known for extensive slag fill and is part of what has been termed the "slag aquifer," a hydrogeologically significant zone where groundwater interacts with porous slag deposits. This region spans several square miles and extends into parts of northwest Indiana.

At the former South Works site, molten slag was managed using ladle or pot systems that transported the slag to designated cooling pits or directly to fill areas. In some locations, slag was "hot-poured"—discharged in molten form onto the ground, where it rapidly cooled to a solid, concrete-like mass. These deposits are distinct in appearance and often exhibit dense, vesicular textures with sharp fracture patterns.

Slag served both functional and logistical roles at the site; it provided a stable platform for industrial development, enabled waste disposal, and supported beneficial reuse. Historically, steel slag has been used as railroad ballast, aggregate in road base and concrete, insulation material, and as a soil amendment in agriculture. In Illinois, iron and steel slags used for land reclamation are recognized under 35 IAC 817.101(e) and are generally exempt from solid waste regulations (35 IAC 817.101(c)) when managed appropriately.

1.4.6 Site Hydrogeology

1.4.6.1 Hydraulic Gradient

Pioneer subcontracted Spaceco, a licensed surveying firm, to perform an elevation survey of the monitoring well casings and surrounding ground surface. The survey was conducted on October 30, 2024 and February 21, 2025. Elevations were referenced to the Chicago City Datum (CCD) to the nearest 0.01 foot, using standard surveying techniques and tied to established CCD benchmarks.

Monitoring well gauging events were conducted in February, May, June, and July 2025. Prior to each event, water levels were allowed to recharge to static conditions to ensure accurate and representative measurements. Water levels were recorded using a Sonic Interface Probe and compared to surveyed ground surface elevations to calculate groundwater elevations and evaluate apparent groundwater flow direction. The following table summarizes groundwater elevations recorded during the May 2025 event. A complete listing of water level measurements from all gauging events is provided in Appendix D.

Table 1-5 Groundwater Elevation Data

May 21, 2025						
Well ID	**Well Elevation (TOC)**	**Ground Elevation**	**Well Depth (TOC)**	**Depth to Water (TOC)**	**Depth to Water (BSG)**	**Groundwater Elevation**

(1) EW-3 is an unused extraction well associated with the former Parcel 22 remedial activities
(2) Vessel slip gauging point from edge of bulkhead wall

As indicated by the inferred groundwater elevation contours on Figure 4—based on the May 2025 groundwater elevations—groundwater is mounded in the north-central and south-central portions of the site. Groundwater at the site is generally directed toward surface water discharge zones, although flow is affected by site complexities including on-site infiltration, variations in topography, soil heterogeneity, and subsurface structures. Groundwater typically flows toward Lake Michigan, the Calumet River, and the North and South Vessel Slips, all of which maintain relatively stable surface water elevations near 0 feet CCD. However, surface water elevations are governed by Lake Michigan levels, which fluctuate over time. A National Oceanic and Atmospheric Administration (NOAA) gauging station (#9087044) located near the southwestern corner of the site has recorded Calumet River elevations ranging from approximately -1.5 feet to 4.5 feet CCD over the past decade, representing certain extreme seasonal variations and consistent with changes to Lake Michigan. Periods of elevated lake levels can reduce the hydraulic gradient toward surface water and increase groundwater elevations at the site, thereby influencing the rate and direction of shallow groundwater discharge.

Groundwater elevations measured during the May 2025 gauging event ranged from approximately 0.40 to 4.25 feet CCD, representing a potentiometric relief of approximately 3.85 feet. (Note: MW-307 was excluded from contouring due to an anomalously high elevation of 13.85 feet CCD, which deviates significantly from site trends and was not identified in historical groundwater monitoring data. Located adjacent to the North Vessel Slip, MW-307 likely reflects a localized condition that is not representative of broader site hydrogeology.)

While the general direction of groundwater flow is toward adjacent surface water bodies, the two observed groundwater mounds create localized radial flow, resulting in deviations from the expected eastward regional trend. The combination of these mounds, the relatively flat hydraulic gradients along the western portion of the site, and the results of the groundwater flow modeling (see Section 2.5.2.1) suggest that stormwater infiltration into permeable fill materials exerts a primary control on groundwater elevations, with limited inflow from off-site areas to the west. This locally recharged water raises the potentiometric surface and drives lateral flow across the site.

To calculate the average hydraulic gradient at the subject property, nine representative transects aligned with the direction of groundwater flow were selected (see Figure 4). The resulting hydraulic gradients ranged from 0.0013 ft/ft to 0.0037 ft/ft, with an overall average of 0.0019 ft/ft. To evaluate vertical gradients, Pioneer gauged two nested well pairs—MW-102/MW-102D and MW-104/MW-104D—screened at shallow and deeper intervals. Gauging results indicated vertical gradients ranging from 0 to 0.00267 ft/ft, consistent with negligible vertical flow.

Collectively, these findings suggest that the site's groundwater flow regime is controlled more by localized recharge and site-specific topographic and hydrogeologic conditions, rather than by broader regional flow. The combination of groundwater mounds, limited inflow from off-site areas, and groundwater discharge to adjacent surface water bodies indicates a complex, yet stable hydrogeologic setting that is largely governed by localized recharge.

1.4.6.2 Hydraulic Conductivity

The site's hydrogeological conditions were further evaluated by conducting hydraulic conductivity testing. Specifically, aquifer slug tests were performed in MW-301 and MW-302 on February 19, 2025, and in MW-314 on February 21, 2025 to obtain site-specific hydraulic conductivity values. The basic methodology consisted of lowering a submersible, data-logging pressure transducer into the well and documenting changes in water table elevations following extraction of water using a submersible pump. The rates of recharge/equilibration were recorded using a laptop computer and the recorded data were subsequently plotted and evaluated utilizing widely-accepted methods for slug test data interpretation (Bouwer and Rice), and third-party, groundwater modeling software (AquiferTest Version 11.0) to calculate hydraulic conductivity values. The water level measurements and graphical interpretation of the data for the slug tests are included in Appendix D.

Based on the results of slug testing conducted by Pioneer, the site's hydraulic conductivity ranged from 4.65×10^{-2} cm/s to 8.16×10^{-4} cm/s. Additionally, Pioneer obtained historical slug test reports from 1995 and 2005, which indicated a range of hydraulic conductivities from 1.35×10^{-2} cm/s to 5.32×10^{-5} cm/s. The following table provides a full listing of these hydraulic conductivity values calculated for the site, which equates to an average of 5.40×10^{-3} cm/s. Refer to Appendix D for the current and historical slug test reports.

Table 1-6 Hydraulic Conductivity Values

Monitoring Well	Hydraulic Conductivity	Investigation
MW-301	8.16×10^{-4} cm/s	Pioneer 2025
MW-302	4.65×10^{-2} cm/s	Pioneer 2025
MW-304	5.40×10^{-4} cm/s	Pioneer 2025
MW-102	6.81×10^{-3} cm/s	CRA 2005
MW-102	5.15×10^{-3} cm/s	CRA 2005
MW-102	1.23×10^{-2} cm/s	CRA 2005
MW-102D	3.06×10^{-3} cm/s	CRA 2005
MW-102D	3.73×10^{-3} cm/s	CRA 2005
MW-102D	3.56×10^{-3} cm/s	CRA 2005
MW-104D	5.32×10^{-5} cm/s	CRA 2005
MW-104D	6.81×10^{-4} cm/s	CRA 2005
MW-104D	2.14×10^{-3} cm/s	CRA 2005
MW-104D	3.14×10^{-3} cm/s	CRA 2005
MW-104D	2.04×10^{-3} cm/s	CRA 2005
MW-3	3.59×10^{-3} cm/s	WTI 1995
MW-3	3.07×10^{-3} cm/s	WTI 1995
MW-7	1.30×10^{-3} cm/s	WTI 1995
MW-7D	3.16×10^{-4} cm/s	WTI 1995
MW-8	1.34×10^{-2} cm/s	WTI 1995
MW-9D	2.20×10^{-5} cm/s	WTI 1995
MW-10	1.22×10^{-3} cm/s	WTI 1995
Average	5.40×10^{-3} cm/s	

1.4.6.3 Potable Well Survey

There are no known potable water supply wells located at the Remediation Site or adjacent properties as evidenced by visual (exterior) inspections, and the subject property and all areas within at least 2,500 feet of the site are within the City of Chicago, which maintains an ordinance that prohibits the use of groundwater for potable purposes.

However, in order to demonstrate that the Remediation Site is not located within the minimum or designated maximum setback zone or within a regulated recharge area of an existing potable water supply well, Pioneer conducted a search for potable wells within a 2,500-foot radius of the Remediation Site. The well survey was performed in accordance with 35 IAC 1600.210 except that a 2,500-foot search distance was used for all wells in place of the default, minimum 200-foot search distance for private, semi-private, and non-community water supply system wells. The results of the well search are outlined in the following table.

Table 1-7 Potable Well Survey Information

Illinois EPA's Division of Public Water Supplies (via the Source Water Assessment Program [SWAP] online ArcGIS Mapping System)	
Private wells (identified as "ISGS Database Wells" and "Water and Related Wells")	Two water wells; 12 monitoring wells; 52 engineering wells
	The water wells (one located on the current Remediation Site and one located on the north adjacent property) are located on vacant parcels associated with the former South Works facility and were installed in 1930. Neither well currently exists based on direct visual inspections of these areas and the documented past demolition activities.
Non-community water supply wells	None
Community water supply wells	None
Maximum designated setback zones	None
Regulated recharge areas	None
Wellhead protection areas	None
Illinois Resource Management Mapping Service (RMMS)	
Private wells (identified as "ISGS Well Data 2012")	Two water wells (consistent with the SWAP map as discussed above)
Community water supply wells	None
Community water supply regulated recharge areas	None
Illinois State Water Survey (ISWS) domestic wells database	
Private wells	This source did not include any data for areas within 2,500 feet of the Remediation Site.
Illinois Department of Public Health (IDPH)	
Non-community water supply wells	None
City of Chicago well survey report compiled by the Department of Environment (DOE)	
Private wells	None

Based on the available documentation, there are no community water supply wells within 2,500 feet of the Remediation Site, and the Remediation Site is not located within the minimum or maximum designated setback zones or regulated recharge areas of any active potable wells. Documentation associated with this well survey is provided in Appendix D.

1.4.6.4 Groundwater Classification

As noted previously, the Illinois EPA issued a letter in January 1995 recommending a Class II groundwater classification for groundwater beneath the site. This designation applied to groundwater within the slag fill material and the upper 10 feet of underlying parent material (see Appendix D for a copy of the Illinois EPA letter). Pioneer's recent subsurface investigations confirmed that current geologic and hydrogeologic conditions are consistent with those documented in earlier investigations supporting the site's existing NFR Letters. Because groundwater classification is determined by physical site characteristics that remain unchanged, the Class II designation continues to apply to this assessment.

Due to recent amendments to 35 IAC Part 620(a) regarding groundwater classification, Pioneer reviewed the new provisions that were not in effect when the original NFR Letters were issued. In particular, subsections 620.210(a)(5) and 620.210(a)(6) were added and have now been evaluated to confirm that the groundwater at the Remediation Site does not qualify as Class I groundwater. The applicability of these new criteria to site-specific conditions is discussed below:

- *620.210(a)(5)—a wellhead protection area, as defined in Section 620.110, that is a Phase I or Phase II wellhead protection area delineated in compliance with the "Guidance Document for Groundwater Protection Needs Assessments" and "The Illinois Wellhead Protection Program", both incorporated by reference in Section 720.125; or*

  As documented in the well survey included in the previous section, the Remediation Site is not located within a wellhead protection area.

- *620.210(a)(6)—the maximum setback zone of a community water supply well adopted under Section 14.3 of the Act.*

  As documented in the well survey included in the previous section, the Remediation Site is not located within the maximum setback zone of any community water supply wells.

It is also noted that in accordance with 35 IAC 620.420(a)(3), barium, pH, and the other inorganic chemical standards identified in 620.420(a)(2) do not apply to groundwater in this setting.

1.5 Endangerment Assessment

For initial screening purposes, the analytical results outlined herein are compared to the Tier 1 SROs, GROs and soil gas remediation objectives (SGROs) found in 35 IAC 742 (TACO).

Note that laboratory reports associated with Pioneer's sampling events are provided in Appendix H. Laboratory reports for samples previously collected by others are provided in respective reports under separate cover, if available.

1.5.1 Applicable Exposure Routes

- Soil Ingestion & Outdoor Inhalation Exposure Routes: Current development plans for the Remediation Site consist of industrial/commercial land use. Therefore, the applicable Tier 1 remediation objectives for the soil ingestion and outdoor inhalation exposure routes include the Tier 1 SROs and/or Tier 1 SGROs for industrial/commercial property and construction workers. The eventual NFR Letter(s) will serve as an institutional control for allowable land use. Due to the size of the site, certain areas may be redeveloped with land uses that would be considered residential (e.g., public trails, parks, medical facilities, etc.), and in those cases, an amended report(s) comparing results to residential standards will be issued once those property uses and areas are defined.

- Soil and Groundwater Components of the Groundwater Ingestion Exposure Route: The Tier 1 SROs and GROs for the soil and groundwater components of Class II groundwater ingestion shall apply to the Remediation Site.

- Indoor Inhalation Exposure Route: The proposed buildings will be constructed with concrete slab-on-grade foundations. Therefore, the applicable objectives for the indoor inhalation exposure route are the industrial/commercial Tier 1 GROs and SGROs where the mode of contaminant transport is

both diffusion and advection (Appendix B, Table H of 35 IAC 742). As noted previously and due to the size of the site, certain areas may be redeveloped with land uses that would be considered residential (e.g., public trails, parks, medical facilities, etc.), and in those cases, an amended report(s) comparing results to residential standards will be issued once those property uses and areas are defined.

1.5.1.1 Updated Background Concentrations - PNAs

In accordance with 35 IAC 742.415, the applicable (Chicago) background concentrations for certain PNAs may be used in place of the current, published Tier 1 SROs. The background values used for this evaluation (as presented on Table No. 3 in the "Tables" section of the appendices) are the current acceptable background concentrations provided by the Illinois EPA in 2022.

1.5.1.2 Updated Background Concentrations - Metals

Pioneer understands that the Illinois EPA has calculated updated background levels for metals in accordance with 35 IAC 742.405(b)(2), and a Remediation Applicant now has the option to use the new 95th parametric percentile background values, determined by an updated study of inorganics in Illinois, in place of the background levels that are currently listed in 35 IAC 742.Appendix A, Table G. Pioneer also understands that the 95th parametric percentile values have been approved by the Illinois EPA in accordance with 35 IAC 742.415(b)(2). Therefore, the background values used for the Remediation Site (presented on Table No. 4 in the "Tables" section of the appendices) are the 95th parametric percentile values provided by the Illinois EPA in 2023, with the exception of antimony and arsenic.

In accordance with 35 IAC 742, Appendix B, Table A, the applicable background concentration for arsenic may be utilized as the Tier 1 SRO for the soil ingestion exposure route. Also, excluding calcium, magnesium, potassium and sodium, for metals where no pH-specific Tier 1 SROs are available for the migration to groundwater exposure route, the analytical testing results may be compared to the concentrations of inorganic chemicals in background soils. Calcium, magnesium, potassium and sodium are excluded from this evaluation since there are no corresponding TCLP or SPLP Tier 1 SROs in the TACO regulations; thus, an evaluation of these metals in relation to the soil component of the groundwater ingestion exposure route is not required.

1.5.1.3 Elevated Detection Limits

Detection limits that exceeded the applicable Tier 1 remediation objectives were only evaluated as potential impacts for compounds that were detected in at least one soil or groundwater sample. Of the detected compounds, arsenic, 2,4-dinitrotoluene, 2-hexanone, and methylene chloride had elevated detection limits that exceeded Tier 1 SROs.

1.5.1.4 Non-TACO SROs

The Illinois EPA formerly provided SROs for non-TACO chemicals; however, the non-TACO SROs were rescinded in 2016. At that time, the Illinois EPA provided updated non-TACO SROs for acenaphthylene, benzo(g,h,i)perylene, and phenanthrene; however, SROs for other non-TACO chemicals must be calculated following the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Chemicals Not Listed in TACO Regulations."

Aside from acenaphthylene, benzo(g,h,i)perylene and phenanthrene, the only non-TACO chemicals detected in soil samples collected from the Remediation Site are aluminum, 2-butanone, 2-hexanone, 2-methylnaphthalene, 2-nitroaniline, 3,4-methylphenol, and dibenzofuran. All detected concentrations of aluminum in soil are below the 95th percentile concentration for background soils. Therefore, non-TACO SROs did not need to be calculated for aluminum, and non-TACO SROs were only calculated for 2-butanone, 2-hexanone, 2-methylnaphthalene, 2-nitroaniline, 3,4-methylphenol and dibenzofuran; see the non-TACO SRO calculation spreadsheets following the analytical data tables in the "Tables" section of the appendices.

1.5.2 Tier 1 Evaluation – Soil

Pioneer's soil sample analytical results revealed the presence of heavy metals (primarily arsenic, chromium, and manganese) generally detected site-wide at concentrations above the Tier 1 SROs for soil ingestion and outdoor inhalation for industrial/commercial property and construction workers. However, results of the extensive leachability (TCLP/SPLP) testing demonstrated that the metals exhibit significant immobility, with only sporadic low-level impacts to the soil migration pathway and no exceedances of the "hazardous" toxicity characteristics.

Aside from metals, and excluding the applicable elevated detection limits, other contaminants of concern (COCs) detected above the applicable Tier 1 SROs in the 250 Pioneer soil samples analyzed for the TCL parameters include:

- VOCs in one sample (only methylene chloride);
- Non-PNA SVOCs in five samples (only dibenzofuran and/or carbazole);
- PNAs in 15 samples (incorporating the current background concentrations for Chicago);
- Pesticides in one sample (only dieldrin and heptachlor epoxide); and
- PCBs in nine samples
    - Note: Only one sample [SB55 (0-3)] exhibited a PCB concentration greater than 10 mg/kg (but less than 50 mg/kg). This impact will be further addressed under the U.S. EPA's self-implementing cleanup regulations (40 CFR 761.61[a]).

The affected Tier 1 SRO exposure routes include soil ingestion, outdoor inhalation, and the soil component of groundwater ingestion. Additionally, PNAs were detected in one sample and TPH in numerous samples at concentrations above the default soil attenuation capacity (Hotspots 1 through 5).

The soil sample analytical results from the 2007 and 2017 Phase II investigations were generally consistent with Pioneer's findings. However, it should be noted that the samples analyzed for total metals as part of the prior investigations were not co-sampled for pH and did not undergo leachability testing. The soil migration to groundwater exposure route will be evaluated solely through Pioneer's current data given:

(1) the relative consistency of the total metals concatenations between the previous and Pioneer investigations;

(2) Pioneer targeting certain prior sample locations with elevated total metals concentrations; and

(3) the extensive leachability testing conducted by Pioneer.

A complete listing of Pioneer's soil sample analytical results in comparison to the applicable Tier 1 SROs is provided in Table Nos. 1 through 10 in the "Tables" section of the appendices. Refer to the attached Figures 5 through 8 for diagrams depicting the locations of Tier 1 impacts. Documentation from the 2007 and 2017 Phase II investigations has been included with this submission under separate cover.

The following table provides a summary of the cumulative (2007-2025) soil sample locations where the applicable Tier 1 SROs were exceeded.

Table 1-8 Soil Sample Locations Where COCs Exceed the Applicable Tier 1 SROs

Th = thallium
TPH = total petroleum hydrocarbons
V = vanadium

Pioneer notes the following regarding certain parameters listed in the preceding table.

- Soil Migration to Groundwater — 2,4-dinitrotoluene (2,4-DNT)

  A total of seven soil samples collected by Pioneer exhibited elevated detection limits for 2,4-DNT (above the published acceptable detection limit). None of the cumulative soil or groundwater samples from the investigations discussed herein identified detectable concentrations of 2,4-DNT with the exception of three groundwater samples from the 2017 investigation. However, based on

Pioneer's updated groundwater results, these historical detections are likely associated with the presence of sediment in the prior groundwater samples and are not actually representative of groundwater conditions. Also, the elevated detection limits in the soil samples (from borings SB61, SB122, SB125, SB126 and SB127) do not correlate to the locations of the three wells where this compound was previously detected above the Tier 1 GRO. Accordingly, evidence indicates that the elevated detection limits of 2,4-DNT identified by Pioneer are not considered actual impacts since this compound has never been detected in samples representative of actual conditions, and no further evaluation is necessary. Refer to Section 1.5.3 for a further discussion.

- Soil Migration to Groundwater — Iron

  Iron was detected in soil samples SB4 (0-3) and SB143 (15-17.5) at leachable concentrations above the Tier 1 SRO for the soil migration to Class II groundwater exposure route. However, in accordance with Section 620.450(a)(3), since these samples were collected from the slag fill or upper 10 feet of parent material, the Tier 1 SRO for the soil migration to Class II groundwater with respect to iron does not apply. Therefore, the concentrations of iron in these samples are not considered impacts and no further evaluation is necessary.

- Soil Migration to Groundwater — Cyanide and Mercury

  Various concentrations of cyanide and mercury did not have a pH-specific Tier 1 SRO for soil migration to groundwater and were also above the background concentration. For the concentrations that were further evaluated by TCLP or SPLP, none were detected at the stated laboratory detection limits except two concentrations of TCLP cyanide, which were detected below the applicable Tier 1 SRO. Further, mercury was not detected in any groundwater sample, and cyanide was either not detected in groundwater or was detected below the most stringent Tier 1 GRO. Therefore, the samples listed in the preceding table with total cyanide and/or total mercury above background (in the absence of pH-specific Tier 1 SROs) are not considered impacts to the soil component of Class II groundwater, and no further evaluation is necessary.

- Soil Saturation Limit — Mercury

  Total mercury was detected in soil samples SB12 (0-3) and SB13 (0-3) at concentrations (13 mg/kg and 9.9 mg/kg, respectively) above its soil saturation limit (3.1 mg/kg). Since the soil saturation limit is specific to elemental mercury, the total concentrations were further evaluated through elemental mercury testing at these locations, the results of which (0.083 mg/kg and <0.001 mg/kg, respectively) were below the soil saturation limit. Therefore, the concentrations of total mercury in these samples are not considered impacts to the soil saturation limit and no further evaluation is necessary. Refer to Section 2.3.1 for a further discussion.

Copies of the complete laboratory analytical reports for the soil samples collected by Pioneer are provided in Appendix H. Laboratory reports for the 2007 investigation are provided in the associated 2008 CRA Limited Phase II ESA, while laboratory reports for the 2017 GHD Phase II ESA were not available for review.

1.5.2.1 Soil Attenuation

Pioneer's soil testing activities also identified five "hotspot" areas where contaminant concentrations exceeded the default soil attenuation capacity for subsurface soil (2,000 mg/kg): one due to PNAs (Hotspot 1) and four due to TPH (Hotspots 2 through 5). Refer to the attached Figure 3 for the locations of the hotspot areas, Figure 9 for a TPH hotspot diagram, Figures 10A, 10B, and 10C for detailed diagrams of the TPH hotspots, and Figures 11A through 11H for corresponding cross sections. The following table provides a summary of each hotspot.

Table 1-9 Hotspot Summary Table

Hotspot	Primary Boring(s)	Contaminant	Suspected Source	Maximum Concentration (mg/kg)	Estimated Area (ac)	Estimated Depth (ft BSG)	Estimated Impacted Volume (yd^3)
1	SB10	PNAs	Fill material	3,458	0.02	5-7.5	80
2	SB141	TPH	Former EJ&E Railroad	2,460	0.7	5-10 (variable)	3,000
3	SB70	TPH	Former Central Treatment Plant, Central Oil House & Pipelines	138,021	12	7.5-17.5 (variable)	95,000
4	SB21/SB118	TPH	8-in Pipeline	91,630	9	10-17.5 (variable)	72,000
5	SB61	TPH	8-in Pipeline	86,042	7	10-35 (variable)	171,000
						Estimated Total Impacted Volume:	341,080

PNAs Hotspot

Hotspot 1 exhibits a total PNA concentration only marginally above the default soil attenuation capacity and is limited to approximately 900 square feet (0.02 acres), with an estimated volume of less than 80 cubic yards of slag fill.

TPH Hotspots

Various lines of evidence, including historical records, field observations, and current analytical results indicate that the highly weathered and viscous petroleum contamination is 50 to 100 years old. The residual petroleum primarily consists of diesel range organics and oil range organics, and is likely a combination of fuel oils and petroleum products including diesel fuel, Bunker C fuel oil, and heavy crude, among others.

Hotspot 2 is limited to approximately 0.7 acres and includes an estimated 3,000 cubic yards of impacted slag fill and sand, and is likely attributable to the former railroad activities on and near former Parcel 22 (current Parcel D). The impacts in this area are limited to depths that correspond with historical groundwater fluctuations from approximately 5 to 10 feet BSG (i.e., the smear zone). The Illinois EPA was previously notified of the petroleum contamination associated with Hotspot 2 and approved a Tier 3 impractical remediation evaluation in accordance with 35 IAC 742.920, noting in a March 18, 2010 Illinois EPA memo that "the remaining petroleum is near residual saturation (which limits the use of extraction wells) and occurs at approximately discontinuous locations (which limits the use of excavation)" (Illinois EPA, 2010a).

Hotspots 3, 4, and 5 encompass approximately 28 acres and include an estimated 338,000 cubic yards of impacted slag fill and sand on the southern portion of the subject property (Parcel 17), which represent 99 percent of the soil attenuation impacts by volume. The impacts in Hotspots 3 and 4 are generally limited to the groundwater smear zone from approximately 10 to 15 feet BSG, with select impacts located at varying depths between 7.5 to 17.5 BSG. While the most severe impacts in Hotspot 5 also correspond with the groundwater smear zone, field observations of petroleum contamination in this area were observed throughout the saturated zone, down to a silty clay confining layer at approximately 35 feet BSG. The observed characteristics of the residual petroleum and maximum TPH concentrations were generally consistent across Hotspots 3, 4, and 5. However, the deeper impacts in Hotspot 5 could be associated with a higher-pressure and longer duration pipeline release and/or a higher concentration of dense Bunker C fuel oil as indicated in the 2000 TPH Remediation Report.

Historical records indicate that the majority of the former South Work's wastewater treatment and petroleum storage and handling took place on the southern portion of the subject property. Specifically, wastewater from the northern portion of the site was apparently pumped to the Central Treatment Plant located near the northwestern portion of Hotspot 3, where it was eventually discharged into the South Vessel Slip via an oil skimmer utilized near the discharge point. The Central Oil House was also reportedly located within Hotspot 3 and historical records seem to indicate that the majority of tanks and pipeline infrastructure were present on the southern portion of the subject property.

Note that the petroleum impacts associated with Hotspots 3, 4, and 5 were not identified as part of the investigation activities leading up to the 1997 NFR Letter. However, the cumulative evidence strongly indicates that these impacts were present at that time and likely decades earlier due to: (1) the highly weathered/degraded nature of the residual petroleum, (2) a 1999 STS Geotechnical Report that identified field evidence of petroleum contamination within Hotspots 4 and 5, (3) the lack of a dissolved-phase plume, and (4) the fact that the majority of the historical soil borings and test pits associated with the 1997 NFR Letter and located within the hotspots were not advanced to the groundwater smear zone, where the impacts start.

The 2000 TPH Remediation Report (submitted to the Illinois EPA) documented the remediation of petroleum-impacted fill in two areas adjacent to Hotspot 4 that underwent excavation and off-site removal, as well as a larger area corresponding with Hotspot 5 that underwent bioremediation. (Note that an approval letter was not found in historical records; however, these areas were apparently remediated to the satisfaction of the Illinois EPA as evidenced by subsequent 2005 and 2007 NFR comfort letters.) The 2000 report indicated that the likely source of the petroleum contamination was an "8-inch tar pipe"; a basement with "oily material" was also apparently found at the southern end of the pipe within Hotspot 5. (The oily contents of the tar pipe and basement were reportedly removed as part of the 2000 remediation activities.)

The presence of significant petroleum-related impacts in soil, contrasted with the consistent absence of LNAPL in all monitoring wells—including key locations such as MW-202 and MW-318 within Hotspot 5—supports the conclusion that (1) there is currently no evidence of

free product (i.e., mobile LNAPL) at the subject property, and (2) a portion of the detected TPH concentrations may reflect weathered or biodegraded petroleum constituents rather than parent hydrocarbons. Given the viscous, degraded, and adsorbed nature of the residual petroleum, the potential for remobilization and migration under current site conditions is considered minimal.

1.5.3 Tier 1 Evaluation – Groundwater

The groundwater analytical results for Pioneer's investigation identified vinyl chloride, benzene, and/or naphthalene in two monitoring wells at concentrations above the Tier 1 GROs for Class II groundwater. Additionally, vinyl chloride or naphthalene were identified in three monitoring wells at concentrations above the Tier 1 GROs for the indoor inhalation exposure route for residential and/or industrial commercial property. However, as discussed herein, soil gas testing conducted at these locations demonstrates compliance with the indoor inhalation exposure route. No other COCs were identified above the applicable Tier 1 GROs in any of the 27 monitoring wells sampled by Pioneer.

The groundwater analytical results from the 2007 and 2017 investigations identified certain metals, vinyl chloride, and/or 2,4-dinitrotoleune in seven monitoring wells at concentrations above the Tier 1 GROs for Class II groundwater. Additionally, in 2017 vinyl chloride was identified at concentrations above the Tier 1 GROs for the indoor inhalation exposure route for residential and industrial/commercial property in one monitoring well. However, soil gas sampling conducted at that time and more recently by Pioneer demonstrates compliance with the indoor inhalation exposure route.

A complete listing of Pioneer's groundwater analytical results in comparison to the applicable Tier 1 GROs is provided in Table Nos. 11 through 16 in the "Tables" section of the appendices. Documentation from the 2007 and 2017 Phase II investigations have been included with this submission under separate cover.

The following table provides a summary of the cumulative (2007-2025) groundwater sample locations where the applicable Tier 1 GROs were exceeded.

1-10 Groundwater Sample Locations Where COCs Exceed the Applicable Tier 1 GROs

Groundwater Sample ID	TACO Groundwater Exposure Pathways		
	Class II Groundwater	Indoor Inhalation (Residential)	Indoor Inhalation (Industrial/Commercial)
CRA Focused Phase II Investigation – 2007			
MW-202	~~Se~~	--	--
GHD Phase II Investigation – 2017			
MW-100	2,4-DNT	--	--
MW-102D	VC	~~VC~~	~~VC~~
MW-104	~~Al~~	--	--
MW-104D	2,4-DNT	--	--
NMW-2	~~Fe~~	--	--
NMW-3	2,4-DNT, ~~Fe~~	--	--
Pioneer Phase II Investigation – 2024-2025			
MW-102D	VC	~~VC~~	~~VC~~
MW-202	B, Naph	~~Naph~~	~~Naph~~
MW-318	--	~~Naph~~	--

Notes: ~~Strikethrough~~ indicates COC not applicable to groundwater ingestion pathway per 620.450(a)(3)
~~Strikethrough~~ indicates associated soil gas sample demonstrates compliance with indoor inhalation exposure route
Al = aluminum
B = benzene
2,4-DNT = 2,4-dinitrotoluene
Fe = iron
Naph = naphthalene
Se = selenium
VC = vinyl chloride

Pioneer notes the following regarding certain parameters listed in the preceding table.

- Groundwater Ingestion — Metals

  The 2007 and 2017 investigations identified aluminum, iron, and selenium in four monitoring wells at concentrations above the Tier 1 GROs for the Class II groundwater ingestion exposure route. However, in accordance with Section 620.450(a)(3), since these samples were collected from groundwater within the slag fill or upper 10 feet of parent material, the Tier 1 GROs for Class II groundwater with respect to these metals do not apply. Therefore, the metals concentrations in these samples are not considered impacts and no further evaluation is necessary. It should also be noted that Pioneer's recent investigation did not identify these COCs in any monitoring well at concentrations above the applicable Tier 1 GROs (based on cumulative dissolved test results).

- Groundwater Ingestion — 2,4-Dinitrotoluene (2,4-DNT)

  The 2017 GHD investigation identified detectable concentrations of 2,4-DNT in three monitoring wells, which were above the applicable Tier 1 GRO. Based on the lack of 2,4-DNT detections during the 2007 and 2024-2025 investigations, where low-flow and/or field-filtered sampling was conducted (and given the lack of supporting documentation associated with the 2017 investigation), evidence suggests GHD utilized standard sampling techniques that can result in erroneous detections and artificially high concentrations due to the introduction of sediment. Based on the

cumulative findings, including the absence of detectable concentrations of 2,4-DNT in any soil sample, the 2017 detections of 2,4-DNT are not considered representative of actual groundwater conditions and no further evaluation is necessary. (Note that the approved laboratory method for 2,4-DNT cannot achieve the current Tier 1 GRO.)

- Indoor Inhalation — Vinyl Chloride and Naphthalene

  Monitoring wells that exhibited indoor inhalation impacts underwent subsequent soil gas testing in the immediate vicinities in order to further evaluate this exposure route. Monitoring well MW-102D underwent soil gas testing with soil gas samples VP-34 (in 2017) and SG-3 (in 2025); and MW-202 (which exhibited the highest naphthalene concentration) and nearby MW-318 underwent soil gas testing with soil gas sample SG-2 (2025). The soil gas analytical results demonstrated compliance with the residential and industrial/commercial indoor inhalation exposure route. Therefore, the concentrations of vinyl chloride and naphthalene detected in groundwater are not considered impacts to the indoor inhalation exposure route and no further evaluation is necessary.

Copies of the complete laboratory analytical reports for the groundwater samples collected by Pioneer are included in Appendix H. Laboratory reports for the 2007 investigation are provided in the associated 2008 CRA Limited Phase II ESA, while laboratory reports for the 2017 GHD Phase II ESA were not available for review.

1.5.4 Tier 1 Evaluation – Soil Gas

The cumulative soil gas analytical results—including 41 samples collected in 2017 by GHD, three samples collected in 2025 by Pioneer, and five samples collected in 2025 by GSG—indicated that no VOCs were detected above the most stringent Tier 1 SGROs for indoor or outdoor inhalation.

Additionally, all 2017 GHD and 2025 GSG soil gas samples were analyzed for hydrogen sulfide due to a concern of slag off-gassing. Only four of the 2017 soil gas samples exhibited detectable concentrations (0.34 to 1.1 mg/m^3), which were still below the typical soil gas screening criteria for vapor intrusion; none of the 2025 samples exhibited detectable levels of hydrogen sulfide.

A complete listing of Pioneer's soil gas analytical results is provided in Table No. 17 in the "Tables" section of the appendices. Copies of the complete laboratory analytical reports for the soil gas samples collected by Pioneer are included in Appendix H. Laboratory reports for the 2025 GSG sampling are included in their 2025 Soil Gas Investigation [Report]; and laboratory reports associated with the 2017 testing were not available for review.

1.6 Conclusions

The cumulative soil analytical results from investigations conducted by CRA (2007), GHD (2017), and Pioneer (2024-2025) identified elevated concentrations of several heavy metals—primarily arsenic, chromium, and manganese—exceeding applicable Tier 1 SROs. Additional isolated exceedances of Tier 1 SROs included methylene chloride (a VOC), various SVOCs and PNAs, dieldrin and heptachlor epoxide (pesticides), and

PCBs. The cumulative groundwater analytical results identified exceedances of the applicable Tier 1 GROs for vinyl chloride, benzene, and naphthalene in only three monitoring wells.

The affected exposure routes include soil ingestion and outdoor inhalation for industrial/commercial property and construction workers, as well as the soil and groundwater components of Class II groundwater ingestion. However, with the exception of total chromium in multiple soil samples, no other COC exceeded the Tier 1 SROs for the industrial/commercial outdoor inhalation pathway. Extensive leachability (TCLP/SPLP) testing, together with groundwater data, indicated significant immobility of the detected metals. Only sporadic, low-level exceedances of the soil migration pathway were identified, and no samples exceeded the regulatory characteristics of hazardous waste.

Pioneer's 2024-2025 investigation also identified PNAs in one soil sample and TPH in multiple samples at concentrations above the default soil attenuation capacity. These impacts were delineated into five defined hotspots:

- Hotspot 1: A PNA-impacted area of approximately 80 cubic yards in the west-central portion of the site (Parcel C)
- Hotspot 2: A previously identified TPH-impacted area of approximately 3,000 cubic yards in the west-central portion of the site (Parcel D; former Parcel 22)
- Hotspots 3, 4, and 5: Three larger TPH-impacted areas totaling approximately 338,000 cubic yards of soil across 28 acres on the southern portion of the site (Parcel 17)

Based on historical records, the TPH impacts in Hotspot 2 are attributable to the former railroad operations in that area. The widespread Parcel 17 TPH impacts in Hotspots 3, 4, and 5 are attributable to former wastewater and petroleum processing and storage operations, which were predominantly located on the southern portion of the subject property. The other identified impacts throughout the Remediation Site are attributable to the ubiquitous presence of slag fill and varying amounts of other intermixed anthropogenic materials associated with historical site operations and demolition.

Overall, the cumulative results from multiple investigations spanning nearly two decades demonstrate that the nature and extent of soil, groundwater, and soil gas impacts at the site have been thoroughly and adequately characterized. With the exceptions of the PNA and TPH hotspots, the identified impacts are consistent in type, magnitude, and distribution with the conditions documented at the time of the prior NFR Letters, confirming that no materially new or unanticipated sources are present at the site.

In order to determine the appropriate level of remedial action necessary to address the Tier 1 exceedances, and as discussed in the following Section 2.0 – Remediation Objectives Report, the various options available in TACO will be utilized to evaluate the potential for exposure to identified contaminants based on the site-specific conditions.

2.0 REMEDIATION OBJECTIVES REPORT

2.1 Introduction

The following tables provide summaries of the TCL parameters identified above the applicable Tier 1 remediation objectives, and the proposed approach for addressing the identified contaminants.

Table 2-1 Summary of the TCL Parameters Identified Above the Tier 1 Remediation Objectives

TCL Parameters	Applicable Tier 1 Exposure Routes							Default Soil Attenuation Capacity
	Soil Ingestion		Outdoor Inhalation		Indoor Inhalation	Class II Groundwater Ingestion		
	Industrial/ Commercial	Construction Worker	Industrial/ Commercial	Construction Worker	Industrial/ Commercial	Soil Component	Groundwater Component	
VOCs	--	--	--	--	--	MC *[2-Hex]*	B, VC, Naph	--
SVOCs (excluding PNAs)	--	--	--	--	--	Carb, DBF	--	--
PNAs	BaA, BaP, BbF, BkF, DahA, IcdP	BaA, BaP, BbF, DahA	--	Naph	--	BaA, BaP, BbF, DahA, IcdP	--	Total PNAs
Pesticides	Dieldrin, HepE	--	--	--	--	Dieldrin	--	--
PCBs	Total PCBs	Total PCBs	--	--	--	--	--	--
Inorganics	As, Cr, Mn, Pb, Th	Cr, Mn, Ni, Pb, Sb, Th	Cr	Cr, Hg, Mn	--	V	--	--
TPH	NA	NA	NA	NA	NA	NA	NA	TPH

Notes: -- indicates the Tier 1 exposure route objectives were not exceeded
NA indicates not applicable
[ ] indicates an elevated detection limit for a confirmed compound
As = arsenic
BaA = benzo(a)anthracene
BaP = benzo(a)pyrene
BbF = benzo(b)fluoranthene
B = benzene
BkF = benzo(k)fluoranthene
Carb = carbazole
CN = cyanide
Cr = chromium
DahA = dibenzo(a,h)anthracene
DBF = dibenzofuran
Fe = Iron
HepE = heptachlor epoxide
2-Hex = 2-hexanone
Hg = mercury
IcdP = indeno(1,2,3-cd)pyrene
MC = methylene chloride
Mn = manganese
Naph = naphthalene
PCBs = polychlorinated biphenyls
PNAs = polynuclear aromatic hydrocarbons
Pb = lead
Sb = antimony
Th = thallium
TPH = total petroleum hydrocarbons
V = vanadium
VC = vinyl chloride

Table 2-2 Proposed Approach for Addressing the Identified TCL Parameters

TCL Parameters	Applicable Tier 1 Exposure Routes							Default Soil Attenuation Capacity
	Soil Ingestion		Outdoor Inhalation		Indoor Inhalation	Class II Groundwater Ingestion

Notes: -- indicates the Tier 1 exposure route objectives were not exceeded
CWC = exclusion of the exposure route using a Construction Worker Caution
EB = exclusion of the exposure route using an Engineered Barrier
GWO = exclusion of the exposure route using a local GroundWater Ordinance that prohibits the use of groundwater
NA = indicates not applicable

As outlined in the preceding table and discussed in the following sections, the overall approach to site closure combines conventional remediation with Tier 3 evaluations in accordance with 35 IAC 742.925 and 742.920. Specifically, the PNA and TPH impacts exceeding the default soil attenuation capacity (SAC) in Hotspots 1 and 2 will be addressed through excavation and off-site disposal. The majority of the remaining impacts will be addressed through a Tier 3 evaluation in accordance with 742.925. This approach allows the remaining TPH impacts exceeding the SAC to be managed in-place through the installation of a hybrid slurry wall to prevent potential future migration to surface waters, and enables exclusion of exposure routes through other engineering, institutional, and preventative controls. Finally, any TPH impacts within the tie-back zones of the Calumet River and South Vessel Slip walls will be addressed through a Tier 3 impractical remediation evaluation in accordance with 742.920.

2.2 Statement of Remedial Goals

The purpose of this Remediation Objectives Report is to demonstrate compliance with Tier 3 evaluation criteria, while achieving the following critical remedial goals established for the proposed development:

(1) protect human health and the environment;

(2) address the legitimate concerns of the community;

(3) solve for the time component of redevelopment;

(4) solve for the cost component of redevelopment;

(5) solve for constructibility components of redevelopment; and

(6) redevelop the subject property, and restore the economic viability and prosperity of the surrounding community.

As mentioned above, the overall approach to site closure proposed herein combines conventional remediation with Tier 3 evaluations, including the installation of a hybrid slurry wall. The conventional remediation component will be performed to address the PNA and TPH impacts in Hotspots 1 and 2. (Refer to Section 3.3.1 for a discussion of the proposed conventional remediation activities.) The remaining impacts will be addressed through Tier 3 evaluations as allowed in Subpart I of the TACO regulations. (Note that any further reference to TPH or residual petroleum impacts in this Remediation Objectives Report refers only to those in Hotspots 3, 4, and 5.) The following sections provide the requisite justification for the Tier 3 evaluations:

- Section 2.3 Remedial Feasibility and Greener Cleanup Framework
- Section 2.4: Overview of the Default Approach for Exclusion of the Affected Exposure Routes;
- Section 2.5: Tier 3 Exposure Route Exclusion [742.925]
  - Section 2.5.1: Descriptions of the Routes Evaluated and Site Characteristics [742.925(a) & (b)]
  - Section 2.5.2: Potential TPH Migration to Surface Waters [742.925(c) & (d)]

- Section 2.5.3: Groundwater Ingestion Exposure Route [742.925(c) & (d)]
- Section 2.5.4: Soil Ingestion and Outdoor Inhalation Exposure Routes [742.925(c) & (d)]

- Section 2.6: Tier 3 Impractical Remediation [742.920]

2.3 Remedial Feasibility and Greener Cleanup Framework

In furtherance of the remedial goals, and considering the significant area of TPH impacts above the SAC in the southern portion of the site (338,000 cubic yards, see Section 1.5.2.1), Pioneer conducted a remedial feasibility study that focused on addressing the six remedial goals outlined above, while also incorporating the U.S. EPA's (and Illinois EPA's) Greener Cleanups initiative. This initiative, which informed and aligns with the ASTM Standard Guide for Greener Cleanups (E2893-16), provides a structured framework for incorporating sustainability into site remediation. It emphasizes minimizing energy use, greenhouse gas emissions, water consumption, waste generation, and impacts to land and ecosystems. Applying these greener cleanup strategies helps reduce the environmental footprint of remedial actions, conserve natural resources, and protect sensitive nearby ecosystems such as Lake Michigan and the Calumet River. Furthermore, these practices deliver tangible benefits to the surrounding community by improving local air and water quality, minimizing construction-related disruptions, and supporting redevelopment in ways that align with broader sustainability and quality-of-life goals for area residents.

Given the large scale of the site, its long history of heavy industrial use, and its proximity to both sensitive water bodies and the surrounding community, evaluating remedial alternatives within the context of the U.S. EPA's Greener Cleanups framework was an essential consideration for this project.

The remedial feasibility study was conducted to identify practicable approaches for addressing the TPH impacts. Consistent with U.S. EPA and ITRC guidance on remedial technology selection and sustainability, a broad suite of physical, chemical, and biological technologies was screened based on effectiveness, implementability, long-term reliability, potential risks to receptors and surface waters, and alignment with the six remedial goals. Technologies such as in-situ chemical oxidation (ISCO) and enhanced bioremediation via injection were determined to be impractical given the site's complex subsurface conditions, which include extensive concrete and slag obstructions, highly heterogeneous fill materials creating preferential flow paths, the weathered nature of the TPH, the high oxidant demand, and an elevated risk of mobilizing remedial amendments and/or contamination into adjacent surface waters (e.g., potential "blowout" to the Calumet River or South Vessel Slip). Evaluation of this option indicated that the constraints would prevent effective distribution and contact of injected amendments with the residual, recalcitrant contaminant mass. In addition, the approach would pose unacceptable environmental risks and require significant resources, with a low probability of achieving the remedial objectives.

In-situ stabilization (ISS) of the impacted soils was also evaluated but determined to be impractical due to significant implementation challenges, extended duration, and potential risks to the surrounding community. The heterogeneity of the site's subsurface would make achieving uniform mixing and effective stabilization uncertain. ISS would likely require extensive subsurface demolition, excavation, staging, and mechanical mixing over a multi-year period, resulting in prolonged noise, dust, odors, and heavy truck traffic through

nearby neighborhoods. These impacts would elevate nuisance conditions, increase potential exposure of the community to particulate matter, and generate sustained disruption to the surrounding area. Moreover, ISS would significantly increase the total volume of treated material, complicate future redevelopment by creating a hardened subsurface, and require substantial engineering controls to protect adjacent infrastructure and sensitive surface waters during implementation.

While full-scale excavation and off-site disposal of the impacted soils, along with the necessary removal of extensive subsurface infrastructure and hot-poured slag, may be theoretically feasible, this approach would prolong site disturbance for multiple years and impose significant risks to surface waters and the community. The prohibitive costs, extended timeline, and elevated risks associated with full excavation could also threaten the viability of the proposed brownfield redevelopment. Moreover, given the various favorable TPH characteristics resulting in limited mobility under existing conditions, such an approach would not result in a site that is appreciably safer or more protective for future users and surface waters than the proposed remedial approach discussed below.

As discussed in more detail in the following sections of this report, the remedial approach selected for the site is to prevent potential exposure to the residual impacts via pathway exclusion under 35 IAC 742.925. This approach will utilize the following engineering and institutional controls:

1. Engineered barrier surface cap across the entire site to eliminate the soil ingestion and outdoor inhalation exposure routes;

2. The City of Chicago groundwater ordinance to eliminate the groundwater ingestion exposure route;

3. Site Safety Plan(s) to be protective of construction workers that will be exposed to subsurface soils; and

4. A hybrid containment system (slurry wall, i.e. vertical engineered barrier) to prevent potential future contaminant migration to adjacent surface waters.

The hybrid containment system will consist of a continuous, low-permeability, soil-bentonite slurry wall integrated with two permeable reactive barrier (PRB) gates. The slurry wall, extending approximately 7,000 linear feet and keyed into the underlying clay confining layer, will provide physical containment with a target hydraulic conductivity of $\leq 1 \times 10^{-7}$ cm/s. The PRB gates, extending approximately 2,000 feet in total and constructed with PetroFix®-amended sand and gravel, will allow controlled groundwater discharge, maintaining hydraulic balance and ensuring treatment of any residual dissolved-phase hydrocarbons prior to release from the containment area. This combined approach is designed to prevent lateral migration, avoid groundwater mounding, and ensure that discharges meet applicable surface water quality standards.

To further illustrate the environmental and community benefits of the proposed hybrid slurry wall relative to excavation and off-site disposal, the following table compares the two approaches within the context of the U.S. EPA's *five core elements of greener cleanups*:

Table 2-3 Environmental Impact Comparison: Excavation and Disposal vs. Slurry Wall

Core Element	Excavation & Disposal	Hybrid Slurry Wall
Energy Use	- **948,000-gal** of diesel fuel (soil transport, excavation/grading, stockpiling)	- **25,000-gal** of diesel fuel (trencher & support, materials & delivery, soil transport)
Air Emissions	- CO^2 Emissions: **9,670 metric tons** - PM_{10}: **1,500 lbs** - $PM_{2.5}$: **1,350 lbs** - **27,000 truckloads of odors** through neighborhoods (100 miles round trip) - **Exposes TPH soils**–volatilization and odors for up to 2 years	- CO^2 Emissions: **250 metric tons** - PM_{10}: **180 lbs** - $PM_{2.5}$: **160 lbs** - **410 truckloads of odors** through neighborhoods - **TPH soils have minimal exposure**
Water Use & Impacts	- **7,000,000-gal** (dust control for 2 years) - **10,000,000-gal** (dewatering, treated & discharged)	- **600,000-gal** (dust control for 60 days) - **3,300,000-gal** (mix requirement) - Protects adjacent surface waters from potential migration
Materials & Waste	- **338,000 yd^3** of landfill space - **338,000 yd^3** of quarry stone - Requires installation of significant earth retention systems (steel)	- **5,000 yd^3** of landfill space - **8,000 yd^3** of quarry stone - **1,000 yd^3** of bentonite - Requires 9,000 ft of additional silt fencing
Land & Ecosystems	- Disrupts and re-handles 338,000 yd^3 of soil and fill, increasing risk of sediment transport and fugitive dust to receptors - Prolongs exposure of impacted soils during multi-year excavation & grading process, increasing risk of volatile emissions & nuisance odors - Increases site-wide disturbance footprint, raising complexity for erosion control & stormwater management	- Limits disturbance to narrow trench - Reduces construction-phase contaminant exposure, helping contain volatiles and reducing odors - Reduces demand for landfill space & associated expansion into new land & ecosystems - Reduces demand for quarried material & associated land disturbance

Partial excavation and disposal was also considered but determined to be impractical and not advantageous relative to the proposed containment-based remedial approach. The presence of extensive subsurface obstructions and heterogenous fill create substantial uncertainty about where excavation can be effectively performed without encountering repeated refusal and requiring significant demolition efforts, or destabilizing adjacent areas. Even with targeted excavation, the same types of community risks associated with full-scale excavation remain, including increased noise, dust, emissions, odors, truck traffic, and potential exposure to impacted soils. Additionally, partial excavation would not eliminate the need for the proposed slurry wall to contain remaining impacts and protect surface waters. Therefore, partial excavation would add significant cost, risk, and community disruption without providing additional benefit to site protectiveness or facilitating redevelopment beyond what the hybrid slurry wall and surface cap would already achieve.

As outlined above, the proposed hybrid slurry wall approach is fully consistent with the U.S. EPA's Greener Cleanup framework and effectively achieves the six remedial goals established for the site. It significantly reduces energy use, emissions, water demand, waste generation, and ecological disruption while maintaining protection of human health and the environment. This approach minimizes risk to the surrounding community and future site occupants, safeguards sensitive surface waters, and enables site redevelopment in a way that is both sustainable and feasible.

2.4 Overview of the Default Approach for Exclusion of the Affected Exposure Routes

Standard exposure route evaluations are performed in accordance with Part 742, Subpart C. As outlined in Subpart C, Section 742.305, certain baseline criteria have to be met before proceeding, including a contaminant source and free product determination, as discussed below.

2.4.1 Contaminant Source and Free Product Determination

- *The sum of the concentrations of all organic COCs shall not exceed the attenuation capacity of the soil as determined under Section 742.215 (Section 742.305(a));*

  Soil testing results outlined herein reveal that numerous TPH concentrations exceed the default SAC for subsurface soils, and this criteria is not satisfied for a default approach to pathway exclusion. However, it should be noted that no physical evidence of free product has been observed in any of the on-site monitoring wells—including those installed in or immediately adjacent/downgradient of the TPH hotspots—during the cumulative investigation activities presented herein (performed from 2007 to 2025). The elevated TPH concentrations, and visual evidence of impact in certain soil cores, contrasted with the absence of free product observed in monitoring wells, suggests that the remaining petroleum impacts are considered residual, with insufficient saturation to render them mobile under existing conditions.

- *The concentrations of any organic COCs remaining in the soil shall not exceed the soil saturation limit as determined under Section 742.220 (Section 742.305(b));*

  None of the cumulative testing identified any COCs at concentrations above the default soil saturation limits when using applicable analyte species. As discussed in Section 1.5.2, two total mercury concentrations exceeded the default soil saturation limit for elemental mercury of 3.1 mg/kg: 13 mg/kg at SB12 (0-3) and 9.9 mg/kg at SB13 (0-3). However, the corresponding elemental mercury concentrations at these locations were 0.083 mg/kg and <0.001 mg/kg, respectively. A total of 326 samples were analyzed for total mercury from 2007 to 2025 and the next highest concentrations detected were 0.93 mg/kg at both SS-107 (0-3) and B-7S20 (7-9) during the 2017 GHD investigation; however, the majority of the cumulative total mercury results were either below background or only marginally above the most stringent Tier 1 SRO (construction worker inhalation) (see Table No. 4 in the appendices, and the tables associated with the 2007 and 2017 investigations submitted under separate cover). Because the soil saturation limit applies solely to elemental mercury, and all measured elemental mercury concentrations and all other total mercury concentrations were below this threshold, the extensive testing demonstrates that soils do not exceed the applicable soil saturation limits. As such, this criteria is satisfied under a default approach to pathway exclusion.

- *Any soil which contains COCs shall not exhibit characteristics of reactivity for hazardous waste (Section 742.305(c));*

  Based on the total cyanide results (Table No. 4 in the appendices), the maximum total cyanide concentration identified at the site is 67 mg/kg, which is below the current U.S. EPA guidance level

of 250 mg/kg for reactive cyanide. Reactive sulfide testing (which yielded results of <50 mg/kg) also demonstrate compliance with the U.S. EPA guidance level of 500 mg/kg. Thus, there is no evidence that soils at the Remediation Site would exhibit the characteristics of reactivity, and this criteria is satisfied under a default approach to pathway exclusion.

- *Any soil which contains COCs shall not exhibit a pH less than or equal to 2.0 or greater than or equal to 12.5 (Section 742.305(d));*

  A total of 250 soil samples from Pioneer's investigation were collected from the Remediation Site for the analysis of pH (see Table No. 4 in the appendices). With the exception of one sample, the pH values ranged from 6.68 to 12.45 standard units. The pH result at the remaining sample [SB96 (7.5-10)] was 13.7 standard units, which exceeds the 742.305(d) corrosivity limit of 12.5 standard units. The mean and median pH values for the soil samples are 9.38 and 9.14. The results show that the majority of the samples at the site fall within the mildly alkaline range.

  Soil sample SB96 (7.5-10 feet) was collected from the slag fill, which is known to contain alkaline compounds, including certain mineral phases. The elevated pH observed in this isolated sample is likely attributable to these stable compounds rather than to conditions indicative of hazardous corrosivity. Although the sample exhibited low moisture content at the time of collection, the slag has been exposed to stormwater infiltration and weathering for more than a century. Such long-term exposure typically leaches and neutralizes more reactive alkaline phases, further reducing the potential for corrosive behavior. Given that all other soil samples collected from the site exhibited pH values within the regulatory range, the elevated pH in SB96 (7.5-10) is considered an isolated condition attributable to localized slag chemistry. Accordingly, there is no indication that soils at the Remediation Site exhibit the characteristics of corrosivity, and this criteria is satisfied under a default approach to pathway exclusion.

- *Any soil which contains arsenic, barium, cadmium, chromium, lead, mercury, selenium or silver shall not exhibit any of the characteristics of toxicity for hazardous waste (Section 742.305(e)); and,*

  TCLP analyses were conducted on samples where a total RCRA 8 metal exceeded the "20 times rule" [based on 40 CFR 261.24 and Subtitle D landfill requirements]. As shown on Table No. 5 in the appendices, all TCLP results are below the corresponding hazardous toxicity characteristic threshold values. Therefore, there is no evidence that soils at the Remediation Site would exhibit the characteristic of toxicity. [Note: due to hold time and other limitations, mercury was only selectively evaluated through TCLP. However, based on Pioneer's and the historical investigation results, leachable mercury is not a concern at the site.] As such, this criteria is satisfied under a default approach to pathway exclusion.

- *If COCs include polychlorinated biphenyls (PCBs), the concentration of any PCBs in the soil shall not exceed 50 parts per million (Section 742.305(f)).*

  A total of 305 soil samples collected from the Remediation Site during the cumulative investigation were analyzed for PCBs. As shown on Table No. 7 in the appendices, and the tables associated with

the 2007 and 2017 investigations submitted under separate cover, all PCB results are below 50 ppm. As such, this criteria is satisfied under a default approach to pathway exclusion.

2.4.2 Bypassing Subpart C

As indicated, site conditions do not meet all of the baseline criteria of 35 IAC 742, Subpart C, Section 742.305 due to the TPH impacts that will remain at the Remediation Site in Hotspots 3, 4, and 5. However, 742.300(c) explicitly states:

> *"As an alternative to the use of the requirements in this Subpart, a person may use the procedures for evaluation of exposure routes under Tier 3 as set forth in Section 742.925."*

This provision unambiguously authorizes a Remediation Applicant to bypass all Subpart C requirements, including those related to the default SAC [i.e., 742.305(a)], by applying the Tier 3 framework under 742.925. The regulation cites no exceptions and refers broadly to *"this Subpart,"* indicating full substitution of the default assumptions otherwise required with the Tier 3 methodology. This indicates a clear regulatory intent to allow flexibility in evaluating exposure routes and risk, enabling a site-specific remedial approach tailored to actual site-specific conditions

2.5 Tier 3 Exposure Route Evaluation [35 IAC 742.925]

The purpose of this Tier 3 evaluation is to bypass the TACO Subpart C requirements in favor of Tier 3 exposure route exclusion under 35 IAC 742.925, while protecting human health and the environment, and achieving the critical remedial goals established for the proposed development (refer to Section 2.2).

According to Section 742.900(c)(6) of the TACO regulations, situations that may be appropriate for a Tier 3 evaluation include:

> *"Incomplete human exposure pathways not excluded under Subpart C."*

The Tier 3 evaluation process for incomplete human exposure pathways is provided in Section 742.925, which states:

> *"Technical information may demonstrate that there is no actual or potential impact of contaminants of concern to receptors from a particular exposure route. In these instances, a demonstration excluding an exposure route shall be submitted to the Agency for review and approval."*

The following Section 2.5.1 provides the information requested by 742.925(a) and (b), and Sections 2.5.2, 2.5.3, and 2.5.4 provide the information requested by 742.925(c) and (d) for each of the specific pathways/ exposure routes included in this evaluation.

2.5.1 Descriptions of the Routes Evaluated and Site Characteristics [35 IAC 742.925(a), (b)]

- *A description of the route evaluated (35 IAC 742.925(a));*

The following exposure routes are being evaluated in this Tier 3 evaluation:

- potential migration of petroleum impacts to the adjacent surface water bodies;
- the soil and groundwater components of Class II groundwater ingestion; and
- soil ingestion and outdoor inhalation for industrial/commercial property and construction workers.

- *A description of the site and physical site characteristics (35 IAC 742.925(b));*

The approximately 440-acre Remediation Site is located on the southeast side of Chicago, Illinois, within approximately 200 feet of Lake Michigan at its closest point. The subject property comprises a substantial portion of the former U.S. Steel South Works steel manufacturing facility, which operated from the late 1800s until its closure in the early 1990s. The site is bisected by the North Vessel Slip, a historic shipping canal connecting to Lake Michigan, and is bounded by the Calumet River to the south and the South Vessel Slip to the southwest; South DuSable Lake Shore Drive runs north-south through the western portion of the site, while East 87th Street runs east-west through the southern portion of the site.

Currently, the site is predominantly vacant and fenced, with a mix of low-lying vegetation, mature and semi-mature trees, remnant asphalt and gravel roadways, and two large gravel pads constructed in the early 2000s. Remnant concrete ore walls line the North and South Vessel Slips, with part of the northern ore wall repurposed as a recreational climbing wall as part of the adjacent Steelworkers Park. A single-story building at 8555 South Green Bay Avenue serves as the on-site security office.

The topography of the site is relatively flat, with surface elevations typically ranging from approximately 10 to 20 feet CCD. However, the overall topographic relief is approximately 25 feet due to localized low-lying depressions in the southern portion of the site and a linear ridge in the north. The ground surface is elevated approximately 10 to 15 feet above the adjacent surface waters of the Calumet River and vessel slips, which typically fluctuate near 0 feet CCD as a function of Lake Michigan's elevation. The site is physically separated from adjacent surface water bodies by steel sheet piling, steel gabion baskets, large stone blocks, and a concrete wall.

The subject property is located within a planned development district, and while predominantly undeveloped, retains evidence of its heavy industrial history as part of the former steel mill. The fill material covering the site includes large volumes of slag that was predominantly placed from the late 1800s to the 1920s to raise and stabilize the area for industrial use, with thicknesses ranging from 5 to 10 feet BSG on the western portion of the site, and up to 40 feet BSG on the eastern portion of the site.

Subsurface investigations have revealed a stratigraphic profile consisting of slag fill underlain by native fine sand and silty clay. Slag particle size appeared to most commonly range from sand to gravel, with silt-sized particles and localized occurrences of cobbles, and frequent layers of dense hot-poured slag. Additional fill constituents included concrete, bricks, metal fragments, cinders, wood, and suspected ore, as well as non-slag silt, sand, and gravel likely composed of crushed brick, concrete, quartz, and limestone. Subsurface obstructions were extensive and included hot-poured slag, suspected skulls (solidified iron), demolition debris, buried railroad tracks, iron beams and anchors, and remnant concrete

footings and foundations (much of it reinforced), which reportedly range in thickness from 1 to 25 feet thick.

Groundwater was generally encountered at depths of approximately 7 to 15 feet BSG within the fill or shallow native soils, and exhibits unconfined conditions. Potentiometric elevations across the site measured in May 2025 ranged from approximately 0.4 feet to 4.25 feet CCD, with one anomalous elevation of 13.85 feet CCD (May 2025). An average horizontal gradient of approximately 0.0019 ft/ft was calculated for the site, although gradients are variable due to recharge and subsurface complexity. Vertical gradients appear negligible based on limited nested well data.

Hydraulic conductivity measurements from slug tests indicate a range of 10^{-2} to 10^{-5} cm/s, consistent with a heterogeneous fill, fine sand, and silty sand. Groundwater flow is generally toward adjacent surface waters, though locally influenced by infiltration, mounding, and subsurface structures.

Field observations of contamination were documented in 13 of Pioneer's 144 original borings, and more extensively at certain delineation points, particularly at five notable borings (SB21, SB61, SB70, SB118, and SB141)—Hotspots 2 through 5. In most areas, impacts were limited to a thickness of 1 to 7 feet—corresponding to the groundwater smear zone—with deeper field impacts extending to approximately 35 feet BSG at SB61 (Hotspot 5). Intermittent hydrogen sulfide odors consistent with off-gassing from the slag fill were also noted during drilling, but soil gas sampling confirmed concentrations below applicable screening criteria.

No measurable free product was observed in monitoring wells during the cumulative investigation, and only a minimal dissolved-phase hydrocarbon plume (limited to benzene and naphthalene at MW-202) was detected, despite numerous elevated TPH concentrations in soil exceeding the SAC and the presence of monitoring wells within and downgradient of the TPH hotspots.

2.5.2 Potential Migration of Petroleum Impacts to Surface Water [742.925(c), (d)]

- *A discussion of the result and possibility of the route becoming active in the future (35 IAC 742.925(c));*

Based on cumulative investigation results, only one monitoring well (MW-202) exhibits dissolved-phase petroleum constituents above the applicable Tier 1 GROs. Fate and transport modeling performed using RBCA Equation R26 indicates that impacted groundwater at MW-202 will meet surface water quality objectives prior to discharge into the Calumet River (Spreadsheet 2 in Appendix E). While a minor sheen potentially associated with petroleum impacts at the Remediation Site was historically identified on the adjacent Calumet River, none of the monitoring wells gauged from 2007 to 2025 exhibited free product, and available records indicate no observed sheens on the adjacent Calumet River in the last 25 years. Additionally, no historical records referencing any sheens observed on the South Vessel Slip have been identified by Pioneer.

TPH concentrations that exceed the default SAC indicate the theoretical potential for mobilization of petroleum-related constituents under the baseline assumptions. However, the cumulative groundwater investigations documented herein, including monitoring wells located within and immediately

downgradient of the TPH hotspots, have consistently shown no evidence of free product and only a negligible dissolved-phase plume. This presents an apparent contradiction between the baseline SAC assumptions suggesting a risk of leaching or migration, and the actual site conditions demonstrating stability of the petroleum impacts, likely due to their weathered, viscous, and recalcitrant nature, which inhibits mobility.

The extensive soil and groundwater testing conducted over multiple phases of the cumulative investigation activities have consistently shown the absence of detectable levels of petroleum indicator contaminants, and where detected, are below the most stringent objectives. This reflects the fact that the lighter, more mobile and soluble fractions of petroleum responsible for dissolved-phase migration have long since volatilized, dissolved, or biodegraded given the age and weathering of the impacts, and prior remedial activities in Hotspot 5. What remains in the subsurface are recalcitrant hydrocarbons—heavy, polar, and complex—that do not partition appreciably into the water or vapor phases. Although TPH concentrations in soil remain above the SAC, the investigation results outlined herein demonstrate that the residual petroleum impacts no longer pose a significant risk of groundwater or vapor contamination under current site conditions.

The potential for further migration of these weathered hydrocarbons is negligible due to the following site-specific conditions:

- Vadose zone residual petroleum remains immobilized due to its high viscosity, strong sorption to mineral surfaces, and entrapment at residual saturation. Capillary forces within unsaturated soils exert an entry pressure that the weathered hydrocarbons cannot overcome, and stormwater infiltration is unlikely to significantly mobilize the contamination, as evidenced by the cumulative findings.

- Saturated zone residual petroleum is similarly immobilized by its high viscosity, strong sorption, and confinement at residual saturation within pore spaces. Capillary forces continue to dominate in the saturated zone, although the higher pore water saturation increases the trapping efficiency compared to the vadose zone, further limiting mobility. Combined with the weathered, viscous nature of the hydrocarbons and the historical flushing of more mobile fractions, appreciable lateral or vertical migration is not expected.

- Dissolved phase migration potential is minimal because the remaining residual petroleum exhibits extremely low aqueous solubility and very slow desorption rates. As a result, the residual hydrocarbons persist in-place as a stable source with negligible contribution to dissolved-phase constituents.

- Lateral and vertical movement of residual petroleum is further constrained by the moderate permeability of underlying soils (with localized areas of low permeability), the viscosity of the weathered petroleum, and the presence of subsurface relic structures—including foundations, footings, and hot-poured slag—that create physical barriers and discontinuities impeding flow and contaminant transport.

The site investigation data presented herein support these conclusions, as no free product or significant plumes of dissolved-phase hydrocarbons have been detected in groundwater despite the extensive volume of impacted soils based on the TPH results. The general absence of dissolved-phase contaminants and the aerobic conditions observed at the site suggest that any potential migration has already occurred decades ago, the residual hydrocarbons are highly degraded and largely immobilized, and the plumes are currently stable. Consequently, under natural conditions the risk of meaningful migration is negligible.

The cumulative evidence supports the conclusion that, under existing conditions, the risk of residual petroleum leaching or migrating to surface waters is low. Nonetheless, the proposed remedial approach to address the SAC exceedances in Hotspots 3, 4, and 5 includes the construction of a hybrid slurry wall (vertical engineered barrier) keyed into a native clay confining layer to further enhance containment and eliminate any remaining exposure concerns by physically isolating the impacts to prevent potential future migration.

- *Technical support (35 IAC 742.925(d));*

  - *a discussion of the natural or man-made barriers to that exposure route (35 IAC 742.925(d)(1));*

  A low-permeability bentonite slurry wall with PRB gates is a highly effective and proven engineered barrier for containing both free-phase and dissolved-phase petroleum. Once hydrated, the bentonite forms a continuous barrier with a hydraulic conductivity several orders of magnitude lower than the existing soils. This low permeability effectively limits advective groundwater flow through the wall, thereby restricting transport of dissolved hydrocarbons. In addition, the high surface area and strong sorptive capacity of bentonite further attenuate contaminants at the barrier interface, which also reduces the diffusive flux of dissolved constituents across the wall.

  Note that Section 742.200 of the TACO regulations defines an engineered barrier and slurry wall as follows:

  > *"Engineered Barrier" means a barrier designed or verified using engineering practices that limits exposure to or controls migration of the contaminants of concern.*
  >
  > *"Slurry Wall" means a man-made barrier made of geologic material which is constructed to prevent or impede the movement of contamination into a certain area.*

  Note also, pursuant to 35 IAC 742.1105, slurry walls are explicitly recognized as acceptable engineered barriers to prevent the completion of the ingestion of groundwater exposure pathway. Section 2.5.2.1 of this report provides details and technical support of the proposed slurry wall.

  By hydraulically isolating residual petroleum impacts in soil and the dissolved-phase impacts identified in MW-202, the hybrid slurry wall will eliminate the potential for future migration into the adjacent surface waters, even though the current evidence shows a low risk under existing conditions. This approach ensures that the latent source material remains contained and stable.

Finally, the proposed redevelopment of this portion of the Remediation Site with the IQMP—a quantum computing research and development campus—will involve no industrial activities that rely on petroleum or hazardous substances. This planned land use supports the long-term stability and safety of the hybrid slurry wall containment system.

- *calculations and modeling (35 IAC 742.925(d)(2));*

As mentioned, the only dissolved-phase petroleum impacts were identified at MW-202. Fate and transport modeling calculations completed using RBCA Equation R26 (Spreadsheet 1 in Appendix E) indicated that *under existing site conditions*, benzene and naphthalene have the potential to migrate into the east adjacent property. As shown on Figure 17, the proposed slurry wall will encapsulate the groundwater impacts at MW-202, thereby eliminating groundwater flow to the east-adjacent property.

Spreadsheet 2 (Appendix E) shows the concentrations of benzene and naphthalene are predicted to meet the surface water quality objectives at the Calumet River, approximately 150 feet to the south. In addition, groundwater flow modeling conducted for the slurry wall system (see the Porewater Solutions Modeling [Report] in Appendix F), indicates that groundwater within the post-construction slurry wall will flow northward through the two PRB gates. Following installation, the nearest surface water body to MW-202—*along the predicted flow of groundwater from within the planned slurry wall*—is Lake Michigan, approximately 1,500 feet away. Based on RBCA Equation R26, the impacts at MW-202 will be completely attenuated within 1,500 feet, even before accounting for the removal capacity of the PRB wall, which will significantly reduce concentrations of potential contaminants migrating through the gate(s).

The fate and transport modeling parameters and results are provided in Section 2.5.3.2 herein. Although the modeling predicts that benzene and naphthalene concentrations already meet surface water quality objectives at the Calumet River under current conditions, the hybrid slurry wall is proposed as a conservative measure to provide additional protection and prevent any potential future dissolved-phase petroleum migration from this area.

- *physical and chemical properties of contaminants of concern; and (35 IAC 742.925(d)(3)); and contaminant migration properties (35 IAC 742.925(d)(4));*

Petroleum is a Light Non-Aqueous Phase Liquid (LNAPL), and due to its immiscibility with water, the migration of petroleum in the subsurface environment is controlled through gravity, buoyancy, and capillary forces, and only occurs when LNAPL pressure exceeds the capillary entry pressure of adjacent pore spaces, displacing water or air and moving laterally through permeable zones.

Gravity is the predominant transport force of LNAPL in unsaturated soils, and capillary pressure initiates lateral spreading as the LNAPL approaches the capillary fringe. When there is no longer an ongoing source, LNAPL remaining in the unsaturated zone will exist in a discontinuous phase (partitioning into soil water, adsorbing onto soil particles, volatilizing into pore space), which is not conducive to flow. Pioneer's observations of weathered and viscous petroleum residue coating certain soil cores, contrasted with the absence of free product observed in monitoring wells, provides

evidence that these petroleum impacts are considered residual, with insufficient saturation to render them mobile under existing conditions.

TPH is a complex mix of organic compounds consisting of carbon and hydrogen atoms arranged in varying structural configurations. The TPH detected at the Remediation Site is characterized by being highly weathered, viscous, and predominantly composed of diesel range organics (DRO) and oil range organics (ORO). These hydrocarbons correspond to heavier fractions of petroleum, which have distinct physical and chemical behaviors compared to lighter, less degraded fuels:

- Low solubility: Heavier and weathered hydrocarbons, particularly those identified at the Remediation Site, exhibit limited solubility in water, often on the order of micrograms per liter, which greatly limits their potential to enter the dissolved phase.
- Low volatility: Over decades of weathering, the lighter, more volatile hydrocarbon fractions have either volatilized or biodegraded, leaving behind DRO and ORO composed almost entirely of non-volatile, heavier hydrocarbons.
- High viscosity: At ambient temperatures, weathered TPH becomes highly viscous and, in some cases, semi-solid, severely limiting its capacity to migrate through pore spaces in the soil.
- Strong sorption to mineral surfaces: Although the slag fill at the Remediation Site contains minimal organic carbon, its porous structure, high surface area, and mineral surfaces provide ample capacity for sorption and physical entrapment of weathered hydrocarbons. Heavier hydrocarbons, which are hydrophobic and viscous, tend to adhere to mineral surfaces and become trapped within pore spaces, where they are immobilized by capillary forces and remain largely static under existing hydraulic conditions.

Given the highly weathered and viscous characteristics of the residual petroleum at the site, further significant migration is unlikely. However, the hybrid slurry wall will provide additional assurance by delivering a continuous, low-permeability barrier with capillary entry pressures greater than the LNAPL's ability to penetrate. Together, these characteristics ensure that both residual petroleum and dissolved-phase petroleum remain contained within the designated area, preventing potential off-site migration and protecting adjacent surface waters.

The following subsections provide details and technical support of the proposed slurry wall.

2.5.2.1 Hybrid Slurry Wall — Design and Performance Goals

To prevent potential migration to surface water bodies, a vertical, low-permeability slurry/containment wall integrated with permeable reactive barrier (PRB) gates is proposed. The hybrid slurry wall will fully encircle the impacted areas, extending approximately 9,000 linear feet, and will provide both hydraulic containment and targeted treatment. The hybrid wall will consist of two components:

(1) a soil-bentonite slurry cut-off wall to serve as a low-permeability hydraulic barrier, and

(2) strategically located PRB gates to allow for controlled groundwater discharge while treating dissolved-phase hydrocarbons.

The soil-bentonite slurry wall will be constructed to a nominal thickness of 2 feet and extend approximately 7,000 linear feet, providing nearly continuous physical encapsulation of the impacted area. The soil-bentonite portions of the slurry wall are planned along the perimeter adjacent to surface waters, while the PRB sections are strategically located away from both the TPH hotspots and the surface waters. This configuration is intended to maximize travel times for dissolved constituents that may migrate from source areas before reaching potential discharge points. In order to prevent potential underflow or leakage, the slurry wall will be keyed a minimum of 2 feet into the clay confining layer located approximately 35 feet BSG. The backfill mixture will include approximately 4% sodium bentonite (by dry weight), which is consistent with soil-bentonite slurry walls constructed in coarse, heterogeneous, contaminated slag fill based on published guidance and vendor experience. Although site-specific compatibility testing has not yet been completed, 4% was selected as a conservative starting point to account for physical and geochemical characteristics of the slag fill, while obtaining the target hydraulic conductivity of $\leq 1 \times 10^{-7}$ cm/s, consistent with U.S. EPA criteria for cutoff walls in contaminated environments. If site-specific compatibility testing indicates, the bentonite content will be adjusted as necessity to achieve the target hydraulic conductivity.

Two PRB gates, approximately 600 and 1,400 linear feet, constructed to a nominal thickness of 3 feet and also keyed into the underlying clay, will be integrated into the hybrid slurry wall to allow for controlled groundwater discharge to the north, away from the Calumet River and South Vessel Slip. Fully enclosed impermeable walls can create the so-called “bathtub effect,” wherein infiltrating water accumulates and raises the internal water table. Incorporating PRB gates provides a controlled outlet for groundwater to discharge, thereby maintaining hydraulic balance. Any water entering the containment area (i.e., via infiltration) will naturally migrate to the gates, preventing excessive head build-up inside the containment area (see the Porewater Solutions Modeling [Report] in Appendix F).

Each PRB gate will be constructed of reactive media consisting of Regenesis PetroFix®, a colloidal activated carbon solution physically mixed on-site into a clean, imported permeable sand/gravel matrix. PetroFix® provides dual mechanisms for contaminant attenuation including immediate adsorption of hydrocarbons onto the high-surface-area carbon particles, and long-term biodegradation stimulated by embedded electron acceptors in the media. Therefore, any potential dissolved-phase hydrocarbons carried with the groundwater will be treated prior to discharge through the containment area. (Note: since the residual petroleum at the Remediation Site is highly weathered with limited mobility and aerobic conditions exist beneath the site, anticipated dissolved-phase concentrations at the gates are low, and free-phase hydrocarbons are not anticipated; therefore, the PRB component is mainly intended as a precaution.)

This hybrid design combines the proven effectiveness of a slurry cutoff wall for physical containment, with the benefits of a funnel-and-gate system to maintain hydraulic balance and treat residual dissolved-phase contamination, thereby achieving the following design objectives:

- prevent potential lateral migration of petroleum hydrocarbons toward surface waters;
- maintain hydraulic equilibrium by providing a controlled outlet for groundwater through the PRB gates, thereby avoiding significant groundwater mounding inside the containment area; and
- ensure that any groundwater discharging through the PRB gates meets the applicable surface water standards prior to reaching the North Vessel Slip or Lake Michigan by adsorbing or degrading petroleum constituents.

The following table provides a summary of the hybrid slurry wall design features, specification, and performance goals.

Table 2-4 Hybrid Slurry Wall Design Specifications

Feature	Specification
Wall Alignment	Continuous, closed-loop encircling Hotspots 3, 4 and 5; maintain at least 50-foot setback from Calumet River and South Vessel Slip to avoid tie-back and USACE easement zones; maintain 10-foot offset from adjacent properties in Hotspot 5
Wall Function	Physical barrier to hydrocarbon migration
Wall Material	Soil-bentonite backfill (native soil mixed with minimum 4% sodium bentonite by weight)
Wall Length	7,000 linear feet (soil-bentonite portion)
Wall Thickness	2 feet (soil-bentonite component)
Wall Depth	Appx. 35 feet (keyed 2 feet minimum into clay confining layer)
Construction Method	DeWind One Pass Trenching (in-situ mixing)
Target Hydraulic Conductivity	$\leq 1 \times 10^{-7}$ cm/s
Target Density	90-120 lb/ft^3
Target Slump	2-6 inches
Reactive Gates	Two permeable reactive gates integrated into the wall
Gate Function	Relieve internal head; inhibit migration of hydrocarbons
Gate Material	Imported sand/gravel amended with PetroFix® (colloidal activated carbon)
Gate Lengths	600 and 1,400 linear feet
Gate Thickness	3 feet
Gate Depth	Appx. 35 feet (keyed 2 feet minimum into clay confining layer)
Gate Construction Method	DeWind One Pass Trenching (in-situ mixing)

Design Justification

To support and refine the proposed hybrid slurry wall design, Pioneer retained Porewater Solutions, an industry leader in various aspects of groundwater modeling, to perform site-specific numerical groundwater flow modeling. The model incorporated existing site hydrogeologic data, including stratigraphy, permeability, and estimated recharge rates, to evaluate whether the proposed system would maintain acceptable hydraulic conditions. The modeling demonstrated that the inclusion of the two planned PRB gates is sufficient to maintain hydraulic balance by providing controlled discharge points, thereby preventing excessive internal mounding (the “bathtub effect”).

The dimensions and configuration of the slurry wall and PRB gates were determined based on published guidance documents (e.g., U.S. EPA, USACE, ITRC), industry standards, and vendor experience, and tailored to site-specific conditions including the low mobility of the weathered hydrocarbons and heterogeneous slag fill. The modeling results provide further assurance that the proposed design is appropriate under site conditions and that long-term hydraulic and chemical performance objectives can be achieved. A pre-construction pumping test is also planned to refine hydraulic parameters, allowing final model calibration and any necessary design adjustments before construction. Together, these analyses demonstrate that the proposed hybrid slurry wall design is robust, conservative, and well-suited to the site's unique conditions. Additionally, pre-construction soil borings will be advanced along the proposed wall alignment at a frequency of approximately every 250 feet in order to confirm the depth to clay, ensuring the hybrid wall is properly keyed into the confining layer.

The proposed hybrid slurry wall alignment and cross section are depicted on Figures 17 through 20. Refer to Appendix F for a copy of Porewater Solutions Modeling [Report], dated September 10, 2025, and PetroFix® product information.

2.5.2.2 Hybrid Slurry Wall — Construction and Performance Testing

The proposed hybrid slurry wall will be constructed as a soil-bentonite slurry cut-off wall with integrated PRB gates, totaling approximately 9,000 linear feet. The project will be completed by DeWind One-Pass Trenching (OPT), an industry leader in deep in-situ trenching solutions, known for its patented One-Pass technology capable of installing soil-bentonite, cement-bentonite, PRB, and cutoff walls to depths of up to 150 feet.

DeWind's OPT method is a continuous in-situ mixing process that eliminates the need for open trenches, slurry ponds, and stockpiled backfill, significantly reducing the risk of trench collapse or instability in heterogeneous fill conditions. OPT produces a homogeneous, seamless barrier without cold joints, ensuring consistent quality and integrity along its full length. The system uses laser and GPS guidance to maintain precise depth, thickness, and alignment, achieving tolerances within ±0.1 foot of design specifications. Because the barrier is mixed directly in-place, OPT requires a smaller surface footprint than conventional slurry trenching, making it ideal for constrained or environmentally sensitive sites. The technology also allows real-time adjustment of backfill proportions to accommodate variable subsurface conditions and seamlessly incorporates multiple backfill types, including soil-bentonite, soil-cement-bentonite, and reactive media within a single, continuous operation.

In addition to constructibility advantages, OPT provides significant environmental and safety benefits compared to traditional methods. By eliminating open excavations, slurry ponds, and stockpiled backfill, OPT substantially reduces the generation of dust, noise, and surface disturbance. The method minimizes spoils and contaminated waste that would otherwise require handling and disposal, and it does not require dewatering, thereby reducing the volume of impacted water that must be managed. OPT also enhances worker safety by limiting the need for personnel in or near trenches and consolidating most operations within the trencher itself. Finally, because OPT achieves

faster production rates—often 200 to 500 linear feet per day—it shortens the construction schedule, reduces overall site disruption, and helps control project costs. Together, these benefits make OPT an efficient, reliable, and environmentally preferable approach for constructing the hybrid slurry wall in support of the project's remedial objectives. Refer to Appendix F for DeWind OPT qualifications and technical information.

The following provides an outline of the anticipated construction methodology, performance testing, and quality control measures.

Construction Methodology

1. Site Preparation
   - Wall alignment and staging areas will be prepared, including a minimum 100- by 100-foot staging area and a stable, 30-foot-wide work platform graded to design elevation.
   - Erosion controls, silt fencing, stormwater protections, and spoil containment measures will be installed in accordance with project specifications.
   - Removal of surface obstructions (vegetation, debris), establishment of benchmark elevations, and installation of survey stakes or markers at 50-foot increments will be conducted to guide alignment and quality control.
   - Test pitting at regular intervals along the wall alignment will be conducted to identify and remove or demolish subsurface obstructions (e.g., foundations, footings, beams, hot-poured slag, rubble) that could impede trenching.
   - Soil borings will also be advanced approximately every 250 feet along the wall alignment to confirm the depth to clay. This information will be utilized to ensure adequate key-in of the cut-off wall and PRB gates into the clay confining layer.

2. Trenching and Backfilling—Soil-Bentonite Section
   - DeWind will mobilize and assemble its specialized equipment, including the OPT trencher, additive hoppers, and water delivery system.
   - The trencher will cut a vertical trench while simultaneously mixing in-situ soils with metered dry sodium bentonite and water to achieve the target backfill properties.
   - Bentonite delivery will be controlled via a patented auger system that synchronizes additive rates with trench advance, ensuring the specified bentonite percentage by weight.
   - Field measurements (e.g., slump, density) will be taken continuously to adjust backfill proportions in real time and maintain target specifications.
   - Where the soil-bentonite wall intersects Hotspots 3 and 5, TPH-impacted soils may be excavated and disposed of at a permitted Subtitle D landfill, then replaced with clean imported sand or gravel to avoid mixing hydrocarbons into the bentonite slurry, if the compatibility testing indicates potential issues.

- Wall depth, thickness, and key-in elevation will be continuously monitored using GPS and laser guidance, ensuring proper penetration into the clay confining layer and maintaining design tolerances.
- The final 1 to 2 feet of barrier wall from each shift will be re-mixed at the start of the next shift to eliminate cold joints and maintain continuity, and will be documented and verified in daily reports.
- A protective stone cap, 2 to 4 feet thick and predominately below grade, will be constructed above the soil-bentonite wall. The top portion of the wall will be excavated in a wedge-shaped profile, then overlain with geotextile fabric and compacted backfill to protect the wall and provide a stable surface for redevelopment.

3. Trenching and Backfilling—PRB Gates
   - Existing trench soils will be excavated and transported off-site for disposal at a permitted Subtitle D landfill, or reused within the appropriate SMZ, as further discussed in Section 3.7.
   - The trench will then be backfilled with clean, imported sand or gravel pre-amended with PetroFix® and homogenized in-place using the OPT system. The result will be a uniform, high-permeability reactive zone approximately 3 feet thick and keyed into the underlying clay confining layer.
   - The soil-bentonite wall will overlap into the PRB gate zones by at least 2 feet to ensure no preferential flow paths develop along the interface.
   - Gate construction will conform to vendor specifications and relevant ASTM guidance for slurry trench and cutoff wall construction, as well as established best practices for reactive barrier installation.

4. Utility Crossings and Special Conditions
   - Where possible, utility crossings will be limited to the PRB gate zones to minimize disturbance of the soil-bentonite wall. Utility corridors and vaults will be backfilled with a low-permeability concrete slurry and existing PRB media.
   - Where utility crossings in the soil-bentonite wall are unavoidable, soil-cement-bentonite segments may be installed to enhance structural strength while maintaining hydraulic containment.
   - In areas of highly variable or unstable fill, slurry density and quality control procedures will be adjusted in real time to avoid trench instability.
   - If unexpected obstructions are encountered, the alignment may be adjusted within the approximate design corridor while maintaining key performance criteria.

Performance Testing and Quality Control (QC)

1. Real-Time Monitoring
   - Slurry properties: slump and density will be measured at regular intervals during construction to ensure proper consistency and trench support.
   - Backfill properties: slump, unit weight, and moisture content will be checked at least every 100 linear feet to confirm that the in-situ mixture achieves the specified workability criteria.
   - Depth and alignment will be verified in real time via laser and GPS, maintaining tolerances within ±0.1 foot.
   - Bentonite feed rates will be continuously monitored and adjusted as needed to maintain mix design targets.

2. Laboratory Testing
   - Backfill samples will be collected at intervals of approximately every 400 cubic yards and tested for permeability (ASTM D5084) to confirm hydraulic conductivity is $\leq 1 \times 10^{-7}$ cm/s.
   - Soil-cement-bentonite segments, if installed, will be tested for unconfined compressive strength (ASTM D2166) to confirm ≥50 psi.
   - PRB gate media may be tested for permeability and amendment distribution to confirm uniformity and effectiveness, if necessary.

3. Documentation
   - Daily field logs will record production rates, mix properties, field test results, and any weather or site conditions affecting construction.
   - As-built drawings will document trench depth, thickness, alignment, material properties, and QC results.
   - All documentation will be summarized and compiled in a Remedial Action Completion Report for submission to the Illinois EPA.

2.5.2.3 Hybrid Slurry Wall — Post-Construction Protection and Monitoring

The following provides an outline of the planned post-construction notifications and protection, and post-construction monitoring.

Post-Construction Notification and Protection

Following construction, the final as-built wall alignment and dimensions will be incorporated into the permanent part of the chain of title for the site with the eventual NFR Letter, and will also be incorporated into the site's environmental management plan. To prevent inadvertent damage during future intrusive activities, a notification and marking protocol will be established, similar to the City of Chicago's Streeterville Thorium Monitoring Area system. Specifically:

- As-built information will be provided to the City of Chicago utility locating service (i.e., 811 Chicago) so that contractors planning subsurface work in the area are notified of the wall's presence.
- Permanent surface markers (e.g., monuments or posts) may be installed at key locations such as corners and PRB gates to delineate the wall's footprint in the field.
- Any entity planning intrusive work in the vicinity of the wall will be directed to coordinate with the property owner and/or site environmental manager prior to initiating subsurface activities.

These measures will help maintain the integrity and performance of the hybrid slurry wall and ensure its long-term effectiveness as an engineered remedial feature.

Post-Construction Monitoring

This monitoring plan is designed to verify the long-term performance of the soil-bentonite and PRB components of the hybrid slurry wall. Although no free product and only a very limited dissolved-phase petroleum plume have been identified, this plan is intentionally conservative and is intended to confirm that the containment system continues to protect surface water receptors over time.

The monitoring plan is designed to achieve three primary objectives:

(1) Confirm that groundwater passing through the PRB gates meets the applicable surface water quality standards, as defined by 35 IAC 302, before discharging into surface waters;

(2) Ensure that groundwater levels inside the containment area remain below design thresholds and confirm that groundwater discharges through the PRB gates in a controlled manner; and

(3) Monitor for slurry wall deterioration from the surface of the site.

- Monitoring Well Network

  A total of 22 monitoring wells will be installed and monitored to ensure accurate detection of contaminant and hydraulic conditions in vital areas of the hybrid slurry wall. Refer to Figure 18 for the proposed monitoring well locations.

  - PRB Gate Pairs (18 wells): Nine upgradient (interior) and nine downgradient (exterior) wells spaced approximately 180 to 260 feet apart along the gates. Upgradient wells will monitor groundwater quality and internal head conditions before water enters the gates. Downgradient wells will measure treatment effectiveness and monitor external head conditions. (Note that certain well pairs will be installed near the ends of each gate to monitor potential preferential flow around the gate termini.)
  - Hydraulic Control (4 wells): Located at the southeastern and southwestern interior areas where groundwater mounding is predicted to be the greatest. These wells will continuously measure groundwater elevations to confirm that hydraulic conditions remain within design limits.

All monitoring wells will be constructed with 10-foot screens that intersect the water table within the unconfined aquifer feeding the PRB gates, with screen elevations encompassing seasonal water level fluctuations. Wells will be installed approximately 10 to 20 feet from the gate faces to measure representative upgradient and downgradient conditions while avoiding disturbance of the gate backfill and preventing hydraulic short-circuiting.

- Monitoring Frequency and Duration

  - Year 1: Quarterly monitoring to establish baseline conditions and evaluate short-term performance across seasonal and hydraulic variations.
    - The first quarterly event will include the sampling of all 18 PRB monitoring wells
    - Remaining quarterly events will include sampling only the nine upgradient wells unless impacts are identified
    - Groundwater elevations will be manually gauged from all 22 monitoring wells
    - The four hydraulic control wells will be fitted with pressure transducers and data loggers to record groundwater levels at 60-minute intervals. Each well will be further equipped with telemetry for real-time data collection during storm events; real-time monitoring will be conducted following rainfall of 0.5 inches or greater within 24 hours
    - Surface inspections along the wall alignment to focus on identifying visible signs of subsurface deterioration, such as settlement, cracking, ponding, or seepage
  - Years 2 through 10: Biannual (twice a year) monitoring to further establish baseline conditions and evaluate long-term performance across seasonal and hydraulic variations.
    - Continue sampling the nine upgradient PRB monitoring wells and manually gauging all 22 monitoring wells
    - Continue real-time monitoring of groundwater elevations in the four hydraulic control wells
    - Continue the surface inspections along the wall alignment
  - Years 11 through 30: Annual monitoring to confirm longer-term stability
    - Continue sampling the nine upgradient PRB monitoring wells and manually gauging all 22 monitoring wells
    - Continue the surface inspections along the wall alignment

  Notes:

  - If impacts (i.e., COC concentrations greater than Tier 1 GROs for Class II groundwater) are identified in any of the upgradient (interior) PRB monitoring wells during the Year 1 through 10 monitoring events, the following event will be used as confirmation. If the impact is confirmed, the corresponding downgradient (exterior) PRB monitoring well will be permanently added to the monitoring schedule.
  - If impacts are identified in any upgradient PRB monitoring wells during the Year 11 through 30 monitoring events, a confirmation event for the well(s) in question will be added within 6

months. If the impact is confirmed, the corresponding downgradient PRB monitoring well will be permanently added to the monitoring schedule.

- If after the first 10 years hydraulic conditions are determined to be nominal during static conditions and transient rain events, the hourly logging and real-time monitoring of groundwater elevations in the four hydraulic control wells will be discontinued.

- Monitoring Parameters and Methods

  - Groundwater samples from the PRB gate monitoring wells will be collected using low-flow sampling techniques to minimize turbidity and ensure representative results.
  - Samples will be analyzed for BTEX/naphthalene, which include the contaminants identified in groundwater and includes the potentially mobile indicator contaminants for fuel oils, crude oil, and other petroleum-based products, as specified in 35 IAC 734.405(c).
  - Groundwater elevations and other key geochemical parameters will be measured including pH, temperature, dissolved oxygen (DO), oxidation-reduction potential (ORP), and specific conductance.
  - Groundwater elevations will be logged hourly from the four hydraulic control monitoring wells via dedicated pressure transducers and data loggers. Manual water level measurements will also be conducted per the proposed monitoring schedule to confirm transducer data and provide continuing calibration.

- Data Review and Response Actions

  - Data will be reviewed after each event to assess both contaminant trends and hydraulic performance.
  - If an upgradient PRB well shows a confirmed impact, the corresponding downgradient well will be added to the permanent monitoring schedule.
  - If elevated contaminant levels or declining PRB reactivity are observed, corrective actions such as further investigation, potential reactive media rejuvenation, or increasing gate capacity will be implemented, as necessary, to mitigate any potential surface water impacts.
  - If water level data indicate unacceptable mounding within the containment area (i.e., transient groundwater mounding within 1-foot of the top of the slurry wall during rain events), contingency measures will be implemented, as necessary, including pumping from interior areas or adjusting the site's stormwater infiltration.
  - If surface inspections indicate potential deterioration, a more invasive inspection will be completed to further evaluate conditions and determine appropriate corrective actions.

- Reporting and Regulatory Coordination

  - Summary Reports: To be prepared after each monitoring event and will include water quality and hydraulic data, trend analyses, and a discussion of overall performance of the hybrid slurry wall containment system. The Remediation Applicant will maintain summary reports

during the duration of the monitoring program and will provide copies to the Illinois EPA upon request.

- Final Summary Report: To be prepared after 30 years of monitoring, providing full documentation of the cumulative monitoring program and requesting Illinois EPA concurrence to discontinue monitoring.
- Trigger-Based Correspondence: If monitoring data indicate: (1) exceedances of applicable objectives in exterior PRB wells that are proven to originate from within the containment area, (2) any other evidence of declining PRB reactivity, (3) unacceptable hydraulic conditions that require corrective action, or (4) slurry wall deterioration that requires corrective action, the Remediation Applicant will prepare a summary memorandum of findings and proposed response measures for submittal to the Illinois EPA.

The proposed monitoring plan represents a highly conservative approach given the current site conditions. No measurable free product has been observed anywhere on the subject property during the cumulative investigation and the only dissolved-phase petroleum impacts are isolated to a limited area (at MW-202 in Hotspot 5) approximately 1,200 feet from the nearest PRB gate. Despite the minimal risk of migration under existing conditions, a network of 22 monitoring wells has been designed to provide comprehensive coverage of the slurry wall and PRB gates.

Baseline monitoring will include sampling from both upgradient and downgradient PRB wells to determine background conditions immediately following installation of the hybrid slurry wall. Routine monitoring will then focus on upgradient wells, with downgradient wells only sampled if an interior well shows a confirmed impact. Groundwater elevations will be measured from all wells during each event, with continuous transducer monitoring at interior hydraulic control wells to evaluate potential mounding and verify controlled discharge through the PRB gates. Monitoring will be conducted quarterly in Year 1, biannually in Years 2 through 10, and annually in Years 11 through 30.

All data will be evaluated by a qualified environmental professional and maintained by the Remediation Applicant to demonstrate continued protection of surface water receptors and enable timely corrective action, if needed. If the containment system continues to meet applicable objectives through the monitoring period, a Final Summary Report will be submitted to the Illinois EPA requesting concurrence to discontinue monitoring. If impacts, evidence of declining PRB reactivity or slurry wall deterioration, or unacceptable hydraulic conditions are identified that require corrective action or regulatory review, a summary report outlining findings and proposed modifications will be submitted to the Illinois EPA for evaluation prior to implementation.

2.5.3 Groundwater Ingestion [742.925(c), (d)]

The following table outlines the cumulative sample locations where TCL parameters were identified above the Tier 1 SROs and/or GROs for the soil and groundwater components of Class II groundwater ingestion, and the approach for addressing each impact.

Table 2-5 Sample Locations Where TCL Parameters Exceed the Applicable Tier 1 Objectives for the Soil or Groundwater Components of Class II Groundwater Ingestion

Sample ID	TCL Parameters Detected Above the Tier 1 SROs or GROs for the Soil or Groundwater Components of Class II Groundwater Ingestion	Approach for Addressing Impacts

2.5.3.1 Soil Migration to Groundwater — Incomplete Pathway [742.925(c), (d)]

The cumulative soil testing has only identified limited and sporadic soil migration to groundwater impacts (or potential but unconfirmed impacts), which are generally only marginally above the applicable Tier 1 SROs. Additionally, the cumulative groundwater testing has consistently shown a lack of corresponding impacts in groundwater, providing strong evidentiary support that the soil migration to groundwater exposure route is incomplete. The basis for this incomplete pathway evaluation is provided in further detail throughout this section.

- *A discussion of the result and possibility of the route becoming active in the future (35 IAC 742.925(c)); and*

A total of 50 groundwater samples were collected from 37 monitoring wells as part of the cumulative (2007-2025) investigation activities. None of the cumulative groundwater samples exhibited concentrations above the applicable Tier 1 GROs for any COCs identified as soil migration to groundwater impacts (or potential but unconfirmed impacts), and the overwhelming majority of associated results were not detected at all, or to a lesser extent, were detected below the most stringent Tier 1 GROs. The following table provides a cumulative listing of the soil migration to groundwater impacts (or potential but unconfirmed impacts) and the corresponding groundwater concentrations.

Table 2-6 Summary of Potential Soil Migration Impacts and Corresponding Groundwater Concentrations

COC	Concentrations (or Detection Limits) Above Applicable Soil Migration Tier 1 SRO (or Background Concentration)		Applicable Tier 1 SRO	Corresponding Groundwater Concentrations	Applicable Tier 1 GRO
[2-Hexanone]	*SB-2 (3-5)*	*<0.27 mg/kg*	0.161 mg/kg	<0.0050 mg/L (MW-308, crossgradient) <0.000493 mg/L (MW-315, crossgradient)	0.175 mg/L

Notes: * The Tier 1 GRO for carbazole is based on the GW_{obj} value from Section 742.Appendix B, Table F.
Italicized indicates an elevated detection limit, not a confirmed concentration
BaA = benzo(a)anthracene
BaP = benzo(a)pyrene
BbF = benzo(f)fluoranthene
DahA = dibenzo(a,h)anthracene
SPLP = synthetic precipitation leaching procedure
TCLP = toxicity characteristic leaching procedure

2-Hexanone

A total of 265 soil samples were collected during the cumulative investigation and analyzed for 2-hexanone, of which there was only one actual, reported detection. That reported detection was below the most stringent Tier 1 SRO. In addition, there were 16 soil samples with detection limits marginally above the applicable soil migration to groundwater Tier 1 SRO. None of the cumulative groundwater samples collected from 2007 to 2025 exhibited detectable concentrations of 2-hexanone, with laboratory detection limits approximately two orders of magnitude below the most stringent Tier 1 GRO. Additionally, various soil samples with elevated detection limits have co-located or downgradient monitoring wells. The cumulative testing has shown that VOCs are generally not a concern at the subject property, and 2-hexanone is not an indicator contaminant or a leaching concern for the residual petroleum impacts.

Methylene Chloride

A total of 265 soil samples were collected during the cumulative investigation and analyzed for methylene chloride. Only five of these samples exhibited detectable concentrations, with four detections below the most stringent Tier 1 SRO, and one detection marginally above the applicable Tier 1 SRO. None of the cumulative groundwater samples collected from 2007 to 2025 exhibited detectable concentrations of methylene chloride, with laboratory detection limits one to two orders of magnitude below the applicable Tier 1 GRO. Additionally, the four samples with elevated detection limits have co-located or downgradient monitoring wells. The recent testing has shown that VOCs are generally not a concern at the subject property, and methylene chloride is not considered an indicator contaminant or a leaching concern for the residual petroleum impacts. Further, historical reports associated with the 1997 NFR Letter indicated that methylene chloride was not a concern for the subject property at that time.

Benzo(a)anthracene (BaA), Benzo(b)fluoranthene (BbF), and Dibenzo(a,h)anthracene (DahA)

A total of 324 soil samples were collected during the cumulative investigation and analyzed for PNAs. Only 16 of these samples exhibited concentrations of PNAs (BaA, BbF, DahA) above the applicable soil migration to groundwater Tier 1 SROs. None of the 2007 and 2017 groundwater samples exhibited detectable concentrations of BaA, BbF, and DahA, and the majority of groundwater samples collected by Pioneer did not exhibit detectable concentrations of PNAs, and those that did were below the most stringent or applicable Tier 1 GROs. (Although it should be noted that the only detections observed by Pioneer were from monitoring wells that were not sampled with more representative low-flow methods.) Additionally, the locations exhibiting potential soil migration to groundwater impacts have co-located or downgradient monitoring wells. The recent testing has shown that PNAs are not a concern for groundwater at the subject property, and only very sporadic and limited impacts are present in soil. Further, historical reports

associated with the 1997 NFR Letter indicated that these COCs were not a concern in groundwater at that time.

Carbazole

A total of 312 soil samples were collected during the cumulative investigation and analyzed for carbazole. Only five of these samples exhibited concentrations above the applicable soil migration to groundwater Tier 1 SRO. There was only one groundwater detection of carbazole in the 2007 investigation and one groundwater detection in the 2017 investigation, although the 2007 detection was below the most stringent Tier 1 GRO and the 2017 detection was from a monitoring well (MW-202) resampled by Pioneer using low-flow methods—there were no groundwater detections of carbazole in the 2024-2025 investigation. Additionally, the locations exhibiting potential soil migration to groundwater impacts have co-located or downgradient monitoring wells. Further, historical reports associated with the 1997 NFR Letter indicated that carbazole was not a concern in groundwater at that time.

Dieldrin

A total of 250 soil samples collected by Pioneer were analyzed for dieldrin and only one of these samples exhibited a detectable concentration, which was above the applicable soil migration to groundwater Tier 1 SRO. All of the Pioneer groundwater samples collected from the site did not exhibit detectable concentrations of dieldrin, with detection limits approximately three orders of magnitude below the applicable Tier 1 GRO. Additionally, the sample location exhibiting the potential soil migration to groundwater impact has a downgradient monitoring well at MW-305 and a cross/downgradient monitoring well at MW-316.

Vanadium

A total of 250 soil samples collected by Pioneer were analyzed for total vanadium and none of these exhibited a concentration above an applicable pH-specific soil migration to groundwater Tier 1 SRO. And only seven samples did not have a pH-specific Tier 1 SRO, were also above background concentrations, and also exhibited leachable concentrations above the applicable Tier 1 SRO. As shown in the preceding table, the seven leachable concentrations are only marginally above the applicable Tier 1 SRO for migration to groundwater. Additionally, all of the 42 groundwater samples collected during the cumulative investigation and analyzed for vanadium exhibited either non-detectable concentrations or concentrations below the most stringent Tier 1 GRO, with one exception where vanadium was still below the applicable Tier 1 GRO. However, it should be noted that none of the wells with vanadium detections were sampled using low-flow methods, and based on the low-flow sampling trends at the site, any vanadium detections are likely artificially high due to the presence of ultra-fine colloids. Further, historical reports associated with the 1997 NFR Letter indicated that vanadium was not a concern in groundwater at that time.

Based on these results, while the aforementioned COCs may be present in soils at concentrations exceeding (or potentially exceeding) the soil migration to groundwater Tier 1 SROs, the extensive leachability and groundwater results demonstrate that the soil impacts have not and will not result in groundwater or surface water impacts. Therefore, the soil component of the groundwater ingestion

exposure route is incomplete with respect to these COCs and will not become active in the future due to the following:

- The Remediation Site was fully developed as a steel mill by the late 1800s, with the majority of the subject property constructed as made land using backfilled slag produced on-site. The detected (or potentially detected) COCs included in this Tier 3 evaluation are associated with the slag fill and/or historical operations and have likely been in place for 50 to over 100 years. During that time, infiltrating stormwater has frequently contacted soils across the site, providing hydraulic conditions suitable for the leaching of contaminants into groundwater. However, groundwater testing conducted from the 1990s to 2025 has consistently shown no evidence that these COCs have contributed to groundwater concentrations above applicable objectives. Therefore, any mobile fraction has likely already been flushed from the subsurface, leaving behind a stable slag fill layer that does not pose a significant risk to groundwater.

- More specifically, and as demonstrated in the preceding table, the majority of soil samples exhibiting potential soil migration to groundwater impacts have corresponding co-located or downgradient monitoring wells that consistently show either non-detectable concentrations or concentrations below the most stringent Tier 1 GROs. Further, low-flow sampling trends suggest that any observed detections of SVOCs (including PNAs) and inorganics are likely artifacts of sampling, such as artificially elevated results caused by ultra-fine colloids bypassing the filters.

- Post-development stormwater infiltration is expected to decrease by approximately 40 to 80 percent, further limiting contact with potentially impacted fill materials and creating hydraulic conditions even less conducive to contaminant leaching than those that have existed for decades.

- The eventual comprehensive NFR Letter(s) will serve as an institutional control to prohibit the use of groundwater beneath the Remediation Site. In addition, the City of Chicago maintains a groundwater ordinance and memorandum of understanding (MOU) with the Illinois EPA prohibiting the use of groundwater for potable purposes.

- *Technical support that may include, but is not limited to, the following (35 IAC 742.925(d)).*

    - *a discussion of the natural or man-made barriers to that exposure route (35 IAC 742.925(d)(1));*

    The Remediation Site and surrounding properties within at least a 2,500-foot radius are located within the City of Chicago, which maintains an ordinance and MOU that prohibit the use of groundwater for potable purposes. Furthermore, as discussed in Section 1.4.6.3, there are no known potable water supply wells located at the Remediation Site or adjoining properties, and the Remediation Site is not located within the minimum or maximum designated setback zones of any potable wells.

    - *calculations and modeling (35 IAC 742.925(d)(2));*

Since no impacts have been detected in groundwater at concentrations exceeding the applicable Tier 1 GROs for the groundwater ingestion exposure route, and the soil component of the groundwater ingestion exposure route is considered to be incomplete for the reasons described herein, there is no migration of these contaminants in groundwater. However, in order to facilitate review of this Tier 3 evaluation, theoretical fate and transport modeling is presented below.

Theoretical Fate and Transport Modeling (Migration to Groundwater Impacts)

Pioneer performed fate and transport modeling calculations using SSL Equation S18 and RBCA Equation R26 to determine the predicted theoretical migration of the soil migration to groundwater impacts. The modeling calculations were performed using spreadsheets prepared by Pioneer, which outline the applicable parameters and completed calculations (see Spreadsheets 3, 4, and 5 in Appendix E).

Default and chemical-specific input variables provided in TACO and site-specific variables were used in the fate and transport modeling equations. The site-specific variables utilized in the calculations are summarized in the following table.

Table 2-7 Site-Specific Variables for Theoretical Fate & Transport Modeling Calculations for the Soil Component of Class II Groundwater Impacts

Variable	Value		Source
Source Width Parallel to Groundwater Flow Direction in the Horizontal Plane ("L") & Source Width Perpendicular to Groundwater Flow Direction in Horizontal Plane ("Sw")	2-Hexanone at SB56	770 feet	Largest dimension of the estimated source areas based on cumulative soil and groundwater results, see Figure 12
	Methylene Chloride & 2-Hexanone at SB2	670 feet	
	2-Hexanone at SB67	1,220 feet	
	2-Hexanone at SB17-SB21, SB27, SB28, SB30, SB34, SB51, SB53, SB54 & SB61(a)	3,490 feet	
	Methylene Chloride at SB30, SB51 & SB61a	1,555 feet	
	PNAs and Carbazole at SB41 & SB48	1,375 feet	Largest dimension of the estimated source areas based on cumulative soil and groundwater results, see Figure 13
	PNA at SS-012 & SB64	1,320 feet	
	Carbazole at SB87	775 feet	
	PNAs and Carbazole at SB115	910 feet	
	PNAs at B-2 & B-2W20	940 feet	
	PNAs at SS-113 & SB124	660 feet	
	PNAs at SS-010, E20, S20 & W20	1,100 feet	
	Vanadium at SB78, SB84, SB90, SB92, SB94 & SB98	2,805 feet	Largest dimension of the estimated source areas based on cumulative soil and groundwater results, see Figure 14
	Vanadium at SB13	850 feet	
	Vanadium at SB76	850 feet	
	Vanadium at SB108	775 feet	
	Dieldrin at SB55	910 feet	Largest dimension of the estimated source area based on cumulative soil and groundwater results, see Figure 15
Hydraulic Conductivity (K)	5.40×10^{-3} cm/s		Average of K values from 1995 to 2025
Hydraulic Gradient (i)	0.0019 ft/ft		Based on averaging hydraulic gradients calculated from various transects on Figure 4
Organic Carbon Content (foc)	0.006 or 0.002		Default values for surface or subsurface soils

Pioneer used SSL Equation S18 to predict the contaminant concentrations in groundwater corresponding to the concentrations or elevated detection limits in the soil samples. The resulting predicted groundwater concentrations (see Spreadsheet 3 in Appendix E), along with TCLP or SPLP vanadium concentrations were used as the "Csource" concentrations in RBCA Equations R16 through R19, and R26, which were used to estimate the extent of potential contaminant migration (Spreadsheet 4 in Appendix E). The following table outlines the results of the fate and transport modeling calculations.

Table 2-8 Summary of S18 and R26 Results for Theoretical Migration of the Soil Component of Class II Groundwater Impacts

COC	Concentrations (or Detection Limits) Above Applicable Soil Migration Tier 1 SRO (or Background Concentration)		Equation S18 Predicted Groundwater Concentrations	Distances to Achieve the Tier 1 GROs for Class II Groundwater	Predicted Concentrations in Groundwater at the Nearest Surface Water Body

Notes: *[ ]* indicates an elevated detection limit, not a confirmed concentration
< = the predicted groundwater concentration is below the Tier 1 GRO for Class II groundwater or surface water objective
— = not applicable
BaA = benzo(a)anthracene
BaP = benzo(a)pyrene
BbF = benzo(f)fluoranthene
DahA = dibenzo(a,h)anthracene
NA = not applicable (the TCLP or SPLP concentration is used as the theoretical groundwater concentration)
SPLP = synthetic precipitation leaching procedure
TCLP = toxicity characteristic leaching procedure test method
* = the predicted concentration exceeds the surface water objective; however, the groundwater result at the well corresponding to this boring (MW-315) demonstrates compliance with the Tier 1 GRO

As outlined in Spreadsheet 4 (Appendix E) and the preceding table, the maximum predicted theoretical distance for the soil migration to groundwater impacts to meet the Tier 1 GRO for

Class II groundwater is 172 feet, for carbazole at SB115 (5-7.5). The R26 calculations (Spreadsheet 5 in Appendix E) indicate that the predicted groundwater concentrations of benzo(a)anthracene and carbazole associated with this soil sample exceed the surface water quality objectives at the nearest surface water to this sample (the North Vessel Slip). Note, however, that MW-315 was installed at the location of soil boring SB115, and the groundwater result demonstrated that both of these compounds were below the laboratory's standard detection limits in the low-flow resampling event performed on March 17, 2025. As such, Pioneer believes the predicted groundwater concentrations are overly conservative, and the detected soil concentrations do not represent an actual threat to the adjacent surface water.

- *physical and chemical properties of contaminants of concern; and (35 IAC 742.925(d)(3)); and contaminant migration properties (35 IAC 742.925(d)(4));*

2-Hexanone

2-Hexanone is a moderately volatile, water-soluble ketone with a relatively low organic carbon partition coefficient, suggesting it can partition into water under certain conditions. However, it is highly biodegradable and readily volatilizes from soil. No detectable groundwater impacts have been observed at the site despite historical soil concentrations and elevated detection limits, indicating that any mobile fraction of 2-hexanone has long since dissipated.

Methylene Chloride

Methylene chloride is a volatile chlorinated solvent (and common laboratory artifact) with high water solubility and a low organic carbon partition coefficient, which could favor migration. However, it is also highly volatile, subject to rapid biodegradation under aerobic and anaerobic conditions, and degrades relatively quickly in subsurface environments. The absence of groundwater impacts demonstrates that any residual methylene chloride in soil has already volatilized, degraded, or remained immobile in the slag matrix.

Benzo(a)anthracene, Benzo(b)fluoranthene and Dibenzo(a,h)anthracene

These PNAs have very low water solubility and very high organic carbon partition coefficient, which results in a strong affinity for fine particles. Their high hydrophobicity and low solubility limit their mobility in soil and groundwater. They bind strongly to soil and slag particles and are essentially immobile under site conditions. Even when present in soil, these compounds are unlikely to leach into groundwater at dissolved concentrations. The absence of corresponding groundwater impacts at the site aligns with their well-documented immobility in subsurface environments.

Carbazole

Carbazole is a nitrogen-containing heterocyclic aromatic compound with low water solubility and moderate to high organic carbon partition coefficient. Similar to PNAs, it is persistent but largely immobile in soils and unlikely to migrate to groundwater in significant amounts. Its sporadic detection in soil contrasted with its absence or non-detected levels in groundwater confirm this behavior at the site.

Dieldrin

Dieldrin is a persistent organochlorine pesticide with very low water solubility and a high organic carbon partition coefficient, which results in strong adsorption to soils and limited mobility in the subsurface. It is highly hydrophobic and resistant to biodegradation, contributing to its long-term persistence in soils. However, these same properties also make it largely immobile and unlikely to leach into groundwater in appreciable amounts. The absence of dieldrin in groundwater samples at the site is consistent with its strong sorption, low solubility, and well-documented tendency to remain bound to soil and slag particles under typical subsurface conditions.

Cyanide

Cyanide can exist in free or complex forms, with free cyanide being highly soluble and mobile in water. However, at neutral to alkaline pH (as is typical of the site's slag fill), cyanide forms stable, insoluble metal-cyanide complexes that limit its mobility. Historical and recent data demonstrate that cyanide present in soil has not migrated into groundwater at levels exceeding Tier 1 objectives, consistent with its known chemical behavior in alkaline environments.

Mercury

Mercury has low solubility and strongly adsorbs to soil and organic matter, particularly in its inorganic forms. Under reducing and alkaline conditions, mercury can be transformed into stable, immobile forms, such as elemental mercury or mercury sulfide, which are sequestered in soils and sediments. Although mercury methylation can occur under certain conditions, the process is slow and unlikely to result in significant groundwater impacts at this site, given the low leachability and absence of groundwater exceedances. Therefore, the detected mercury is expected to remain stable and immobile under current site conditions.

Vanadium

Vanadium occurs in multiple oxidation states, with vanadium (V) being more soluble than vanadium (III). Its mobility is strongly influenced by pH and redox conditions. Under the alkaline conditions present at the site, and with limited evidence of strongly oxidizing conditions, vanadium is expected to adsorb to iron-rich slag or precipitate as relatively insoluble oxides or hydroxides. These processes limit its solubility and explain the negligible impact on groundwater observed during the cumulative investigation.

These physical and chemical characteristics, combined with up to over 100 years of exposure to infiltration, confirm that the evaluated COCs are immobile or have already dissipated, or are not actually present. Extensive leachability and groundwater testing demonstrating non-detected or compliant concentrations further corroborate these characteristics. Therefore, the properties of these COCs and site-specific conditions at the Remediation Site support the conclusion that the soil component of the groundwater ingestion exposure route is incomplete and will not become active in the future.

2.5.3.2 Groundwater Ingestion — Benzene and Naphthalene [742.925(c)–(d)]

A total of 50 groundwater samples were collected from 37 monitoring wells during the cumulative investigation. As discussed in Section 1.5.3, only two of these monitoring wells exhibited COCs above the applicable Tier 1 GROs for Class II groundwater: MW-202 (benzene and naphthalene) and MW-102D (vinyl chloride; addressed in the following Section 2.5.3.3).

- *A discussion of the result and possibility of the route becoming active in the future (35 IAC 742.925(c)); and Technical support that may include, but is not limited to, the following (35 IAC 742.925(d)).*
    - *a discussion of the natural or man-made barriers to that exposure route (35 IAC 742.925(d)(1));*

As presented in Section 2.5.2 and shown on Figure 17, the proposed slurry wall will encapsulate the groundwater impacts at MW-202. Based on the groundwater modeling conducted for the hybrid slurry wall, groundwater will flow from the encapsulated area to the north through the PRB gates. This, along with the physical and chemical characteristics of the slurry wall inhibiting advective and diffusive flow of the benzene and naphthalene, will mitigate any potential risk to the adjacent surface waters.

The Remediation Site and surrounding properties within at least a 2,500-foot radius are located within the City of Chicago, which maintains an ordinance and MOU that prohibit the use of groundwater for potable purposes. Furthermore, as discussed in Section 1.4.6.3, there are no known potable water supply wells located at the Remediation Site or adjoining properties, and the Remediation Site is not located within the minimum or maximum designated setback zones of any potable wells.

- *calculations and modeling (35 IAC 742.925(d)(2));*

As a conservative measure, Pioneer performed fate and transport modeling calculations—without accounting for the proposed hybrid slurry wall—using RBCA Equation R26 to determine the predicted theoretical migration of benzene and naphthalene in groundwater. The modeling calculations were performed using a spreadsheet prepared by Pioneer (see Spreadsheet 1 in Appendix E). Default and chemical-specific input variables provided in TACO and several site-specific variables were used in the fate and transport modeling equations. The site-specific variables utilized in the calculations and Equation R26 results are summarized in the following tables.

Table 2-9 Site-Specific Variables for Fate & Transport Modeling Calculations

Variable	Value	Source
Source Width Perpendicular to Groundwater Flow Direction in the Horizontal Plane ("Sw")	440 ft	While benzene and naphthalene were not identified above the applicable Tier 1 SROs or GROs except for MW-202, a conservative 440-foot source area was used (see Figure 16).
Hydraulic Conductivity (K)	5.40 x 10^{-3} cm/s	Average of K values from 1995 to 2025
Hydraulic Gradient (i)	0.0019 ft/ft	Based on averaging hydraulic gradients calculated from various transects on Figure 4

Table 2-10 Equation R26 Results for MW-202

COC	Modeled Distance to Achieve the Tier 1 GRO for Class I Groundwater	Modeled Distance to Achieve the Tier 1 GRO for Class II Groundwater
Benzene	128 ft	49 ft
Naphthalene	48 ft	37 ft

As outlined in Spreadsheet 1 (Appendix E) and the preceding table, and as depicted on the attached Figure 16, the R26 modeling calculations demonstrate that the contamination identified in MW-202 is predicted to meet the applicable Tier 1 GROs for Class II groundwater at a maximum distance of 49 feet. Following installation of the hybrid slurry wall, the potential contaminant migration from this location will be contained within the Remediation Site.

Pioneer also utilized equation R26 to predict the extent of contaminant concentrations in groundwater at the nearest surface water body. As outlined in Spreadsheet 2 (Appendix E), the predicted concentrations of benzene and naphthalene are below surface water quality standards at the Calumet River, located approximately 150 feet to the south.

2.5.3.3 Groundwater Ingestion — Vinyl Chloride [742.925(c)–(d)]

- *A discussion of the result and possibility of the route becoming active in the future (35 IAC 742.925(c)); and Technical support that may include, but is not limited to, the following (35 IAC 742.925(d)).*
    - *a discussion of the natural or man-made barriers to that exposure route (35 IAC 742.925(d)(1));*

A total of 265 soil samples and 50 groundwater samples were analyzed for vinyl chloride through the cumulative investigation, and none of the samples exhibited detectable concentrations of vinyl chloride with the exception of groundwater sample MW-102D.

The Remediation Site and surrounding properties within at least a 2,500-foot radius are located within the City of Chicago, which maintains an ordinance and MOU that prohibit the use of groundwater for potable purposes. Furthermore, as discussed in Section 1.4.6.3, there are no known potable water supply wells located at the Remediation Site or adjoining properties, and the

Remediation Site is not located within the minimum or maximum designated setback zones of any potable wells.

- *calculations and modeling (35 IAC 742.925(d)(2));*

Preliminary RBCA R26 modeling indicates that the vinyl chloride concentration at MW-102D does not pose a risk to any existing water supply wells and is not a concern for nearby surface water bodies. Accordingly, this concentration may be managed through an institutional control, specifically Chicago's groundwater use ordinance and the MOU with the Illinois EPA.

However, the Remediation Applicant may elect to remediate this groundwater impact (e.g., through ISCO), or conduct additional testing to further refine the site-specific input parameters in the R26 calculations. Any future testing, remediation, or modeling specific to this detection will be documented under a separate submittal to the Illinois EPA.

2.5.4 Soil Ingestion and Outdoor Inhalation Exposure Routes [742.925(c)–(d)]

The cumulative site investigation activities have identified certain PNAs, metals, and PCBs at concentrations above the Tier 1 SROs for the soil ingestion and/or outdoor inhalation exposure routes for industrial/commercial property and construction workers. The following table provides a summary of the sampling locations where TCL parameters were identified above the Tier 1 SROs for the soil ingestion and/or outdoor inhalation exposure routes.

- *A discussion of the result and possibility of the route becoming active in the future (35 IAC 742.925(c)); and Technical support (35 IAC 742.925(d)).*

Site-wide engineered barriers (surface caps) complying with the requirements of Part 742, Subparts K and I will be installed in order to eliminate the identified exceedances of the industrial/commercial soil ingestion and outdoor inhalation exposure routes. The engineered barriers will consist of a combination of concrete pavement and foundations, asphalt pavement, 36 inches of clean soil, 18 inches of clean soil underlain by a geotextile fabric, and 10 inches of compacted asphalt grindings, and will be maintained in perpetuity to prevent exposure to the underlying contaminated soils.

Note that the only parameter exceeding a Tier 1 SRO for the industrial/commercial outdoor inhalation exposure route is chromium. In relation to inhalation exposure, chromium is a fugitive dust concern, not a vapor concern. Therefore, standard barriers for the soil ingestion exposure route are sufficient to address the outdoor inhalation exposure route at the Remediation Site. Refer to Section 3.4 for an additional discussion on the specific types of engineered barriers proposed for the Remediation Site.

Construction worker notification of the site's contaminant conditions and the necessary safety precautions will be utilized to eliminate the identified exceedances of the construction worker soil ingestion and outdoor inhalation exposure routes. Construction workers will be notified prior to the commencement of any intrusive activities, and the necessary precautions outlined in site-specific health and safety plans will be utilized to prevent worker exposure.

The future NFR Letter(s) will be used as an institutional control in accordance with Part 742, Subpart J to exclude the pathways, and ensure that the engineered barriers are properly maintained and construction workers are notified of contaminant conditions.

2.6 Tier 3 Impractical Remediation (742.920)

Due to site-specific conditions, certain areas of TPH impacts cannot be practicably contained by the proposed slurry wall. Specifically, residual impacts within the structural tie-back zones of the Calumet River and South Vessel Slip bulkheads, as well as within a 10-foot setback from adjacent properties in the southeastern corner of the site, are not practicably accessible for installation of the proposed hybrid slurry wall. This section presents a Tier 3 evaluation in accordance with the requirements of 35 IAC 742.920(a) through (f). This evaluation demonstrates that active remediation of these areas is impractical due to the physical constraints imposed by the retaining wall systems and property boundaries, the highly weathered and immobile nature of the residual hydrocarbons, and the evidence indicating the low risk to groundwater and surface water receptors under existing conditions.

- *The reasons why remediation is impractical (35 IAC 742.920(a));*

<u>Tie-Back Zones</u>

Pioneer has evaluated the feasibility of installing the proposed hybrid slurry wall to address TPH impacts in areas adjacent to the Calumet River and South Vessel Slip, within the structural tie-backs of the bulkheads that retain the subject property landmass at these surface waters. These tie-back zones lie immediately

adjacent to the bulkhead structures dating to the early 1900s. Specifically, the Calumet River wall is reportedly constructed of a 3-foot-thick concrete wall and wood-driven piles, with 40-foot-long subsurface tie-backs extending from the wall; the South Vessel Slip wall is reportedly constructed of steel sheet piling with 40-foot-long subsurface tie-backs extending from the outer sheet piling. The TPH-impacted soils in these areas are located within and below the horizontal and vertical extents of the tie-backs, which are essential to the structural integrity of the river and slip walls. The walls prevent collapse of the riverbank and limit erosion into the Calumet River and South Vessel Slip.

Based on current engineering assessments and available historical construction data, any excavation, trenching, or deep subsurface mixing (e.g., in-situ stabilization/solidification or jet grouting) to remediate the impacted soils would compromise the stability of these retaining structures. Disturbance of soils near or through the tie-backs could result in wall movement or failure, potentially leading to release of TPH to surface waters, loss of near shore site stability, and significant safety and environmental risks to adjacent waterways and workers. Further, aggressive or high-pressure injection techniques pose additional risks of hydraulic blowout, preferential mobilization of residual petroleum, and uncontrolled migration of contaminants into surface waters. The physical obstructions posed by the tie-backs, combined with the proximity to sensitive surface water receptors, render remediation within these areas impractical and potentially environmentally counterproductive.

Equipment Access Limitations

In addition to the structural constraints described above, access limitations further contribute to the impracticality of active remediation in certain areas. Installation of the slurry wall requires a minimum 10-foot setback from adjacent property boundaries near Hotspot 5 and from the tie-back zones. This buffer is necessary to prevent encroachment onto Steelworkers Park to the east, U.S. Army Corps of Engineers operations to the southeast, and to avoid damage to the tie-back systems. Accordingly, intrusive remedial activities—including excavation, trenching, or in-situ treatment—cannot be safely or effectively implemented within this zone. As a result, TPH-impacted soils in these areas cannot be directly remediated without violating property boundaries or compromising adjacent land uses and structural supports.

In-situ Chemical Oxidation (ISCO)

ISCO was evaluated for areas within the tie-back zones and near the property boundary where slurry wall installation is infeasible. However, elevated residual TPH concentrations create a very high oxidant demand, resulting in excessive reagent requirements, and injections could mobilize petroleum constituents toward adjacent surface waters. In addition, the heterogeneous slag fill would limit uniform oxidant distribution. Together, these factors indicate that ISCO is unlikely to achieve remedial goals and represents an impractical, and potentially counterproductive, option for this localized area.

Excavation and Off-Site Disposal

Excavation and off-site disposal was also evaluated for the limited areas near the property boundary where the slurry wall cannot be installed. This option was also determined to be impractical due to the depth of contamination, and the significant structural earth retention that would be required. In addition, dewatering

would be necessary to facilitate excavation, further increasing complexity, risk, and cost. For these reasons, excavation and off-site disposal were not considered a feasible remedial alternative for this localized area.

- *The current extent and modeled migration of contamination (35 IAC 742.920(b));*

As shown on Figures 10B and 10C, the vertical and horizontal extent of TPH contamination in Hotspots 3 and 5 have been defined by soil sample analytical results obtained from borings and test pits in and around these areas. Based on these results and as shown on Figure 19, the residual TPH impacts within the impractical remediation areas are estimated at approximately 260 cubic yards in the Hotspot 3 tie-back zone, and 14,500 cubic yards in the Hotspot 5 tie-back and 10-foot setback zones. The impacts within Hotspot 3 are limited to the smear zone and present at varying depths between 7.5 feet to 17.5 feet BSG. The impacts within Hotspot 5 begin within the smear zone at 10 feet BSG, but also extend into the saturated zone and potentially to maximum depths of 35 feet BSG in limited portions of this hotspot; although significant variability was observed and vertical delineation was confirmed in one location within the tie-back zone at 22.5 feet BSG.

The only on-site monitoring well exhibiting petroleum-based contaminants in groundwater during the cumulative investigation activities was MW-202 in Hotspot 5, where benzene and naphthalene were detected at concentrations above the applicable Tier 1 GROs. However, MW-202 is located approximately 150 feet from the Calumet River and approximately 107 feet from the tie-back zone, and will be contained within the proposed slurry wall. The more representative monitoring well for the Hotspot 5 tie-back zone is MW-318, which is located approximately 70 feet from the Calumet River and 27 feet from the tie-back zone, at the approximate midpoint of the hotspot along the river. The groundwater sample collected from this well did not identify any petroleum-based contaminants at concentrations above the most stringent Tier 1 GROs, and the majority of target analytes were not detected.

- *Geology, including soil types and parameters (35 IAC 742.920(c));*

The site geology is discussed in Section 1.4.5.

- *The potential impact to groundwater (35 IAC 742.920(d));*

Groundwater conditions at the Remediation Site have been extensively characterized through the cumulative investigation activities. While residual TPH contamination remains in the smear zone (and in the saturated zone at Hotspot 5), the available data indicate its impact to groundwater is limited, stable, and does not pose a significant ongoing threat to off-site migration or surface water receptors.

As mentioned previously, the only on-site monitoring well to exhibit petroleum-based contaminants in groundwater above the applicable Tier 1 GROs was MW-202, located approximately 150 feet from the Calumet River and 107 feet from the tie-back zone. The area of this well will be contained by the proposed slurry wall. In contrast, MW-318—located approximately 70 feet from the Calumet River and 27 feet from the tie-back zone, at the approximate midpoint of Hotspot 5 along the river—did not exhibit any petroleum-based contaminants in groundwater above the Tier 1 GROs for the groundwater component of groundwater ingestion, and most target analytes were below detection limits. Additionally, MW-317, located immediately adjacent to Hotspot 5 and approximately 80 feet from the east adjacent property, both downgradient and crossgradient of Hotspot 5, did not exhibit any petroleum-based contaminants above the most stringent Tier

1 GROs. Multiple groundwater sampling events documented herein provide evidence that any dissolved-phase hydrocarbons within the tie-back and 10-foot setback zones have stabilized at concentrations below the most stringent objectives.

The residual TPH contamination in these areas is highly weathered, viscous, recalcitrant, and effectively immobile. Cumulative analytical results—along with the absence of free product and sheens on adjacent surface waters—indicate that hydrocarbons remain trapped within pore spaces at residual saturation and strongly adsorbed to soil particles, making appreciable migration or leaching into groundwater unlikely under existing conditions. Although the site soils exhibit moderate permeability, localized low-permeability zones and the viscous, strongly sorbed nature of the hydrocarbons significantly limit their ability to move. Additionally, the depletion of more mobile fractions through weathering and biodegradation, minimal hydraulic gradients, and the presence of the river and vessel slip walls further constrain potential lateral migration toward surface waters.

The proposed remedial approach—installing a continuous, hybrid slurry wall to enclose the majority of the impacted soils outside the tie-back and property line setback zones—will mitigate potential groundwater migration from the enclosed area. This design will hydraulically isolate the contained soils, minimize horizontal flow, and protect surface water bodies by maintaining internal head control and preventing outward gradients from the enclosed area. While the residual impacts within the tie-back zones will not be encompassed by the slurry wall due to structural constraints, their potential to impact groundwater and surface water remains minimal for the reasons described herein.

Additionally, there are no known potable water supply wells located at the Remediation Site or adjoining properties, and the Remediation Site is not located within the minimum or maximum designated setback zones of any potable wells. Chicago also maintains a groundwater ordinance and MOU with the Illinois EPA prohibiting the use of groundwater for potable purposes, and the eventual comprehensive NFR Letter will serve as an institutional control to prohibit the use of groundwater beneath the Remediation Site.

- *Results and locations of sampling events (35 IAC 742.920(e));*

The cumulative sampling plan and a summary of impacted locations are provided in Sections 1.3 and 1.5, while the attached Table Nos. 1 through 17 provide a summary of the analytical results associated with Pioneer's 2024-2025 investigation. The analytical results associated with the 2007 CRA and 2017 GHD investigations can be found in respective documentation provided under separate cover. Refer to the attached Figure 2 for a depiction of the cumulative sample locations, and Figure 9 for the TPH delineation sample locations.

- *Map of the area, including all utilities and structures (35 IAC 742.920(f));*

Figure 19 depicts the areas of TPH impacts included within this Tier 3 evaluation. Historical schematics of the river and vessel slip wall systems, and current and historical photos are provided in Appendix F.

- *Present and post-remediation uses of the area of contamination, including human receptors at risk (Section 742.920(g));*

The areas of the tie-back and 10-foot property line setback zones exhibiting TPH contamination are currently vacant. The proposed plans for these areas following development of the IQMP will consist of unused vegetated land and/or park space. As previously noted, if park space is the intended use, an amended report will be submitted to compare results to residential standards for these areas, but it is not anticipated that the proposed remedial strategy will be appreciably different from that proposed herein.

2.7 Summary

Investigations conducted by CRA, GHD, and Pioneer between 2007 and 2025 identified elevated concentrations of certain metals in soil, along with isolated and limited detections of a VOC, certain SVOCs, pesticides, and PCBs exceeding Tier 1 SROs. Groundwater results showed vinyl chloride, benzene, and naphthalene (VOCs) above Tier 1 GROs in only two monitoring wells. Additional impacts include a single soil sample with PNAs and extensive TPH exceedances of the default SAC, delineated into five hotspots. The cumulative impacts are attributable to the presence of slag fill, historical site operations, and demolition activities. The proposed remedial approach combines conventional remediation, installation of a hybrid slurry wall to prevent migration of petroleum impacts to the adjacent surface waters, the demonstration of impractical remediation in certain limited areas, and the use of engineered, institutional, and preventative controls to exclude all exposure routes under a Tier 3 evaluation in accordance with 35 IAC 742.925.

The cumulative investigation results and Part 742 regulatory framework clearly support bypassing the default assumptions and requirements of Subpart C in favor of a Tier 3 exposure route evaluation, as explicitly permitted under 35 IAC 742.300(c). This provision was designed to accommodate sites—like the former South Works property—with unique historical, physical, and contaminant conditions that cannot be effectively or meaningfully addressed using default assumptions.

While TPH concentrations in soil exceed the default SAC, the cumulative evidence demonstrates that the residual hydrocarbons are highly weathered, viscous, and immobile. The absence of free product, lack of surface water sheens, and stable groundwater quality indicate that the hydrocarbons do not pose a significant risk of leaching or migration under current conditions. The Tier 3 approach enables a remedy that reflects actual site conditions, protects human health and the environment, and avoids unnecessary and impractical measures that would otherwise further prevent brownfield redevelopment.

The proposed remedy not only addresses current site conditions, but also significantly improves upon the limited protections afforded by the existing NFR Letters. The engineered barriers and institutional controls explicitly mitigate pathways that were not addressed in earlier closures, particularly the potential for long-term migration to adjacent surface waters. The soil ingestion and outdoor inhalation pathways will be addressed with a surface cap of engineered barriers designed and maintained to inhibit exposure of the underlying impacted soils. Construction worker exposure will be managed through notification requirements and site-specific health and safety plans. The groundwater ingestion pathway will be addressed through the City of Chicago's groundwater ordinance and MOU, and a comprehensive NFR Letter prohibiting groundwater use. Potential residual petroleum migration toward surface waters will be further controlled by the hybrid slurry

wall, in addition to existing subsurface infrastructure, hot-poured slag, and river and vessel slip bulkheads. Collectively, these measures will ensure that all potential pathways are addressed or rendered incomplete, meeting the substantive requirements of Part 742 while greatly exceeding the protections of the existing NFR Letters. Although Subpart C is bypassed, the closure approach is consistent with those frequently utilized for impacted sites in the Chicago area, where contamination is effectively managed in-place through engineered, institutional, and preventative controls.

This remedial approach also explicitly accounts for the safety and comfort of the surrounding community. Unlike more disruptive alternatives—such as full-scale excavation, in-situ stabilization, or aggressive injection—the proposed containment strategy minimizes noise, dust, emissions, odors, truck traffic, and other nuisances that would otherwise impact nearby residents and businesses. It avoids destabilizing the bulkhead structures, protects sensitive surface water bodies, and maintains site stability during and after implementation. Consistent with the U.S. EPA's Greener Cleanups framework, the selected remedy minimizes the environmental footprint of remediation activities by conserving resources, reducing greenhouse gas emissions, and limiting impacts to land, water, and ecosystems, while still achieving protective outcomes.

Importantly, the remedy fully satisfies the critical remedial goals established for the site: (1) protect human health and the environment; (2) address legitimate concerns of the community; address the (3) time, (4) cost, and (5) constructibility components of redevelopment; and (6) redevelop the site and restore economic viability of the surrounding community. The combination of the hybrid slurry wall, surface caps, and institutional controls ensures a protective, feasible, and sustainable remedy, while making the site significantly safer, more stable, and more compatible with redevelopment than under existing conditions.

3.0 REMEDIAL ACTION PLAN

3.1 Introduction

This Remedial Action Plan (RAP) has been prepared to describe the proposed remedial activity and the engineered, preventative, and institutional controls that will apply to the Remediation Site. The following table outlines the TCL parameters that exceed the applicable remediation objectives.

Table 3-1 Proposed Approach for Addressing Identified Exceedances

TCL Parameters	Applicable Tier 1 Exposure Routes							Default Soil Attenuation Capacity
	Soil Ingestion		Outdoor Inhalation		Indoor Inhalation	Class II Groundwater Ingestion		
	Industrial/ Commercial	Construction Worker	Industrial/ Commercial	Construction Worker	Industrial/ Commercial	Soil Component	Groundwater Component	
VOCs	--	--	--	--	--	--	GWO	--
SVOCs (excluding PNAs)	--	--	--	--	--	--	--	--
PNAs	EB	CWC	--	CWC	--	--	--	Remediation
Pesticides	EB	--	--	--	--	--	--	--
PCBs	EB	CWC	--	--	--	--	--	--
Inorganics	EB	CWC	EB	CWC	--	--	--	--
TPH	NA	NA	NA	NA	NA	NA	NA	Remediation / Containment

Notes: -- indicates the Tier 1 exposure route objectives were not exceeded
CWC = exclusion of the exposure route using a Construction Worker Caution
EB = exclusion of the exposure route using an Engineered Barrier
GWO = exclusion of the exposure route using a local GroundWater Ordinance that prohibits the use of groundwater

The TCL parameters identified at the Remediation Site shall be eliminated from consideration through the exclusion of the affected exposure routes as discussed in the Remediation Objective Report and detailed further in this Remedial Action Plan.

3.2 Current & Post-Remediation Land Uses

The Remediation Site is currently vacant industrial property and will be redeveloped for industrial/commercial use, specifically as a technology corridor known as Quantum Shore Chicago. The first development phase, the Illinois Quantum and Microelectronics Park (IQMP), is a proposed 128-acre quantum computing technology campus located on the southern portion of the Remediation Site. Therefore, the objectives for industrial/commercial property are deemed applicable to the Remediation Site. The current redevelopment plan is provided in Appendix A.

Due to the size of the site, certain areas may be redeveloped with land uses that would be considered residential (e.g., public trails, parks, medical facilities, etc.), and in those cases, an amended report(s) comparing results to residential standards will be issued once those property use(s) and area(s) are defined. However and based on the testing results, it is not anticipated that the residential comparison will result in an appreciably different or more conservative approach to closure.

3.3 Remedial Technology Selection

The COCs identified at the Remediation Site can be eliminated from further consideration by performing conventional remediation of the PNA and TPH impacts of the SAC in Hotspots 1 and 2, containment of the TPH impacts of the SAC in Hotspots 3, 4, and 5, and through exclusion of the exposure routes in accordance with the Tier 3 evaluation presented in Section 2.5 of this report.

3.3.1 Conventional Remediation — Hotspots 1 and 2

Conventional remediation will be implemented to address exceedances of the SAC in Hotspots 1 and 2. Specifically, total PNA concentrations in soil sample SB10 (5-7.5), and TPH concentrations in SB141 (5-7.5) and SB141a (7.5-10) exceed the SAC. The lateral extents of these impacts have been delineated from soil samples collected from adjacent soil borings SB10b through SB10e (Hotspot 1), and SB140, SB141b, SB141c, and SB142 (Hotspot 2). Vertical delineation has also been established from deeper soil samples collected from borings SB10(a) (Hotspot 1), and SB141 plus delineation boring 141a (Hotspot 2). Refer to Figure 3 for the locations of Hotspots 1 and 2, Figure 10A for a Hotspot 2 detail, and Figures 11A and 11B for Hotspot 2 cross sections.

The following table summarizes the estimated quantities of soil to be excavated, along with corresponding confirmation sample requirements.

Table 3-2 Conventional Remediation Summary

Hotspot	Estimated Dimensions (ft)	Estimated Area (ft^2)	Estimated Depth (ft)	Estimated In-Situ Volume (yd^3)	Estimated Ex-Situ Mass (tons)	Confirmation Sampling Analysis	Cleanup Objective
1	30 x 30	900	5-7.5	80	130	PNAs	<2,000 mg/kg
2	134 x 225	30,150	5-10 (variable)	3,000	5,000	TPH	<2,000 mg/kg

The remedial approach will involve removing the overburden soils with an excavator, which will be temporarily stockpiled for reuse as backfill. Impacted soils will be excavated, loaded, and transported off-site for disposal at a permitted Subtitle D landfill. Waste characterization sampling will be conducted prior to excavation, if required by the landfill. Analytical results from the waste characterization and/or existing analytical data will be submitted to the landfill for the approval of a non-hazardous, non-special waste disposal profile.

The remedial activities will be conducted under the supervision of OSHA-trained personnel, who will screen excavation conditions for visual, olfactory, and volatile indicators of contamination (using a PID). Standard industry practices and proper waste manifesting protocols will be followed. Temporary fencing will be installed to secure the perimeter of excavation areas during remediation.

Although the hotspot boundaries have been delineated by prior sampling, final excavation limits will be determined based on real-time field observations and post-excavation confirmation sampling. Confirmation samples will be collected from the base and sidewalls of each excavation at a frequency of one sample per 20 linear feet. Sidewall samples will be obtained from the midpoint of the observed or expected contaminated interval, or at a depth deemed most representative of potential residual impacts based on field screening and judgement of the field geologist.

Confirmation samples will be submitted for laboratory analysis of PNAs (Hotspot 1) or TPH (Hotspot 2). Once analytical results confirm that residual concentrations are below the SAC, the excavations will be backfilled to grade using the stockpiled overburden and, as needed, imported virgin quarry stone.

3.3.2 Hybrid Slurry Wall

To prevent the potential petroleum migration toward adjacent surface waters, a hybrid slurry wall system will be installed around the TPH-impacted areas of Hotspots 3, 4, and 5. The hybrid wall will include a low-permeability soil-bentonite slurry wall with strategically placed permeable reactive barrier (PRB) gates.

This hybrid containment approach combines the physical barrier function of a slurry cutoff wall with the controlled discharge and treatment capabilities of a PRB. This design prevents lateral migration of petroleum impacts, maintains hydraulic balance to avoid groundwater mounding, and ensures that any potential dissolved-phase petroleum constituents in groundwater are treated through adsorption and biodegradation prior to discharge through the PRB gates.

The proposed hybrid slurry wall alignment is shown on Figure 17, with a cross section provided on Figure 20, and will be constructed in accordance with the details provided in Section 2.5.2.

3.4 Engineered Barriers

Engineered barriers are required to address the presence of certain PNAs, metals, and pesticides at concentrations impacting the industrial/commercial soil ingestion and outdoor inhalation (chromium only) pathways. As a conservative measure, site-wide engineered barriers will be installed and maintained to cap existing soils, and will consist of a combination of the following conventional and alternative barriers:

- hardscapes (concrete and asphalt pavement, concrete building foundations);
- 3 feet of clean soil or certified virgin stone;
- 18 inches of clean soil or certified virgin stone underlain by a geotextile fabric; and
- 10 inches of compacted asphalt grindings.

In connection with the import of clean soil to be used as engineered barriers, Pioneer proposes the following methodology to demonstrate that imported soils meet applicable Illinois EPA requirements.

- The source location(s) for the proposed clean soil will be investigated to determine whether the source property is listed on any State or Federal environmental databases.
- One sample from each source location will be analyzed for the TCL parameters to confirm that the imported soil meets the applicable Tier 1 SROs at a rate of one TCL sample per 500 cubic yards of imported soil. Alternatively, if stone is used, documentation from the quarry of origin certifying the material as virgin will be obtained prior to being imported to the site.

- Additionally, based on the proposed redevelopment grading plans, a substantial quantity of soil will need to be imported to the site for use as structural fill. Given the anticipated volumes and the fact that these soils will be placed beneath an engineered barrier, it is proposed that imported soils used as structural fill be sampled at a rate of one TCL sample per 2,500 cubic yards to confirm compliance with applicable Tier 1 SROs.

The proposed geotextile for this project is Mirafi 140N (or equivalent); the manufacturer's specification sheet and a sample of the geotextile are provided in Appendix G. Considering that landscaped areas at the site will be professionally managed for the foreseeable future and given the robust characteristics, Pioneer believes the proposed alternative engineered barriers will be equally as capable as 3 feet of clean fill to prevent exposure via the soil ingestion pathway, and are therefore acceptable under 35 IAC 742.1105(d).

Upon installation of all required engineered barriers, the soil ingestion and outdoor inhalation exposure routes for industrial/commercial property will be effectively eliminated at the Remediation Site.

3.5 Preventive Controls

As required by 35 IAC 742.1100(d), if intrusive construction work is performed at the Remediation Site, construction workers will be notified of site conditions in advance of performing intrusive activities. Specifically, construction workers will be provided with a Hazard Communication Program or site-specific safety plan that outlines the COCs known to be present above the applicable objectives for the construction worker soil ingestion and outdoor inhalation exposure routes.

3.6 Institutional Controls

1) In accordance with 35 IAC 742.310(d), 742.315(d), and 742.1005, the NFR Letter(s) to be issued for the Remediation Site will be recorded as a permanent part of the chain of title for the site and shall serve as the appropriate institutional control regarding maintenance of engineered barriers and construction worker precautions.

2) The NFR Letter(s) shall also serve as an institutional control for allowable land use and to ensure that any future buildings constructed on the site must contain full concrete slab-on-grade floors or full concrete basement walls and floors with no sumps.

3) The City of Chicago ordinance (#097990) and Memorandum of Understanding (MOU) with the Illinois EPA will be used as an institutional control in accordance with 35 IAC 742.1015 for prohibition of the use of groundwater beneath the site. A copy of the ordinance will be recorded with the NFR Letter.

   As required by 742.1015(b), a request for approval of a local ordinance as an institutional control shall provide the following:

   - *A copy of the ordinance restricting groundwater use (Section 742.1015(b)(1));*

     The City of Chicago groundwater use ordinance is provided in Appendix G.

- *A scaled map(s) delineating the area and extent of groundwater contamination modeled above the applicable remediation objectives (Section 742.1015(b)(2));*

  Figure 16 is a scaled map showing the modeled extent of groundwater impacts in MW-202.

- *A scaled map delineating the boundaries of all properties under which groundwater is located which exceeds the applicable groundwater remediation objectives (Section 742.1015(b)(3));*

  Figure 16 is a scaled map showing the modeled extent of groundwater impacts identified in MW-202. Regarding the sole groundwater impact (vinyl chloride at MW-102D) not addressed through the hybrid slurry wall, the Remediation Applicant may elect to remediate this location or further refine site-specific parameters in the R26 calculations. Any future testing, remediation, or modeling specific to this impact will be documented under a separate submittal to the Illinois EPA.

- *Information identifying the current owner(s) of each property identified in subsection (b)(3) of this Section (Section 742.1015(b)(4)); and*

  If subsequent RBCA R26 modeling indicates a potential for off-site migration, applicable property owners will be identified under a separate submittal to the Illinois EPA.

3.7 Soil Management Zone

The site grading plan is being developed to minimize the environmental impact associated with transporting and disposing of contaminated soils generated during redevelopment. Soils impacted by TPH above the SAC will not be reused on-site and may be disposed of at a permitted Subtitle D landfill in accordance with applicable regulations. All other impacted construction spoils will either be disposed of off-site or reused on their respective parcels beneath an engineered barrier, as appropriate. The reuse of impacted materials in this manner will not alter the overall closure strategy for the Remediation Site, nor will it introduce any new or unacceptable risks to human health or the environment.

Pursuant to Section 740.535, an SMZ may be established in order to allow for the placement of contaminated soils for structural fill and/or the consolidation of contaminated soils within a Remediation Site without violating the solid waste disposal regulations of 35 IAC Part 807 and Parts 811 through 815. In general, the SMZs are proposed for the Remediation Site in order to allow for the on-site reuse of the impacted materials that will be excavated for the planned improvements and subsurface utilities.

The 440-acre subject property will be redeveloped in multiple phases. Each development phase will be treated as a separate Remediation Site for purposes of obtaining corresponding NFR Letters. Consistent with this approach, each Remediation Site will also function as a discrete SMZ. Accordingly, impacted construction spoils generated within a given development phase will only be reused within that same Remediation Site/SMZ. This approach not only minimizes the quantity of material requiring off-site disposal and supports environmentally responsible redevelopment, but also ensures that reused construction spoils are promptly encapsulated beneath engineered barriers. As a result, if subsequent phases of redevelopment are delayed, previously reused spoils will not remain exposed or unaddressed pending future construction.

In order to formally establish an SMZ at a site, certain criteria must be satisfied, as described below.

- *All contaminants of concern within the remediation site shall be identified by a comprehensive site investigation under Section 740.420 [740.535(b)(1)];*

A comprehensive site investigation has been completed at the Remediation Site.

- *The horizontal and vertical dimensions of the soil management zone shall be defined [740.535(b)(2)];*

The horizontal extent of each SMZ will encompass the corresponding Remediation Site/development phase and will be limited in depth to 10 feet BSG.

- *The uses of the soil management zone shall be defined [740.535(b)(3)];*

As allowed under 740.535(a)(2)(A), the SMZs will be established in order to reuse contaminated soils as structural and non-structural fill to the extent practicable during site redevelopment.

- *All contaminants of concern within the soil management zone shall satisfy the requirements of 35 IAC 742.305(a) through (f) [740.535(b)(4)];*

Since the SMZ(s) will not extend into the TPH-impacted soils of Hotspots 3, 4 and 5, and following removal of the PNA and TPH impacts in Hotspots 1 and 2, the requirements of Part 742 Subpart C will be bypassed but effectively addressed through the Tier 3 evaluation per 742.925, documented herein.

- *All applicable requirements of 35 IAC 742 shall be satisfied within the soil management zone (e.g., all exposure routes must be addressed; institutional controls and engineered barriers shall be in full compliance with 35 IAC 742, Subparts J and K) [740.535(b)(5)];*

Based on the cumulative analytical testing results, certain TCL parameters were identified above the Tier 1 objectives for the soil ingestion and outdoor inhalation exposure routes for industrial/commercial property and construction workers, and the groundwater component of Class II groundwater. As discussed in this report, following remediation and installation of the engineered barriers (i.e., hybrid slurry wall and surface caps), the soil ingestion and outdoor inhalation exposure routes for industrial/commercial property will be effectively eliminated. The final recorded NFR Letter will include certain restrictive covenants to serve as the appropriate institutional control for the maintenance of engineered barriers, implementation of construction worker precautions, and reliance upon the City of Chicago groundwater ordinance to prohibit the use of groundwater beneath the site. Therefore, this requirement will be satisfied.

- *The soil management zone shall be constructed, operated and maintained in a manner that prevents odors from occurring [740.535(b)(6)(A)];*

Standard construction and engineering practices will be utilized to prevent odors from emanating from the SMZs. The SMZs will be capped with engineered barriers during redevelopment activities, which will prevent any residual odors from escaping into the air. Therefore, this requirement will be satisfied.

- *The soil management zone shall be constructed, operated and maintained in a manner that minimizes fugitive emissions of particulate matter in accordance with 35 IAC 212, Subpart K and dust generation [740.535(b)(6)(B)];*

In accordance with 35 IAC 212, fugitive particle emissions and dust generation will be controlled at the site during the construction of the SMZs through the surficial application of water on an as-needed basis, and the SMZs will be capped with asphalt, concrete, other approved alternative engineered barriers. In addition, any active construction zones will be fenced with windscreens, and stockpiled soils will be covered/stabilized in order to prevent the generation of dust and/or fugitive particle emissions. Therefore, this requirement will be satisfied.

- *The soil management zone shall be constructed, operated and maintained in a manner that prevents the generation of potentially contaminated runoff [740.535(b)(6)(C)];*

Standard construction and engineering practices (e.g. erosion control) will be utilized to prevent potentially contaminated runoff during the redevelopment activities. After redevelopment, SMZs will be capped with asphalt, concrete, or other approved alternative engineered barriers.

- *The soil management zone shall be constructed, operated and maintained in a manner that does not provide a breeding place or food source for vectors [740.535(b)(6)(D)];*

There is no reason to believe that the construction of the proposed improvements or the maintenance of the SMZs would provide a breeding place or food source for vectors.

- *Within the soil management zone, management of soil containing hazardous wastes shall comply with the applicable requirements of the Resource Conservation and Recovery Act (42 USCA 6901-6992k) and 35 IAC 700 through 730 [740.535(b)(7)];*

The cumulative investigation and existing NFR Letters have demonstrated that there is no evidence of soils at the Remediation Site containing hazardous waste.

- *Soil containing contaminants of concern above the concentrations in 35 IAC 742, Appendix B, Table A (Tier 1 objectives for residential properties) or approved by the Agency pursuant to 35 IAC 742.510(c) may not be treated or placed in any area where all contaminants of concern within the remediation site are at or below the concentrations in 35 IAC 742, Appendix B, Table A (Tier 1 objectives for residential properties) or approved by the Agency pursuant to 35 IAC 742.510(c) [740.535(b)(8)];*

Surface cap engineered barriers are being proposed for the entire Remediation Site. Therefore, soils may be reused anywhere within respective Remediation Sites/SMZs in accordance with this section.

- *The three-dimensional boundaries of the soil management zone shall be as defined in the approved Remedial Action Plan…the soil management zone may not extend beyond the boundaries of the remediation site [740.535(c)];*

The SMZs shall be located entirely within the boundaries of future, respective Remediation Sites. The boundaries of future Remediation Sites within the current 440-acre Remediation Site/subject property will be

clarified in separate submittals to the Illinois EPA. The depth of all SMZs shall be limited to 10 feet BSG unless otherwise proposed.

3.8 Post-Remedial Monitoring

Post-remedial groundwater monitoring will verify that the hybrid slurry wall is effectively containing petroleum-impacted groundwater, preventing excessive groundwater mounding, and is not deteriorating, as described in Section 2.5.2.3. The program is designed to identify potential issues early and confirm long-term performance. Monitoring and visual inspections will be conducted quarterly for the first year to determine baseline conditions and capture seasonal and hydraulic variations, then biannually for the following nine years, and annually for an additional 20 years. Limited real-time monitoring during the first 10 years will also assess groundwater levels during transient rain events to ensure they remain within acceptable limits.

Monitoring parameters will include BTEX and naphthalene, along with field measurements including groundwater elevations, pH, temperature, dissolved oxygen, oxidation-reduction potential, and specific conductance. Data will be evaluated for both contaminant trends and hydraulic stability. If impacts or unacceptable hydraulic conditions are identified, confirmation sampling will be performed, and the monitoring procedures may be adjusted in accordance with the proposed plan, and in consultation with the Illinois EPA, if necessary. Corrective measures may include additional investigation, reactive media rejuvenation, pumping to relieve hydraulic pressure, or modifications to the site's stormwater infiltration plan.

3.9 Other Conditions

As noted in Section 1.5.2, soil sample SB55 (0-3) exhibited a PCB concentration greater than 10 mg/kg, but less than 50 mg/kg. To comply with U.S. EPA requirements for PCBs, this impact will be addressed under the self-implementing cleanup provisions of 40 CFR 761.61(a). The Illinois EPA will be copied on future submittals to the U.S. EPA.

Soil or groundwater removed from known impacted areas must be managed in accordance with applicable regulations. This typically requires the material to be returned to its original location or to be managed in accordance with applicable solid waste regulations.

3.10 Conclusions

Based on the cumulative investigation results, the nature and extent of contamination has been adequately characterized at the Remediation Site. Following completion of the remedial activities proposed herein, Pioneer believes the exposure route elimination for the residual contamination will allow for the issuance of a comprehensive NFR Letter(s) pursuant to 35 IAC 740.605 and 415 ILCS 5/58.10 of the Illinois Environmental Protection Act. The eventual NFR Letter(s) are expected to contain the following conditions:

- The Remediation Site may be used for industrial/commercial purposes.

- The hybrid slurry wall must remain in-place around residual petroleum contamination to prevent potential migration to surface waters, with post-remedial monitoring conducted in accordance with the 30-year plan.
- The surface cap engineered barriers must remain in-place to prevent exposure to underlying contaminated soils.
- The groundwater ingestion pathway will be eliminated using the City of Chicago ordinance. The City of Chicago shall be notified of the use of the local ordinance #097990 (and the associated MOU with the Illinois EPA) as an institutional control.
- Construction workers will be notified of site conditions prior to performing intrusive work at the Remediation Site.
- Any on-site structures shall be constructed with full concrete slab-on-grade foundations or contain basements with full concrete floors and walls with no sumps.
- The NFR Letter(s) shall be recorded as a permanent part of the chain of title for the Remediation Site and serve as an appropriate institutional control.

4.0 CLOSING REMARKS

This report has been prepared for the use of the Client and Remediation Applicant identified in the report, and for evaluation by the Illinois Environmental Protection Agency, and cannot be relied upon by other persons or entities without the permission of Pioneer Engineering & Environmental Services, LLC (Pioneer). The observations and conclusions contained herein are limited by the scope and intent of the work mutually agreed upon by the Client and Pioneer and the work actually performed. There are no warranties, implied or expressed, concerning the environmental integrity of areas and/or mediums not analytically tested.

Legend: Approximate Property Line

- Soil Boring Location (Pioneer 2024/ 2025)
- Monitoring Well Location (Pioneer 2024/ 2025)
- Soil Gas Sample Location (Pioneer 2025)
- Existing Monitoring Well Location
- Vessel Slip Gauging Point (Pioneer 2025)

(0-3') = soil sample interval

(GW) = groundwater sample

[ ] = indicates COC not detected, but detection limit > applicable Tier 1 SRO

2-HEX = 2-hexanone
B = benzene
MC = methylene chloride
Naph = naphthalene
VC = vinyl chloride

Monitoring wells are analytically clean unless specified otherwise

Borings not highlighted indicate sample not analyzed for VOCs

- = COCs above soil attention capacity
- = COCs above I/C soil ingestion
- = COCs above I/C outdoor inhalation
- = COCs above Class II groundwater
- = COCs below applicable objectives

Legend: Approximate Property Line

- Soil Boring Location (Pioneer 2024/ 2025)
- Monitoring Well Location (Pioneer 2024/ 2025)
- Soil Gas Sample Location (Pioneer 2025)
- Existing Monitoring Well Location
- Vessel Slip Gauging Point (Pioneer 2025)

(0-3') = soil sample interval

(GW) = groundwater sample

[ ] = indicates COC not detected, but detection limit > applicable Tier 1 SRO

As = arsenic
Cr = chromium
Mn = manganese
Pb = lead
Th = thallium
V = vanadium

Monitoring wells do not exhibit any inorganics above applicable Tier 1 GROs

Borings not highlighted indicate sample not analyzed for inorganics

- = COCs above soil attention capacity
- = COCs above I/C soil ingestion
- = COCs above I/C outdoor inhalation
- = COCs above Class II groundwater
- = COCs below applicable objectives

PNAs & Carb. at SB41 & SB48
L & Sw = 1,375'

R26 Results:
SB41: Max. X = 55'
SB48: Max. X = 66'

Carb. at SB87
L & Sw = 775'

The S18 calculation indicates the predicted groundwater concentration is less than the applicable Tier 1 GRO.

SB41
0-3' PNAs, Carb.

SB48
5-7.5' PNAs, Carb.

SB87
0-3' Carb.

SB10(a)
3-5' PNAs, Carb, DBF

NOTE: these contaminants will be addressed through conventional remediation; any residual impacts that exceed the applicable Tier 1 SROs for migration to Class II groundwater will be addressed in the eventual RACR

PNAs & Carb. at SB115
L & Sw = 910'

R26 Results:
SB115: Max. X = 172'

SB115
0-3' PNAs
5-7.5' PNAs, Carb.

PNAs at B-2 & B-2W20
L & Sw = 940'

R26 Results:
B-2: X = 42'
B-2W20: Max. X = 118'

B-2 & B-2W20
7-9' PNAs

SB124 & SS-113
0-3' PNAs

PNAs at SS-113 & SB124
L & Sw = 660'

R26 Results:
SS-113: Max. X = 76'
The S18 calculation indicates the predicted groundwater concentrations at SB124 are less than the applicable Tier 1 GRO.

SS-012
0-0.5' PNAs

PNA at SS-012
L & Sw = 1,035'

The S18 calculation indicates the predicted groundwater concentration is less than the applicable Tier 1 GRO.

SS-010, E20, S20 & W20
0-0.5' PNAs

PNAs at SS-010
L & Sw = 1,100'

R26 Results:
SS-010S20: X = 26'
The S18 calculation indicates the predicted groundwater concentrations at SS-010, E20 and W20 are less than the applicable Tier 1 GRO.

Dieldrin at SB55 L & Sw = 990’

The S18 calculation indicates the predicted groundwater concentration is less than the applicable Tier 1 GRO.

Legend:
- Approximate Property Line
- Soil Boring Location (Pioneer 2024/ 2025)
- Monitoring Well Location (Pioneer 2024/ 2025)
- Soil Gas Sample Location (Pioneer 2025)
- Existing Monitoring Well Location
- Vessel Slip Gauging Point (Pioneer 2025)

(0-3’) = soil sample interval

GW = groundwater sample

Monitoring wells do not exhibit any Pesticides above applicable Tier 1 GROs

- = COCs above Class II groundwater
- = COCs below applicable objectives for Class II groundwater
- = estimated source area
- = line showing the ~longest dimension of the source area

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A)
(2) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
Bolded cell indicates the detection limit exceeds the ADL and an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO
** Per a NELAP accredited laboratory, the published ADL is incorrect; the allowable test method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the published ADL.
^ Per a NELAP accredited laboratory, while there is no ADL published in 35 IAC 742, the allowable analytical testing method pursuant to 35 IAC 740 (Method 8270C) cannot achieve the most stringent Tier 1 SROs.
(1) The laboratory is currently unable to separate the 3- and 4-Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported and the more stringent non-TACO SROs are presented
(2) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether
(3) Pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix A, Table A) (Note: Csat for 2-Chlorophenol is pH-specific)
(4) Non-TACO SRO calculated in accordance with the Illinois EPA's online "Procedures for Determining Soil Remediation Objectives for Non-TACO Chemicals" (see the calculation spreadsheets following the analytical data tables)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates a value that exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
(1) Non-TACO SRO provided by the Illinois EPA (2016, subject to revision)
(2) Indicates the current Tier 1 SRO; the background concentration may be utilized in place of the Tier 1 SRO in accordance with 35 IAC 742.415 if approved by the Illinois EPA.
(3) Indicates the corrected background concentration for Chicago (Illinois EPA 2022)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
Shaded/Italicized cell indicates a detection limit that exceeds an applicable Tier 1 SRO, or does not have a pH-specific soil migration Tier 1 SRO and is above the indicated background concentration
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
Shaded/Italicized cell indicates a detection limit that exceeds an applicable Tier 1 SRO, or does not have a pH-specific soil migration Tier 1 SRO and is above the indicated background concentration
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
Shaded/Italicized cell indicates a detection limit that exceeds an applicable Tier 1 SRO, or does not have a pH-specific soil migration Tier 1 SRO and is above the indicated background concentration
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
Shaded/Italicized cell indicates a detection limit that exceeds an applicable Tier 1 SRO, or does not have a pH-specific soil migration Tier 1 SRO and is above the indicated background concentration
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
Shaded/Italicized cell indicates a detection limit that exceeds an applicable Tier 1 SRO, or does not have a pH-specific soil migration Tier 1 SRO and is above the indicated background concentration
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Tables B, C and D)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO (the Tier 1 SROs for the soil component of Class I groundwater ingestion are not applicable)
Shaded/Italicized cell indicates a detection limit that exceeds an applicable Tier 1 SRO, or does not have a pH-specific soil migration Tier 1 SRO and is above the indicated background concentration
* indicates the TCLP or SPLP test result demonstrates compliance with the migration to groundwater exposure route (see Table No. 5)
^∞ indicates a total concentration that is above the indicated background concentration (used in the absence of a pH-specific soil migration Tier 1 SRO), and the TCLP or SPLP test result is above the applicable objective (see Table No. 5), or no TCLP or SPLP test result is available
^ indicates the value is above a Tier 1 SRO, but is less than or equal to the background at the 95th percentile
< indicates not detected at stated detection limits
-- indicates value not available
(1) Proposed background at 95th Percentile unless indicated otherwise; † indicates background concentration pursuant to 35 IAC 742 (Appendix A, Table G)
(2) Pursuant to 35 IAC 742 the background concentration may be utilized as the Tier 1 SRO for the soil ingestion exposure route
(3) Chemical-specific properties are such that this route is not of concern at any soil contaminant concentration
(4) The SROs for the outdoor inhalation and construction worker inhalation exposure routes, and the soil saturation limit only apply to sites where elemental mercury is a contaminant of concern. There are no known potential sources of elemental mercury at the subject property; thus, the inhalation SROs and soil saturation limit for mercury are not applicable to the subject property

Notes: Results listed in mg/L (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table A)
Shaded/Bolded cell indicates value exceeds the applicableTier 1 SRO
~~Strikethrough~~ text indicates a value that is replaced by the corresponding SPLP or TCLP test result
* the total concentration demonstrates compliance with the pH-specific Tier 1 SRO for the migration to groundwater exposure route
H indicates the analysis was performed past the specified hold time
< Indicates not detected at stated detection limits
-- Indicates value not available (the sample was not analyzed for the parameter based on total metals results, there is no SRO available, or the hazardous threshold characteristic is not applicable)
(1) Pursuant to 35 IAC 721.124 & 40 CFR 261.24; applies only to TCLP RCRA metal test results
(2) Value represents the non-TACO GRO provided by the Illinois EPA (March 31, 2016)

Notes: Results listed in mg/L (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table A)
Shaded/Bolded cell indicates value exceeds the applicableTier 1 SRO
* the total concentration demonstrates compliance with the pH-specific Tier 1 SRO for the migration to groundwater exposure route
H indicates the analysis was performed past the specified hold time
< Indicates not detected at stated detection limits
-- Indicates value not available (the sample was not analyzed for the parameter based on total metals results, there is no SRO available, or the hazardous threshold characteristic is not applicable)
(1) Pursuant to 35 IAC 721.124 & 40 CFR 261.24; applies only to TCLP RCRA metal test results
(2) Value represents the non-TACO GRO provided by the Illinois EPA (March 31, 2016)

Notes: Results listed in mg/L (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table A)
Shaded/Bolded cell indicates value exceeds the applicableTier 1 SRO
Shaded/Italicized cell indicates an elevated detection limit that exceeds the applicable Tier 1 SRO
* the total concentration demonstrates compliance with the pH-specific Tier 1 SRO for the migration to groundwater exposure route
H indicates the analysis was performed past the specified hold time
< Indicates not detected at stated detection limits
-- Indicates value not available (the sample was not analyzed for the parameter based on total metals results, there is no SRO available, or the hazardous threshold characteristic is not applicable)
(1) Pursuant to 35 IAC 721.124 & 40 CFR 261.24; applies only to TCLP RCRA metal test results
(2) Value represents the non-TACO GRO provided by the Illinois EPA (March 31, 2016)

Notes: Results listed in mg/L (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table A)
Shaded/Bolded cell indicates value exceeds the applicableTier 1 SRO
* the total concentration demonstrates compliance with the pH-specific Tier 1 SRO for the migration to groundwater exposure route
H indicates the analysis was performed past the specified hold time
< Indicates not detected at stated detection limits
-- Indicates value not available (the sample was not analyzed for the parameter based on total metals results, there is no SRO available, or the hazardous threshold characteristic is not applicable)
(1) Pursuant to 35 IAC 721.124 & 40 CFR 261.24; applies only to TCLP RCRA metal test results
(2) Value represents the non-TACO GRO provided by the Illinois EPA (March 31, 2016)

Notes: Results listed in mg/L (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table A)
Shaded/Bolded cell indicates value exceeds the applicableTier 1 SRO
~~Strikethrough~~ text indicates a value that is replaced by the corresponding SPLP or TCLP test result
* the total concentration demonstrates compliance with the pH-specific Tier 1 SRO for the migration to groundwater exposure route
H indicates the analysis was performed past the specified hold time
< Indicates not detected at stated detection limits
-- Indicates value not available (the sample was not analyzed for the parameter based on total metals results, there is no SRO available, or the hazardous threshold characteristic is not applicable)
(1) Pursuant to 35 IAC 721.124 & 40 CFR 261.24; applies only to TCLP RCRA metal test results
(2) Value represents the non-TACO GRO provided by the Illinois EPA (March 31, 2016)

Notes: Results listed in mg/L (parts per million)
Tier 1 SROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table A)
Shaded/Bolded cell indicates value exceeds the applicableTier 1 SRO
~~Strikethrough~~ text indicates a value that is replaced by the corresponding SPLP or TCLP test result
* the total concentration demonstrates compliance with the pH-specific Tier 1 SRO for the migration to groundwater exposure route
H indicates the analysis was performed past the specified hold time
< Indicates not detected at stated detection limits
-- Indicates value not available (the sample was not analyzed for the parameter based on total metals results, there is no SRO available, or the hazardous threshold characteristic is not applicable)
(1) Pursuant to 35 IAC 721.124 & 40 CFR 261.24; applies only to TCLP RCRA metal test results
(2) Value represents the non-TACO GRO provided by the Illinois EPA (March 31, 2016)

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results listed in mg/kg (parts per million)
Tier 1 SROs and ADLs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table B)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 SRO
< indicates not detected at stated detection limits
-- indicates value not available
* indicates that the ADL is less than or equal to the most stringent Tier 1 SRO

Notes: Results in mg/L (parts per million)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 GRO
< indicates not detected at stated detection limits
-- indicates value not available
Class I and Class II GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table E)
Indoor Inhalation GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table H, Diffusion & Advection)
(1) GROs for Non-TACO chemicals provided by IEPA Toxicity Assessment Unit (May 2022)
(2) Current TACO chemical for the Indoor Inhalation exposure route; proposed TACO chemical for the Class I and Class II groundwater ingestion exposure routes
(3) Laboratory is currently unable to separate m- and p-xylenes, therefore the combined result is reported, and the more stringent GRO for m-xylene is provided for comparison.
(4) The indoor inhalation Tier 1 GROs provided in 35 IAC 742 were calculated using an outdated inhalation URF value. The GROs calculated using the current URF are 2.04 mg/L for residential and 7.6 mg/L for industrial/commercial.

Notes: Results in mg/L (parts per million)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 GRO
< indicates not detected at stated detection limits
-- indicates value not available
Class I and Class II GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table E)
Indoor Inhalation GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table H, Diffusion & Advection)
(1) GROs for Non-TACO chemicals provided by IEPA Toxicity Assessment Unit (May 2022)
(2) Current TACO chemical for the Indoor Inhalation exposure route; proposed TACO chemical for the Class I and Class II groundwater ingestion exposure routes
(3) Laboratory is currently unable to separate m- and p-xylenes, therefore the combined result is reported, and the more stringent GRO for m-xylene is provided for comparison.
(4) The indoor inhalation Tier 1 GROs provided in 35 IAC 742 were calculated using an outdated inhalation URF value. The GROs calculated using the current URF are 2.04 mg/L for residential and 7.6 mg/L for industrial/commercial.

Notes: Results in mg/L (parts per million)
Shaded/Bolded cell indicates value exceeds the most stringent Tier 1 GRO
+ monitoring well resampled using low-flow method
°° former extraction well erroneously identified as NW-2 in lab report
* soil gas sample (SG-2) result from this location demonstrates compliance with the indoor inhalation exposure route (see Table No. 17)
< indicates not detected at stated detection limits
-- indicates value not available
Class I and Class II GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table E)
Indoor Inhalation GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table H, Diffusion & Advection)
(1) GROs for Non-TACO chemicals provided by IEPA Toxicity Assessment Unit (May 2022)
(2) Current TACO chemical for the Indoor Inhalation exposure route; proposed TACO chemical for the Class I and Class II groundwater ingestion exposure routes
(3) Laboratory is currently unable to separate m- and p-xylenes, therefore the combined result is reported, and the more stringent GRO for m-xylene is provided for comparison.
(4) The indoor inhalation Tier 1 GROs provided in 35 IAC 742 were calculated using an outdated inhalation URF value. The GROs calculated using the current URF are 2.04 mg/L for residential and 7.6 mg/L for industrial/commercial.

Notes: Results in mg/L (parts per million)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 GRO
< indicates not detected at stated detection limits
-- indicates value not available
Class I and Class II GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table E)
Indoor Inhalation GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table H)
(1) GROs for Non-TACO Chemicals provided by IEPA Toxicity Assessment Unit (May 2022)
(2) Current TACO chemical for the Indoor Inhalation exposure route; proposed TACO chemical for the Class I and Class II groundwater ingestion exposure routes
(3) Most stringent pH-Specific value
(4) The laboratory is currently unable to separate the 3- and 4- Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported, and the more stringent Non-TACO objectives for 3,-Methylphenol are provided for comparison.
(5) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether

Notes: Results in mg/L (parts per million)

Shaded/Bolded cell indicates value exceeds an applicable Tier 1 GRO

< indicates not detected at stated detection limits

-- indicates value not available

Class I and Class II GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table E)

Indoor Inhalation GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table H)

(1) GROs for Non-TACO Chemicals provided by IEPA Toxicity Assessment Unit (May 2022)

(2) Current TACO chemical for the Indoor Inhalation exposure route; proposed TACO chemical for the Class I and Class II groundwater ingestion exposure routes

(3) Most stringent pH-Specific value

(4) The laboratory is currently unable to separate the 3- and 4- Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported, and the more stringent Non-TACO objectives for 3,-Methylphenol are provided for comparison.

(5) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether

Notes: Results in mg/L (parts per million)
Shaded/Bolded cell indicates value exceeds an applicable Tier 1 GRO
< indicates not detected at stated detection limits
-- indicates value not available
Class I and Class II GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table E)
Indoor Inhalation GROs pursuant to 35 IAC 742-Tiered Approach to Corrective Action Objectives (Appendix B, Table H)
(1) GROs for Non-TACO Chemicals provided by IEPA Toxicity Assessment Unit (May 2022)
(2) Current TACO chemical for the Indoor Inhalation exposure route; proposed TACO chemical for the Class I and Class II groundwater ingestion exposure routes
(3) Most stringent pH-Specific value
(4) The laboratory is currently unable to separate the 3- and 4- Methylphenol isomers; therefore, a combined 3,4-Methylphenol result is reported, and the more stringent Non-TACO objectives for 3,-Methylphenol are provided for comparison.
(5) Compound is also known as 2,2-oxybis(1-chloropropane) and bis(2-chloro-1-methylethyl)ether

Summary of Approach for Calculating Non-TACO Soil Remediation Objectives

Non-TACO soil remediation objectives (SROs) are no longer posted on the Illinois EPA website. For those chemicals detected at the site, but not included in 35 IAC 742, Pioneer followed the procedures for determining non-TACO SROs at: http://www.epa.illinois.gov/topics/cleanup-programs/taco/procedures-for-determining-soil-remediation-objectives-for-non-taco-chemicals/index.

Pioneer calculated objectives for the following non-TACO chemicals: acenaphthylene; aluminum; benzo(g,h.i)perylene; bis(2-chloro-1-methylethyl)ether [a.k.a. 2,2'oxybis(1-chloropane)]; chloromethane; 2-chloronaphthalene; 3-methylphenol (a.k.a. m-cresol); 4-methylphenol (a.k.a. p-cresol); dibenzofuran; dimethylphthalate; 4,6-dinitro-2-methylphenol (a.k.a. 4,6-dinitro-o-cresol); chloroethane (a.k.a. ethyl chloride); hexachlorobutadiene; methyl ethyl ketone (a.k.a. 2-butanone); methyl isobutyl ketone (a.k.a. 4-methyl-2-pentanone); 2-methylnaphthalene; 2-nitroaniline; 3-nitroaniline; 4-nitroaniline; phenanthrene; 1,1,2,2-tetrachloroethane; and 2-hexanone.

For the industrial/commercial ingestion exposure route Pioneer utilized SSL Equations S1 and S3 (for non-carcinogens and carcinogens, respectively), and the toxicity data and chemical/physical data listed in the USEPA Regional Screening Level (RSL) tables (https://www.epa.gov/risk/regional-screening-levels-rsls) and calculations in 35 IAC Part 742. The oral reference dose (RfD_o) and/or oral slope factor (SF_o) were unavailable for the following chemicals: acenaphthylene; benzo(g,h,i)perylene; chloromethane; dimethylphthalate; chloroethane (a.k.a. ethyl chloride); methyl isobutyl ketone (a.k.a 4-methyl-2-pentanone); 3-nitroaniline; and phenanthrene. Therefore, Pioneer was unable to calculate SROs for the industrial/commercial soil ingestion exposure route for these chemicals. The calculations for the remaining chemicals are provided in the following Spreadsheets 1 and 2.

For the construction worker ingestion exposure route, Pioneer utilized SSL Equations S1 and S3, and the chemical/physical data listed in the RSL tables and the subchronic reference doses (RfDs) listed in the table provided at http://www.epa.illinois.gov/topics/cleanup-programs/taco/index. The RfDs were unavailable for chloromethane, dimethylphthalate and 3-nitroaniline. Therefore, Pioneer was unable to calculate SROs for the construction worker soil ingestion exposure route for these chemicals. The calculations for the remaining chemicals are provided in the following Spreadsheets 3 and 4.

For the industrial/commercial outdoor inhalation exposure route, Pioneer utilized SSL Equations S4 and S6 (for non-carcinogens and carcinogens, respectively), and for the construction worker outdoor inhalation exposure route Pioneer utilized SSL Equations S5 and S7, along with toxicity data and chemical/physical data listed in the USEPA RSL tables (https://www.epa.gov/risk/regional-screening-levels-rsls). The inhalation reference concentration (RfC) [subchronic for the construction worker populations], Inhalation Unit Risk Factor (URF), and/or chemical/physical data were unavailable for acenaphthylene; aluminum; benzo(g,h,i)perylene; 2,2'-oxybis(1-chloropropane) [a.k.a. bis(2-chloro-1-methylethyl)ether; 2-chloronaphthalene; dibenzofuran; dimethylphthalate; 4,6-dinitro-2-methylphenol (a.k.a. 4,6-dinitro-o-cresol); 2-methylnaphthalene; 3-nitroaniline; and phenanthrene. Therefore, Pioneer was unable to calculate the SROs for the industrial/commercial and construction worker outdoor inhalation exposure route for these chemicals. The calculations for the remaining chemicals are provided in the following Spreadsheets 5 through 8.

For the migration to groundwater exposure route, Pioneer utilized SSL Equations S17, S18 and S19 and the Class I and Class II groundwater objectives provided at http://www.epa.illinois.gov/topics/cleanup-programs/taco/index. It should be noted that certain chemicals, specifically acenaphthylene, benzo(g,h,i)perylene, and phenanthrene were not listed in the USEPA RSL tables. Therefore, Pioneer is proposing to use the chemical properties provided by the Illinois EPA Toxicity Assessment Unit for the Organic Carbon Partition Coefficient (Koc) and Henry's Law Constant (H') values. Additionally, the Class I and Class II groundwater objectives were not available for chloromethane, chloroethane (a.k.a. ethyl chloride), dimethylphthalate, methyl isobutyl ketone (a.k.a 4-methyl-2-pentanone), and 3-nitroaniline. Therefore, Pioneer was unable to calculate migration to groundwater SROs for these chemicals. The calculations for the remaining chemicals are provided in the following Spreadsheets 9 and 10.

Appendix A SRP Forms, ALTA Land Title Survey and Legal Descriptions, Proposed Site Plans

Site Remediation Program (SRP)
Application and Services Agreement (DRM-1) Form

This fillable form may be completed online, a copy saved locally, printed and signed before it is submitted to the Remedial Project Management Section at the above address.

For Illinois EPA Use:

Log No. _____

____ Site Base Map (required)
____ $2500 Advance Partial Payment (required)
____ DRM-2 Form (if reports included)

I. Site Identification:

Site Name: U.S. Steel South Works County: Cook

Street Address: 8080 South DuSable Lake Shore Drive P.O. Box: _____

City: Chicago Zip Code: 60617 Approx. site size (acres) 440

Illinois Inventory ID Number: 0316515061 USEPA ID Number _____

Site Base Map Attached: ☑ Yes ☐ No Illinois EPA Permit(s): _____

LUST/IEMA Incident Number(s), if applicable: _____

II. Remediation Applicant ("RA"):

RA's Name: Mr./Ms. Mr. Curt R. Bailey Title: Authorized Agent

Company: RMW CRG Quantum Shore Ground Tenant LLC

Street Address: 350 West Hubbard Street P.O. Box: _____

City: Chicago State: IL Zip Code: 60654 Phone: _____

FEIN or SSN: 32-0826877 RA Email Address: mellch@relatedmidwest.com

I hereby certify that I am authorized to sign this application and services agreement. I certify that the proposed project meets the eligibility criteria set forth in Section 58.1(a)(2) of the Environmental Protection Act (415 ILCS 5/58.1(a)(2)) and regulations promulgated thereunder and that this submittal and all attachments were prepared at my direction. In consideration for the Illinois EPA's agreement to provide (subject to applicable law, available resources, and receipt of the advance partial payment) review and evaluation services for activities carried out pursuant to Title 17 of the Illinois Environmental Protection Act (415 ILCS 5/58-58.12), I agree to:

(1) Conform with the procedures of Title 17 of the Illinois Environmental Protection Act (415 ILCS 5/58 - 58.12) and implementing regulations;

(2) Allow for or otherwise arrange site visits or other site evaluations by the Illinois EPA when requested;

(3) Pay any reasonable costs incurred and documented by the Illinois EPA in providing such services; and

(4) Make a $2500 advance partial payment to the Illinois EPA for such anticipated services provided in Section V of this application.

As the RA, I understand that I may terminate this services agreement at any time, by notifying the Illinois EPA in writing that services previously requested under the services agreement are no longer wanted. Within 180 days of receipt of the notice, the Illinois EPA shall provide me with a final invoice for services provided until the date of receipt of such notification.

To the best of my knowledge and belief, this request and all attachments are true, accurate and complete. I hereby certify that I have the authority to enter into this agreement.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent conviction is a Class 3 felony. (415 ILCS 5/44(h)).

RA's Signature: _____ Date: 10/2/2025

***In addition to the fees applicable under this Services Agreement, the recipient of a No Further Remediation (NFR) Letter must pay to the Illinois EPA an NFR Assessment in the amount of the lesser of $2500 or an amount equal to the costs incurred by the Illinois EPA under this Agreement (35 IAC 740.615)**

III. Project Objectives:

A. Release Letter Requested.

Please complete one of the subsections by checking applicable boxes and including other information (if necessary, additonal information may be attached to this application form):

☑ Comprehensive No Further Remediation ("NFR") Letter

☐ Focused NFR Letter
Identify the focused contaminants of concern by checking the applicable box(es):

☐ Volatiles ☐ BTEX ☐ PCBs ☐ Metals ☐ Semivolatiles ☐ PNAs
☐ Pesticides ☐ Other (identify) _____

☐ 4(y) Letter
Identify the focused contaminants of concern by checking the applicable box(es):

☐ Volatiles ☐ BTEX ☐ PCBs ☐ Metals ☐ Semivolatiles ☐ PNAs
☐ Pesticides ☐ Other (identify) _____

Identify the media of concern by checking the applicable box(es):

☐ Soil ☐ Sediments ☐ Other: _____

Identify the actions (e.g. drum removal, spill response, etc.):

B. Identify any support services being sought from the Illinois EPA in addition to the review and evaluation services. If necessary, additional information may be attached to this application form.

☐ No additional support services are being sought
☐ Assistance with community relations
☐ Sample collection and analyses
☐ Other (identify): _____

C. Anticipated Schedule

SRP Document	Projected Date of Receipt by Illinois EPA
Site Investigation Report	October 2025
Remediation Objectives Report	October 2025
Remedial Action Plan	October 2025
Remedial Action Completion Report	October 2026

D. Identify the current and post-remedation uses of the remediation site. If necessary, additional information may be attached to this application form.

Current Use:
Vacant

Post-Remediation Use:
Industrial/Commercial

IV. Written Permission from the Property Owner (check one of the applicable boxes and provide additional information):

☐ RA is the property owner of the remediation site identified in Section 1 of this application

☑ RA is **not** the property owner of the remediation site identified in Section 1 of this application

Property Owner's Name: Mr./Ms. Mr. Ryan Phelan Title: Managing Director - Delagatee

Company: Blue Owl Capital

Street Address: 150 N Riverside Plaza, 37th Floor P.O. Box: _____

City: Chicago State: IL Zip Code: 60602 Phone: 312-283-7111

Email Address: ryan.phelan@blueowl.com

I hereby certify that the RA has my permission to enroll the site identified in Section 1 of this application into the Illinois EPA Site Remediation Program. I certify that the RA and designated representatives have permission to enter the indicated premises for the purpose of conducting remedial investigations or activities.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent conviction is a Class 3 felony. (415 ILCS 5/44(h)).

Ryan Phelan
Owner's Signature:

10/6/25
Date:

For multiple property owners, attach additional sheets containing all the information above along with a signed, dated certification for each.

V. Advance Partial Payment:

☑ A $2500 advance partial payment is included with this application. Please make the check payable to: "Illinois Environmental Protection Agency". Please include "For Deposit in the Hazardous Waste Fund" and the Remediation Applicant's FEIN or SSN on the check.

If plans or reports for review and evaluation by the Illinois EPA accompany this application, a completed DRM-2 Form must also accompany this submittal.

The Illinois EPA is authorized to require this information under Section 415 ILCS 5/58 - 58.12 of the Environmental Protection Act and regulations promulgated thereunder. Disclosure of this information is required as a condition of participation in the Site Remediation Program. Failure to do so may prevent this form from being processed and could result in your application being rejected. This form has been approved by the Forms Management Center.

All information submitted as part of this application is available to the public except when specifically designated by the RA to be treated confidentially as a trade secret or secret process in accordance with the Illinois Compiled Statutes, Section 7(a) of the Environmental Protection Act, applicable Rules and Regulations of the Illinois Pollution Control Board and applicable Illinois EPA rules and guidelines.

IV. Written Permission from the Property Owner (check one of the applicable boxes and provide additional information):

☐ RA is the property owner of the remediation site identified in Section 1 of this application

☑ RA is **not** the property owner of the remediation site identified in Section 1 of this application

Property Owner's Name: Mr./Ms. Mr. Michael Ellch Title: Authorized Agent

Company: Related Chicago 8080 LLC

Street Address: 350 W Hubbard Street, Ste 300 P.O. Box: _____

City: Chicago State: IL Zip Code: 60654 Phone: _____

Email Address: mellch@relatedmidwest.com

I hereby certify that the RA has my permission to enroll the site identified in Section 1 of this application into the Illinois EPA Site Remediation Program. I certify that the RA and designated representatives have permission to enter the indicated premises for the purpose of conducting remedial investigations or activities.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent conviction is a Class 3 felony. (415 ILCS 5/44(h)).

Owner's Signature: Date: 10/9/25

I attest that all site investigations or remedial activities that are subject of this plan(s) or report(s) were performed under my direction, and this document and all attachments were prepared under my direction or reviewed by me, and to the best of my knowledge and belief, the work described in the plan and report has been designed or completed in accordance with the Illinois Environmental Protection Act (415 ILCS 5), 35 Ill. Adm. Code 740, and generally accepted engineering practices or principles of professional geology, and the information presented is accurate and complete.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 Felony. A second or subsequent offense after conviction is a Class 3 felony. (415 ILCS 5/44(h))

Engineer's or Geologist's Name: Jeffrey McClelland

Company: Pioneer Engineering & Environmental Services, LLC

Registration Number: 062-054039

Phone: 773-722-9200

License Expiration Date: 11/2025

Signature: _____ Date: 10/3/2025

Note: The authority of a Licensed Professional Geologist to certify documents submitted to the Illinois Environmental Protection Agency for review and evaluation pursuant to Title XVII of the Environmental Protection Act is limited to Site Investigation Reports (415 ILCS 58.7(f), as amended by P.A. 92-0735, effective July 25, 2002. A Licensed Professional Geologist cannot certify to Remediation Objectives Reports, Remedial Action Plans or Remedial Action Completion Reports.

PROPERTY DESCRIPTION:

PARCEL A:

THAT PART OF BLOCK 1 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST, AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: COMMENCING AT NORTHWEST CORNER OF SAID BLOCK 1; THENCE ALONG AN ASSUMED BEARING SOUTH 01 DEGREES 28 MINUTES 02 SECONDS EAST BEING THE WEST LINE OF SAID BLOCK 1, A DISTANCE OF 242.85 FEET TO A POINT ON A SOUTHEASTERLY LINE OF SOUTH AVENUE 'O'-US ROUTE 41 PER PLAT OF HIGHWAYS RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023 AND RECORDED NOVEMBER 21, 2008 AS DOCUMENT NUMBER 0832645125, SAID POINT BEING THE POINT OF BEGINNING; THENCE CONTINUING SOUTH 01 DEGREES 28 MINUTES 02 SECONDS EAST ALONG SAID WEST LINE, 2044.25 FEET TO A CORNER OF SAID BLOCK 1; THENCE NORTH 88 DEGREES 32 MINUTES 54 SECONDS EAST ALONG A SOUTH LINE OF SAID BLOCK 1, A DISTANCE OF 989.89 FEET TO A POINT ON THE EAST LINE OF SOUTH MACKINAW AVENUE, SAID EAST LINE ALSO BEING A WEST LINE OF SAID BLOCK 1; THENCE SOUTH 01 DEGREES 32 MINUTES 35 SECONDS EAST ALONG SAID WEST LINE, 290.88 FEET TO A POINT ON A NORTH LINE OF EAST 83RD STREET PER PLAT OF HIGHWAYS FOR SOUTH AVENUE 'O'- US ROUTE 41 RELOCATION RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023 AND RECORDED NOVEMBER 21, 2008 AS DOCUMENT NUMBER 0832645125; THENCE EAST, NORTH AND WEST ALONG THE NORTH, WEST AND SOUTH LINES OF EAST 83RD STREET AND SOUTH AVENUE 'O'- US ROUTE 41 PER SAID PLATS FOR THE FOLLOWING 41 COURSES; THENCE NORTH 88 DEGREES 29 MINUTES 30 SECONDS EAST, 558.81 FEET; THENCE NORTH 70 DEGREES 18 MINUTES 23 SECONDS EAST, 13.02 FEET; THENCE NORTH 49 DEGREES 34 MINUTES 03 SECONDS EAST, 33.75 FEET; THENCE NORTH 12 DEGREES 27 MINUTES 45 SECONDS EAST, 15.18 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 541.19 FEET; THENCE NORTH 46 DEGREES 33 MINUTES 47 SECONDS WEST, 14.14 FEET; THENCE SOUTH 88 DEGREES 26 MINUTES 49 SECONDS WEST, 10.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE NORTH 88 DEGREES 26 MINUTES 49 SECONDS EAST, 10.00 FEET; THENCE NORTH 43 DEGREES 26 MINUTES 10 SECONDS EAST, 14.14 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 578.34 FEET; THENCE NORTH 69 DEGREES 46 MINUTES 48 SECONDS WEST, 26.93 FEET; THENCE SOUTH 88 DEGREES 25 MINUTES 05 SECONDS WEST, 25.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 81.00 FEET; THENCE NORTH 88 DEGREES 25 MINUTES 05 SECONDS EAST, 40.00 FEET; THENCE NORTH 42 DEGREES 56 MINUTES 25 SECONDS EAST, 14.03 FEET TO A POINT ON A NON-TANGENT CURVE; THENCE NORTHWESTERLY 816.38 FEET, ALONG THE ARC OF A NON-TANGENT CIRCLE TO THE LEFT, HAVING A RADIUS OF 685.00 FEET AND WHOSE CHORD BEARS NORTH 36 DEGREES 59 MINUTES 16 SECONDS WEST, 768.92 FEET; THENCE NORTH 71 DEGREES 07 MINUTES 51 SECONDS WEST NON-TANGENT TO THE LAST DESCRIBED COURSE, 81.94 FEET; THENCE NORTH 71 DEGREES 07 MINUTES 49 SECONDS WEST, 417.77 FEET; THENCE SOUTH 01 DEGREES 25 MINUTES 45 SECONDS EAST, 32.28 FEET; THENCE SOUTH 88 DEGREES 34 MINUTES 15 SECONDS WEST, 100.00 FEET; THENCE NORTH 01 DEGREES 25 MINUTES 45 SECONDS WEST, 69.27 FEET; THENCE NORTH 71 DEGREES 07 MINUTES 49 SECONDS WEST, 582.36 FEET; THENCE SOUTH 27 DEGREES 03 MINUTES 21 SECONDS WEST, 57.48 FEET (57.45 FEET, RECORD) TO THE POINT OF BEGINNING, IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL B:

THAT PART OF BLOCKS 1 AND 2 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST, AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: COMMENCING AT THE NORTHWEST CORNER OF SAID BLOCK 1; THENCE NORTH 88 DEGREES 26 MINUTES 11 SECONDS EAST ALONG AN ASSUMED BEARING BEING THE NORTH LINE OF SAID BLOCK 1, A DISTANCE OF 1677.00 FEET TO AN ANGLE POINT; THENCE SOUTH 62 DEGREES 00 MINUTES 50 SECONDS EAST ALONG THE NORTHEASTERLY LINE OF SAID BLOCK 1, A DISTANCE OF 2654.83 FEET; THENCE SOUTH 05 DEGREES 29 MINUTES 17 SECONDS EAST 476.70 FEET TO A POINT ON A LINE LYING 300.00 FEET WEST OF AND PARALLEL WITH THE EAST LINE OF SAID BLOCK 1, SAID POINT BEING THE POINT OF BEGINNING; THENCE SOUTH 06 DEGREES 15 MINUTES 26 SECONDS EAST ALONG SAID PARALLEL LINE 2227.25 FEET TO A POINT ON THE NORTH LINE OF THE NORTH SLIP, SAID SLIP BEING LOCATED AS INDICATED IN SAID RESUBDIVISION; THENCE SOUTH 88 DEGREES 31 MINUTES 57 SECONDS WEST ALONG SAID NORTH LINE 2149.16 FEET TO A POINT ON AN EAST LINE OF INTERSECTION OF 85TH STREET AND SOUTH AVENUE 'O'- US ROUTE 41, PER PLAT OF HIGHWAYS RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023; THENCE NORTH AND WEST ALONG THE EAST LINES OF SAID INTERSECTION AND OF SAID SOUTH AVENUE 'O'- US ROUTE 41 AND ITS INTERSECTION WITH 83RD STREET AS SHOWN ON SAID PLAT, THE FOLLOWING 25 COURSES; THENCE NORTH 01 DEGREES 28 MINUTES 56 SECONDS WEST, 87.19 FEET; THENCE SOUTH 88 DEGREES 31 MINUTES 11 SECONDS WEST, 315.04 FEET; THENCE NORTH 64 DEGREES 56 MINUTES 01 SECONDS WEST, 22.38 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 578.06 FEET; THENCE NORTH 43 DEGREES 26 MINUTES 00 SECONDS EAST, 14.14 FEET; THENCE NORTH 88 DEGREES 26 MINUTES 15 SECONDS EAST, 10.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE SOUTH 88 DEGREES 26 MINUTES 15 SECONDS WEST, 10.00 FEET; THENCE NORTH 46 DEGREES 34 MINUTES 12 SECONDS WEST, 14.14 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 558.67 FEET; THENCE NORTH 35 DEGREES 19 MINUTES 11 SECONDS EAST, 24.99 FEET; THENCE NORTH 88 DEGREES 29 MINUTES 30 SECONDS EAST, 65.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 80.00 FEET; THENCE SOUTH 88 DEGREES 29 MINUTES 30 SECONDS WEST, 70.00 FEET; THENCE NORTH 46 DEGREES 32 MINUTES 27 SECONDS WEST, 14.15 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 571.29 FEET; THENCE NORTH 43 DEGREES 26 MINUTES 07 SECONDS EAST, 14.14 FEET; THENCE NORTH 88 DEGREES 26 MINUTES 49 SECONDS EAST, 10.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE SOUTH 88 DEGREES 26 MINUTES 49 SECONDS WEST, 10.00 FEET; THENCE NORTH 46 DEGREES 33 MINUTES 41 SECONDS WEST, 14.14 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 578.42 FEET; THENCE NORTH 43 DEGREES 25 MINUTES 20 SECONDS EAST, 14.14 FEET; THENCE NORTH 88 DEGREES 25 MINUTES 05 SECONDS EAST, 40.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE NORTH 88 DEGREES 25 MINUTES 05 SECONDS EAST, 905.83 FEET; THENCE SOUTH 78 DEGREES 36 MINUTES 47 SECONDS EAST, 505.63 FEET; HENCE SOUTH 18 DEGREES 13 MINUTES 09 SECONDS EAST, 233.11 FEET; THENCE NORTH 88 DEGREES 31 MINUTES 58 SECONDS EAST 111.07 FEET; THENCE SOUTH 75 DEGREES 54 MINUTES 23 SECONDS EAST 701.83 FEET TO THE POINT OF BEGINNING, IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL C:

THAT PART OF BLOCK 2 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST, AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: COMMENCING AT NORTHWEST CORNER OF BLOCK 1 IN SAID ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION; THENCE SOUTH 01 DEGREES 28 MINUTES 02 SECONDS EAST ALONG AN ASSUMED BEARING, BEING THE WEST LINE OF SAID BLOCK 1, A DISTANCE OF 2287.12 FEET TO A CORNER OF SAID BLOCK 1; THENCE NORTH 88 DEGREES 32 MINUTES 54 SECONDS EAST ALONG A SOUTH LINE OF SAID BLOCK 1, A DISTANCE OF 989.89 FEET TO A POINT ON THE EAST LINE OF SOUTH MACKINAW AVENUE, ALSO BEING A WEST LINE OF SAID BLOCK 1; THENCE SOUTH 01 DEGREES 32 MINUTES 35 SECONDS EAST ALONG SAID WEST LINE 296.93 FEET TO A POINT ON THE NORTH LINE OF EAST 83RD STREET ALSO BEING A SOUTH LINE OF SAID BLOCK 1; THENCE NORTH 88 DEGREES 31 MINUTES 03 SECONDS EAST ALONG THE LAST DESCRIBED LINE 329.88 FEET TO A POINT ON THE EAST LINE OF SOUTH GREEN BAY AVENUE, ALSO BEING A WEST LINE OF SAID BLOCK 1; THENCE SOUTH 01 DEGREE 28 MINUTES 03 SECONDS EAST ALONG THE LAST DESCRIBED WEST LINE AND A WEST LINE OF SAID BLOCK 2 A DISTANCE OF 73.81 FEET TO A POINT ON A SOUTH LINE OF 83RD STREET PER PLAT OF HIGHWAYS FOR SOUTH AVENUE 'O'- US ROUTE 41 RELOCATION RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023, SAID POINT BEING THE POINT OF BEGINNING; THENCE CONTINUING SOUTH 01 DEGREES 28 MINUTES 03 SECONDS EAST ALONG THE WEST LINE OF SAID BLOCK 2 A DISTANCE OF 1252.54 FEET TO A POINT ON A NORTH LINE OF 85TH STREET PER SAID PLAT; THENCE EAST, NORTH AND WEST ALONG THE NORTH LINE OF SAID 85TH STREET, THE WEST LINE OF SOUTH AVENUE 'O'- US ROUTE 41 AND THE SOUTH LINE OF 83RD STREET ALL PER SAID PLAT, THE FOLLOWING 11 COURSES; THENCE NORTH 88 DEGREES 31 MINUTES 11 SECONDS EAST, 263.72 FEET; THENCE NORTH 43 DEGREES 28 MINUTES 24 SECONDS EAST, 14.13 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 577.87 FEET; THENCE NORTH 46 DEGREES 34 MINUTES 00 SECONDS WEST, 14.15 FEET; THENCE SOUTH 88 DEGREES 26 MINUTES 15 SECONDS WEST, 10.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE NORTH 88 DEGREES 26 MINUTES 15 SECONDS EAST, 10.00 FEET; THENCE NORTH 43 DEGREES 25 MINUTES 54 SECONDS EAST, 14.14 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 568.79 FEET; THENCE NORTH 46 DEGREES 32 MINUTES 26 SECONDS WEST, 14.15 FEET; THENCE SOUTH 88 DEGREES 29 MINUTES 30 SECONDS WEST, 261.41 FEET TO THE POINT OF BEGINNING, (EXCEPTING THEREFROM THAT PART DEDICATED FOR 84TH STREET EXTENSION IN DEDICATION PLAT RECORDED 10-13-16 AS DOCUMENT 1628713010) IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL D:

THAT PART OF SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN AND PART OF BLOCK 2 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST, AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: COMMENCING AT NORTHWEST CORNER OF BLOCK 1 IN SAID ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION; THENCE SOUTH 01 DEGREES 28 MINUTES 02 SECONDS EAST ALONG AN ASSUMED BEARING, BEING THE WEST LINE OF SAID BLOCK 1, A DISTANCE OF 2287.12 FEET TO A CORNER OF SAID BLOCK 1; THENCE NORTH 88 DEGREES 32 MINUTES 54 SECONDS EAST ALONG A SOUTH LINE OF SAID BLOCK 1, A DISTANCE OF 989.89 FEET TO A POINT ON THE EAST LINE OF SOUTH MACKINAW AVENUE, ALSO BEING A WEST LINE OF SAID BLOCK 1; THENCE SOUTH 01 DEGREES 32 MINUTES 35 SECONDS EAST ALONG SAID WEST LINE 296.93 FEET TO A POINT ON THE SOUTH LINE OF SAID BLOCK 1; THENCE NORTH 88 DEGREES 31 MINUTES 03 SECONDS EAST ALONG THE LAST DESCRIBED LINE 329.88 FEET TO A POINT ON THE EAST LINE OF SOUTH GREEN BAY AVENUE, ALSO BEING A WEST LINE OF SAID BLOCK 1; THENCE SOUTH 01 DEGREE 28 MINUTES 03 SECONDS EAST ALONG THE LAST DESCRIBED WEST LINE AND A WEST LINE OF SAID BLOCK 2 A DISTANCE OF 1390.88 FEET TO A CORNER OF SAID BLOCK 2; THENCE NORTH 88 DEGREES 31 MINUTES 54 SECONDS EAST ALONG SAID WEST LINE 8.00 FEET TO A CORNER OF SAID BLOCK 2; THENCE SOUTH 01 DEGREES 28 MINUTES 03 SECONDS EAST ALONG SAID WEST LINE 1.47 FEET TO A POINT ON A SOUTH LINE OF 85TH STREET AS ESTABLISHED BY PLAT OF HIGHWAYS FOR SOUTH AVENUE 'O'- US ROUTE 41 RELOCATION RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023, SAID POINT BEING THE POINT OF BEGINNING; THENCE EAST AND SOUTH ALONG THE SOUTH LINE OF SAID 85TH STREET AND THE WEST LINES OF SOUTH AVENUE 'O'- US ROUTE 41 PER SAID PLAT, THE FOLLOWING 15 COURSES; THENCE NORTH 88 DEGREES 31 MINUTES 11 SECONDS EAST, 245.84 FEET; THENCE SOUTH 64 DEGREES 56 MINUTES 01 SECONDS EAST, 22.38 FEET; THENCE SOUTH 01 DEGREES 34 MINUTES 23 SECONDS EAST, 220.59 FEET; THENCE SOUTH 43 DEGREES 28 MINUTES 20 SECONDS WEST, 14.13 FEET; THENCE SOUTH 88 DEGREES 31 MINUTES 03 SECONDS WEST, 10.00 FEET; THENCE SOUTH 01 DEGREES 34 MINUTES 23 SECONDS EAST, 66.00 FEET; THENCE NORTH 88 DEGREES 31 MINUTES 03 SECONDS EAST, 10.00 FEET; THENCE SOUTH 46 DEGREES 31 MINUTES 40 SECONDS EAST, 14.15 FEET; THENCE SOUTH 01 DEGREES 34 MINUTES 23 SECONDS EAST, 335.74 FEET; THENCE SOUTH 32 DEGREES 24 MINUTES 50 SECONDS WEST, 16.58 FEET; THENCE SOUTH 66 DEGREES 24 MINUTES 04 SECONDS WEST, 38.84 FEET; THENCE SOUTH 23 DEGREES 35 MINUTES 56 SECONDS EAST, 66.00 FEET; THENCE NORTH 66 DEGREES 24 MINUTES 04 SECONDS EAST, 22.14 FEET; THENCE SOUTH 01 DEGREES 34 MINUTES 23 SECONDS EAST, 483.35 FEET; THENCE SOUTH 43 DEGREES 28 MINUTES 27 SECONDS WEST, 21.34 FEET TO A POINT ON THE NORTH LINE OF EAST 87TH STREET AS OPENED PER DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT NUMBER 0434944043; THENCE SOUTH 88 DEGREES 31 MINUTES 20 SECONDS WEST ALONG SAID NORTH LINE, 731.46 FEET; THENCE SOUTH 01 DEGREES 28 MINUTES 42 SECONDS EAST ALONG SAID NORTH LINE, 20.00 FEET; THENCE SOUTH 88 DEGREES 31 MINUTES 20 SECONDS WEST ALONG THE NORTH LINE OF SAID EAST 87TH STREET, 455.55 FEET; THENCE NORTH 46 DEGREES 28 MINUTES 32 SECONDS WEST 56.57 FEET TO A POINT ON THE EAST LINE OF SOUTH BURLEY AVENUE; THENCE NORTH 01 DEGREES 28 MINUTES 26 SECONDS WEST ALONG SAID EAST LINE 581.40 FEET TO A POINT ON THE CENTERLINE OF EAST 86TH STREET; THENCE NORTH 88 DEGREES 26 MINUTES 13 SECONDS EAST ALONG SAID CENTERLINE 974.07 FEET TO A POINT ON A WEST LINE OF SAID BLOCK 2; THENCE NORTH 01 DEGREES 28 MINUTES 03 SECONDS WEST ALONG SAID WEST LINE 629.11 FEET TO THE POINT OF BEGINNING, (EXCEPTING THEREFROM THAT PART DEDICATED FOR 86TH STREET SOUTH 1/2 BY DEDICATION PLAT RECORDED 10-13-16 AS DOCUMENT 1628713012) IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL E:

THAT PART OF BLOCK 2 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST, AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: COMMENCING AT THE NORTHWEST CORNER OF BLOCK 1 IN SAID ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION; THENCE NORTH 88 DEGREES 26 MINUTES 11 SECONDS EAST ALONG AN ASSUMED BEARING BEING THE NORTH LINE OF SAID BLOCK 1, A DISTANCE OF 1677.00 FEET TO AN ANGLE POINT; THENCE SOUTH 62 DEGREES 00 MINUTES 50 SECONDS EAST ALONG THE NORTHEASTERLY LINE OF SAID BLOCK 1, A DISTANCE OF 2654.83 FEET; THENCE SOUTH 05 DEGREES 29 MINUTES 17 SECONDS EAST 476.70 FEET TO A POINT ON A LINE LYING 300.00 FEET WEST OF AND PARALLEL WITH THE EAST LINE OF SAID BLOCK 1; THENCE SOUTH 06 DEGREES 15 MINUTES 26 SECONDS EAST ALONG SAID PARALLEL LINE 2423.94 FEET TO A POINT ON THE SOUTH LINE OF THE NORTH SLIP, SAID SLIP BEING LOCATED AS INDICATED IN SAID RESUBDIVISION, SAID POINT BEING THE POINT OF BEGINNING; THENCE CONTINUING SOUTH 06 DEGREES 15 MINUTES 26 SECONDS EAST ALONG SAID PARALLEL LINE 708.26 FEET; THENCE SOUTH 88 DEGREES 55 MINUTES 23 SECONDS EAST 47.44 FEET; THENCE SOUTH 00 DEGREES 49 MINUTES 53 SECONDS EAST 140.44 FEET; THENCE NORTH 88 DEGREES 55 MINUTES 23 SECONDS WEST 34.05 FEET TO A POINT ON THE LAST DESCRIBED PARALLEL LINE; THENCE SOUTH 06 DEGREES 15 MINUTES 26 SECONDS EAST ALONG SAID PARALLEL LINE 55.25 FEET TO A POINT ON A NON-TANGENT CURVE, SAID CURVE BEING THE EASTERLY LINE OF EAST 87TH STREET AS OPENED PER DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT NUMBER 0434944043; THENCE NORTHWESTERLY 95.72 FEET ALONG SAID CURVE TO THE LEFT HAVING A RADIUS OF 60.00 FEET AND WHOSE CHORD BEARS NORTH 51 DEGREES 57 MINUTES 42 SECONDS WEST 85.89 FEET TO A POINT OF TANGENCY; THENCE SOUTH 82 DEGREES 36 MINUTES 47 SECONDS WEST ALONG THE NORTH LINE OF SAID EAST 87TH STREET 1623.83 FEET TO A BEND POINT; THENCE SOUTH 88 DEGREES 31 MINUTES 20 SECONDS WEST ALONG SAID NORTH LINE 882.29 FEET TO A POINT ON AN EAST LINE OF SOUTH AVENUE 'O'- US ROUTE 41 PER PLAT OF HIGHWAYS RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023; THENCE NORTH AND EAST ALONG THE EAST AND SOUTH LINES OF SAID SOUTH AVENUE 'O'- US ROUTE 41, THE FOLLOWING 15 COURSES; THENCE NORTH 46 DEGREES 31 MINUTES 33 SECONDS WEST, 14.30 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 486.31 FEET; THENCE NORTH 43 DEGREES 28 MINUTES 20 SECONDS EAST, 14.14 FEET; THENCE NORTH 88 DEGREES 31 MINUTES 03 SECONDS EAST, 9.99 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE SOUTH 88 DEGREES 31 MINUTES 03 SECONDS WEST, 10.00 FEET; THENCE NORTH 46 DEGREES 31 MINUTES 40 SECONDS WEST, 14.14 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 333.00 FEET; THENCE NORTH 43 DEGREES 28 MINUTES 20 SECONDS EAST, 14.14 FEET; THENCE NORTH 88 DEGREES 31 MINUTES 03 SECONDS EAST, 10.00 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 66.00 FEET; THENCE SOUTH 88 DEGREES 31 MINUTES 03 SECONDS WEST, 10.00 FEET; THENCE NORTH 46 DEGREES 31 MINUTES 40 SECONDS WEST, 14.15 FEET; THENCE NORTH 01 DEGREES 34 MINUTES 23 SECONDS WEST, 206.58 FEET TO THE SOUTH LINE OF 85TH STREET PER SAID PLAT OF HIGHWAYS RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023; THENCE NORTH 88 DEGREES 31 MINUTES 11 SECONDS EAST 82.44 FEET ALONG SAID SOUTH LINE, TO A POINT ON THE WEST LINE OF SAID NORTH SLIP; THENCE SOUTH 01 DEGREES 28 MINUTES 02 SECONDS EAST ALONG SAID WEST LINE 193.13 FEET TO THE SOUTHWEST CORNER OF SAID NORTH SLIP; THENCE NORTH 88 DEGREES 31 MINUTES 57 SECONDS EAST ALONG THE SOUTH LINE OF SAID NORTH SLIP 2418.05 FEET TO THE POINT OF BEGINNING, IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL G:

LOT 24 IN BLOCK 30 OF SOUTH CHICAGO, BEING A SUBDIVISION OF THE EAST HALF OF THE WEST HALF, AND PARTS OF THE EAST FRACTIONAL HALF OF FRACTIONAL SECTION 6, NORTH OF THE INDIAN BOUNDARY LINE, AND THAT PART OF FRACTIONAL SECTION 6 SOUTH OF THE INDIAN BOUNDARY LINE, LYING NORTH OF THE MICHIGAN SOUTHERN RAILROAD, AND FRACTIONAL SECTION 5, NORTH OF THE INDIAN BOUNDARY LINE, ALL IN TOWNSHIP 37 NORTH RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN; AND ALL OF THE VACATED ALLEY LYING EAST OF AND ADJOINING SAID LOT 24, AND THAT PART OF BLOCK 3 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RESUBDIVISION OF LOTS, PIECES AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, TOWNSHIP 37, NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, ALL DESCRIBED AS FOLLOWS: COMMENCING AT THE INTERSECTION OF THE NORTH LINE OF EAST 89TH STREET AND THE EAST LINE OF SOUTH AVENUE 'O'- US ROUTE 41, AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 04349440431; THENCE ON AN ASSUMED BEARING OF SOUTH 88 DEGREES 29 MINUTES 59 SECONDS WEST ALONG THE NORTH LINE OF SAID 89TH STREET, 100.00 FEET TO A POINT ON A LINE 20 FEET WESTERLY OF AND PARALLEL WITH THE NORTHERLY EXTENSION OF THE WEST LINE OF SAID SOUTH AVENUE 'O' (THEN KNOWN AS 'THE STRAND') IN SOUTH CHICAGO SUBDIVISION, BEING A POINT ON THE WEST LINE AS ESTABLISHED BY SAID PLAT 04349440431, SAID POINT BEING THE POINT OF BEGINNING; THENCE CONTINUING SOUTH 88 DEGREES 29 MINUTES 59 SECONDS WEST ALONG SAID NORTH LINE, 661.36 FEET TO A POINT ON THE EAST LINE OF SOUTH MACKINAW AVENUE; THENCE NORTH 01 DEGREES 35 MINUTES 19 SECONDS WEST ALONG SAID EAST LINE 1166.93 FEET TO AN ANGLE POINT, SAID POINT BEING THE SOUTH LINE OF THE EAST 87TH STREET AS OPENED PER DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 0434944043; THENCE NORTH 44 DEGREES 59 MINUTES 57 SECONDS EAST, ALONG SAID SOUTH LINE 94.26 FEET TO AN ANGLE POINT; THENCE NORTH 88 DEGREES 31 MINUTES 20 SECONDS EAST, ALONG SAID SOUTH LINE 548.54 FEET TO AN ANGLE POINT; THENCE SOUTH 37 DEGREES 37 MINUTES 50 SECONDS EAST, ALONG SAID SOUTH LINE 67.67 FEET TO A POINT ON THE WEST LINE OF THE SOUTH AVENUE 'O'- US ROUTE 41 AS OPENED PER DOCUMENT NUMBER 0434944043; THENCE SOUTH 05 DEGREES 00 MINUTES 15 SECONDS EAST ALONG SAID WEST LINE 69.47 FEET TO AN ANGLE POINT; THENCE SOUTH 01 DEGREES 36 MINUTES 33 SECONDS EAST ALONG SAID WEST LINE, 1107.60 FEET, MORE OR LESS, TO THE POINT OF BEGINNING, IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS, (EXCEPT THAT PART DEDICATED (WIDENING) ALONG EAST LINE THEREOF FOR SOUTH AVENUE 'O'-US ROUTE 41 PER PLAT OF HIGHWAYS RECORDED MARCH 9, 2006 AS DOCUMENT NUMBER 0606834023)

PROPERTY DESCRIPTION (CONTINUED):

PARCEL 16a:

THAT PART OF BLOCK 3 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RESUBDIVISION OF LOTS, PIECES AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, TOWNSHIP 37 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: BEGINNING AT THE INTERSECTION OF THE NORTH LINE OF 89TH STREET AND THE EAST LINE OF SOUTH AVENUE 'O'- US ROUTE 41, AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 0434944043; THENCE ON AN ASSUMED BEARING OF NORTH 01 DEGREES 36 MINUTES 33 SECONDS WEST ALONG THE EAST LINE OF SAID SOUTH AVENUE 'O'- US ROUTE 41, 1187.45 FEET TO AN ANGLE POINT; THENCE NORTH 43 DEGREES 27 MINUTES 29 SECONDS EAST, ALONG SAID EAST LINE 62.28 FEET TO THE SOUTH LINE OF EAST 87TH STREET AS OPENED PER DOCUMENT NUMBER 04349440431; THENCE NORTH 88 DEGREES 31 MINUTES 20 SECONDS EAST ALONG SAID SOUTH LINE 117.03 FEET; THENCE SOUTH 00 DEGREES 31 MINUTES 14 SECONDS EAST, 468.13 FEET TO AN ANGLE POINT; THENCE SOUTH 15 DEGREES 09 MINUTES 30 SECONDS WEST, 286.54 FEET TO A POINT OF CURVATURE; THENCE SOUTHERLY 531.46 FEET ALONG A CURVE TO THE LEFT, HAVING A RADIUS OF 486.00 FEET AND WHOSE CHORD BEARS SOUTH 16 DEGREES 10 MINUTES 09 SECONDS EAST 505.37 FEET; THENCE SOUTH 88 DEGREES 29 MINUTES 59 SECONDS WEST NON TANGENT TO THE LAST DESCRIBED COURSE, ALONG THE EASTERLY EXTENSION OF THE NORTH LINE OF 89TH STREET 196.62 FEET MORE, OR LESS, TO THE POINT OF BEGINNING IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL 16b:

THAT PART OF BLOCK 3 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RESUBDIVISION OF LOTS, PIECES AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, TOWNSHIP 37, NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: COMMENCING AT THE INTERSECTION OF THE NORTH LINE OF EAST 89TH STREET AND THE EAST LINE OF SOUTH AVENUE 'O'- US ROUTE 41 AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 04349440431; THENCE ON AN ASSUMED BEARING OF SOUTH 01 DEGREES 36 MINUTES 33 SECONDS EAST ALONG THE EAST LINE OF SAID SOUTH AVENUE 'O'- US ROUTE 41, 80.00 FEET TO THE POINT OF BEGINNING; THENCE ALONG THE EASTERLY EXTENSION OF THE SOUTH LINE OF SAID EAST 89TH STREET, NORTH 88 DEGREES 29 MINUTES 59 SECONDS EAST 60.74 FEET TO A POINT ON A NON-TANGENTIAL CURVE; THENCE SOUTHERLY 61.01 FEET ALONG SAID CURVE TO THE LEFT, HAVING A RADIUS OF 453.34 FEET WHOSE CHORD BEARS SOUTH 11 DEGREES 09 MINUTES 12 SECONDS EAST 60.96 FEET TO A POINT OF COMPOUND CURVATURE; THENCE SOUTHEASTERLY 69.65 FEET ALONG A CURVE TO THE LEFT, HAVING A RADIUS OF 478.90 FEET AND WHOSE CHORD BEARS SOUTH 19 DEGREES 10 MINUTES 32 SECONDS EAST 69.59 FEET TO A POINT OF TANGENCY; THENCE SOUTH 23 DEGREES 20 MINUTES 31 SECONDS EAST 244.22 FEET TO A POINT OF CURVATURE; THENCE SOUTHERLY 166.98 FEET ALONG A CURVE TO THE RIGHT, HAVING A RADIUS OF 440.60 FEET AND WHOSE CHORD BEARS SOUTH 12 DEGREES 29 MINUTES 07 SECONDS EAST 165.98 FEET TO A POINT OF TANGENCY; THENCE SOUTH 01 DEGREES 37 MINUTES 42 SECONDS EAST, 537.58 FEET TO A POINT OF CURVATURE; THENCE SOUTHWESTERLY 198.38 FEET ALONG A CURVE TO THE RIGHT, HAVING A RADIUS OF 376.60 FEET AND WHOSE CHORD BEARS SOUTH 13 DEGREES 27 MINUTES 45 SECONDS WEST 196.10 FEET TO A POINT OF TANGENCY; THENCE SOUTH 28 DEGREES 33 MINUTES 12 SECONDS WEST 72.10 FEET TO AN ANGLE POINT; THENCE SOUTH 18 DEGREES 14 MINUTES 53 SECONDS WEST 208.45 FEET TO AN ANGLE POINT; THENCE SOUTH 20 DEGREES 09 MINUTES 23 SECONDS EAST 163.11 FEET TO A POINT ON THE NORTH LINE OF THE CALUMET RIVER; THENCE SOUTH 59 DEGREES 48 MINUTES 01 SECONDS WEST ALONG SAID NORTH LINE 17.49 FEET TO THE EASTERLY CORNER OF A PARCEL OF LAND RECORDED SEPTEMBER 1972, AS DOCUMENT NUMBER 22050136; THENCE NORTH 30 DEGREES 11 MINUTES 45 SECONDS WEST ALONG THE EASTERLY LINE OF SAID PARCEL 25.00 FEET TO THE NORTHERLY CORNER OF SAID PARCEL; THENCE SOUTH 66 DEGREES 01 MINUTES 48 SECONDS WEST ALONG THE NORTHERLY LINE OF SAID PARCEL 55.33 FEET TO THE WESTERLY CORNER OF SAID PARCEL ALSO BEING A WESTERLY LINE OF SAID BLOCK 3; THENCE NORTH 29 DEGREES 44 MINUTES 33 SECONDS WEST ALONG THE LAST DESCRIBED LINE 257.44 FEET TO A POINT THAT IS 46 FEET SOUTHEASTERLY OF THE SOUTHERLY LINE OF HARBOR AVENUE; THENCE NORTH 59 DEGREES 48 MINUTES 42 SECONDS EAST ALONG A LINE PARALLEL TO AND 46 FEET SOUTHEASTERLY OF THE SOUTHERLY LINE OF HARBOR AVENUE, 105.04 FEET TO THE EAST LINE OF SOUTH AVENUE 'O' NOW US ROUTE 41, EXTENDED SOUTH; THENCE NORTH 01 DEGREES 36 MINUTES 33 SECONDS WEST ALONG THE EXTENSION OF AND THE EAST LINE OF SAID SOUTH AVENUE 'O', 1386.60 FEET TO THE POINT OF BEGINNING; TOGETHER WITH ANY AND ALL INTEREST IN LANDS ABUTTING AND LYING SOUTHERLY OF SAID PART OF BLOCK 3 AS HERETOFORE DESCRIBED AND LYING ADJACENT TO AND UNDER THE CALUMET RIVER, SAID RIVER AS IDENTIFIED ON SAID PLAT OF RESUBDIVISION, IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL 17:

THAT PART OF SECTION 32, TOWNSHIP 38 NORTH, RANGE 15, AND SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, IN TOWNSHIP 37 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, DESCRIBED AS FOLLOWS: COMMENCING AT THE INTERSECTION OF THE NORTH LINE OF EAST 89TH STREET AND THE EAST LINE OF SOUTH AVENUE 'O'- US ROUTE 41 AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 04349440431; THENCE NORTH 88 DEGREES 29 MINUTES 59 SECONDS EAST ALONG THE EASTERLY EXTENSION OF SAID NORTH LINE OF EAST 89TH STREET 196.62 FEET TO A POINT ON THE ARC OF A CIRCLE, SAID POINT BEING THE POINT OF BEGINNING; THENCE NORTHERLY 531.46 FEET ALONG THE ARC OF A CIRCLE, CONCAVE EASTERLY, HAVING A RADIUS OF 486 FEET, AND WHOSE CHORD BEARS NORTH 16 DEGREES 10 MINUTES 09 SECONDS WEST 505.37 FEET TO A POINT OF TANGENCY; THENCE NORTH 15 DEGREES 09 MINUTES 30 SECONDS EAST 286.54 FEET; THENCE NORTH 00 DEGREES 31 MINUTES 14 SECONDS WEST 468.13 FEET TO A POINT ON A LINE LYING 100 FEET SOUTH OF AND PARALLEL WITH THE EASTERLY EXTENSION OF THE NORTH LINE OF EAST 87TH STREET, BEING NOW THE SOUTH LINE OF 87TH STREET AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 04349440431; THENCE NORTH 88 DEGREES 31 MINUTES 20 SECONDS EAST ALONG THE LAST DESCRIBED LINE 752.91 FEET; THENCE NORTH 82 DEGREES 36 MINUTES 47 SECONDS EAST 1570.37 FEET; THENCE SOUTH 15 DEGREES 07 MINUTES 23 SECONDS EAST 1491.78 FEET TO A POINT ON THE NORTHERLY LINE OF BLOCK 4 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RE-SUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, AND IN SECTION 5, NORTH OF THE INDIAN BOUNDARY LINE, IN TOWNSHIP 37 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT 5384242, SAID BLOCK 4 ALSO BEING GOVERNMENT LOT NUMBER 1; THENCE SOUTH 59 DEGREES 50 MINUTES 12 SECONDS WEST ALONG THE LAST DESCRIBED NORTHERLY LINE 309.94 FEET TO THE NORTHWESTERLY CORNER OF SAID BLOCK 4; THENCE SOUTH 30 DEGREES 09 MINUTES 47 SECONDS EAST ALONG THE WESTERLY LINE OF SAID BLOCK 4 A DISTANCE OF 150 FEET TO THE SOUTH LINE OF BLOCK 3; THENCE SOUTH 59 DEGREES 50 MINUTES 14 SECONDS WEST ALONG THE SOUTH LINE OF SAID BLOCK 3 AND THE WESTERLY EXTENSION THEREOF, A DISTANCE OF 2045.26 FEET TO THE WEST EDGE OF A SHEET PILE WALL; THENCE NORTH 62 DEGREES 14 MINUTES 22 SECONDS WEST ALONG SAID WEST EDGE OF SAID WALL, 16.67 FEET; THENCE NORTH 64 DEGREES 26 MINUTES 58 SECONDS WEST CONTINUING ALONG THE WEST EDGE OF SAID WALL 33.72 FEET; THENCE NORTH 20 DEGREES 18 MINUTES 07 SECONDS WEST 140.94 FEET; THENCE NORTH 19 DEGREES 31 MINUTES 11 SECONDS WEST CONTINUING ALONG SAID WEST EDGE 256.73 FEET; THENCE NORTH 19 DEGREES 58 MINUTES 49 SECONDS WEST CONTINUING ALONG SAID WEST EDGE 422.23 FEET; THENCE NORTH 19 DEGREES 49 MINUTES 22 SECONDS WEST CONTINUING ALONG SAID WEST EDGE 193.84 FEET; THENCE NORTH 19 DEGREES 34 MINUTES 09 SECONDS WEST CONTINUING ALONG SAID WEST EDGE AND THE NORTHERLY EXTENSION OF SAID WEST EDGE 214.38 FEET; THENCE NORTH 63 DEGREES 25 MINUTES 08 SECONDS WEST 106.94 FEET TO A POINT OF CURVATURE; THENCE NORTHWESTERLY 135.06 FEET ALONG THE ARC OF A CIRCLE, CONCAVE EASTERLY, HAVING A RADIUS OF 486 FEET, AND WHOSE CHORD BEARS NORTH 55 DEGREES 27 MINUTES 28 SECONDS WEST 134.62 FEET TO THE POINT OF BEGINNING, IN COOK COUNTY, ILLINOIS.

EASEMENT PARCEL FOR THE BENEFIT OF PARCEL 17:

PERPETUAL, NON-EXCLUSIVE EASEMENT AS CREATED BY ACCESS AND UTILITY EASEMENT AGREEMENTS EXECUTED BY USX CP AND SOLO CUP COMPANY RECORDED JULY 18, 2001 AS DOCUMENT 0010642149 FOR THE PURPOSE OF CONSTRUCTING, MAINTAINING AND REPAIRING AN ACCESS ROAD, CURB CUTS, CURBING AND REASONABLY NECESSARY RELATED TRAFFIC CONTROL SIGNS AND GATES AND OTHER SURFACE IMPROVEMENTS REASONABLY BENEFITING INGRESS AND EGRESS BETWEEN THE SOLO PARCEL AND SOUTH AVENUE 'O'- US ROUTE 41 WITHIN THE ACCESS AND UTILITY EASEMENT; VEHICULAR AND PEDESTRIAN INGRESS AND EGRESS OVER AND ACROSS THE ACCESS ROAD BY SOLO, ITS TENANTS AND LICENSEES OR THEIR RESPECTIVE EMPLOYEES OR INVITEES AND INSTALLING, CONSTRUCTING, INSPECTING, OPERATING, REPLACING, RENEWING, ALTERING, ENLARGING, REMOVING, REPAIRING, CLEANING AND MAINTAINING ELECTRICAL, CABLE TELEVISION, COMMUNICATION, GAS, TELEPHONE, WATER, SANITARY SEWER, STORM SEWER OR OTHER UTILITY LINES AND APPURTENANCES AND SUCH OTHER INSTALLATIONS AND SERVICE CONNECTIONS AS MAY BE REQUIRED TO FURNISH UTILITY SERVICES TO THE SOLO PARCEL OVER THE FOLLOWING DESCRIBED PARCELS OF LAND: THAT PART OF BLOCK 3 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RESUBDIVISION OF LOTS, PIECES AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST AND IN SECTION 5 OF THE INDIAN BOUNDARY LINE, TOWNSHIP 37 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, IN COOK COUNTY, ILLINOIS, MORE PARTICULARLY DESCRIBED AS FOLLOWS: BEGINNING AT THE INTERSECTION OF THE NORTH LINE OF 89TH STREET AND THE EAST LINE OF SOUTH AVENUE 'O'-US ROUTE 41 AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 04349440431; THENCE ON AN ASSUMED BEARING ON NORTH 88 DEGREES 29 MINUTES 59 SECONDS EAST ALONG EASTERLY EXTENSION OF THE NORTH LINE OF SAID 89TH STREET, A DISTANCE OF 196.62 FEET TO A POINT ON A NON-TANGENTIAL CURVE CONCAVE TO THE NORTHEAST HAVING A RADIUS OF 486.00 FEET AND WHOSE CORD BEARS SOUTH 55 DEGREES 27 MINUTES 28 SECONDS EAST; THENCE SOUTHEASTERLY 135.06 FEET ALONG SAID CURVE THROUGH A CENTRAL ANGLE OF 15 DEGREES 55 MINUTES 19 SECONDS TO A POINT; THENCE SOUTH 63 DEGREES 25 MINUTES 10 SECONDS EAST; A DISTANCE OF 1.68 FEET TO A POINT; THENCE SOUTH 88 DEGREES 29 MINUTES 59 SECONDS WEST, A DISTANCE OF 306.80 FEET TO A POINT ON THE SAID EAST LINE OF SAID SOUTH AVENUE 'O'- US ROUTE 41, FORMERLY KNOWN AS THE STRAND; THENCE NORTH 1 DEGREE 36 MINUTES 33 SECONDS WEST ALONG THE SAID EAST LINE OF SAID SOUTH AVENUE 'O', A DISTANCE OF 80.00 FEET, MORE OR LESS, TO THE POINT OF BEGINNING (EXCEPTING THEREFROM THAT PART FALLING PARCEL 25a).

PARCEL 25a:

THAT PART OF BLOCK 3 IN ILLINOIS STEEL COMPANY'S SOUTH WORKS RESUBDIVISION, BEING LOTS, PIECES, AND PARCELS OF LAND IN SECTION 32, TOWNSHIP 38 NORTH, RANGE 15 EAST, AND IN SECTION 5 NORTH OF THE INDIAN BOUNDARY LINE, IN TOWNSHIP 37 NORTH, RANGE 15 EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED MARCH 27, 1914 AS DOCUMENT NUMBER 5384242, DESCRIBED AS FOLLOWS: BEGINNING AT THE INTERSECTION OF THE NORTH LINE OF EAST 89TH STREET AND THE EAST LINE OF SOUTH AVENUE 'O'-US ROUTE 41 AS OPENED BY DOCUMENT RECORDED DECEMBER 14, 2004 AS DOCUMENT 04349440431; THENCE NORTH 88 DEGREES 29 MINUTES 59 SECONDS EAST ALONG THE EASTERLY EXTENSION OF SAID NORTH LINE OF EAST 89TH STREET 52.77 FEET; THENCE SOUTH 07 DEGREES 17 MINUTES 53 SECONDS EAST 80.41 FEET TO A POINT ON THE EASTERLY EXTENSION OF THE SOUTH LINE OF SAID EAST 89TH STREET; THENCE SOUTH 88 DEGREES 29 MINUTES 59 SECONDS WEST ALONG THE LAST DESCRIBED LINE 60.74 FEET TO A POINT ON THE EAST LINE OF SAID SOUTH AVENUE 'O'- US ROUTE 41, FORMERLY KNOWN AS THE STRAND; THENCE NORTH 01 DEGREES 36 MINUTES 33 SECONDS WEST ALONG THE LAST DESCRIBED LINE 80.00 FEET TO THE POINT OF BEGINNING, IN THE CITY OF CHICAGO, COOK COUNTY, ILLINOIS.

PARCEL 26:

LOTS 17 THROUGH 29, BOTH INCLUSIVE, IN BLOCK 3, IN MARY P. M. PALMER'S ADDITION TO SOUTH CHICAGO, BEING A SUBDIVISION OF THE NORTH 1/2 OF THE SOUTH 1/2 OF THE SOUTH 1/2, (EXCEPTING THEREFROM THE WEST 155 FEET OF THE SOUTH 445 FEET); THE WEST 5 ACRES OF THE SOUTH 1/2 OF THE NORTH 1/2 OF THE SOUTH 1/2; AND THE SOUTH 1 ACRE OF THE EAST 5 ACRES OF THE WEST 10 ACRES OF THE SOUTH 1/2 OF THE NORTH 1/2 OF THE SOUTH 1/2, ALL OF FRACTIONAL SECTION 32, TOWNSHIP 38 NORTH, RANGE 15, EAST OF THE THIRD PRINCIPAL MERIDIAN, IN COOK COUNTY, ILLINOIS.

PARCEL T-1:

THAT PART OF THE WEST 1/2 OF LOT 8 AND ALL OF LOTS 9 AND 10 IN MAHAN'S SUBDIVISION OF THE EAST HALF OF THE NORTHEAST QUARTER OF THE NORTHEAST QUARTER OF THE NORTHEAST QUARTER OF SECTION 31, TOWNSHIP 38 NORTH, RANGE 15, EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED AUGUST 9, 1889 AS DOCUMENT 1140084, MORE PARTICULARLY DESCRIBED AS FOLLOWS: BEGINNING AT THE SOUTHWEST CORNER OF SAID LOT 10; THENCE NORTH 01 DEGREES 25 MINUTES 07 SECONDS WEST, ALONG THE WEST LINE OF SAID LOT 10, A DISTANCE OF 40.21 FEET; THENCE NORTH 02 DEGREES 50 MINUTES 48 SECONDS EAST, 54.61 FEET; THENCE SOUTH 60 DEGREES 34 MINUTES 36 SECONDS EAST, 65.36 FEET; THENCE SOUTH 64 DEGREES 02 MINUTES 19 SECONDS EAST, 10.97 FEET TO A POINT ON THE EAST LINE OF THE WEST 1/2 OF SAID LOT 8; THENCE SOUTH 01 DEGREES 23 MINUTES 43 SECONDS EAST, ALONG SAID EAST LINE, 55.93 FEET TO A POINT ON THE SOUTH LINE OF SAID LOT 8; THENCE SOUTH 88 DEGREES 25 MINUTES 32 SECONDS WEST, ALONG THE SOUTH LINE OF SAID LOTS 8, 9 AND 10, FOR A DISTANCE OF 69.90 FEET TO THE POINT OF BEGINNING, IN COOK COUNTY, ILLINOIS.

PARCEL T-2:

THAT PART OF LOTS 2, 3, 4, 5, 6, 7 AND THE EAST HALF OF LOT 8, IN MAHAN'S SUBDIVISION, DEDICATED FOR PART OF INTERSECTION OF U.S. 41, 79TH STREET AND BRANDON ROAD BY PLAT OF DEDICATION RECORDED MARCH 9, 2006 AS DOCUMENT 0606834023 (PART OF PARCEL OFV0019 THEREIN); AND THAT PART OF THE NORTH HALF OF THE 16-FOOT EAST-WEST ALLEY, SOUTH AND ADJOINING LOTS 1, 2 AND 3, IN MAHAN'S SUBDIVISION BEING A SUBDIVISION OF THE EAST HALF OF THE NORTHEAST QUARTER OF SECTION 31, TOWNSHIP 38 NORTH, RANGE 15, EAST OF THE THIRD PRINCIPAL MERIDIAN, ACCORDING TO THE PLAT THEREOF RECORDED AUGUST 9, 1889 AS DOCUMENT 1140084; AS VACATED BY ORDINANCE RECORDED OCTOBER 13, 2016 AS DOCUMENT 1628713011 WITH PLAT RECORDED OCTOBER 13, 2016 AS DOCUMENT 1628713013, MORE PARTICULARLY DESCRIBED AS FOLLOWS: COMMENCING AT THE SOUTHWEST CORNER OF SAID LOT 10; THENCE NORTH 01 DEGREES 25 MINUTES 07 SECONDS WEST, ALONG THE WEST LINE OF SAID LOT 10, A DISTANCE OF 40.21 FEET; THENCE NORTH 02 DEGREES 50 MINUTES 48 SECONDS EAST, 54.61 FEET; THENCE SOUTH 60 DEGREES 34 MINUTES 36 SECONDS EAST, 65.36 FEET; THENCE SOUTH 64 DEGREES 02 MINUTES 19 SECONDS EAST, 10.97 FEET TO A POINT ON THE WEST LINE OF THE EAST HALF OF SAID LOT 8, BEING THE POINT OF BEGINNING; THENCE SOUTH 64 DEGREES 02 MINUTES 19 SECONDS EAST, 31.26 FEET TO A POINT OF CURVATURE; THENCE EASTERLY 68.71 FEET, ALONG THE ARC OF A TANGENT CIRCLE TO THE LEFT, HAVING A RADIUS OF 321.00 FEET AND WHOSE CHORD BEARS SOUTH 70 DEGREES 10 MINUTES 16 SECONDS EAST, 68.58 FEET TO A POINT OF TANGENCY; THENCE SOUTH 76 DEGREES 18 MINUTES 12 SECONDS EAST, 61.38 FEET; THENCE SOUTH 71 DEGREES 13 MINUTES 38 SECONDS EAST, 23.84 FEET TO A POINT ON THE SOUTH LINE OF THE NORTH HALF OF SAID 16-FOOT EAST-WEST ALLEY; THENCE SOUTH 88 DEGREES 25 MINUTES 32 SECONDS WEST, ALONG SAID SOUTH LINE, 56.04 FEET TO A POINT ON THE WEST LINE OF THE EAST 78.00 FEET OF SAID 16-FOOT EAST-WEST ALLEY; THENCE NORTH 01 DEGREES 28 MINUTES 02 SECONDS WEST, ALONG SAID WEST LINE, 8.00 FEET TO A POINT ON THE NORTH LINE OF SAID 16-FOOT EAST-WEST ALLEY; THENCE SOUTH 88 DEGREES 25 MINUTES 32 SECONDS WEST, ALONG SAID NORTH LINE, ALSO BEING THE SOUTH LINE OF SAID LOTS 3, 4, 5, 6, 7 AND 8, FOR A DISTANCE OF 117.28 FEET TO A POINT ON THE WEST LINE OF THE EAST HALF OF SAID LOT 8; THENCE NORTH 01 DEGREES 23 MINUTES 43 SECONDS WEST, ALONG SAID EAST LINE, 55.93 FEET TO THE POINT OF BEGINNING, IN COOK COUNTY, ILLINOIS.

NOTES:

THIS SURVEY REFLECTS MATTERS OF TITLE AS LISTED ON A COMMITMENT FOR TITLE INSURANCE BY CHICAGO TITLE INSURANCE COMPANY, NUMBER 1401 008984097 D2 WITH AN EFFECTIVE DATE OF MAY 31, 2017.

UNDERGROUND UTILITIES ARE SHOWN BY USING PHYSICAL EVIDENCE FOUND ON THE SURFACE AND/OR FROM UTILITY COMPANY FIELD STAKES, AND/OR ENGINEERING DESIGN PLANS. THEREFORE, THEIR LOCATIONS ARE APPROXIMATE AND SUSPECTED AND MAY NOT BE COMPLETELY ACCURATE. FOR MORE ACCURATE LOCATION, FIELD EXCAVATE. OTHER UTILITIES NOT SHOWN MAY EXIST. NO UNDERGROUND UTILITIES WERE LOCATED. BEFORE DIGGING CALL J.U.L.I.E. AT 1-800-892-0123.

ALL DIMENSIONS ARE IN FEET AND DECIMAL PARTS THEREOF. NO DISTANCES OR ANGLES SHOWN HEREON MAY BE ASSUMED BY SCALING.

THIS PROFESSIONAL SERVICE CONFORMS TO THE CURRENT ILLINOIS MINIMUM STANDARDS FOR A BOUNDARY SURVEY IN ADDITION TO THE 2016 MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/NSPS LAND TITLE SURVEYS.

SPACECO, INC IS AN ILLINOIS PROFESSIONAL DESIGN FIRM REGISTERED UNDER LICENSE NUMBER 184-001157.

BASED UPON A REVIEW OF THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) MAP NUMBERS 170074C0545J AND 170074C0660J, MAPS REVISED AUGUST 19, 2008, IT IS OUR CONSIDERED OPINION THAT THIS PROPERTY LIES IN "ZONE X (UNSHADED)" AS IDENTIFIED BY SAID F.I.R.M. MAP. (TABLE A, ITEM 3)

CURRENT ZONING CLASSIFICATION AND BUILDING SETBACK REQUIREMENTS, HEIGHT AND FLOOR SPACE AREA RESTRICTIONS AS SET FORTH IN THAT CLASSIFICATION FOR THE SURVEYED PROPERTY WAS NOT PROVIDED TO THIS SURVEYOR AS REQUIRED BY THE MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS EFFECTIVE 2/23/2016. (TABLE A, ITEM 6A)

SUBSTANTIAL FEATURES ARE SHOWN HEREON. (TABLE A ITEM 8)

AERIAL PHOTOGRAPHY PRODUCED BY SPACECO ON MARCH 29, 2017 UTILIZING POST-PROCESSED IMAGES AND ILLINOIS STATE PLANE COORDINATES VIA GNSS REAL TIME NETWORK (REILNET) AND EXCEEDS RECOMMENDED ACCURACIES FOR FEATURE & TOPOGRAPHIC SITE PLANS & SPECS PER FEDERAL GEOGRAPHIC DATA COMMITTEE (FGDC TABLE A-3). (TABLE A ITEM 15)

THERE IS NO OBSERVABLE EVIDENCE OF EARTH MOVING WORK, BUILDING CONSTRUCTION OR BUILDING ADDITIONS WITHIN RECENT MONTHS. (TABLE A ITEM 16)

NOTES FROM TITLE COMMITMENT:

G 11. RIGHTS, IF ANY, OF THE UNITED STATES OF AMERICA, THE STATE OF ILLINOIS, THE MUNICIPALITY AND THE PUBLIC IN AND TO THAT PART OF THE LAND LYING WITHIN THE BED OF THE CALUMET RIVER; AND THE RIGHTS OF OTHER OWNERS OF LAND BORDERING ON THE RIVER IN RESPECT TO THE WATER OF SAID RIVER. (SURVEYOR'S NOTE: THE EDGE OF WATER OF FOR THE CALUMET RIVER AT THE TIME OF SURVEY HAS BEEN SHOWN HEREON.)

H 12. TERMS, PROVISIONS AND CONDITIONS CONTAINED IN AN UNRECORDED AGREEMENT DATED JUNE 1, 1909, JUNE 29, 1921 AND MARCH 19, 1929 BETWEEN ILLINOIS STEEL COMPANY AND CHICAGO LAKE SHORE AND EASTERN RAILROAD COMPANY CONCERNING THE USE OF PORTIONS OF THE LAND, THE OWNERSHIP OF TRACKS CONSTRUCTED OR TO BE CONSTRUCTED THEREON AND THE EXERCISE OF CERTAIN RIGHTS BY CHICAGO LAKE SHORE AND EASTERN RAILWAY COMPANY, ITS SUCCESSORS, GRANTEES, ASSIGNS, LESSEES AND LICENSEES AS DISCLOSED BY DEED RECORDED OCTOBER 1, 1935 AS DOCUMENT 11686963. (SURVEYOR'S NOTE: SAID DEED INCLUDES PARCELS A, B, C, PART OF D, E, G, 16A, 16B AND 25A, BUT CONTAINS NO PLOTTABLE EASEMENTS OR RESTRICTIONS.)

I 13. EASEMENT IN FAVOR OF THE METROPOLITAN SANITARY DISTRICT OF GREATER CHICAGO, AND ITS SUCCESSORS AND ASSIGNS, TO INSTALL, OPERATE AND MAINTAIN ALL EQUIPMENT NECESSARY FOR THE PURPOSE OF SERVING THE LAND AND OTHER PROPERTY, TOGETHER WITH THE RIGHT OF ACCESS TO SAID EQUIPMENT, AND THE PROVISIONS RELATING THERETO CONTAINED IN THE GRANT RECORDED OCTOBER 30, 1978 AS DOCUMENT NO. 24693101 AND AMENDED BY DOCUMENT 24693102. (SURVEYOR'S NOTE: SAID EASEMENT BURDENS PARCEL 16B AND OTHER PROPERTY. THE LOCATION OF SAID EASEMENT WAS FURTHER DEFINED BY DOCUMENT 98089543. SAID EASEMENT HAS BEEN SHOWN HEREON.)

J 14. EASEMENT IN FAVOR OF THE ILLINOIS BELL TELEPHONE COMPANY, AND ITS SUCCESSORS AND ASSIGNS, TO INSTALL, OPERATE AND MAINTAIN ALL EQUIPMENT NECESSARY FOR THE PURPOSE OF SERVING THE LAND AND OTHER PROPERTY, TOGETHER WITH THE RIGHT OF ACCESS TO SAID EQUIPMENT, AND THE PROVISIONS RELATING THERETO CONTAINED IN THE GRANT RECORDED AS DOCUMENT 86020598, AFFECTING A STRIP OF LAND 10.00 FEET IN WIDTH RUNNING THROUGH A PORTION OF THE LAND AND OTHER PROPERTY. PARTIAL RELEASE OF EASEMENT RECORDED NOVEMBER 22, 2004 AS DOCUMENT 0432708003. (SURVEYOR'S NOTE: SAID EASEMENT BURDENS PARCEL G AND HAS BEEN SHOWN HEREON.)

K 15. ENVIRONMENTAL NO FURTHER REMEDIATION LETTERS FROM THE ILLINOIS ENVIRONMENTAL PROTECTION AGENCY AS FOLLOWS: 1. RECORDED AUGUST 27, 1997 AS DOCUMENT 97630473. (SURVEYOR'S NOTE: SAID LETTER BURDENS PARCELS A, B, C, PART OF D, E, G, 16A, 16B, 17 AND 25A, BUT CONTAINS NO PLOTTABLE EASEMENTS OR RESTRICTIONS.) 2. RECORDED AUGUST 5, 2010 AS DOCUMENT 1021710085. (SURVEYOR'S NOTE: SAID LETTER BURDENS THE REMAINDER OF PARCEL D NOT COVERED IN DOCUMENT 97630473, BUT CONTAINS NO PLOTTABLE EASEMENTS OR RESTRICTIONS.)

L 16. EASEMENT IN FAVOR OF THE METROPOLITAN WATER RECLAMATION DISTRICT OF GREATER CHICAGO, A MUNICIPAL CORPORATION, AND ITS SUCCESSORS AND ASSIGNS, TO INSTALL, OPERATE AND MAINTAIN ALL EQUIPMENT NECESSARY FOR THE PURPOSE OF SERVING THE LAND AND OTHER PROPERTY, TOGETHER WITH THE RIGHT OF ACCESS TO SAID EQUIPMENT, AND THE PROVISIONS RELATING THERETO CONTAINED IN THE GRANT MADE BY USX CORPORATION RECORDED FEBRUARY 3, 1998 AS DOCUMENT NO. 98089543. (SURVEYOR'S NOTE: SAID EASEMENT BURDENS PARCEL 16B AND OTHER PROPERTY AND HAS BEEN SHOWN HEREON. THE TEMPORARY EASEMENT GRANTED THEREIN EXPIRED OCTOBER 1, 2002.)

M 17. ACCESS, EMERGENCY TRUCK AND UTILITY EASEMENT AS RESERVED IN THE ACCESS AND UTILITY EASEMENT FROM USX CORPORATION TO SOLO CUP COMPANY DATED JUNE 28, 2001 AND RECORDED JULY 18, 2001 AS DOCUMENT 0010642149 AND AS SET FORTH IN CONVEYANCE OF THAT PART OF SAID EASEMENT AREA CONTAINED IN PARCEL 25B IN SPECIAL WARRANTY DEED FROM USX CORPORATION AND THE CITY OF CHICAGO RECORDED JULY 18, 2001 AS DOCUMENT 0010642158, AS RE-RECORDED SEPTEMBER 14, 2006 AS DOCUMENT 0625734039 AND RE-RECORDED OCTOBER 31, 2008 AS DOCUMENT 0830518084, RESERVING EASEMENTS FOR USX AND FOR COMMONWEALTH EDISON AND THE TERMS AND CONDITIONS THEREIN. (SURVEYOR'S NOTE: SAID ACCESS, EMERGENCY TRUCK AND UTILITY EASEMENT BURDENS ALL OF PARCEL 25A AND OTHER PROPERTY AND HAS BEEN SHOWN HEREON. SAID DOCUMENT ALSO RESERVES A WATER INTAKE/OUTFLOW FACILITY EASEMENT OVER PART OF PARCEL E AND OTHER PROPERTY THAT APPEARS TO HAVE BEEN ABANDONED AND IS SHOWN HEREON FOR REFERENCE.)

N 18. TERMS, CONDITIONS AND PROVISIONS OF REDEVELOPMENT AGREEMENT RECORDED JULY 18, 2001 AS DOCUMENT 0010642153 BY AND BETWEEN THE CITY OF CHICAGO AND SOLO CUP COMPANY RELATING TO THE PROJECT, PARK LAND, STORMWATER, SEAWALL CONSTRUCTION AND MAINTENANCE, CONSERVATION EASEMENT, FINANCING, CONDITIONS PRECEDENT, COMPLETION OF CONSTRUCTION, COVENANTS, REPRESENTATIVES AND WARRANTIES, ENVIRONMENTAL MATTERS AND OTHERS. PIONEER PROJECT NUMBER 24-0124-103

PROJECT LOCATION 8080 South Lake Shore Drive, Chicago, IL

DATE DRILLED 2/19/25 **DATE MW INSTALLED**

GROUND ELEVATION 14.7 ft CCD **BOREHOLE DIAM.** 2.25" / 4.25" Dia

DRILLING RIG GeoProbe7822 DT

GROUND WATER DEPTH (BELOW GROUND SURFACE ELEVATION):

SAMPLING METHOD Dual Tube

AT TIME OF DRILLING

LOGGED BY J. Mizwicki **CHECKED BY** J. Hartsock

AT END OF DRILLING

NOTES Well installed via 4.25" hollow-stem auger on 2/5/25

AFTER DRILLING 12.94 ft / Elev 1.76 ft 13.94' below TOC on 5/21/25)

DEPTH (ft)	RECOVERY (%)	SHADING = SAMPLE ANALYZED	DEPTH INTERVAL (Feet below surface)	PID CONCENTRATION (ppm) 100 200 300 400	GRAPHIC LOG	MATERIAL DESCRIPTION	WELL DIAGRAM
0						Stratification lines represent approximate boundaries; the transition may be gradual.	Stick-up cover
	75		(0-3)	0		FILL (Silty clay, with gravel, sand, slag), black/brown; stiff, moist	Cement Seal
				0		3.0 / 11.7 FILL (Sand, some slag and gravel), brown/gray; dense, moist	Medium Chip Bentonite Fill; Riser: 10' of 2" I.D. Sch 40 PVC

SUBSURFACE SOIL SAMPLING PROTOCOL

Subsurface samples are collected by employing various soil boring techniques based on site-specific conditions. Soil borings may be advanced using any of the following methodologies: 1) a Bosch™ manual hydraulic/ percussive Macro-Core® barrel sampler; 2) a truck-mounted GeoProbe 5410 hydraulic/percussive direct push sampling unit utilizing dual-tube sampling techniques; 3) a track-mounted GeoProbe 7822DT hydraulic/percussive direct push sampling unit utilizing dual-tube sampling techniques; 4) a track-mounted GeoProbe 6620DT hydraulic/percussive direct push sampling unit utilizing dual-tube sampling techniques; 5) a limited access GeoProbe hand-cart with a Macro-Core® barrel sampler or dual-tube sampler; and/or 6) stainless steel hand augers. The specific methodologies employed are described in the report and listed on the soil boring log for each soil boring location (i.e., Bosch, GeoProbe 5410, GeoProbe 7822DT, GeoProbe 6620DT, GeoProbe Hand-Cart, or HA, respectively).

The soil sampling activities are conducted in accordance with American Society of Testing and Materials (ASTM) standards (ASTM:D 1586 or 6282). Soil samples are collected with a stainless steel hand auger, a dual-tube sampler, and/or a Macro-Core® sampler at 2, 3, 4 or 5-foot intervals depending on the specific method used. In the dual-tube barrel sampling technique, a stainless steel barrel having a length of 3, 4 or 5 feet is used as an outer casing, and a the inner string consists of a center rod fitted with a dedicated disposable DT22 liner. In the Macro-Core® barrel sampling technique, a stainless steel barrel with a length of 2 or 3 feet is fitted with a dedicated disposable PVC liner and is driven into the soil to collect a representative and undisturbed sample.

The soil borings are sampled across continuous intervals from ground surface to the desired sampling depth, unless otherwise noted. The desired sampling depth is predicated on the specific conditions to be assessed, but may be restricted due to site-specific conditions. The drilling is directed by a Pioneer Engineering & Environmental Services, LLC (Pioneer) Field Project Geologist/Engineer, who field screens auger cuttings and soil samples, prepares samples for laboratory analysis, logs geologic materials encountered during drilling, observes the drilling activities, and supervises sample collection.

After retrieval, soil samples obtained from each interval are immediately field screened for the presence of organic vapors along the exposed surface of the soil sample under ambient conditions. The samples are screened for volatile organic compounds (VOCs) and/or semivolatile organic compounds (SVOCs) using a MiniRAE™ 2000 handheld air monitor / photoionization detector (PID). This device is sensitive to a variety of petroleum/hazardous substances, including those typically targeted in subsurface investigations, and provide qualitative indications of the relative concentrations of organic contaminants trapped in the sample matrix.

After the sampling sleeve is opened and screened, and where elevated ambient screening results or other field indications of contamination are observed, an undisturbed portion of the sample from the portion of the interval displaying the highest indications of contamination is immediately selected for possible analysis. Where no elevated screening results are registered, the sample selected for analysis is chosen based on the nature of the REC being assessed, and the judgment of the Field Project Manager. The sample is immediately packed into laboratory provided glassware, or preserved in accordance with US EPA's SW-846 Method 5035, if submitted for VOC analysis. In accordance with Method 5035, a measured portion of the sample collected in the field (subsample - small diameter core) is transferred directly from the sampling device(s) to pre-labeled, pre-weighed, air-tight, laboratory-provided glassware with appropriate preservative (either empty vials with stir bars or deionized water-for samples with estimated VOC concentrations less than 0.200 ppm; or methanol-for samples with estimated VOC concentrations greater than 0.200 ppm) immediately after sample collection.

After initial screening and sample preparation, the remaining soil from the sample interval is logged according to its predominant geological characteristics, in accordance with the Unified Soil Classification System (USCS). The sample is further examined for the presence of odors and/or visual evidence of contamination (hydrocarbon or other), and a headspace reading is obtained from a portion of the sample that is allowed to equilibrate to the ambient atmospheric temperature in a dedicated Zip-lock™ bag for approximately 15 minutes, depending upon various factors, using a PID to obtain a maximum field reading. The soil classifications and the results of the headspace screening are described in the report and listed on the soil boring logs.

SUBSURFACE SOIL SAMPLING PROTOCOL (cont.)

Any soil samples chosen for possible analysis are packed in appropriate containers, properly labeled, designated for possible analysis, and placed in a cooler on ice for storage immediately after sample packing/preservation has been completed to preserve the integrity of the sample during field activities. Sample coolers are retained in the possession of Pioneer personnel at all times, and upon completion of the field activities, samples are delivered to the laboratory on the same day as sample collection, or delivered to Pioneer's office. Samples delivered to Pioneer's office are transferred directly from the coolers into a refrigerator dedicated to storing soil and groundwater samples. The samples are then contained within the refrigerator until they are relinquished to a NELAC-certified, independent laboratory under standard chain-of-custody procedures. Note that empty, stir bar vials or vials with deionized water are placed in the freezer section of the refrigerator if they will not be picked up by the laboratory within 48 hours of sample collection.

Samples are selected based on the scope of work, field observations (i.e. visual/odor observations, elevated PID readings, etc.), other site-specific conditions, and the judgment of the Pioneer Field Project Geologist/Engineer, and are submitted for possible analysis of the appropriate compounds targeted in the investigation.

Drill cuttings and liquids generated are left at the borehole. All boreholes are decommissioned in accordance with applicable Illinois Department of Public Health guidelines. When required, these spoils are contained in 55-gallon Type 17H drums.

Any deviations to or modifications of this standard protocol will be described on a site by site basis.

For a list of acronyms used on Pioneer's boring logs, please refer to the information on the following page.

SUBSURFACE SOIL SAMPLING PROTOCOL (cont.)

List of Acronyms
BSG = below surface grade
BTEX = benzene, toluene, ethylbenzene and total xylenes
HA = hand augers
MTBE = methyl tertiary-butyl ether
PCBs = polychlorinated biphenyls
Pest = pesticides
PID = photoionization detector
PNAs = polynuclear aromatic hydrocarbons
PP = priority pollutants
PPM = parts per million
RCRA = Resource Conservation and Recovery Act
SG = soil gas
SPLP = Synthetic Precipitation Leaching Procedure
SVOCs = semi-volatile organic compounds
TAL = target analyte list
TCL = target compound list
TCLP = toxicity characteristic leaching procedure
TOC = total organic carbon (usage related to soil tests)
TOC = top of casing (usage related to well construction and/or groundwater levels)
TPH = total petroleum hydrocarbons
TRPH = total recoverable petroleum hydrocarbons
VOCs = volatile organic compounds
USCS = Unified Soil Classification System

GROUNDWATER MONITORING WELL INSTALLATION & SAMPLING PROTOCOL

Groundwater monitoring wells are typically installed using hollow stem auger borings. When spatial constraints dictate, wells may be installed using manual hand-augering techniques, or other acceptable practices. Soil sampling conducted during well installation is performed according to Pioneer Engineering & Environmental Services, LLC (Pioneer's) Subsurface Soil Sampling Protocol. The activities are directed by a Pioneer Field Project Geologist/Engineer, who logs geologic materials encountered, field screens auger cuttings and soil samples, and supervises the drilling activities and well installations. All drilling equipment and tools are steam-cleaned prior to mobilization onto the site, between boreholes, and upon completion of the drilling program. In accordance with Pioneer's Site Safety Plan, a PID or FID is used to monitor ambient air concentrations during sampling activities, and personal protective equipment is utilized by site personnel as necessary.

Wells are constructed of 2-inch or 1-inch I.D. schedule 40 flush-joint PVC riser and screen. The well materials are steam-cleaned prior to installation. When the depth of the well allows, the annular space surrounding the screen is backfilled with silica sand filter pack to a height not less than 1 foot above the top of the well screen, and a minimum of 1 foot of bentonite is placed above the filter pack to provide a low permeability seal. The remaining annulus is sealed with a cement/bentonite grout to the ground surface. Well screens are positioned to monitor selected areas of the water column based on site specific contaminant conditions. The position of the screened interval relative to the water table is determined based on the presence of water/moisture in the soil samples retrieved during sampling, and the water levels observed during/after the drilling activities. When possible, the top of the screen is positioned at least 1 foot above the estimated water level to account for fluctuations in the water table. All wells are completed with flush-mounted protective casings and locking well caps or "stickup" locking protective casings (depending upon site traffic) and secured with concrete at the surface. The majority of the wells are installed near suspected source areas to evaluate contaminant conditions and determine the direction of groundwater flow.

After installation, each well is developed using a new disposable Teflon© or high-density polyethylene (HDPE) bailer, or a stainless steel submersible pump. Approximately 5 to 10 well volumes of water are purged from each well, until the well water is visually clear of suspended sediments or until further yield cannot be achieved. If a stainless steel pump is used during well development, it is decontaminated between wells using a tri-sodium phosphate (TSP) wash and triple water rinse. An elevation survey is also conducted to obtain well casing elevations for calculating groundwater elevations. An arbitrary site datum of 100.00 feet is used as a benchmark to initiate the survey, and well casing elevations are measured to the nearest 0.01 feet relative to the established benchmark using standard surveying techniques.

Water levels are allowed to recharge to static conditions prior to the collection of groundwater samples or elevation data, to ensure the collection of accurate and representative data. Water level measurements are recorded to the nearest 0.01 feet using a Sonic Interface Probe, and are compared with the respective casing elevations to calculate water level elevations and apparent groundwater flow directions. Measurable thicknesses of free product are also recorded during well gauging activities when present. Sample collection is accomplished following well development using a new disposable Teflon© or HDPE bailer for each well. If wells have been previously developed/sampled and are being re-sampled, they are purged of 3 to 5 well volumes of water from each well, or until further yield cannot be achieved, using techniques similar to those for well development. The groundwater samples are carefully decanted into appropriately-sized and properly-preserved laboratory provided sample containers, and labeled to identify the sample number/ location, date, and sampling personnel. The samples are subsequently packed in a cooler on ice, and shipped overnight to an independent laboratory under standard chain of custody procedures for possible analysis of the appropriate COCs.

Quality Assurance/Quality Control (QA/QC) procedures for field sampling techniques are performed on a site-by-site basis per scope of work considerations and contract obligations. Any deviations to or modifications of this standard protocol will be described on a site-by-site basis.

LOW FLOW GROUNDWATER SAMPLING PROTOCOL

Due to site specific conditions (i.e., geology, hydrogeology, and contaminants of concern), Pioneer Engineering & Environmental Services, LLC (Pioneer) may perform low-flow groundwater sampling at specific wells at the subject property.

Typical groundwater sampling involves the use of either disposable bailers or high speed pumps. These sampling methods frequently provide acceptable groundwater samples for analysis; however, at some sampling locations these methods provide groundwater samples with high turbidity. This turbidity is caused by the presence of suspended particles in the water sample. Groundwater samples exhibiting turbidity provide suspect analytical results as it will be unclear if analytically detected compounds are dissolved (i.e., the true groundwater concentration of the targeted compound) or suspended (i.e., the groundwater concentration due to the turbidity). Low-flow groundwater sampling is a widely accepted sampling method employed as a method of limiting the turbidity of groundwater samples.

For all low-flow sampling events, Pioneer utilizes an In-Situ, Inc. low-flow groundwater sampling system and ASTM Method D6771. The In-Situ, Inc. system utilizes a variable speed low flow water pump, a MP Troll 9000 multi-parameter probe, and a precision flow cell that incorporates the multi-parameter probe. After determining the distance to groundwater using a sonic interface probe, Pioneer inserts the low-flow pump to a level slightly above the midpoint of the water column (for confined aquifers) or near the top of the water column (for unconfined aquifers). Pioneer purges 3 to 5 well volumes using a flow rate of 0.1 to 0.5 liters/min. The water level is continuously monitored with the sonic interface probe and the flow rate is modified in order to minimize drawdown at the well.

After the appropriate volume of water is purged from the well, groundwater samples are collected. Using the same low-flow pump, the groundwater discharge line is connected to the inlet valve of the flow cell and the properly calibrated multi-parameter probe was inserted into the cell. Pioneer utilizes Flow-Sense software, which continuously monitors data from the probe (i.e., dissolved oxygen, turbidity, specific conductance, dissolved oxygen, red-ox potential, and temperature), in order to determine when groundwater in the well has stabilized. When the Flow-Sense software indicates that statistically valid stabilization characteristics are achieved, the groundwater samples are carefully decanted into appropriately-sized and properly-preserved laboratory provided sample containers, and labeled to identify the sample number/location, date, and sampling personnel. The samples are packed in a cooler on ice, and subsequently retrieved (on the same day or as soon as practicable) by the contract laboratory under standard chain of custody procedures for possible analysis of the appropriate contaminants of concern.

Quality Assurance/Quality Control (QA/QC) procedures for field sampling techniques are performed on a site-by-site basis per scope of work considerations and contract obligations. Any deviations to or modifications of this standard protocol will be described on a site-by-site basis.

SOIL GAS SAMPLING PROTOCOL

Active soil gas sampling is performed in general accordance with 35 IAC 742.227 and standard industry practices using the GeoProbe® and Post-Run Tubing (PRT) system. Prior to sampling, Pioneer visits the USGS website to verify that the site has not received more than 0.5-inch of rain within the last 48 hours. If the site has received more than 0.5-inch of rain within the 48 hours of the anticipated sample collection time, the sampling schedule is adjusted as necessary to ensure a sufficient amount of time has passed prior to soil gas sample collection.

The PRT system consists of probe rods fitted with a PRT Adapter with O-ring, a PRT expendable point holder with O-ring, and an expendable drive point. A jackhammer is used to drive the probe rods equipped with expendable drive points to the desired sampling depth (greater than 3 feet below surface grade, and above the water table, per IEPA guidelines). The rods are retracted approximately 4 to 6 inches and a thin rod is used to disengage the expendable drive point and allow exposure to the soil. An adequate length of 0.25-inch (inside diameter) Teflon® tubing is connected to the PRT Adapter and fed down through the probe rod. The Teflon® tubing is rotated until the PRT Adapter is threaded into the expendable point holder and the O-ring is firmly seated.

To create an air-tight environment around the soil gas probe, VOC-free modeling clay is used to seal around the top of the probe rod. Once sealed, field technicians wait 30 minutes to allow the subsurface conditions to equilibrate prior to sampling. A shroud system is set-up over the sealed hole and a helium gas canister line and 60-cc syringe tubing are connected to the respective ports on the shroud system. Lastly, a 1- or 6-L summa canister is connected to the T-manifold on the sampling train with the in-line pressure regulator/ vacuum gauge.

After the soil gas probe has been sealed, the shroud is covered with plastic sheeting to create a “closed” environment. A vacuum check is performed on the sampling train by using an in-line pressure regulator/ vacuum gauge to apply a vacuum to the system with a 60-cc syringe and monitoring the gauge to ensure the vacuum remains steady for approximately 30 seconds. Once the vacuum test passes, a Radiodetection MGD 2002 Multi-Gas Leak Locator is connected to the tubing port where the syringe was previously connected. The shroud is then filled with helium tracer gas (as approved by the IEPA). If no helium is detected in the sampling train, the leak test passed. If in the case helium is detected, all connections are checked and another helium leak test is completed. Once the system passes the helium leak test, the Radiodetection MGD 2002 Multi-Gas Leak Locator is disconnected and the 60-cc syringe is reconnected to the system. A minimum of three air volumes is purged from the sampling system and the sample vacuum is monitored during purging to ensure high vacuum pressures are avoided in order to maintain equilibrium in the soil. Prior to sample collection, the initial canister pressure is recorded. To begin sampling, the valve on the T-manifold is opened and the soil gas sample is collected through the sampling train directly into a laboratory-provided 1- or 6-L summa canister set at a flow rate of 200 ml/min. The final canister pressure is recorded at the completion of sampling activities. Once all sampling activities are complete and rods are removed, the borehole is backfilled with bentonite to surface grade.

Any deviations to or modifications of this standard protocol will be described on a site by site basis.

Superfund/Technical Reports

Dear Margaret:

The Illinois Environmental Protection Agency (Agency) has reviewed the request submitted by Waste Technology, Inc. (WTI) on behalf of U.S. Steel (USX) to change the classification of groundwater beneath the site from Class I to Class II. The request is dated November 10, 1994 and was received by the Agency on November 14, 1994. Documentation reviewed in support of the request included boring logs, sieve test analysis and a table of fill thickness encountered beneath the site in which groundwater appears to reside.

Originally, groundwater was classified as Class I due to the presence of sand layers greater than five feet in thickness. Further study of these layers has been attempted with sieve test.

In the request, USX states. "...Section 620.210(a)(2) states, in part, that in a Class I: Potable Resource Groundwater, aquifer soils '...that contain 12 percent or less of fines (i.e. fines which pass through a No. 200 sieve...', partially defines a Class I aquifer." Groundwater that is located 10 feet or more below the land surface and within unconsolidated sand, gravel or sand and gravel which is five feet or more and 12 percent or less of fines partially defines a Class I aquifer. Three of the five samples taken for sieve analysis were from intervals described in the field as clay and all five of the samples were described on the graphs as clays, not sand, gravel or sand and gravel. Therefore, the sieve analyses performed are irrelevant in regards to groundwater classification.

Groundwater located in fill material is <u>not</u> a Class I groundwater since it does not meet 620.210(a)(1) through (3) and is not a geologic material (therefore, it cannot meet 620.210(a)(4)). Groundwater which is located in fill material, defined as clean earthen materials, slag, ash, clean demolition debris, or other similar materials, is a Class II groundwater. Pursuant to 620.420(a)(4), groundwater within the upper 10 feet of parent material under such fill is also Class II. Standards for inorganic chemical constituents listed in 620.420(a)(2), barium or Ph do not apply.

SCREENED
JSR 1-13-95

Printed on Recycled Paper

The Agency recommends that the groundwater located within the fill material and within the upper 10 feet of parent material under such fill material be classified as a Class II groundwater. Such a classification does not extend to groundwater located below the aforementioned.

Evidence that the layer of unconsolidated sand, gravel or sand and gravel, which is five feet or more in thickness, has greater than 12 percent fines would be reason to request the Agency to revaluate the classification of the deeper groundwater.

Please inform the Agency at least fourteen days in advance of any additional field activities to allow Agency personnel to be on-site or to split samples. If you have any questions, please feel free to contact me at my direct line 708/338-7891.

Sincerely,

Vickie Moy

1. INTRODUCTION

Porewater Solutions has conducted a modeling study to support the remedial design of a barrier wall with reactive gates for the Illinois Quantum & Microelectronics Park in Chicago, Illinois. This development project is located at the former U.S. Steel South Works Property (Site) and generally consists of flat infill land. Figure 1 shows the site location.

The purpose of this modeling study was to assess the potential for increased groundwater mounding inside the walled area. Two development phases were considered when evaluating wall performance: a Final Development scenario when infiltration basins have been constructed outside the walled area and the recharge rate inside the wall is substantially reduced; and an Interim Development scenario where recharge occurs normally inside the wall and infiltration basins have not yet been constructed outside the barrier wall. This modeling study is consistent with a focused feasibility study level of effort. Results from the modeling study are used to identify potential data gaps for consideration in a pre-design investigation at the remedial design phase.

This report presents the conceptual site model (Section 2), the approach used for the Pre-Remediation Model construction and calibration (Section 3), and the Wall Model remedial design simulations to evaluate barrier wall performance (Section 4). Conclusions and recommendations based on this study are presented in Section 5, followed by a list of references cited in this report.

2. CONCEPTUAL SITE MODEL

The Site is partially surrounded by surface water on four sides: the North Vessel Slip to the North, Lake Michigan to the east, Calumet River to the south, and the South Vessel Slip to the west. The Site consists of a shallow aquifer typically comprised of silty sand overlain by slag fill, and is underlain by a continuous layer of silty clay across the Site. Groundwater in the shallow aquifer flows towards surface water discharge zones surrounding the site. The average hydraulic conductivity of the shallow aquifer based on prior slug tests conducted at the Site is $3x10^{-3}$ cm/s (i.e., 8.5 ft/day).

Several detailed geotechnical investigations have been conducted at the Site (GSG, 2024 and 2025). Table 1 presents a summary of the top elevations of the silty clay layer at 61 soil borings; the top of this low-permeability layer represents the base of the shallow aquifer at the Site. The average top elevation of the silt/clay layer at these 61 soil borings is -18 ft Chicago City Datum (ft CCD).

The topographic surface at the Site is generally level and ranges from 8 ft CCD at proposed infiltration basin locations, to a high of about 17 ft CCD. Surface water levels around the site are controlled by the level in Lake Michigan. Levels in Lake Michigan have been observed to vary historically between extremes of -1.5 ft and 4.5 ft ft CCD. Typically, the surface water level around the Site ranges from about 0 to 1 ft CCD. Periods of elevated Lake Michigan levels will result in increased groundwater elevations below the Site.

May 2025 Groundwater Elevations

Pioneer (2025) provided groundwater elevations at Site and nearby monitoring wells for the May 2025 water level monitoring event. These groundwater elevations and associated contours are shown on Figure 2.1. The surface water elevation at the time of this monitoring event was measured to be 0.7 ft CCD. The groundwater elevation contours shown on Figure 2.1 indicate that there are two recharge-induced mounds, one south of the North Vessel Slip and another on the north side of the slip. The maximum groundwater elevation observed at monitoring well MW-302 at the Site was 4.3 ft CCD. Groundwater flow at the Site is shown to be radially outwards from the center of the groundwater mound, towards the surface water bodies to the north, east, south, and west.

(Note: MW-307 was excluded from contouring due to an anomalously high elevation of 13.85 feet CCD, which deviates significantly from site trends and was not identified in historical groundwater monitoring data. Located adjacent to the North Vessel Slip, the groundwater elevation at MW-307 likely reflects a localized condition that is not representative of broader site hydrogeology.)

These observed groundwater mounds in the shallow aquifer indicate that stormwater infiltration is exerting a primary control on groundwater elevations at the Site, with limited inflow from off-site areas to the west. This locally recharged water raises the potentiometric surface and drives lateral flow across the Site. The average horizontal hydraulic gradient observed at the Site is approximately 0.0019 ft/ft. Vertical flow in the shallow aquifer is negligible because of the low-permeability silt/clay layer that forms a continuous base for this hydrostratigraphic unit.

Scope of On-Site Remedy

Figure 2.2 shows the three local, discontinuous source areas previously delineated at the Site. Benzene and naphthalene are the two Chemicals of Concern (COCs) which have been found at low concentrations in groundwater exceeding cleanup criteria in these source areas, with exceedances that are only several times higher than the appliable cleanup criteria. Given that releases to these areas ceased several decades

ago, recharge and groundwater flow over time have depleted the residual sources in these areas.

To contain groundwater in the vicinity of these three areas, the site remedy is specified to have a barrier wall with a total length of approximately 8500 feet that encompasses these three source zones, except for a small portion of the western source area that is too close to the South Vessel Slip, and a portion of the eastern source area that is too close to the Calumet River boundary to be included inside the wall (see Figure 2.2). The portion of the Site to be included inside the walled area will be approximately 100 acres in size.

The barrier wall principally consists of a low-permeability slurry wall which will be keyed into the top of the silty clay unit. Permeable reactive gates will be placed on the northwest and northeast portions of the barrier wall alignment to allow water to be released from inside the walled area after treatment in the reactive gates. The use of permeable reactive gates will mitigate the potential for long-term flooding that could occur if the water table inside the walled area rises up to the ground surface.

Petro-Fix will be used for in-situ treatment of the COCs in the reactive gate sections. Petro-Fix includes colloidal activated carbon which will adsorb the COCs, and it also includes reagents which accelerate the biodegradation of these COCs within the reactive gates. The shallow aquifer is already under aerobic conditions naturally, which illustrates the lack of substantial organic contamination remaining in these source areas. Both benzene and naphthalene are known to undergo rapid biodegradation under the naturally-occurring aerobic conditions currently present in groundwater at the Site.

In addition to the barrier wall remedy, the proposed development at the Site will include construction of several infiltration basins. The purpose of these basins is to facilitate the subsurface infiltration of captured storm water once specific phases of the development have been completed. It is expected that approximately 80% of the current precipitation falling at the Site will be diverted to these infiltration basins and through an outfall directly discharging to surface water at the completion of the property development.

Two proposed infiltration basins are shown on Figure 2.2. The first basin is proposed to be constructed outside the west barrier wall alignment, and the second basin is proposed along the southwest corner outside the barrier wall. It is important that these basins be constructed outside the proposed wall so that the infiltrating water does not cause excessive mounding inside the barrier wall.

While there are two reactive gates proposed along the northwest and northeast corners of the barrier wall, there will still be some increased mounding inside the wall area because water has to travel farther than it currently does to reach surface water discharge zones. One of the goals of the model was to assess how much mounding is

expected to occur inside the walled area in the Final Development scenario (when 80% of the current recharge will be diverted to infiltration basins outside the barrier wall). The model was also used to estimate the mounding in the proposed wall area that may be anticipated in an Interim Development scenario, prior to the diversion of most of the precipitation falling at the Site.

3. MODEL CONSTRUCTION AND CALIBRATION

A two-dimensional steady-state groundwater flow model was developed to simulate horizontal flow in the shallow aquifer at the Site. MODFLOW 2005 was used as the groundwater flow simulation code. Groundwater Vistas was used as the graphical pre- and post-processor for running the model and visualizing the distribution of input parameters and model output results. Final report figures were prepared using Golden Surfer, and a custom Fortran program was used to prepare some of the map layers in these report figures.

The Pre-Remediation Model was used to simulate current conditions at the Site. The approach used for model construction is described in Section 3.1, and the results of the model calibration are discussed in Section 3.2.

3.1 Pre-Remediation Model Construction

Model Domain Extent and Discretization

The extent of the model domain is shown on Figure 3.1, where the domain has a north-south extent of 8500 ft and an east-west extent of 5700 ft. The western portion of the model domain is shown with the aerial photograph in Figure 3.1 to be fully developed with engineered storm water controls, so the recharge through infiltration to the aquifer will be lower in this portion of the domain.

The model domain was discretized into small grid cells (25 ft x 25 ft) at the Site, and slightly larger grid cell sizes outside of the Site area (up to 100 ft x 100 ft). The model grid is discretized into 159 columns and 182 rows for a total of 28,938 grid cells. The model grid discretization is shown on Figure 3.2.

Boundary Conditions

Constant-head boundary conditions were used to specify groundwater elevations representing: 1. Surface water with a uniform elevation of 0.7 ft CCD; and 2. A uniform groundwater elevation of 2.0 ft CCD along the western boundary of the model domain to represent easterly groundwater flow into the domain. These constant-head boundary conditions are shown on Figure 3.3.

Properties

Two zones were used to represent hydraulic conductivity: 1. Eastern hydraulic conductivity zone with 8.5 ft/day based on the average of Site slug test results; and 2. Western zone with a calibrated hydraulic conductivity of 42 ft/day. These two hydraulic conductivity zones are shown on Figure 3.4.

The Pre-Remediation Model has two recharge zones: a) developed area with a reduced recharge rate of 2 inches per year (i.e., 0.00045 ft/day); and b) the undeveloped area where the recharge rate was calibrated to be 3 inches per year (i.e., 0.000675 ft/day) to match the observed May 2025 groundwater mound elevation of 4.3 ft CCD at the Site (refer to Section 3.2). The Pre-Remediation Model recharge zones are shown on Figure 3.5.

The shallow aquifer was simulated using the MODFLOW unconfined condition, so that the transmissivity of the aquifer in each grid cell is calculated using the saturated thickness modeled in each cell. The base of the model domain was specified to be at a bottom elevation of -18 ft CCD, which is the average top elevation of the continuous silt/clay unit that underlies the shallow aquifer at the Site.

3.2 Model Calibration

The purpose of the model calibration was to ensure that the simulated recharge rate resulted in a reasonable match between the simulated and observed groundwater mounding contours, with a focus on matching the observed mound elevation of 4.3 ft CCD at the Site (i.e., south of the North Vessel Slip).

The model property that was mainly adjusted during model calibration was the average annual recharge rate in the undeveloped portion of the model domain. Using the average slug test hydraulic conductivity of 8.5 ft/day, the calibrated infiltration rate was 3 inches per year (i.e., 0.000675 ft/day). Comparison of the modeled groundwater elevations shown on Figure 3.6 with the observed groundwater elevation contours on Figure 2.1 indicates that there's a good match between the Pre-Remediation Model and observed groundwater elevation contours. The modeled maximum groundwater elevation at the Site was 4.4 ft CCD, which is close to the observed maximum groundwater elevation of 4.3 ft CCD at monitoring well MW-302.

Note that there was insufficient range in groundwater elevations to justify a statistical analysis of the model calibration (i.e., only 3.6 feet range between the maximum observed elevation at the Site and the surface water level of 0.7 ft CCD). This small range in heads across the Site is difficult to match precisely with a model using uniform hydraulic conductivity and recharge zones across the Site; there may be local

heterogeneities which result in minor changes in groundwater elevations across the Site that we are not able to match with a model at this scale. Regardless, the match between the observed and modeled maximum groundwater elevations, flow directions, and lateral mound extents confirm that the model is sufficiently calibrated for the purpose of evaluating the potential for mounding inside the proposed barrier wall.

4. WALL MODEL SIMULATIONS

The steady-state groundwater flow model boundary conditions and recharge properties were adjusted to simulate the proposed barrier wall. The Final Development scenario includes engineering controls that divert most storm water falling at the Site to several infiltration basins. During the Interim Development scenario, the barrier wall will be in place and storm water diversion controls will not yet have been constructed.

Thus two barrier wall scenarios were modeled: 1. Final Development including representation of two large infiltration basins (as discussed below) and an 80% reduction in the recharge rate; and an Interim Development scenario where storm water controls are not constructed yet, so future infiltration basins are not modeled and the Pre-Remediation Model recharge rate is used in the Wall Model.

The approach used to simulate these two scenarios using the Wall Model are discussed further in Section 4.1. The results of the Wall Model simulations are summarized in Section 4.2.

4.1 Wall Model Construction

Barrier Wall

The footprint of the proposed barrier wall is shown on Figure 4.1 using solid and dotted black lines along the wall alignment. The solid line portion of the barrier wall footprint represents the low-permeability slurry wall. The MODFLOW Horizontal-Flow Barrier package was used to simulate the slurry wall portion of the barrier wall. The thickness of the wall in the model was specified to be 2 ft, and the hydraulic conductivity of the wall in the model was specified to be $1x10^{-7}$ cm/s (i.e., 0.00028 ft/day).

The black dotted lines shown at the northwest and northeast corners of the barrier wall on Figure 4.1 represent the permeable reactive (i.e., Petro-Fix) gates. Petro-Fix includes the injection of colloidal-sized activated carbon particles with an average size of 1 to 2 microns, as part of a liquid solution. These activated carbon particles are small enough that they will not cause clogging of the aquifer, and thus the reactive gates will not involve a reduction in hydraulic conductivity at the permeable gate locations. The

reactive gate portions of the barrier wall were simulated in the model simply by incorporating openings in the barrier wall at the reactive gate locations in the model (i.e., no wall segments were simulated where the reactive gates are shown on Figure 4.1).

A small north-south oriented wing wall was simulated in the model at the south side of the barrier wall, just east of the southwest infiltration basin. The purpose of this wing wall is to mitigate the potential for lateral groundwater flow from the infiltration basin into the portion of the source area that falls outside of the barrier wall (i.e., adjacent to Calumet River).

Infiltration Basins

The Southwest Basin shown on Figure 4.1 has a design average infiltration rate of 23,500 ft^3/day. The surface area of this Southwest Basin in the Wall Model was simulated to be 3.7 acres. Infiltration at this basin was specified in the model to have a recharge rate of 0.144 ft/day, which is equivalent to the design flow rate over the modeled surface area of the infiltration basin.

The maximum design water table elevation in this area outside the barrier wall is approximately 16 ft CCD. A diversion outlet to a surface water outfall will be used if the actual water table rises up to this elevation at the Southwest Basin. It was confirmed with the model that the simulated groundwater elevations in the vicinity of this Southwest Basin are less than the maximum allowable level when using the Southwest Basin design infiltration rate.

The second infiltration basin shown on Figure 4.1 is referred to as the West Basin, and is located outside the western barrier wall alignment. The design infiltration rate for this basin is an annual average rate equivalent to 11,500 ft^3/day and the surface area is approximately 2.8 acres. A test with the Wall Model indicated that at this infiltration rate, the water table outside the wall will rise above the design maximum groundwater elevation of 12 ft CCD. For this reason, a constant-head boundary at this location was used to specify the maximum design groundwater elevation of 12.0 ft CCD for this infiltration basin, instead of specifying a recharge rate. The Wall Model indicates that the maximum average infiltration rate sustainable at the West Basin, based on a maximum allowable groundwater elevation of 12 ft CCD, is approximately 4300 ft^3/day. Excess infiltration water that may occur during storm events will be diverted to the South Slip from the West Basin when groundwater rises to the design threshold of 12 ft CCD.

Recharge Rate in the Walled Area

The green zone inside the walled area on Figure 4.1 represents the recharge zone specified for the walled area. For the Final Development scenario, the walled area recharge zone rate is reduced by 80% from the calibrated Pre-Remediation rate (i.e., reduced to 0.6 inch/year or 0.000135 ft/day). For the Interim Development scenario,

this recharge zone rate is the same as the Pre-Remediation Model (i.e., 3 inch/year or 0.000675 ft/day).

Steady-State versus Transient Conditions

For this focused feasibility study modeling effort, steady-state conditions are appropriate for the groundwater flow model. For this reason, the current model represents average recharge rates, and a steady surface water elevation. As part of the detailed remedial design phase, it is recommended that seasonal precipitation variations be evaluated to consider the effects of transient recharge rates and surface water elevations on barrier wall performance.

4.2 Barrier Wall Simulations

Final Development Scenario

The Final Development scenario involves the use of two infiltration basins which receive diverted storm water (i.e., West Basin and Southwest Basin), and the recharge rate inside the walled area is reduced by 80% compared to pre-remediation conditions. Figure 4.2 shows the simulated groundwater elevations for the Final Development scenario.

The maximum simulated head inside the walled area in this scenario is 5.9 ft CCD, which indicates that future storm water engineering controls will result in only a small increase in groundwater mounding inside the walled area (i.e., less than two feet above May 2025 groundwater levels). This demonstrates that long-term engineering controls will not be required inside the walled area to prevent flooding, because storm water diversion keeps down the groundwater mounding levels inside the walled area.

The simulated groundwater elevations below the West and Southwest Basins are 12 ft CCD and 9 ft CCD, respectively. The design maximum groundwater elevation at the Southwest Basin is approximately 16 ft, and during large storm events this level may be reached due to transient infiltration which is not simulated in the focused feasibility study model. Thus there may be potentially sustained periods during long storm events where a head differential across the slurry wall of about 10 ft may occur.

Interim Development Scenario

The Interim Development scenario uses the same recharge rate in the walled area as was used in the Pre-Remediation Model, and infiltration basins are not simulated in this scenario. Groundwater mounds to a higher elevation in the Interim Development scenario because the recharge rate is specified to be the same as the pre-remediation

rate, and construction of the barrier wall increases the distance groundwater must travel before discharging to surface water.

Figure 4.3 shows the modeled groundwater elevation contours for the Interim Development scenario. As shown on Figure 4.3, the maximum simulated groundwater elevation in the walled area is in the southwest corner where a maximum head of 12.0 ft CCD was simulated based on a steady-state recharge (i.e., infiltration) rate.

Figure 4.3 also indicates that the simulated groundwater elevation adjacent to Calumet River, outside the barrier wall, is about 0.8 ft CCD. This indicates that there is a simulated head difference across the slurry wall of about 11 ft below at the southwest corner.

5. CONCLUSIONS AND RECOMMENDATIONS

The conclusions of this modeling study include:

- The Pre-Remediation Model provides a good match between the modeled and observed May 2025 groundwater elevation contours, the maximum observed groundwater elevation measured during this event at the Site, and the general groundwater flow directions. This confirms that the model calibration is sufficient for the purpose of this focused feasibility study level of effort for evaluating barrier wall performance.
- The barrier wall will not cause excessive groundwater mounding inside the walled area in the Final Development phase when storm water controls divert most precipitation to infiltration basins located outside of the walled area.
- Mounding simulated during the Interim Development scenario was at a maximum groundwater elevation of 12 ft CCD in the southwest corner of the walled area, which indicates that there may be a sustained head difference of about 11 ft across this portion of the barrier wall prior to construction of the Southwest Basin.
- Modeling demonstrates that the barrier wall and reactive gate system will divert groundwater flow through the PetroFix reactive gates for treatment. The presence of oxygen in site groundwater will also result in natural attenuation of chemicals of concern (e.g., benzene and naphthalene) upgradient of the reactive gates, inside the walled area. This combination of natural and enhanced treatment will ensure that COCs are effectively treated within the walled system.

The following are recommendations for a pre-design investigation to be implemented as part of the detailed remedial design phase:

1. Conduct a pumping test to confirm the hydraulic conductivity and specific yield properties in the shallow aquifer.
2. Use the pumping test results to refine the groundwater model properties, and to update the calibration of the pre-remediation recharge rate at the Site.
3. Evaluate seasonal precipitation variations to assess potential effects of fluctuations in recharge rates and surface water levels on barrier wall performance.

Comparison to Other Barrier Wall Installation Technologies

The One Pass Trencher offers distinct advantages over auger mixing or cutter soil mixing (CSM) when it comes to the unique demands of deep soil mixing.

Auger soil mixing:

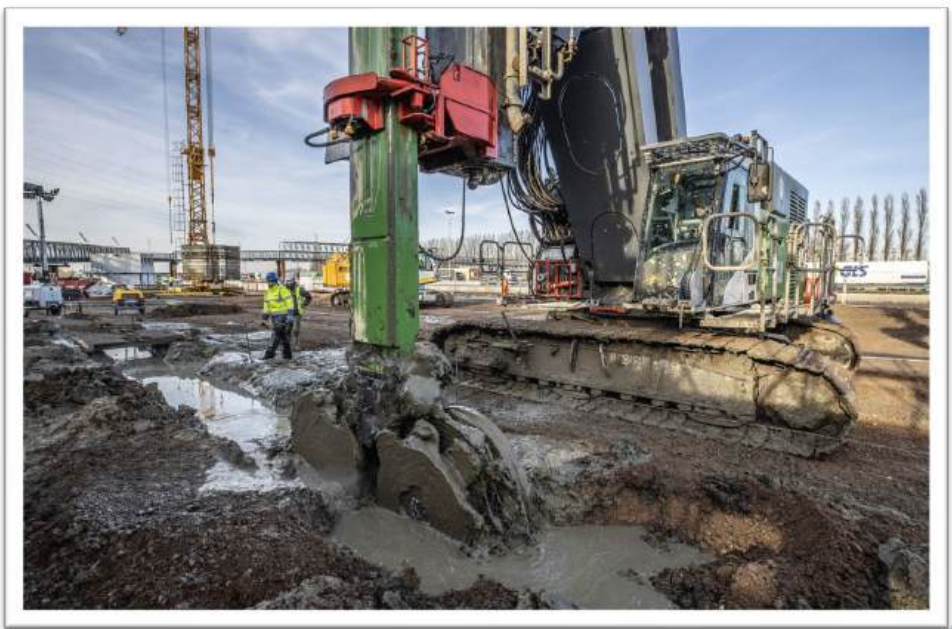
Cobbles:
Tend to jam the augers.

Boulders:
Cannot penetrate, or deflect augers.

Bedrock Key-In:
Frequently impossible.

Work Platform:
Perfect transverse and longitudinal levelness required.

Cutting Torque:
10,000 – 20,000 lb-ft.



Cutter soil mixing:

Cobbles:
Tend to jam the cutters.

Boulders:
Unfavorable. Cannot lift out.

Bedrock Key-In:
Substantial time required.

Work Platform:
Perfect transverse and longitudinal levelness required.

Cutting Torque:
10,000 – 70,000 lb-ft.

One Pass Trencher:

Cobbles:
No problem. Hundreds of carbide rock cutting teeth.

Boulders:
Up to 2 ft in diameter.

Bedrock key-in:
>10 ft thickness

Work Platform:
Transverse levelness required. Longitudinal grades up to 8:1 permitted.

Cutting Torque:
600,000 - 1,500,000 lb-ft

Homogeneity:
Complete homogenization of soil profile from top to bottom.

One Pass Trencher:

Unmatched ability in cobbles, boulders, and bedrock.

One Pass Trencher:

Unmatched on tight sites and longitudinal grades.

Dry Additives & The Metered Auger Delivery System

One-pass trenching is a great improvement over traditional slurry trenching in terms of safety, speed, homogeneity, work platform space requirements, uniform trench depth, etc. DeWind recognized that the full benefits of one-pass trenching were not being realized using slurry addition of bentonite and Portland cement in one-pass trenches. DeWind developed and patented the metered auger delivery system for dry additives, enabling nearly-unlimited addition of cement and/or bentonite to one-pass trenches for in-situ mixing. DeWind has successfully installed mix-in-place soil-cement-bentonite-(slag) walls containing up to 20% Portland cement by dry weight. With a cutting chain speed of 14 ft/sec, constant control over water entering the trench, and dry addition of components based on the trench volume, a homogeneously mixed and hydrated wall can be installed with superior control over slump and strength.

How Does the Metered Auger delivery System Work?

Each delivery hopper contains an auger which dispenses the dry material. The auger dispenses a set amount of material per revolution. The auger speed is directly synced to the track speed of the trencher. The cutoff wall mix design establishes a required dry weight % of bentonite, Portland cement, and/or slag based on weight of soil to be mixed in-situ. Once established, the amount of bentonite and/or Portland cement required per linear foot of trench installed are calculated based on the trench volume (trench width x trench depth) and unit soil weight.

Hydraulic Barrier Wall
Quality Control Measures

Dry Additive Method

This is an example of Quality Control testing standards, testing equipment, and specified measures, with emphasis on how they apply, for the continuous One Pass Trenching in-situ method of installing a soil-mixed hydraulic barrier wall.

Contractor Staking Alignment

Contractor Staking must provide two rows of stakes offset from the center of trench alignment.

- Row 1; 6'-1" (dependent on trencher size) offset and every 20 ft where trencher tracks can run alongside of stake centering the trencher boom.
- First Row stake should be labeled with station, alignment surface elevation, and bottom of barrier wall elevation.
- Row 2; Offset just off the work platform, every 50 ft, and a safe distance from construction traffic.
- Second Row stake should be labeled with offset distance of the barrier wall alignment.

Laser Depth Control

- A laser receiver is mounted to the trencher and will follow a horizontal plane or a specified grade. A nearby surveyed hub elevation sets the benchmark for the laser. The depth of the boom is referenced from the bench marked elevation to establish a profile elevation. The target elevation can be achieved within +/- 1/10th of a foot to account for operational tolerances

Global Position System (GPS) Depth and Alignment Control*

- A GPS option requires a CAD file of the alignment and bottom of wall elevations. DeWind can upload this file to the trencher. The GPS Data Logger can save real time data for As-built information. A csv file can be exported from the Data Logger and provided. From this csv file, an As-Built alignment and profile can be made by Others. DeWind can provide the data from the GPS logger for others to utilize further.

  **This method must be known prior to bid, or the typical Contractor Staking and Laser Depth will be used.*

Verticality

- Transverse Verticality (perpendicular to the trench alignment)-The work platform must be leveled side-to-side within project specified tolerance to achieve transverse verticality tolerance.
- Longitudinal Verticality (parallel to the trench alignment)-A sensor on the digging box displays to the trencher operator the inclination of the boom. The indicator is at the boom end closest to the operator cab. It is for operator use only as an indicator for boom position and should not be used for data attributed to the continuous trench or confused with transverse verticality.

Continuity

- A DeWind One Pass Trench installation is a continuous trench installation method. There is no overlapping of panels, shafts, or piles.
- Installation can resume on a following shift by remixing the previous shift's installation approximately 1 to 2 feet. The overlap is ensured, and an extended overlap length is not necessary. A longer overlap creates more ambiguity within the wall section. There is no separate mix design for overlap sections and the spoils volume is larger than a normal section and the barrier wall's specified performance will be exceeded.

Homogeneity

- Dry powder additives are used with DeWind's patented auger delivery method.
- The One-Pass Trencher mixes the soil profile continuously from top to bottom with a chain speed up to 14 feet/second.
- Slump may vary slightly with greater depths as higher pressure at the bottom of the trench forces the mixing water to the top. At lesser depths there is little difference between the mixed material at the top or the bottom using DeWind's One-Pass Trencher.
- The One Pass Trenching method uses fewer additives as compared to other installation methods. The quantity, and frequency, of installation sampling can be reduced for post-installation testing those other methods may require.
- There is no chance for voids and no need for soundings. The homogenous mixture and even distribution of additives ensures consistent permeability, and strengths at any depth.

Trench Width Options

- Standard trench widths vary 1.5', 2', 2.5', 3', 4', 6', 12' and custom widths are an option if necessary.

Testing Standards

- American Society for Testing and Materials (ASTM) for materials and Quality Control
- American Petroleum Institute (API) for bentonite material

Additives

- Manufacturer Certificate of Material Compliance furnished when shipped.
- Powder additives may be stored in dry a Bulk Trailer, Silo, or super-sack aggregate bag.
- Water used for soil mixing is assumed to be of good quality for mixing with additives.

DeWind One Pass Trenching Deep Sampling Methods

- Method 1 – Trencher Chain Sampler
  A bailer type sampler is attached to the trencher mixing chain. The chain is reversed into the soil-bentonite mix to a depth below the surface. The trencher chain is put in standard cutting rotation and the sampler is then raised. The reversing action retrieves the bulk sample at the specified depth. The sample is then brought to the surface for inspection or testing. This method requires the trencher to pause cutoff wall installation.

- Method 2 – Excavator Mounted Deep Sampler
  A bailer type sampler is attached to a cable wench that lowers the sampler into the soil-bentonite mix. At the specified depth, the sampler is lifted-up and the bulk sample is retrieved for testing at surface. This method does not require the trencher to pause cutoff wall installation and done with an additional operation using an excavator.

The excavator mounted deep sampler is 16.6' long with a door for sampling 1.6' from bottom of the sampler. A measured length of cable is attached to Deep Sampler when lowered. Cable length plus 15' is where sample is taken when Deep Sampler is raised back towards the surface.

Due to the height of the collection port on the sampling equipment itself, the sampler can be lowered to near the bottom of the Seepage Barrier Wall within about 2 feet, but not at the actual bottom of the trench.

Wet Bulk Sampling

- Due to the homogenous mixing from top to bottom of the One Pass Trencher and it's increased speed with accuracy placing materials.

With every 50 feet in depth, a minimum of 1 station location a day is suggested in addition to the following maximums:

Bulk Sample	*Depth*	*Between Stations*
1 Each	*0' ≤ 50'*	*200'*
2 Each	*0' to 100'*	*100'*
3 Each	*0' to 150'*	*50'*

- If a cement additive is used and wet bulk sampling is needed, the wet bulk sampling must occur within 20 minutes of it's original placement. If subsequent wet bulk sample depths are required, for every depth bulk sample taken it must move along the alignment to ensure collection of the sample has occurred within 20 minutes of it's placement.
- Sampling depths must be provided by the owner's representative or engineer with timely notice to sufficiently prepare for the bulk sample extraction.
- Sampling of wet bulk samples are screened with ½" screen if soil-mixed materials, or aggregates, are present that are greater than ½".

Soil-Mixed Backfill Testing

- *Bulk Density* (ASTM C29/C29) M-particularly of interests for gravity dams to ensure free body diagram of the gravity dam isn't compromised.
- *Slump* (ASTM C143)-slump typically is between 5 to 6 inches for the One Pass Trencher.
- *Temperature (*ASTMC31) – pocket type thermometer can be used when freezing of cementitious materials are a concern. Often ground conditions, do permit installation though ambient air temperatures may be below freezing.
- *Hydraulic Conductivity* (ASTM D5084)
  - 3"x 6" cylinder molds
  - $\leq 1x10^{-5}$ cm/sec (temporary applications like dewatering)
  - $\leq 1x10^{-6}$ cm/sec (most common)
  - $\leq 1x10^{-7}$ cm/sec (strict compliance at a 10 test running average with none greater than $5x10^{-7}$ cm/sec)
  - The picture below is of a large capacity lab for hydraulic conductivity testing. Most labs cannot handle the quantity of sampling needed for most hydraulic barrier wall projects for timely results.

ASTM D 5084 – Method C (falling head, rising tailwater)

- *Unconfined Compressive Strength* (ASTM D2166)
  - 3”x 6” cylinder molds
  - The most useful test frequencies are 14-, and 28-day intervals with the best early indication coming from a 14 day test. Additional, early strength tests may be performed at 3, 7, or 56 days during an early demonstration section to witness the curing process for specific project reference but is not necessary to complete the entire project.
  - If a slag additive is used, a 56-day test may be needed to capture the slow curing process of the slag contribution.

<u>Daily Installation Reports</u>

- Stations and depths
- Additive placement rates
- Material concentration calculations
- Injection and usage rates
- Summary statements of daily activities
- Quality Control tests
- As-Built alignment and elevation data can be obtained from a csv file

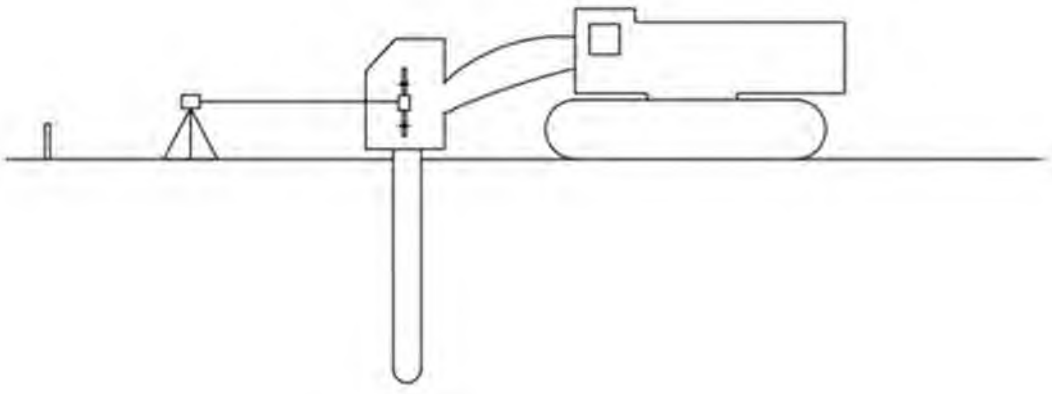
Laser Level Monitoring System

A laser level can be set up to a horizontal or sloped plane (example 5% grade). The laser plane is independent of the surface grade. The trencher boom is guided by the laser plane which is set to a design plane grade. Any changes, or control points, with design grade need to be marked so a new laser plane can be established and followed by the trencher.

1. Find a known elevation for: a) hub stake, b) an object near the work zone, or c) work platform.
2. At a known elevation marker, set up the laser beacon on a tripod. Find the elevation of the laser beam and the elevation of the receiver mounted on the digging box using a grade rod from the known elevation.
3. Identify the target bottom elevation of your trench from design drawings.
4. Measure the total length: For soil mixing, measure from the bottom of the digging box to the end of cutters on the boom. For collection trenches, measure the length of the hopper; if laying pipe, then measure only to where the pipe exits the sweep.
5. Subtract the bottom of trench elevation from the laser beam elevation and record the difference. Subtract the length of boom from the difference to establish where the receiver must be relative to the bottom of the digging box.

Example:
Laser beam mount elevation = 640’
Bottom trench elevation = 605’
Length from bottom of digging box to end of cutters = 30’
640’-605’= 35’ to bottom of trench.
Boom length is 30’, so 35’ – 30’ = **+5’**
This means the *receiver must be 5’ above the bottom of the digging box* for a bottom of trench elevation of 635’ to be maintained.



PetroFIX™
Remediation Fluid

TAKE CONTROL

You Design, You Apply.

PetroFIX™
Remediation Fluid

Key Benefits:

- Fast Results
- Affordable and Reliable
- Excellent Distribution Properties
- Simple Online Design Assistant
- Full Customer Support
- Safe to Use

Easy to Apply:

- Inject Under Low Pressure
- Pour Into Open Excavations
- Add to UST or Pipework Bedding

Target Contaminants:

- Petroleum Hydrocarbons – both Gasoline and Diesel range
- BTEX
- MTBE
- Naphthalene
- PAHs

Overview

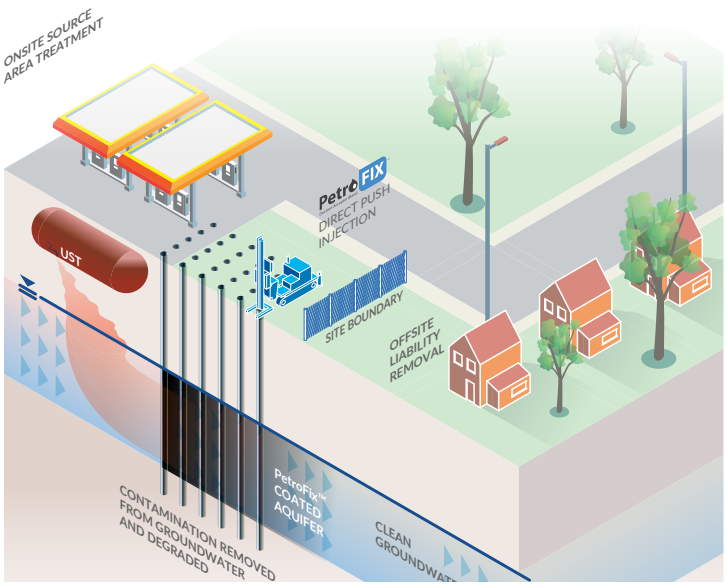
PetroFix: Technology at-a-glance

PetroFix™ is a cost-effective solution for petroleum spills that equips environmental professionals with tools to take control of the remediation process. This technology works hand-in-hand with the PetroFix Design Assistant™, an online tool that enables users to design and apply individually-tailored remediation plans.

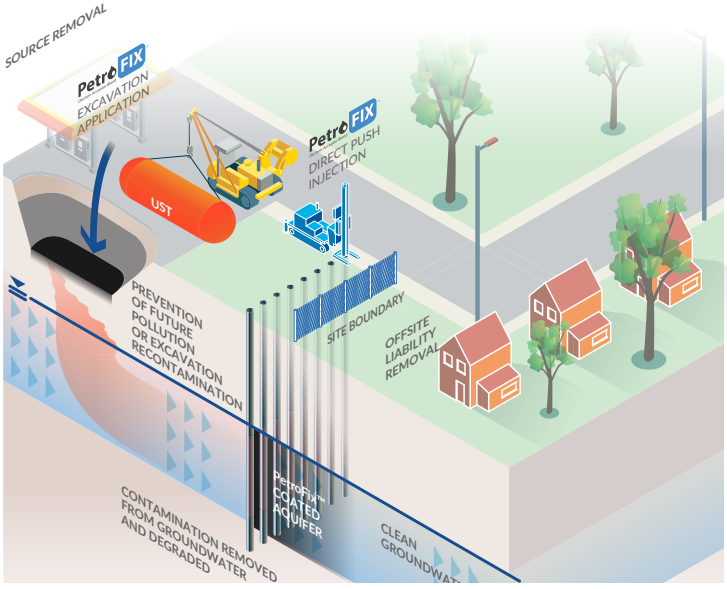
A Dual-Functioning, Activated Carbon Remedial Technology for Treating Petroleum Hydrocarbons

Petrofix has a dual function: it removes hydrocarbons from the dissolved phase by adsorbing them onto activated carbon particles and then stimulates hydrocarbon biodegradation by adding electron acceptors. The environmentally-compatible formulation of micron-scale activated carbon (1-2 microns) is combined with both slow and quick-release inorganic electron acceptors. Practitioners can select between a sulfate and nitrate combination blend (recommended) or sulfate only for the additional electron acceptors required.

Source Treatment Using a Grid Injection Design



Excavation with a Barrier Application Design

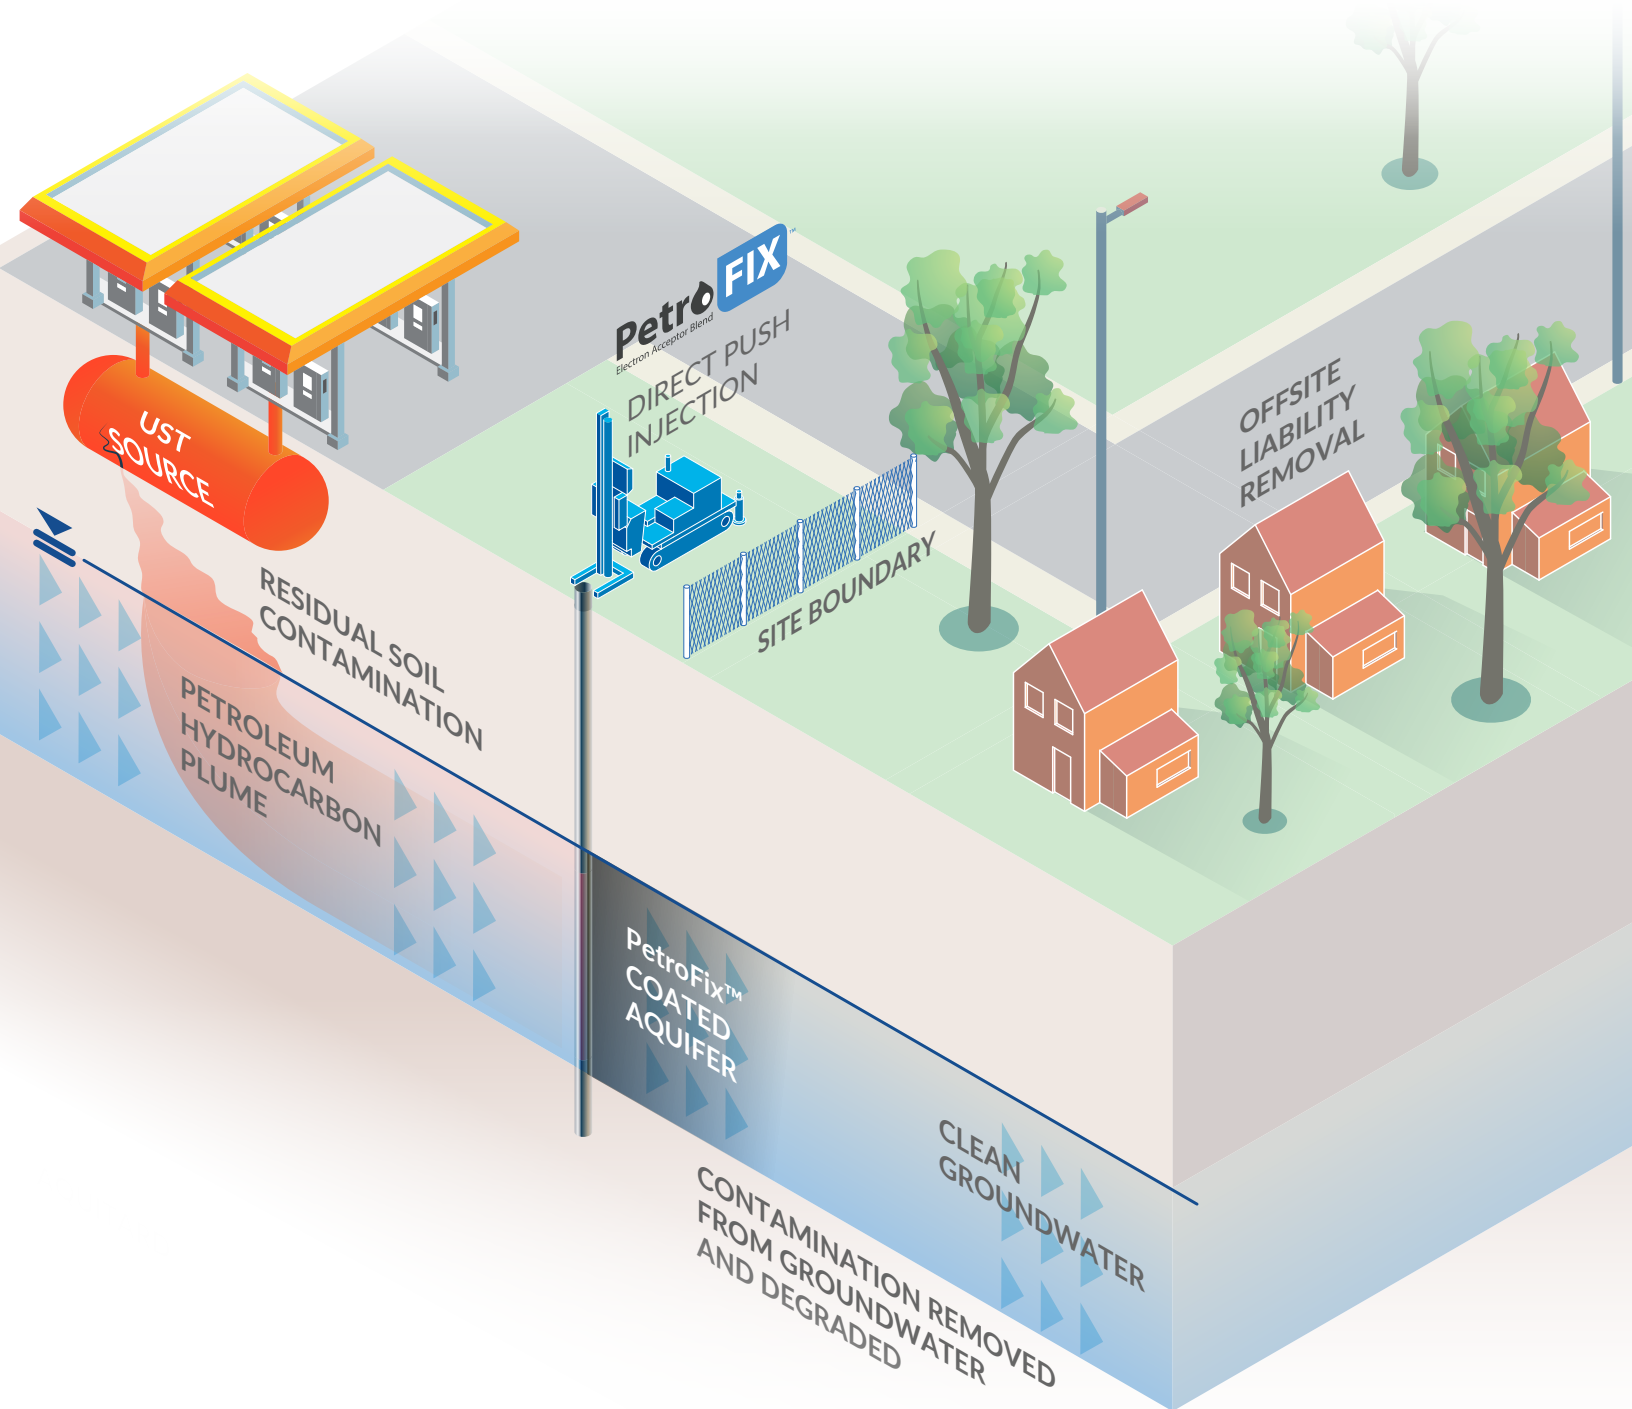


A Wide Range of Applications

- Target hydrocarbon plumes caused by recent spills or old leaks
- Treatment barriers to prevent plume migration and remove off site liability
- Excavation applications to prevent recontamination and mitigate future releases
- Suppress vapor risk from subsurface hydrocarbon contamination
- Protect against future pollution events by coating bedding material around tanks and pipework

Safe to Use

PetroFix is made from natural nonhazardous carbon and nutrients. It requires only dilution before application.



The PetroFix Design Assistant: You Design

Use our Online Software to Generate an Estimate When you Need it

To make applying PetroFix simple and easy to use, REGENESIS created an innovative and effective online tool for developing recommended dosage and designs for your site. The PetroFix Design assistant equips environmental professionals with the tools to design individually-tailored remediation plans. This self-design, self-apply tool guides users toward effective designs that will yield the best results and allows users to easily order PetroFix through REGENESIS' customer service department. Educational resources and best practices are also offered along with an online video tutorial which walks the user step-by-step through the design and ordering process.

1 Create Your Account

Begin by creating an account with details about your site including the surface area and average vertical thickness and whether or not NAPL is present at this time.

2 Recommended Treatment

After providing the soil grain size and the groundwater contaminant levels, the Design Assistant will provide results showing the suggested treatment including the recommended volume, dosing, and product required for treatment.

3 Order PetroFix

Once all areas for the site are submitted, start the order process directly within the Design Assistant.

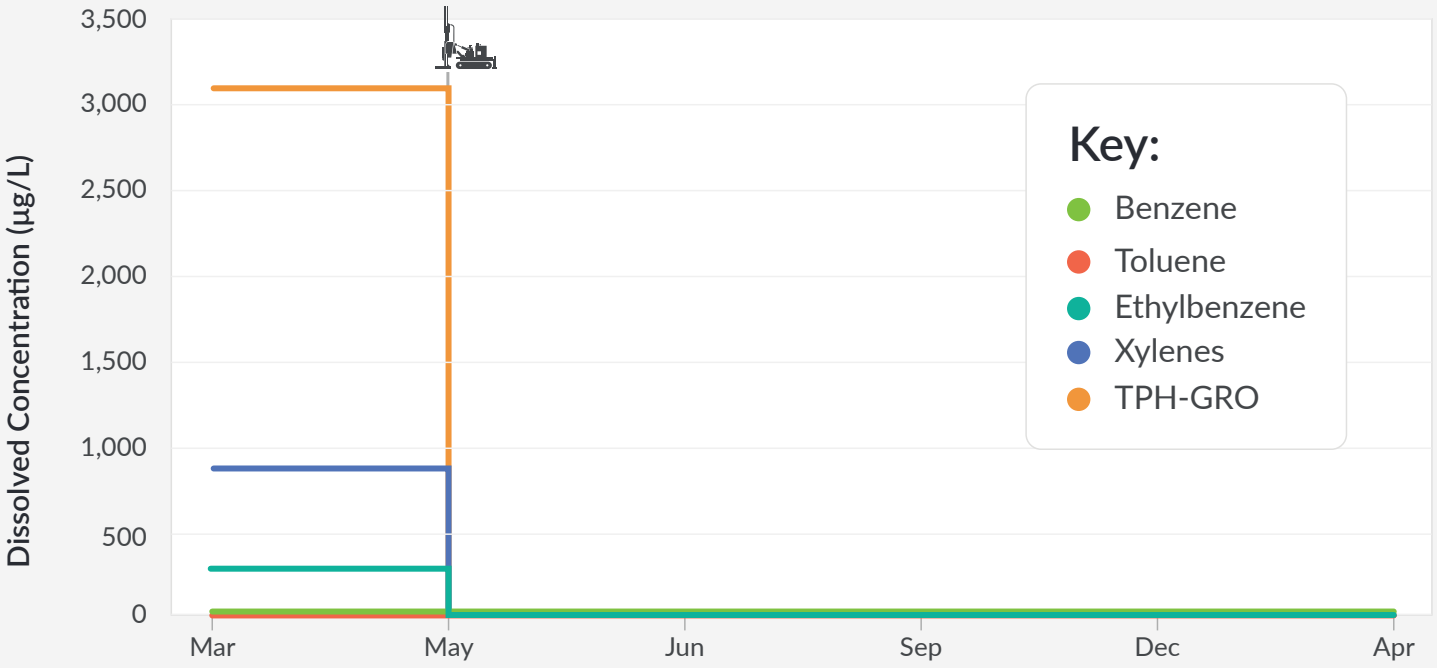
Case Study: PetroFix Provides Rapid and Long-Lasting Results

PetroFix is simply mixed with water and applied

A multi-use convenience store located in Panama City Beach, Florida was impacted by contamination from a leaking underground storage tank (UST). A 2007 report determined that 1,000 gallons of fuel were discharged from this tank and subsequently contaminated the soil and water table.

After various remediation strategies failed to adequately reduce groundwater contaminant concentration levels, A new strategy was needed. PetroFix proved to be the ideal solution for this site because it is easy to apply, is highly versatile, and promises rapid, lasting results. Just 60 days after the PetroFix injection, the contaminant concentrations were below detection and have remained so after one year post-injection. PetroFix was able to degrade the petroleum contaminants within a fast-moving, 200-foot plume.



PetroFix was able to degrade petroleum contaminants within a fast-moving 150-yard plume. Within just 60 days post-injection all contaminant concentrations reached non-detect.

PetroFix™ Specification Sheet

PetroFix Technical Description

PetroFix is a new remedial technology designed to treat petroleum fuel spills in soil and groundwater. A simple-to-use fluid that can be applied under low pressure into the subsurface or simply poured into open excavations, PetroFix offers a cost-effective solution for environmental practitioners and responsible parties to address petroleum hydrocarbon contaminants quickly and effectively.

PetroFix has a dual function; quickly removing hydrocarbons from the dissolved phase, by absorbing them onto the activated carbon particles, while added electron acceptors stimulate hydrocarbon biodegradation in-place. PetroFix does not require high pressure "fracking" for application and can be applied with ease using readily available equipment associated with direct push technology.

The remedial fluid is a highly concentrated water-based suspension consisting of micron-scale activated carbon and biostimulating electron acceptors. PetroFix has a viscosity higher than water and is black in appearance. Its environmentally-compatible formulation of micron-scale activated carbon (1-2 microns) is combined with both slow and quick-release inorganic electron acceptors. A blend of additional electron acceptors is included along with the PetroFix fluid. Practitioners can select between a sulfate and nitrate combination blend (recommended), or sulfate only for the additional electron acceptors required.

PetroFix Design Assistant

REGENESIS has developed a proprietary web-based design assistant called PetroFix Design Assistant™ that provides environmental professionals the ability to input their site parameters, determine the required product amount, and order the product through REGENESIS' customer service. The PetroFix Design Assistant includes defaults and warnings throughout the process to guide users toward effective designs that will offer best results.

PetroFIX™ Remediation Fluid

PetroFix Fluid Chemical Composition	Properties
Activated Carbon - CAS 7440-44-0 > 30% Calcium Sulfate Dihydrate - CAS 10101-41-4 < 10%	**Appearance:** Black Fluid **Viscosity:** 1500-3500 cP (corn syrup-like) **pH:** 8-10

PetroFix Electron Acceptor Powder Chemical Composition	Properties
OPTION 1 - EA Blend (preferred) Sodium Nitrate - CAS 7631-99-4, 50% Ammonium Sulfate - CAS 7783-20-2, 50% OPTION 2 - EA Blend NF Potassium Sulfate - CAS 7778-80-5, 50% Ammonium Sulfate - CAS 7783-20-2, 50%	**Appearance:** White Powder
