Watershed Protection Plan

Prepared for Illinois EPA

October 2023

CDM Smith

Table of Contents

Executive Summary ES-1

Section 1 Goals and Objectives for the Salt Creek Watershed (Little Wabash River Basin) . 1-1

1.1 Total Maximum Daily Load Overview 1-1
1.2 Total Maximum Daily Load Goals and Objectives 1-2
1.3 Report Overview 1-5

Section 2 Salt Creek Watershed (Little Wabash River Basin) Description 2-1

2.1 Location 2-1
2.2 Topography 2-1
2.3 Land Use 2-1
2.3.1 Subbasin Land Use 2-3
2.4 Soils 2-8
2.4.1 Soil Characteristics 2-8
2.5 Population 2-10
2.6 Climate and Streamflow 2-12
2.6.1 Climate 2-12
2.6.2 Streamflow 2-12

Section 3 Salt Creek Watershed (Little Wabash River Basin) Public Participation 3-1

Section 4 Salt Creek Watershed (Little Wabash River Basin) Water Quality Standards 4-1

4.1 Illinois Water Quality Standards 4-1
4.2 Designated Uses 4-1
4.2.1 General Use 4-1
4.3 Water Quality Criteria 4-2
4.4 Illinois Nutrient Loss Reduction Strategy 4-2
4.5 Potential Pollutant Sources 4-3

Section 5 Salt Creek Watershed (Little Wabash River Basin) Data and Potential Pollution Sources 5-1

5.1 Water Quality Data 5-1
5.1.1 Stream Water Quality Data 5-1
5.1.1.1 Dissolved Manganese 5-11
5.1.1.2 Total Phosphorus 5-12
5.2 Point Sources 5-17
5.3 Nonpoint Sources 5-19
5.3.1 Crop Information 5-19
5.3.2 Animal Operations 5-20
5.3.3 Septic Systems 5-21
5.4 Watershed Studies and Other Watershed Information 5-21

Section 6 Approach to Developing Total Maximum Daily Loads and Identifying Data Needs 6-1

6.1 Simple and Detailed Approaches for Developing Total Maximum Daily Loads 6-1

6.2 Additional Data Recommendations for Total Maximum Daily Load and Water Quality Goal Development 6-1
6.3 Approaches for Developing Water Quality Goals for Stream Segments 6-2

Section 7 Methodology Development for Load Reductions in the Salt Creek Watershed (Little Wabash River Basin) 7-1
7.1 Methodology Overview 7-1
7.1.1 Load Duration Curve Overview 7-1
7.2 Methodology Development for Load Duration Curves 7-2
7.2.1 Watershed Delineation and Flow Estimation 7-2
7.2.2 Total Phosphorus Load Duration Curves 7-4

Section 8 Water Quality Goals for the Salt Creek Watershed (Little Wabash River Basin) .. 8-1
8.1 Load Reduction Targets 8-1
8.2 Pollutant Sources and Linkages 8-2
8.2.1 Sources of Nutrients 8-2
8.3 Total Maximum Daily Load Allocation 8-3
8.3.1 Total Phosphorus Load Reduction Targets 8-3
8.3.1.1 Loading Capacity 8-3
8.3.1.2 Seasonal Variation 8-4
8.3.1.3 Waste Load Estimates 8-4
8.3.1.4 Margin of Safety 8-4
8.3.1.5 Reserve Capacity 8-5
8.3.1.6 Load Allocations and Calculation Summaries 8-5

Section 9 Watershed Protection Plan for the Salt Creek Watershed (Little Wabash River Basin) 9-1
9.1 Implementation Overview 9-1
9.2 Adaptive Management 9-1
9.3 Best Management Practice Recommendations 9-2
9.3.1 Recommendations for Total Phosphorus Reduction 9-3
9.3.1.1 Point Sources of Phosphorus 9-4
9.3.1.2 Nonpoint Sources of Phosphorus 9-5
9.4 Costing Estimates and Funding Opportunities 9-17
9.4.1 Best Management Practice Cost Estimates 9-17
9.4.2 Project Funding 9-18
9.4.2.1 State-Level Funding 9-18
9.4.2.2 Federal Funding 9-20
9.4.3 Planning-Level Cost Estimates for Implementation Measures 9-27
9.5 Watershed-Specific Priority Areas and Projects 9-28
9.6 Information and Education 9-29
9.7 Milestones and Success Criteria 9-30
9.8 Plan Monitoring and Schedule 9-31
9.8.1 Monitoring Plan 9-31
9.8.2 Implementation Schedule 9-32

Executive Summary

A total maximum daily load (TMDL) is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA develops a list, known as the 303(d) list, of water bodies not meeting water quality standards every 2 years, which is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. In accordance with U.S. Environmental Protection Agency (EPA) guidance, the report assigns all waters of the state to one of five categories; 303(d)-listed water bodies make up category five in the Integrated Report.

Water bodies listed as impaired in the 2018 Integrated Water Quality Report and 303(d) List[1] were originally targeted for TMDL development in 2019. A Stage 1 TMDL report was initiated for the Salt Creek watershed (Little Wabash River basin) based on the 2018 303(d) list. Stage 1 of TMDL development reviews and documents the physical characteristics of a watershed as well as available historical data in comparison to applicable water quality standards. **Table ES-1** contains information on the 2018 impaired water bodies that were investigated for this report:

Table ES-1 Impaired Water Bodies in the Salt Creek Watershed (Little Wabash River Basin)

Segment ID	Segment Name	Potential Cause of Impairment	Designated Use	Potential Sources (as identified by the 2018 303(d) list)
IL_CPD-01	Second Salt Creek	**Manganese**	Aquatic Life	Source Unknown, Natural Sources
		Total Phosphorus (TP)	Aquatic Life	Animal Feeding Operations, Livestock
IL_CPD-03	Second Salt Creek	*TP*	Aquatic Life	Animal Feeding Operations, Crop Production
IL_CPD-04	Second Salt Creek	*TP*	Aquatic Life	Animal Feeding Operations, Crop Production
IL_CPC-TU-C1	First Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production
IL_CP-04	Salt Creek	*TP*	Aquatic Life	Crop Production, Agriculture
IL_CP-EF-C2	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-EF-C4	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-TU-C3	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production

Notes: **Bold** text indicates the potential cause of impairment has a numeric water quality standard.
Italicized text indicates the potential cause of impairment does not have a numeric water quality standard and a reduction goal will be applied as directed by Illinois EPA.

[1] Illinois EPA. 2018. *Illinois Integrated Water Quality Report and Section 303(d) List, 2018.* https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2018-cycle-integrated-report-final-20210201.pdf

Illinois EPA is currently only developing TMDLs for parameters that have numeric water quality standards. For potential causes that do not have numeric water quality standards, as noted in **Table ES-1**, TMDLs have been deferred until those criteria are developed. However, until numeric criteria are adopted, watershed protection plans (WPPs) have been developed using parameter-specific reduction goals that have been established by Illinois EPA.

During the TMDL development process, historical data showed that the aquatic life use is no longer impaired by manganese on Second Salt Creek (IL_CPD-01). The Illinois aquatic life use water quality standard for manganese changed in 2012 from the total fraction to the dissolved fraction and is now a hardness-based calculation. The segment has since been removed from the 2020/2022 303(d) list for manganese, and TMDL development did not proceed beyond Stage 1. Load reduction targets have been established for TP in stream in lieu of TMDLs as there is no water quality criterion established for TP in streams in Illinois and a WPP has been developed to ensure that watershed practices maintain water quality and continue to support the designated uses.

Section 1

Goals and Objectives for the Salt Creek Watershed (Little Wabash River Basin)

1.1 Total Maximum Daily Load Overview

A total maximum daily load (TMDL) is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Every 2 years, Illinois EPA develops a list known as the 303(d) list of water bodies not meeting water quality standards. The list is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. In accordance with U.S. Environmental Protection Agency (EPA) guidance, the report assigns all waters of the state to one of five categories; 303(d)-listed water bodies make up category five in the Integrated Report.

In general, a TMDL is a quantitative assessment of water quality impairments, contributing potential sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a water body.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters
- Where attainable, achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water

Water quality standards consist of three elements:

- Designated beneficial use or uses of a water body or segment of a water body
- Water quality criteria necessary to protect the use or uses of that particular water body
- Antidegradation policy

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as narrative statements. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 Total Maximum Daily Load Goals and Objectives

Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

Water bodies listed as impaired in the 2018 Integrated Water Quality Report and 303(d) List[2] were originally targeted for Stage 1 TMDL development in 2019. Illinois EPA uses the U.S. Geological Survey (USGS) 10-digit hydrologic unit code (HUC) to group subbasins into TMDL watersheds. This report addresses Stages 1 and 3 of the TMDL development process for the Salt Creek watershed (Little Wabash River basin) (HUC 0512011402). Stage 2 was not completed as data collection was not necessary to establish the TMDLs.

The TMDL goals and objectives for the Salt Creek watershed (Little Wabash River basin) included developing TMDLs for all impaired water bodies within the watershed, describing all of the necessary elements of the TMDL, developing a watershed-based plan (WBP) for each TMDL, and gaining public acceptance of the process. The following impaired water body segments in the Salt Creek watershed (Little Wabash River basin) are addressed in this report:

- Second Salt Creek (IL_CPD-01)
- Second Salt Creek (IL_CPD-03)
- Second Salt Creek (IL_CPD-04)
- First Salt Creek (IL_CPC-TU-C1)
- Salt Creek (IL_CP-04)
- Salt Creek (IL_CP-EF-C2)
- Salt Creek (IL_CP-EF-C4)
- Salt Creek (IL_CP-TU-C3)

[2] Illinois EPA. 2018. *Illinois Integrated Water Quality Report and Section 303(d) List, 2018.* https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2018-cycle-integrated-report-final-20210201.pdf

The eight impaired water body segments are shown on **Figure 1-1**, and TMDLs and/or percent reduction goals were developed for each segment and parameter where data confirmed impairment. **Table 1-1** lists the water body segment and potential causes and sources of impairment as identified by the 2018 Integrated Report.[3] Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[4] was approved by EPA on June 30, 2022.

Table 1-1 Impaired Water Bodies in the Salt Creek Watershed (Little Wabash River Basin)

Segment ID	Segment Name	Potential Cause of Impairment	Designated Use	Potential Sources (as identified by the 2018 303(d) list)
IL_CPD-01	Second Salt Creek	**Manganese**	Aquatic Life	Source Unknown, Natural Sources
		Total Phosphorus (TP)	Aquatic Life	Animal Feeding Operations, Livestock
IL_CPD-03	Second Salt Creek	*TP*	Aquatic Life	Animal Feeding Operations, Crop Production
IL_CPD-04	Second Salt Creek	*TP*	Aquatic Life	Animal Feeding Operations, Crop Production
IL_CPC-TU-C1	First Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production
IL_CP-04	Salt Creek	*TP*	Aquatic Life	Crop Production, Agriculture
IL_CP-EF-C2	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-EF-C4	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-TU-C3	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production

Notes: **Bold** text indicates the potential cause of impairment has a numeric water quality standard.
Italicized text indicates the potential cause of impairment does not have a numeric water quality standard and a reduction goal will be applied as directed by Illinois EPA. A WPP will be developed where appropriate.

Illinois EPA is currently only developing TMDLs for parameters that have numeric water quality standards. For potential causes that do not have numeric water quality standards, as noted in **Table 1-1**, TMDLs have been deferred until those criteria are developed. However, until numeric criteria are adopted, watershed protection plans (WPPs) have been developed using parameter-specific reduction goals that have been established by Illinois EPA.

DRAFT

Figure 1-1: Salt Creek Watershed (Little Wabash River Basin)
HUC 0512011402

CDM Smith

During the TMDL development process, historical data show that the aquatic life use is no longer impaired by manganese on Second Salt Creek (IL_CPD-01). The Illinois aquatic life use water quality standard for manganese changed in 2012 from the total fraction to the dissolved fraction and is now a hardness-based calculation. Section 5.1.1.1 provides additional discussion of data compared to the current standard. The segment has been removed from the 2020/2022 303(d) list for manganese, and TMDL development did not proceed beyond Stage 1.

TMDLs specify the following elements:

- Loading capacity (LC), or the maximum amount of pollutant loading a water body can receive without violating water quality standards
- Waste load allocation (WLA), or the portion of the TMDL allocated to existing or future point sources
- Load allocation (LA), or the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- Margin of safety (MOS), or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- Reserve capacity (RC), or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\mathbf{TMDL = LC = \Sigma WLA + \Sigma LA + MOS + RC}$$

Load reduction targets have been established for TP in stream in lieu of TMDLs as there is no water quality criterion established for TP in streams in Illinois. In this case, the LC is treated as equivalent to a load reduction target (see Sections 7 and 8). Reasonable assurance that the load reduction goals will be achieved is presented in the WPP (Section 9). The WPP for the Salt Creek watershed (Little Wabash River basin) describes how water quality goals will be met and attained. The WPP includes recommendations for implementing best management practices (BMPs), cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completing implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Salt Creek Watershed (Little Wabash River Basin) Description** provides a description of the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Salt Creek Watershed (Little Wabash River Basin) Public Participation** discusses public participation activities that occurred throughout report development.

- **Section 4 Salt Creek Watershed (Little Wabash River Basin) Water Quality Standards** defines the water quality standards and water quality guidelines for the impaired water bodies.
- **Section 5 Salt Creek Watershed (Little Wabash River Basin) Data and Potential Pollution Sources** presents the available water quality data needed to develop TMDLs and water quality goals, discusses the characteristics of the impaired stream segments in the watershed, and describes the point and nonpoint sources with potential to contribute to the watershed load.
- **Section 6 Approach to Developing Total Maximum Daily Loads and Identifying Data Needs** makes recommendations for the models and analysis that are needed for TMDL and WBP/WPP development and suggests segments for Stage 2 data collection.
- **Section 7 Methodology Development for Load Reductions in the Salt Creek Watershed (Little Wabash River Basin)** details the development of load reduction targets for the impaired segments.
- **Section 8 Water Quality Goals for the Salt Creek Watershed (Little Wabash River Basin)** provides the results of the load reduction analyses for the impaired segments within the watershed.
- **Section 9 Watershed Protection Plan for the Salt Creek Watershed (Little Wabash River Basin)** includes recommendations for implementation actions, point source monitoring, management measures, and BMPs that can be used to improve and maintain water quality in the watershed.

Section 2

Salt Creek Watershed (Little Wabash River Basin) Description

2.1 Location

The Salt Creek watershed (Little Wabash River basin) (HUC 0512011402 shown on **Figure 1-1**) is in central Illinois and drains approximately 60,900 acres (95.2 square miles). Roughly 56,600 acres (93 percent of the total watershed) lie in Effingham County and 4,300 acres lie in Cumberland County (7 percent of the total watershed).

2.2 Topography

Topography is an important factor in watershed management because stream types, precipitation, and soil types can vary significantly with elevation. Elevation data are available from USGS[5] for each 1:24,000 topographic quadrangle in the United States. Elevation data for the Little Wabash River/Green Creek watershed were obtained by overlaying the USGS grid data onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed.

Elevation in the Salt Creek watershed (Little Wabash River basin) ranges from approximately 650 feet above sea level in the north-central portion of the watershed to 465 feet above sea level where Salt Creek feeds into the Little Wabash River.

2.3 Land Use

Land use data for the Salt Creek watershed (Little Wabash River basin) was extracted from the U.S. Department of Agriculture's (USDA's) National Agriculture Statistics Service (NASS) 2018 Cropland Data Layer (CDL).[6] The CDL is a raster based, geo-referenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities, and to produce digital, crop-specific, categorized geo-referenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2018 and includes 26 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters.

DRAFT

Figure 2-1: Salt Creek Watershed (Little Wabash River Basin) Topography

CDM Smith

Land use characteristics of the Salt Creek watershed (Little Wabash River basin) were determined by overlaying the Illinois Statewide 2018 CDL onto the GIS-delineated watershed. **Table 2-1** contains the main categories of land uses contributing to the Salt Creek watershed (Little Wabash River basin), based on the 2018 CDL land cover categories, and includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed. **Appendix A** contains a table of all land uses in the watershed.

Table 2-1 Land Cover and Land Use in the Salt Creek Watershed (Little Wabash River Basin)

Land Cover Category	Area (Acres)	Percentage of Watershed Area
Soybeans	17,173	28.2
Corn	15,149	24.9
Deciduous Forest	12,082	19.8
Grass/Pasture	5,598	9.2
Developed/Open Space	5,303	8.7
Developed/Low Intensity	2,531	4.2
Developed/Medium Intensity	894	1.5
Double Crop Winter Wheat/Soybeans	868	1.4
Developed/High Intensity	408	0.7
Winter Wheat	317	0.5
Alfalfa	244	0.4
All Others	346	0.6
Total	**60,913**	**100**

The land cover data reveal that 33,751 acres, representing 55.4 percent of the total watershed area, are dedicated to agricultural activities. Corn and soybean make up 96 percent of the agricultural land use within the watershed. Forests and woodlands cover 19.8 percent of the watershed (12,082 acres). Approximately 15 percent of the watershed area (9,136 acres) is developed, urbanized land. Grasslands and pasture make up 9.2 percent of the area (5,598 acres) and the remainder (0.6 percent) of the watershed is wetland or open water.

2.3.1 Subbasin Land Use

The subbasin area draining to the impaired segments were further delineated through GIS (see **Figure 2-2**). Land cover data was then intersected with the subbasin boundaries to determine the land uses contributing runoff to the impaired waterbodies, as shown in **Table 2-2** through **Table 2-9**. These tables include all land areas upgradient of the impaired segment, including areas draining more directly to upstream impaired segments within the watershed.

2.4 Soils

Soils data are available through the Natural Resources Conservation Service's (NRCS's) Soil Survey Geographic (SSURGO) database.[7] For SSURGO data, field mapping methods using national standards are used to construct the soil maps. Mapping scales generally range from 1:12,000 to 1:63,360, making SSURGO the most detailed level of soil mapping done by NRCS.

Attributes of the spatial coverage can be linked to the SSURGO databases, which provides information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups and the K-factor of the Universal Soil Loss Equation. The following sections describe and summarize the specified soil characteristics for the Salt Creek watershed (Little Wabash River basin).

2.4.1 Soil Characteristics

Appendix B contains a table of the SSURGO soil series for the Salt Creek watershed (Little Wabash River basin). A total of 49 soil types exist in the watershed. The most common type, Cisne silt loam (0 to 2 percent slopes), covers 24 percent of the watershed. The next most common types, Bluford silt loam (0 to 2 percent slopes), Ava silt loam (2 to 5 percent slopes), and Newberry silt loam (0 to 2 percent slopes), cover 10.7, 10.5, and 9.1 percent of the watershed, respectively. All other individual soil types each represent less than 8 percent of the total watershed area. The table in **Appendix B** also contains the area, dominant hydrologic soil group, and K-factor range. Each of these characteristics is described in more detail in the paragraphs that follow.

Figure 2-3 shows the hydrologic soils groups found within the Salt Creek watershed (Little Wabash River basin).[8] Hydrologic soil groups are used to estimate runoff from precipitation. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

DRAFT

Figure 2-3: Salt Creek Watershed (Little Wabash River Basin)
Hydrologic Soil Groups

CDM Smith

While hydrologic soil groups B, C, D, B/D, and C/D are all found within the Salt Creek watershed (Little Wabash River basin), group C/D soils are the most common type, representing 62.5 percent of the watershed. Group C/D is a dual hydrologic soil group. Dual hydrologic soil groups can be adequately drained. The first letter applies to the drained condition and the second letter to the undrained condition. For the purpose of hydrologic soil grouping, "adequately drained" means that the seasonal high-water table is kept at 24 inches below the surface.[9]

A commonly used soil attribute is the K-factor, which is a measure of soil erodibility and quantifies the relative susceptibility of soil to sheet and rill erosion. Values of K range from 0.02 to 0.69, from least erodible to most erodible, respectively, and are influenced by elements including texture, organic matter content, structure, and saturated hydraulic conductivity.[10] The distribution of K-factor values in the Salt Creek watershed (Little Wabash River basin) range from 0.28 to 0.55, as shown in **Figure 2-4**.

2.5 Population

The Census TIGER/Line data[11] from the U.S. Census Bureau were retrieved. Geographic shapefiles of census block groups[12] were downloaded for the entire state of Illinois. All census block groups that have geographic center points (centroids) within the watershed were selected and tallied to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Given that the optimal size of a census block group is 1,500 people, and 8 block group centroids are within the watershed, it is estimated that approximately 12,000 people reside in the Salt Creek watershed (Little Wabash River basin). The major municipality in the watershed is shown in **Figure 1-1**. The largest urban development in the watershed is the city of Effingham, approximately half of which lies outside of the watershed, with a population of approximately 12,600.

2.6 Climate and Streamflow

2.6.1 Climate

Central Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly temperature and precipitation data from Effingham, Illinois (Station USC00112687) were extracted from the National Centers for Environmental Information database[13] for 1893 through 2019. Although there are no climate stations within the Salt Creek watershed (Little Wabash River basin), this station is less than 4 miles to the west and was selected because of its proximity to the watershed and completeness of its dataset. **Table 2-10** contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is approximately 40 inches. May and June are historically the wettest months, while January and February are the driest. July is historically the warmest month, with an average maximum temperature of 89 degrees Fahrenheit (°F), while January is typically the coldest month, with an average minimum temperature of 20°F.

Table 2-10 Average Monthly Climate Data for Effingham, Illinois

Month	Average Total Precipitation (inches)	Average Daily Maximum Temperature (°F)	Average Daily Minimum Temperature (°F)
January	2.4	37.5	20.0
February	2.2	41.1	22.5
March	3.5	52.4	32.0
April	3.8	65.5	42.6
May	4.5	75.4	52.2
June	4.6	84.8	61.5
July	3.6	88.8	65.1
August	3.3	87.1	63.0
September	3.2	80.8	55.6
October	3.0	68.7	44.3
November	3.3	53.5	33.6
December	2.9	41.1	24.3
Annual Average	**40.3[1]**	**64.7**	**43.1**

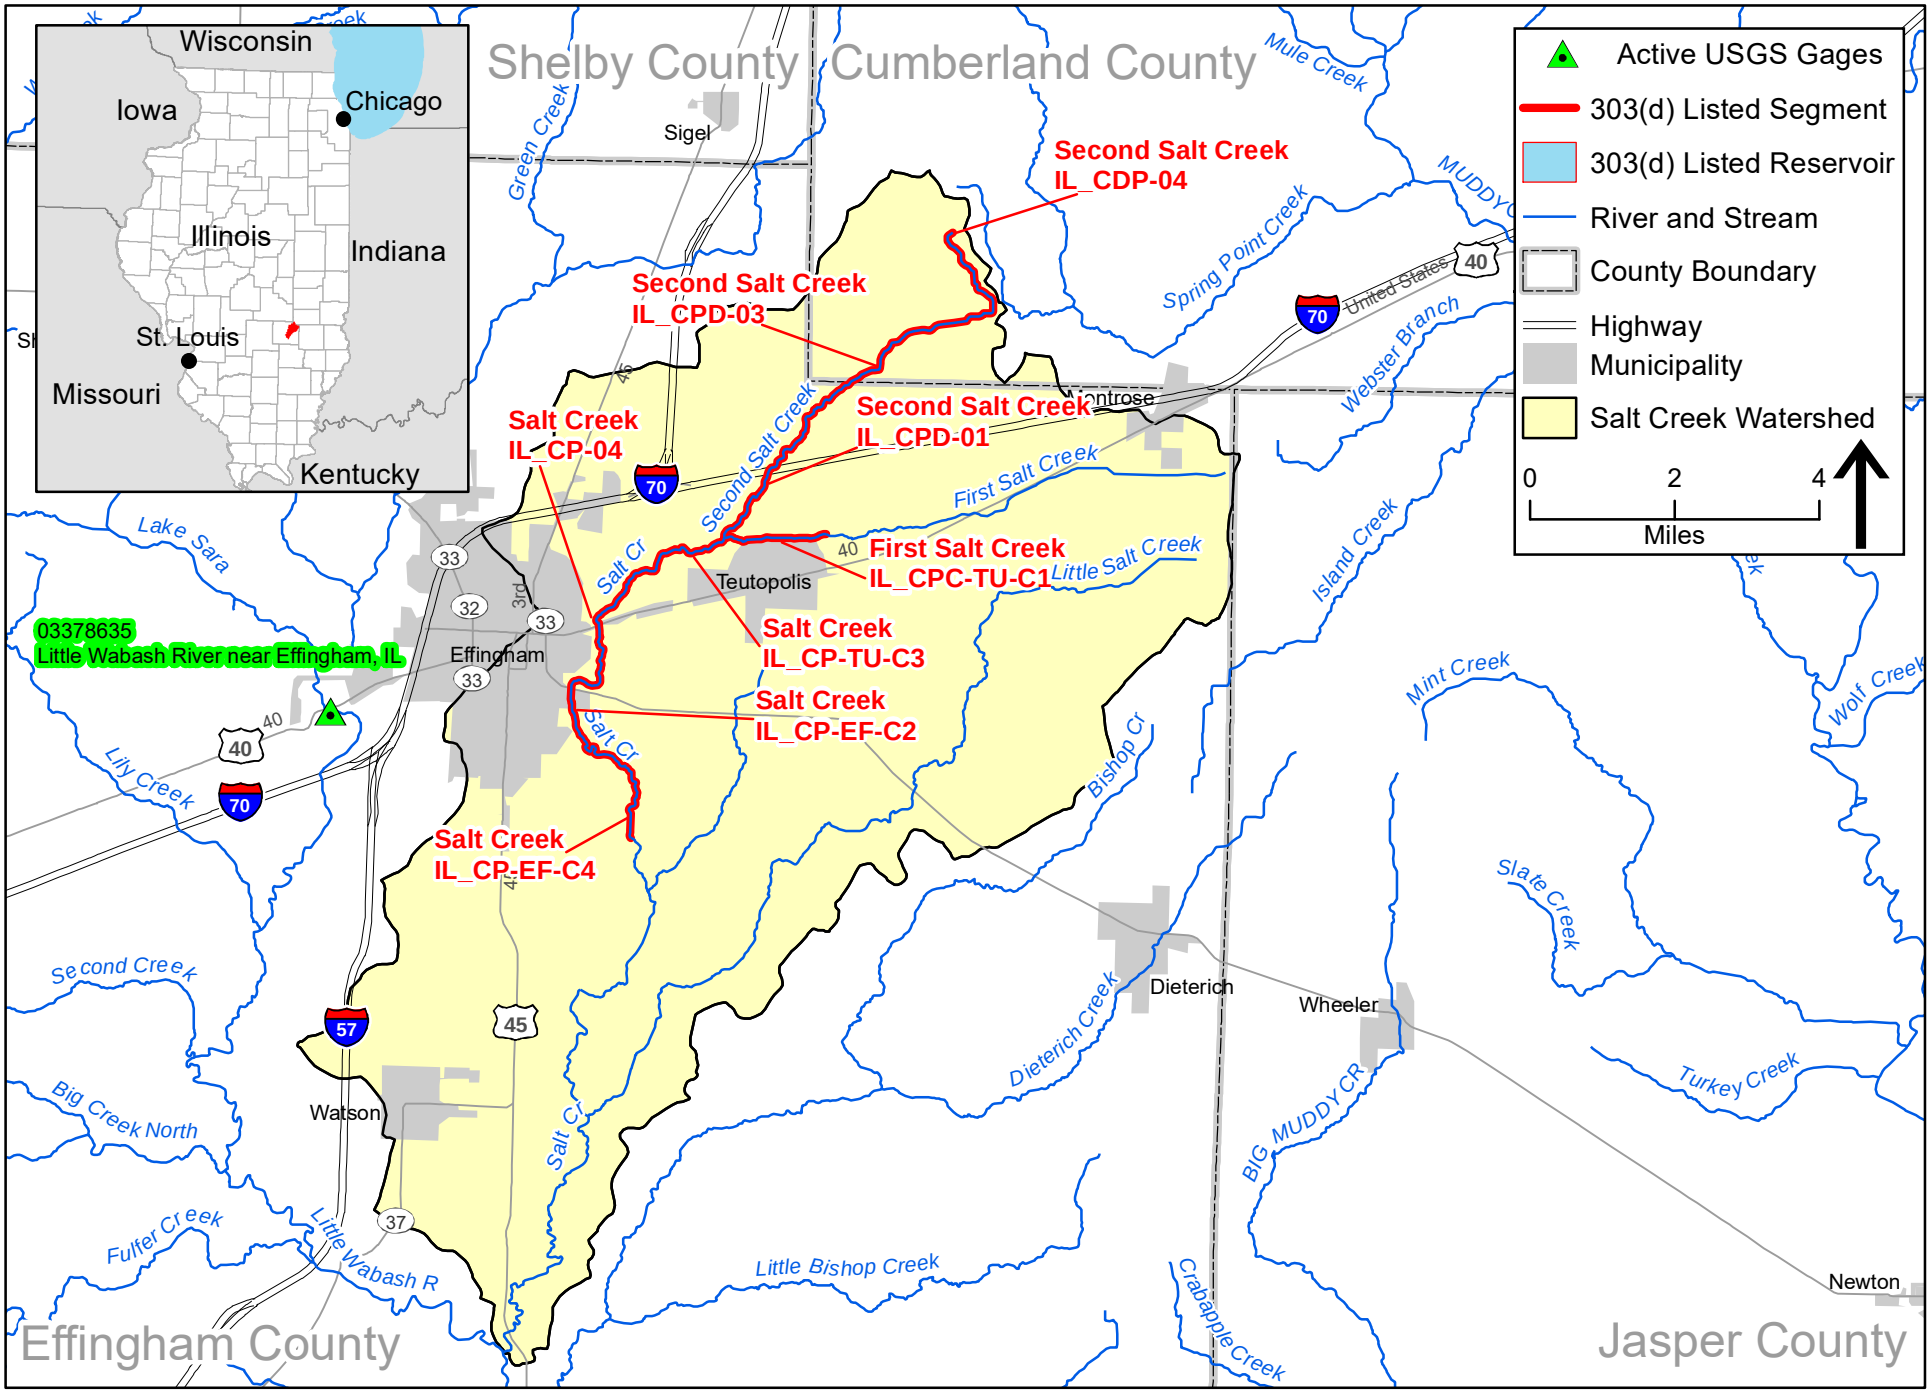
Note:
[1] Average annual total.

2.6.2 Streamflow

Analysis of the Salt Creek watershed (Little Wabash River basin) requires an understanding of flow throughout the drainage area. There are no USGS stream gages within the watershed; however, one gage is nearby, in an adjacent watershed with similar characteristics to that of the Salt Creek watershed (Little Wabash River basin)[14] as shown in **Figure 2-5**. **Table 2-11** summarizes the information from this station.

[13] National Centers for Environmental Information. Station USC00112687 data. https://www.ncdc.noaa.gov/cdo-web/datatools/findstation

[14] USGS. National Water Information System. Daily Streamflow Data for Illinois. https://waterdata.usgs.gov/IL/nwis/current/?type=dailydischarge&group_key=basin_cd



DRAFT

Figure 2-5: Salt Creek Watershed (Little Wabash River Basin)
Active USGS Gages

CDM Smith

Table 2-11 Streamflow Gages in the Salt Creek Watershed (Little Wabash River Basin)

Gage Number	Name	Drainage Area (square miles)	Approximate Distance from Salt Creek Watershed (miles)	POR	Minimum Monthly Mean Flow (cfs)	Maximum Monthly Mean Flow (cfs)
03378635	Little Wabash River near Effingham	240	1.5	1966–2020	52	421

cfs – cubic feet per second

Gage 03378635, Little Wabash River near Effingham, was used to estimate flow values for the impaired water bodies in the Salt Creek watershed (Little Wabash River basin) using the drainage area ratio method, represented by the following equation:

$$Q_{gaged}\left(\frac{Area_{ungaged}}{Area_{gaged}}\right)=Q_{ungaged}$$

where Q_{gaged} = Streamflow of the gaged basin

$Q_{ungaged}$ = Streamflow of the ungaged basin

$Area_{gaged}$ = Area of the gaged basin

$Area_{ungaged}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Data downloaded through the USGS for the surrogate gage for the available period of record were adjusted to account for point source influence in the watershed upstream of the gaging station. Average daily flows from all National Pollutant Discharge Elimination System (NPDES) permitted facilities upstream of the surrogate USGS gage were subtracted from the gaged flow prior to flow-per-unit-area calculations. The resulting estimates account for flows associated with precipitation and overland runoff only. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Salt Creek watershed (Little Wabash River basin) were added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment.

Section 3

Salt Creek Watershed (Little Wabash River Basin) Public Participation

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet water quality goals for the Salt Creek watershed. It is important to involve the public as early in the process as possible to achieve community cooperation and to counter any potential concerns regarding the process and the regulatory authority to implement any recommendations.

Illinois EPA, along with CDM Smith, held a virtual public meeting on June 30, 2021, to present Stage 1 of TMDL development (Sections 1 through 6). An additional public meeting will be held at the completion of Stage 3 (Sections 7 through 9). Comments received through the public meeting process are included in **Appendix D**. This section and the appendix will be updated following the final public meeting.

This page intentionally left blank.

Section 4

Salt Creek Watershed (Little Wabash River Basin) Water Quality Standards

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the "designated uses" of the state's waterways. In Illinois, the Illinois Pollution Control Board (IPCB) is responsible for setting the standards. Illinois is required to update water quality standards every 3 years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA in conjunction with EPA. New standards are then developed or revised during the 3-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards.[15]

4.2 Designated Uses

The waters of Illinois are classified into four primary categories of narrative and numeric water quality standards for surface waters: General Use Standards, Public and Food Processing Water Supplies Standards, Secondary Contact and Indigenous Aquatic Life Standards, and Lake Michigan Basin Water Quality Standards. Segments IL_CPD-01, IL_CPD-03, and IL_CPD-04 of Second Salt Creek; IL_CPC-TU-C1 of First Salt Creek; and IL_CP-04, IL_CP-EF-C2, IL_CP-EF-C4, and IL_CP-TU-C3 of Salt Creek are impaired for TP for the aquatic life designated use under the General Use Standard. Segment IL_CPD-01 of Second Salt Creek was also listed in 2018 for impairment of the aquatic life designated use by manganese under the General Use Standard.

4.2.1 General Use

The General Use classification is defined by IPCB as standards that "are intended to protect aquatic life, wildlife, agricultural, primary contact, secondary contact, and most industrial uses." They are also intended to "ensure the aesthetic quality of the state's aquatic environment and to protect human health from disease or other harmful effects that could occur from ingesting aquatic organisms taken from surface waters of the state." [16]

[16] Illinois EPA, *Integrated Report*, 9. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

4.3 Water Quality Criteria

According to the Illinois EPA Integrated Report,[17] aquatic life use assessments in streams are typically based on the interpretation of biological information, physiochemical water data, and physical habitat. The primary biological measures used are the fish Index of Biotic Integrity (fIBI), the macroinvertebrate Index of Biotic Integrity (mIBI), and the Macroinvertebrate Biotic Index. Physical habitat information used in assessments includes quantitative and qualitative measures of stream bottom composition and qualitative descriptors of channel and riparian conditions. Physiochemical water data used include measures of conventional parameters (e.g., dissolved oxygen [DO], pH, and temperature), priority pollutants, nonpriority pollutants, and other pollutants.

Table 4-1 presents the numeric water quality standards of the potential causes of impairment (based on the 2018 303(d) list) for Second Salt Creek.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of 2018 Stream Impairments in the Salt Creek Watershed (Little Wabash River Basin)

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Manganese (dissolved)	µg/L	Acute = $e^{A+B\ln(H)} \times 0.9812^{1}$ where A = 4.9187 and B = 0.7467 Chronic = $e^{A+B\ln(H)} \times 0.9812^{1}$ where A = 4.0635 and B = 0.7467	302.208(e)

Note:
[1] Conversion factor multiplier for dissolved metals.
µg/L – micrograms per liter ; H – hardness

As noted in Section 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List was approved by EPA on June 30, 2022.[18] Second Salt Creek (segment IL_CPD-01) is no longer on the 303(d) list for manganese. Based on this updated information, additional TMDL development for manganese in Second Salt Creek did not progress beyond the data and source review completed during Stage 1.

4.4 Illinois Nutrient Loss Reduction Strategy

In addition to the water quality standards provided above, Illinois EPA has also established water quality guidelines for nutrients in accordance with the Illinois Nutrient Loss Reduction Strategy (NLRS).[19] The NLRS was developed in response to hypoxia in the Gulf of Mexico and all 12 states within the Mississippi River basin were called upon by EPA to reduce nutrient loads flowing into the Mississippi River. Water quality goals will be incorporated into the WBPs and WPPs based on the NLRS, which calls for an overall 45 percent load reduction of total phosphorus leaving the state of Illinois, and an interim target of 25 percent load reduction by 2025. A WPP will be developed for all stream segments listed as impaired by TP using the interim TP load reduction

[17] Illinois EPA. 2022.
[18] Illinois EPA. 2022. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf
[19] IDA. Illinois NLRS. Illinois Nutrient Loss Reduction Strategy

goal of 25 percent. The WPP for the Salt Creek watershed (Little Wabash River basin) will include a comprehensive suite of BMPs for reducing loads from identified watershed sources.

4.5 Potential Pollutant Sources

To properly address the conditions within the Salt Creek watershed (Little Wabash River basin), potential pollutant sources must be investigated for the pollutants where TMDLs and/or load reduction goals will be developed. **Table 4-2** summarizes the potential sources associated with the listed impairments in the 2018 303(d) list for each of the impaired segments in this watershed.

Table 4-2 Impaired Water Bodies in the Salt Creek Watershed (Little Wabash River Basin)

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2018 303(d) list)
IL_CPD-01	Second Salt Creek	**Manganese**[1]	Aquatic Life	Source Unknown, Natural Sources
		TP	Aquatic Life	Animal Feeding Operations, Livestock
IL_CPD-03	Second Salt Creek	*TP*	Aquatic Life	Animal Feeding Operations, Crop Production
IL_CPD-04	Second Salt Creek	*TP*	Aquatic Life	Animal Feeding Operations, Crop Production
IL_CPC-TU-C1	First Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production
IL_CP-04	Salt Creek	*TP*	Aquatic Life	Crop Production, Agriculture
IL_CP-EF-C2	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-EF-C4	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-TU-C3	Salt Creek	*TP*	Aquatic Life	Municipal Point Source Discharges, Crop Production

Notes: **Bold** text indicates the potential cause of impairment has a numeric water quality standard.
Italicized text indicates the potential cause of impairment does not have a numeric water quality standard and a reduction goal will be applied as directed by Illinois EPA. A WPP will be developed where appropriate.

[1] Manganese has been removed from the 2020/2022 303(d) list and TMDL development did not continue beyond Stage 1 (Sections 1 through 6).

This page intentionally left blank.

Section 5

Salt Creek Watershed (Little Wabash River Basin) Data and Potential Pollution Sources

To further characterize the Salt Creek watershed (Little Wabash River basin), a wide range of pertinent data were collected and reviewed. Water quality data for streams, and information on potential point and nonpoint sources within the watershed, were compiled from a variety of data sources. This information is presented and discussed in further detail in the remainder of this section.

5.1 Water Quality Data

Illinois EPA monitoring programs that contribute data to the assessment of streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program.[20] Much of the data used for this report came from Intensive Basin Surveys, which are typically conducted on a 5-year cycle and focus on basins where intensive data are currently lacking or where historical data need updating. Additional information on Illinois EPA's monitoring programs can be found in the "Illinois Water Monitoring Strategy."[21]

Data from a total of 19 historical water quality stations on, or upgradient of, the impaired stream segments within the Salt Creek watershed (Little Wabash River basin) were located and reviewed for this report. These water quality data were provided by Illinois EPA. **Figure 5-1** shows the water quality data stations within the watershed that may contain data relevant to the impaired segment. **Figure 5-2** through **Figure 5-9** show the subbasins draining to each impaired segment. These figures include land use/land cover data that were presented in Section 2.3.1 and show the locations of permitted discharges (further discussed in Section 5.3).

Impaired water body segments in the Salt Creek watershed (Little Wabash River basin) were presented in Section 1. The data summaries provided in this section includes all available date ranges of collected data.

5.1.1 Stream Water Quality Data

Eight impaired stream segments exist within the Salt Creek watershed (Little Wabash River basin). The data summarized in this section include water quality data for the constituents listed as causing impairment in 2018 (manganese and TP). All historical water quality data for the impaired segments in the Salt Creek watershed (Little Wabash River basin) are available in **Appendix C**.

5.1.1.1 Dissolved Manganese

Second Salt Creek segment IL_CPD-01 was listed in 2018 for impairment of aquatic life use caused by elevated manganese concentrations. **Table 5-1** and **Figure 5-10** summarize the available historical dissolved manganese data for this segment. Both the acute and chronic general use water quality standards for dissolved manganese are calculated standards that vary with the total hardness of the sampled water.

Table 5-1 Existing Dissolved Manganese Data for Second Salt Creek Segment IL_CPD-01

Illinois Water Quality Standard (µg/L)	Period of Record and Number of Data Points	Mean (µg/L)	Maximum (µg/L)	Minimum (µg/L)	Number of Exceedances	Sample Locations
Varies[1]	2007–2017; 6	791	1500	128	0	CPD-01

Note:

[1] Hardness-dependent.

The summary of data presented in **Table 5-1** reflects single samples from the impaired segment compared to the hardness-dependent standard. No exceedances of the water quality standard were noted in the available dataset for Second Salt Creek. **Figure 5-10** shows the dissolved manganese measurements collected over time on the segment.

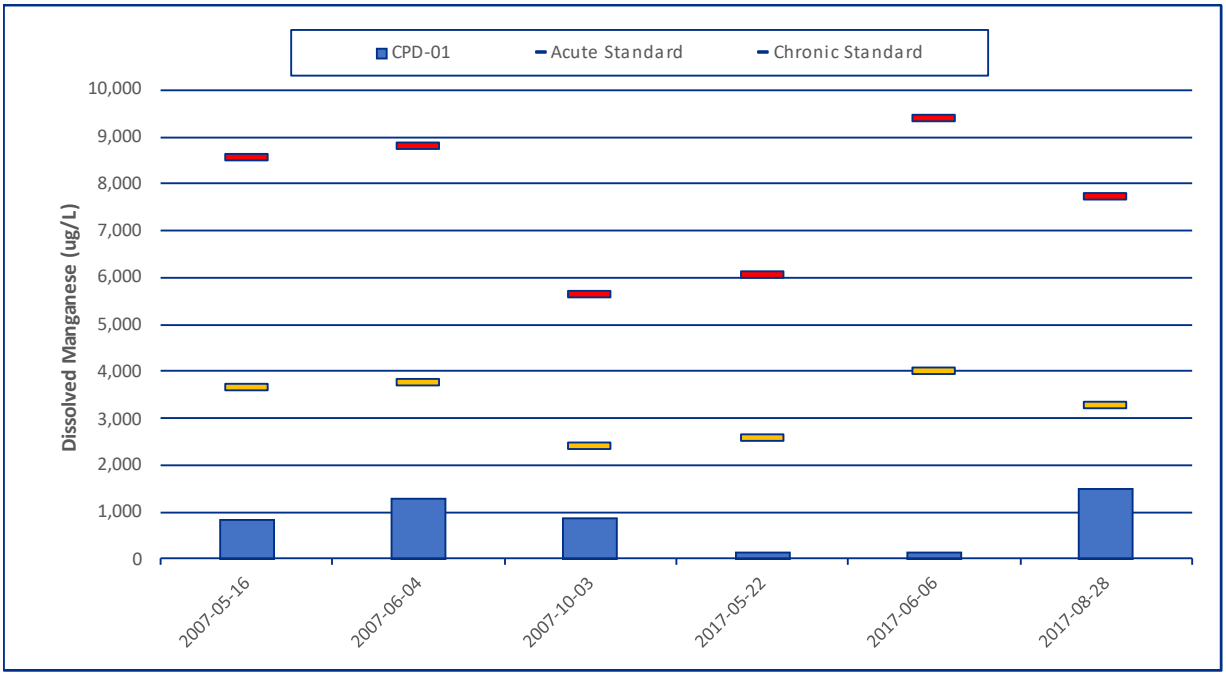

Figure 5-10 Dissolved Manganese concentrations in Second Salt Creek Segment IL_CPD-01

The lack of reported exceedances, where data exists, suggests that this segment was assessed as impaired because of elevated manganese concentrations based on a previous water quality standard for manganese. Prior to 2012, the applicable water quality standard for manganese to protect aquatic life uses in Illinois was 1.0 milligrams per liter (mg/L) of total manganese. This standard has since been replaced by the current hardness-dependent standards developed for the dissolved fraction of manganese in water. The lack of reported exceedances for segment IL_CPD-

01 resulted in the parameter being removed from the 2020/2022 303(d) list. Because the segment has been delisted, no further TMDL development was warranted.

5.1.1.2 Total Phosphorus

The following segments are listed for aquatic life use impairments caused by TP:

- Second Salt Creek segment IL_CPD-01
- Second Salt Creek segment IL_CPD-03
- Second Salt Creek segment IL_CPD-04
- First Salt Creek segment IL_CPC-TU-C1
- Salt Creek segment IL_CP-04
- Salt Creek segment IL_CP-EF-C2
- Salt Creek segment IL_CP-EF-C4
- Salt Creek segment IL_CP-TU-C3

Table 5-2, along with **Figure 5-11** through **Figure 5-19**, summarize historical phosphorus data collected on the impaired segments. No data are available for two of the impaired segments (IL_CPD-03 and IL_CPD-04). Data show that TP concentrations have generally decreased over time, starting around 2001 for most segments with sufficient data and periods of record. TP concentrations have also historically been highest during late summer/early fall. This is typically at the end of the agricultural growing season and during low stream flows. Currently, there are no numeric stream standards for TP in Illinois, however, as discussed in Section 4.4, the NLRS calls for an overall 45 percent load reduction of total phosphorus leaving Illinois, and an interim target of 25 percent load reduction by 2025.

Table 5-2 Existing Total Phosphorus Data for Impaired Segments within the Salt Creek Watershed (Little Wabash River Basin)

Impaired Segment	Period of Record and Number of Data Points	Mean (mg/L)	Maximum (mg/L)	Minimum (mg/L)	Sample Locations
IL_CPD-01	2007–2017; 12	0.51	0.74	0.21	CPD-01

5.2 Point Sources

There are three active point sources within the Salt Creek watershed (Little Wabash River basin) that discharge to or upstream of the impaired segment. **Table 5-3** contains permit information for these point sources, while **Figure 5-20** shows the locations of outfalls for each facility. Not all facilities within the watershed discharge upstream of impaired segments. In general, facilities discharging treated domestic wastewater have the potential to affect nutrient levels in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain metals and/or nutrients. NPDES facilities with permit limits are required to submit discharge monitoring reports (DMRs) to Illinois EPA. DMR data from discharges with the potential to impact impaired streams were reviewed and considered during load reduction calculations (refer to Section 7 and Section 8).

Table 5-3 Permitted Facilities Discharging to or Upstream of Impaired Segments in the Salt Creek Watershed (Little Wabash River Basin)

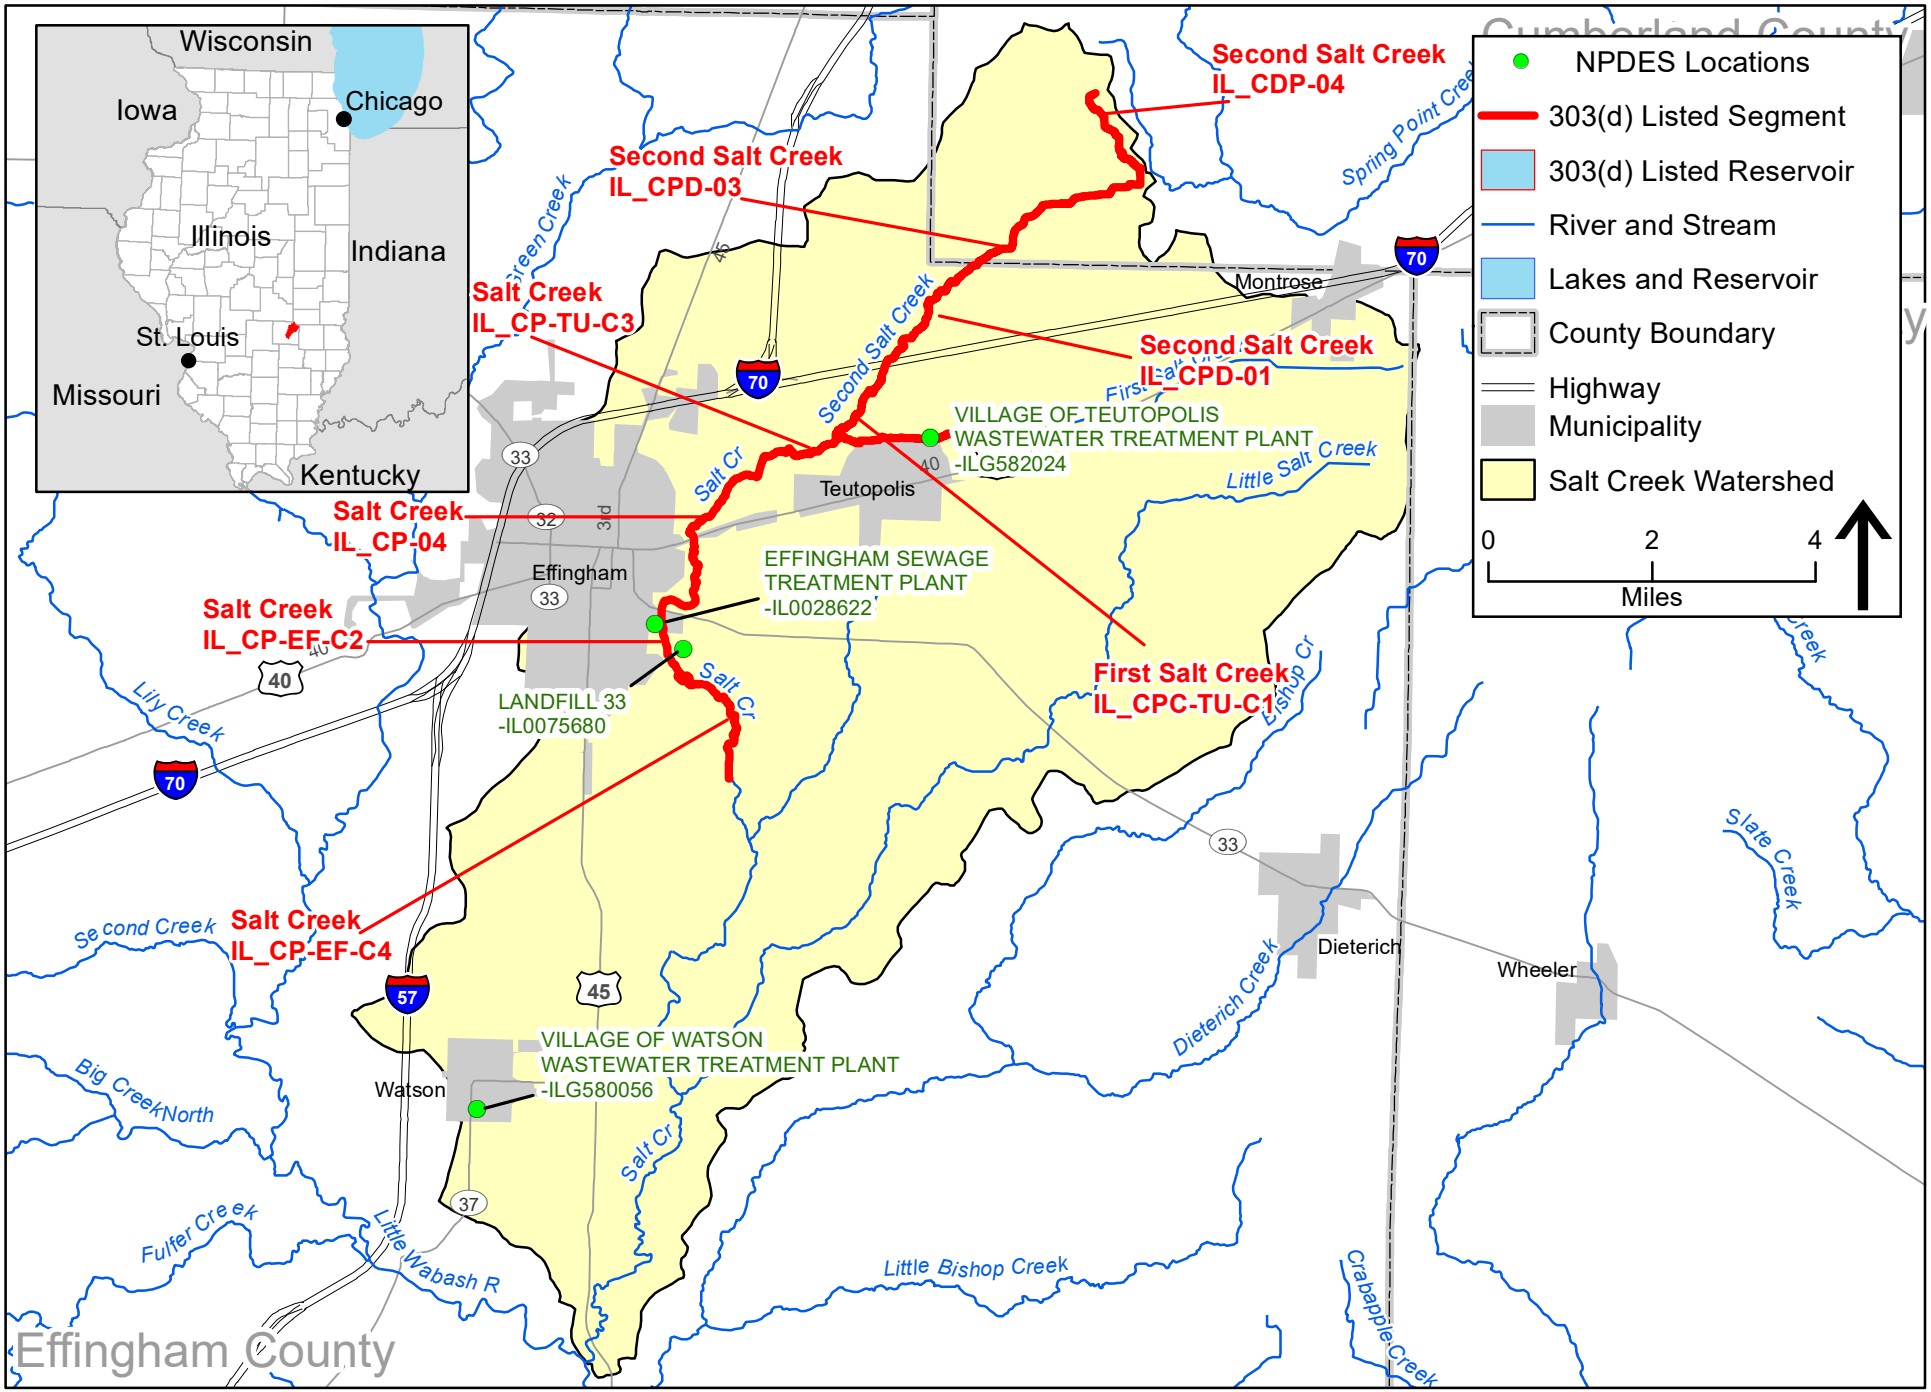
Facility ID	Facility Name	Design Average/ Maximum Flow (mgd)	Receiving Water
IL0028622	Effingham Sewage Treatment Plant	3.75/9.0[1]	Unnamed Tributary of Salt Creek
IL0075680	Landfill 33	Intermittent Stormwater[2]	Unnamed Tributary of Salt Creek
ILG582024	Village of Teutopolis Wastewater Treatment Plant	0.372/1.5	First Salt Creek (IL_CPC-TU-C1)
ILG580056	Village of Watson Wastewater Treatment Plant	0.1/0.37	Unnamed Tributary of Salt Creek

Notes:

[1] Flows are for the main outfall only. This facility also has a second outfall for treated combined sewer overflows (CSOs).

[2] No flow data are available for this outfall. It is likely that discharge only occurs during extreme high-flow events.

mgd – million gallons per day



DRAFT

CDM Smith

Figure 5-20: Salt Creek Watershed, NPDES Locations

5.3 Nonpoint Sources

There are many potential nonpoint sources of pollutant loading to the impaired segments in the Salt Creek watershed (Little Wabash River basin). This section will discuss site-specific cropping practices, animal operations, and area septic systems. Data were collected through communications with the local NRCS, Illinois Soil and Water Conservation Districts (SWCDs), and county health departments.

5.3.1 Crop Information

Approximately 56 percent of the land within the Salt Creek watershed (Little Wabash River basin) is dedicated to agriculture. Because much of the watershed is under cultivation, soil loss from fields is likely the primary source of sediment and any pollutant attached to the sediment (nutrients and, potentially, naturally occurring metals such as manganese). Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. The percentage of each tillage practice for corn, soybeans, and small grains by county are generated from county transect surveys by the Illinois Department of Agriculture (IDA).[22] Data are presented in **Table 5-4** and **Table 5-5** for Effingham and Cumberland Counties, respectively.

Table 5-4 Tillage Practices in Effingham County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	94.0%	94.6%	29.5%	29.4%	0.0%	33.3%
Reduced Till	2.8%	3.1%	27.5%	31.6%	0.0%	0.0%
Mulch Till	3.2%	1.3%	27.5%	20.6%	27.3%	26.7%
No Till	0.0%	0.9%	15.6%	18.4%	72.7%	40.0%

Table 5-5 Tillage Practices in Cumberland County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	91.0%	89.1%	17.4%	28.8%	0.0%	28.6%
Reduced Till	4.0%	3.9%	38.3%	30.4%	75.0%	57.1%
Mulch Till	2.0%	1.2%	35.4%	24.8%	25.0%	0.0%
No Till	3.0%	5.8%	9.0%	16.0%	0.0%	14.3%

According to the County Transect Survey Summary Report,[23] fields planted conventionally leave less than 15 percent of the soil surfaced covered with crop residue after planting, while mulch till leaves at least 30 percent of the residue from the previous crop remaining on the soil surface after being tilled and planted. Reduced till falls between conventional and mulch (greater than 15 percent but less than 30 percent) and no till practices leave the soil virtually undisturbed from

[23] IDA. 2018. *Illinois Soil Conservation Transect Survey Summary Report*. https://agr.illinois.gov/content/dam/soi/en/web/agr/resources/landwater/documents/2018-transect-survey-summary-report.pdf

harvest through planting. Residue is important because it shields the ground from the eroding effects of rain and helps retain moisture for crops.

Information on field tiling practices was also sought as field drains can influence the timing and amount of water delivered to area streams and reservoirs, and deliver dissolved nutrients from fields to receiving waters. Local NRCS offices reported, however, that tile drainage is very rare within the watershed.[24]

5.3.2 Animal Operations

Information on commercial animal operations is available from the NASS. Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals have the potential to increase erosion and contribute nutrients through manure. Although watershed-specific data are not available, countywide data for Effingham and Cumberland Counties are presented in **Table 5-6** and **Table 5-7**, respectively.[25,26]

Table 5-6 Effingham County Animal Population

Livestock Type	2012	2017	Percent Change
Cattle and Calves	35,491	26,737	-24.7
Beef	4,395	4,836	10.0
Dairy	4,363	3,925	-10.0
Hogs and Pigs	159,036	177,645	11.7
Poultry	83	79	-4.8
Sheep and Lambs	1,205	977	-18.9
Horses and Ponies	1,138	770	-32.3

Table 5-7 Cumberland County Animal Population

Livestock Type	2012	2017	Percent Change
Cattle and Calves	13,268	9,344	-29.6
Beef	1,533	1,462	-4.6
Dairy	2,720	1,794	-34.0
Hogs and Pigs	23,627	71,697	203.5
Poultry	30	29	-3.3
Sheep and Lambs	180	179	-0.6
Horses and Ponies	286	222	-22.4

These tables show significant cattle, hog, and pig populations within the watershed counties. There are no known concentrated animal feeding operations within the watershed, but communications with local NRCS officials have indicated that livestock is generally prolific within the Salt Creek watershed (Little Wabash River basin).[27]

5.3.3 Septic Systems

Most households in rural areas of Illinois that are not connected to municipal sewers make use of on-site sewage disposal systems, or septic systems. There are several types of septic systems, but the most common septic system is composed of a septic tank draining to a septic field, where nutrient removal occurs. However, the degree of nutrient removal is limited by local soils and the extent of system upkeep and maintenance. Across the U.S., septic systems have been found to be a significant source of phosphorus pollution.

Information on the extent of septic use in the Salt Creek watershed (Little Wabash River basin) was obtained from the Effingham County Health Departments. Health department officials stated that there are approximately 3,300 permitted septic systems within the county.[28]

5.4 Watershed Studies and Other Watershed Information

Previous efforts completed within the watershed are discussed below, although it is assumed that more information will become available through public meetings within the watershed community. In the event that other watershed-specific information becomes available, it will be reviewed, and all applicable data will be incorporated into the final report.

2008 – TMDLs were developed for the Little Wabash River 8-digit hydrologic unit watershed, which includes the 10-digit hydrologic unit Salt Creek watershed (Little Wabash River basin) discussed in this report. TMDLs were developed for First Salt Creek (IL_CPC-TU-C1), Second Salt Creek (IL_CPD-01, IL_CPD-03, and IL_CPD-04), and Salt Creek (IL_CP-EF-C2 and IL_CP-TU-C3), all of which are also addressed in this report. First Salt Creek was listed for manganese, DO, and TP. Second Salt Creek was listed for DO, sedimentation/siltation, total suspended solids (TSS), and TP. Salt Creek was listed for manganese, TP, DO, and total nitrogen as N.[29]

2021 – Regina Cassidy developed the Salt Creek Watershed Plan30 as her capstone project for the Master of Urban and Regional Planning from University of Illinois. The goals of the plan are to (1) improve water quality; (2) prevent and reduce flood damage; (3) protect and enhance natural resources; (4) restore and improve water-based recreational opportunities; and (5) support sustainable watershed communities. A suggested implementation schedule, interim measurable milestones, evaluation criteria, and a monitoring component are included. The report was reviewed and has been referenced and incorporated throughout the WPP presented in Section 9.

Section 6

Approach to Developing Total Maximum Daily Loads and Identifying Data Needs

Illinois EPA is currently developing TMDLs for pollutants that have numeric water quality standards. Of the pollutants listed in 2018 as causing impairment in the Salt Creek watershed (Little Wabash River basin), manganese is the parameter for which numeric water quality standards currently exist. As previously mentioned in this report, manganese was removed from the 2020/2022 303(d) listing for Second Salt Creek (segment IL_CPD-01) and no further TMDL development is warranted. For the remaining streams that remain on the 2020/2022 303(d) list for TP, a water quality goal has been developed based on the Illinois NLRS. Refer to **Table 1-1** for a full list of potential causes of impairment.

6.1 Simple and Detailed Approaches for Developing Total Maximum Daily Loads

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass balance, load duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL; this link can be established through a variety of techniques. The objective of the remainder of this section is to recommend approaches for establishing these links for the constituents of concern in the Salt Creek watershed (Little Wabash River basin).

6.2 Additional Data Recommendations for Total Maximum Daily Load and Water Quality Goal Development

Table 6-1 contains summary information regarding data availability for all 2018 listed impairments in the Salt Creek watershed (Little Wabash River basin). The available datasets for assessing TP impairments on Second Salt Creek, First Salt Creek, and Salt Creek are generally sufficient for basic water quality loads and reduction calculations. Additional data collection would further support load reduction calculations for segments with limited, outdated, and/or no segment-specific data available.

Table 6-1 Data Availability and Data Recommendations for Water Quality Goal Development in the Salt Creek Watershed (Little Wabash River Basin)

Impaired Segment	Impairment	Period of Record	Data Points for Impairment Assessment	Additional Data Needs
Second Salt Creek (IL_CPD-01)	Manganese	2007–2017	6	None – Delisted in 2020/2022 Integrated Report
	TP	2007–2017	12	None
Second Salt Creek (IL_CPD-03)	TP	NA	0	Additional data collection recommended
Second Salt Creek (IL_CPD-04)	TP	NA	0	Additional data collection recommended
First Salt Creek (IL_CPC-TU-C1)	TP	1999–2001	4	Additional data collection recommended
Salt Creek (IL_CP-04)	TP	1999–2017	33	None
Salt Creek (IL_CP-EF-C2)	TP	1999–2017	3	Additional data collection recommended
Salt Creek (IL_CP-EF-C4)	TP	1999–2017	1	Additional data collection recommended
Salt Creek (IL_CP-TU-C3)	TP	1999–2017	5	Additional data collection recommended

6.3 Approaches for Developing Water Quality Goals for Stream Segments

The recommended approach for developing load reduction estimates for the TP-impaired streams in the Salt Creek watershed (Little Wabash River basin) is the load duration curve method. The load duration methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a waterbody. A 25 percent reduction from historical average loads are the suggested endpoints for segments (with available data) and subbasins (where data are limited).

Section 7

Methodology Development for Load Reductions in the Salt Creek Watershed (Little Wabash River Basin)

7.1 Methodology Overview

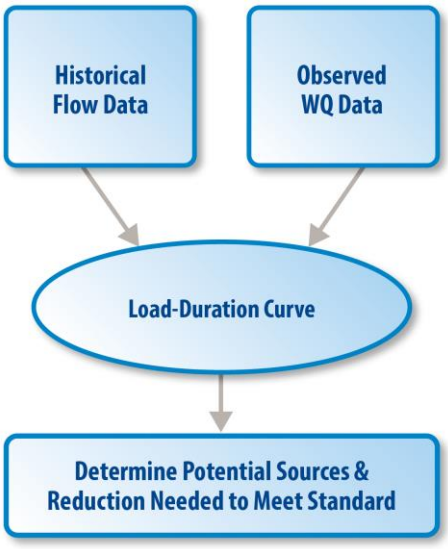
Table 7-1 contains information on the methodologies selected and used to develop load reduction goals for impaired segments within the Salt Creek watershed (Little Wabash River basin).

Table 7-1 Methodologies Used to Develop Calculated Reduction Goals in the Salt Creek Watershed (Little Wabash River Basin)

Segment ID	Segment Name	Cause of Impairment	Methodology
IL_CPD-01	Second Salt Creek	Manganese	Removed from 2020/2022 303(d) List – no TMDL developed
		TP	Modified load duration curve and calculated load reduction based on the Illinois NLRS
IL_CPD-03	Second Salt Creek	TP	
IL_CPD-04	Second Salt Creek	TP	
IL_CPC-TU-C1	First Salt Creek	TP	
IL_CP-04	Salt Creek	TP	
IL_CP-EF-C2	Salt Creek	TP	
IL_CP-EF-C4	Salt Creek	TP	
IL_CP-TU-C3	Salt Creek	TP	

7.1.1 Load Duration Curve Overview

A modified LC analysis was performed for the TP loads in each of the impaired segments through the development of load duration curves. Typically, a load duration curve is developed to show a graphical representation of the maximum load of a pollutant that a stream segment can assimilate over a range of flow scenarios while still meeting the instream water quality standard. The State of Illinois does not currently have an instream water quality standard for TP in streams. In this case, historical flow data and observed water quality data were used to determine the existing loading conditions for each impaired segment over the entire range of possible site-specific flow scenarios (see schematic at right). Once the existing loading conditions were established, a load reduction goal of 25 percent was



applied to the average of historical loads in each flow category. This reduction goal was selected based on the Illinois NLRS[31] (refer to previous discussion in Section 4.4).

7.2 Methodology Development for Load Duration Curves

Load duration curves are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. This approach was used to characterize the current loading of TP to each of the impaired segments in the Salt Creek watershed (Little Wabash River basin).

7.2.1 Watershed Delineation and Flow Estimation

Watersheds contributing runoff to each impaired stream segment consist of both the impaired segment's subbasin and all upgradient subbasins. The contributing watersheds were delineated with GIS analyses and result in the following estimates of directly contributing watershed areas used for each impaired segment's load duration curve development:

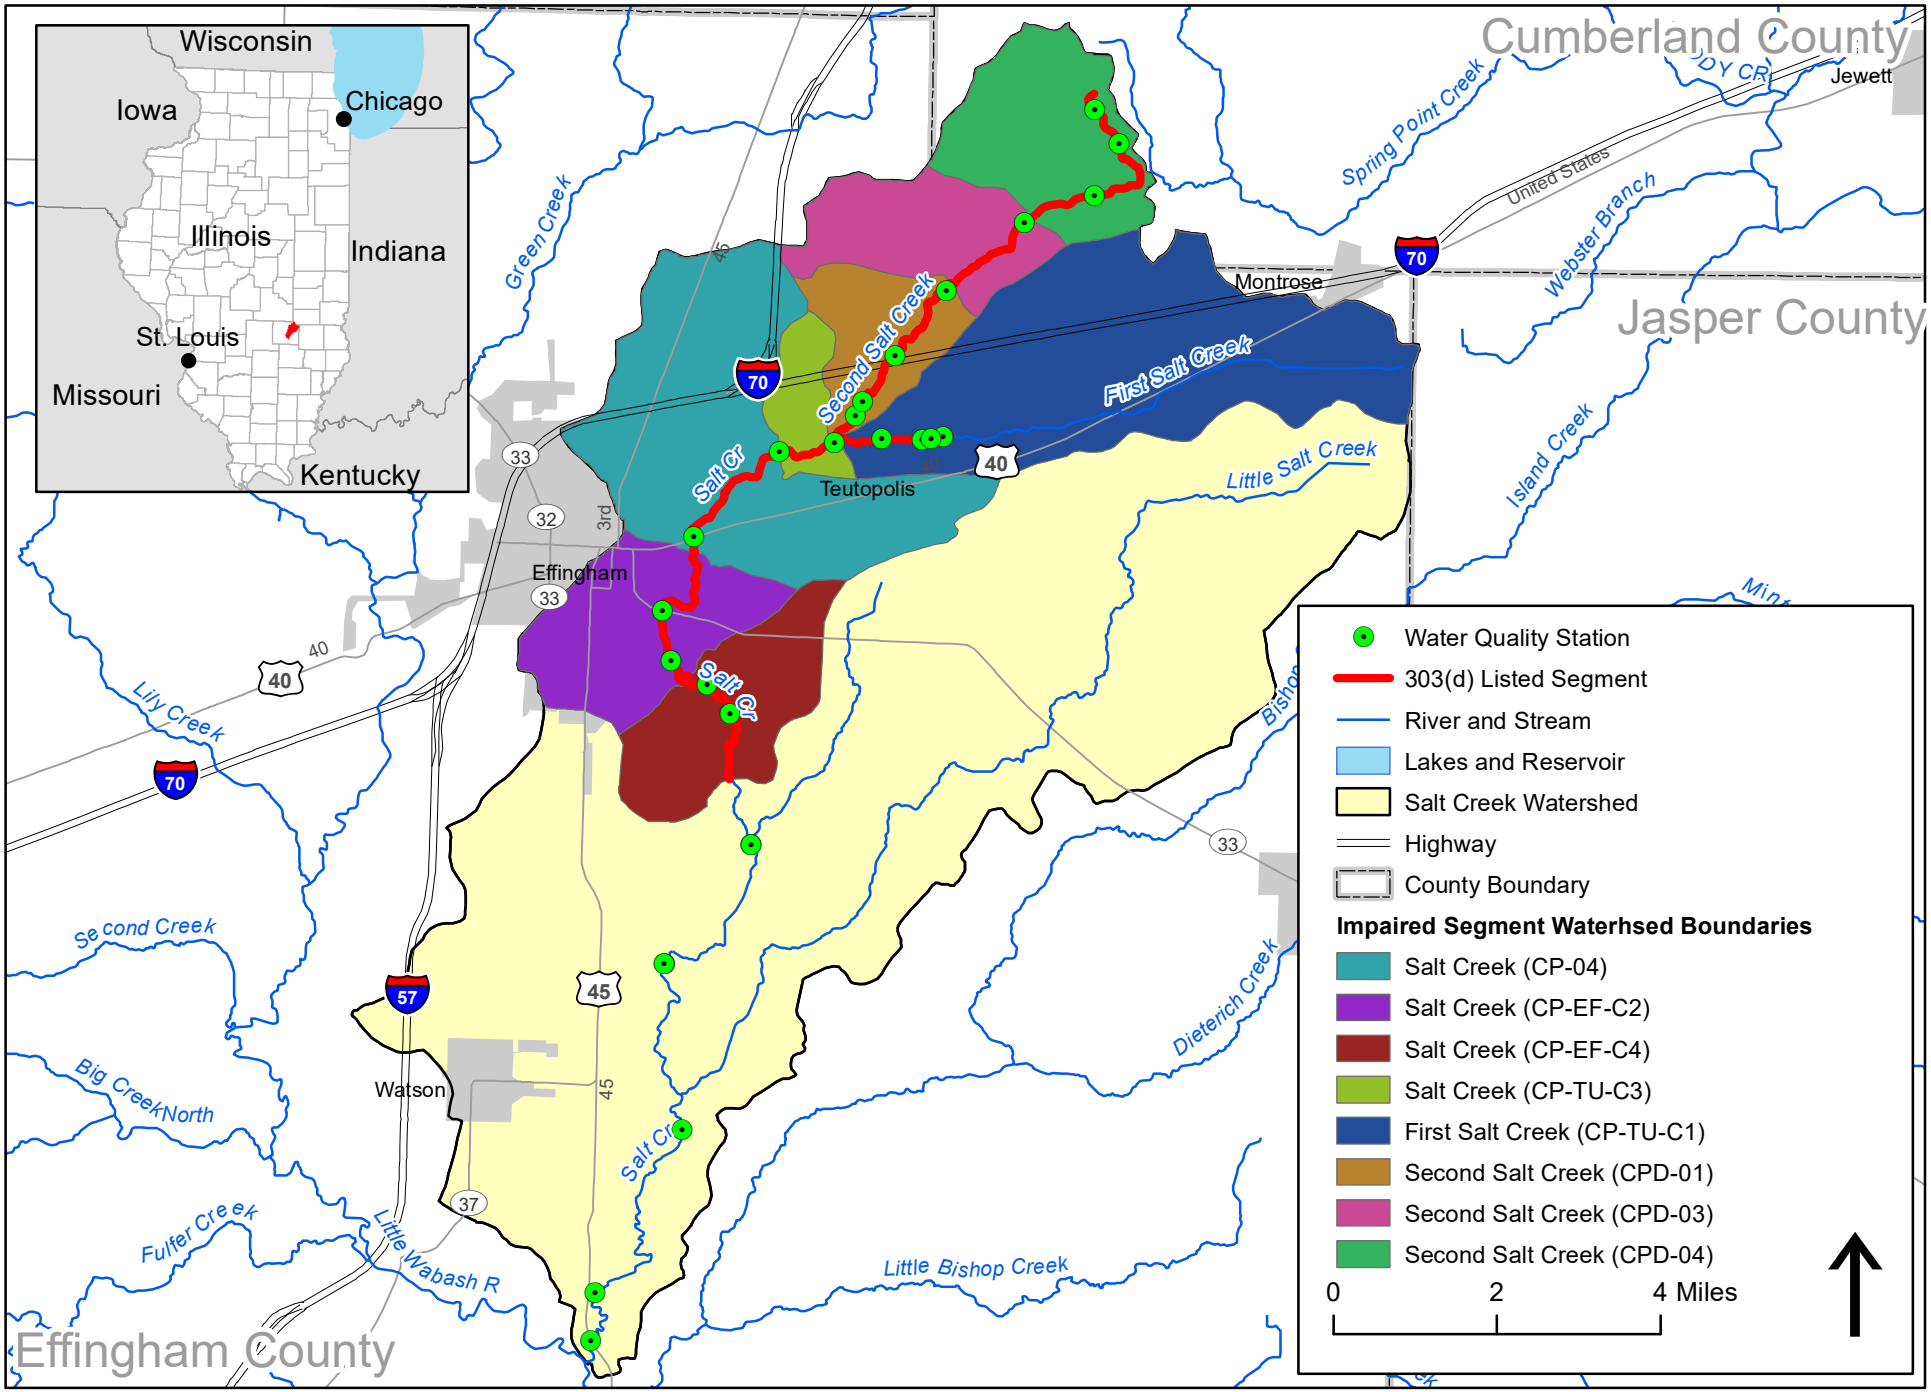
- Second Salt Creek IL_CPD-01: 10.7 square miles
- Second Salt Creek IL_CPD-03: 8.1 square miles
- Second Salt Creek IL_CPD-04: 4.6 square miles
- First Salt Creek IL_CPC-TU-C1: 12.0 square miles
- Salt Creek IL_CP-04: 34.3 square miles
- Salt Creek IL_CP-EF-C2: 38.8 square miles
- Salt Creek IL_CP-EF-C4: 42.8 square miles
- Salt Creek IL_CP-TU-C3: 24.1 square miles

Figure 7-1 shows the location of the water quality stations on each segment as well as the boundary of the GIS-delineated watersheds.

To create a load duration curve, it was necessary to obtain flow data corresponding to each water quality sample. As discussed in Section 2.6.2, there are no active USGS stream gages in the watershed. A USGS stream gage located approximately 1.5 miles from the watershed on the Little Wabash River was used as a surrogate gage.

USGS gage 03378635 (Little Wabash River near Effingham) was used to estimate stream flows for each of the impaired segments. Average monthly flows at the Little Wabash River gage range from 52 cfs during late summer/early fall low flows to 421 cfs during spring. The Little Wabash River near Effingham gage station drains an area of 240 square miles.

[31] IDA. Illinois NLRS. https://agr.illinois.gov/resources/nutrientloss.html



DRAFT

Figure 7-1: Watershed Boundaries and Water Quality Sampling Locations for Impaired Stream Segments within Salt Creek Watershed

CDM Smith

Data from this gage was used to estimate flow values at locations throughout the Salt Creek watershed (Little Wabash River basin) using the drainage area ratio method represented by the following equation:

$$Q_{gauged}\left(\frac{Area_{ungauged}}{Area_{gauged}}\right)=Q_{ungauged}$$

where Q_{gaged} = Streamflow of the gaged basin

$Q_{ungaged}$ = Streamflow of the ungaged basin

$Area_{gaged}$ = Area of the gaged basin

$Area_{ungaged}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Data downloaded through the USGS for the surrogate gage for the available period of record were adjusted to account for point source influences in the watershed upstream of the gauging stations. Average daily flows from all NPDES permitted facilities upstream of the surrogate USGS gages were subtracted from the gaged flow prior to flow-per unit-area calculations. The resulting estimates account for flows associated with precipitation and overland runoff only. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Salt Creek watershed (Little Wabash River basin) were then added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment. Spreadsheets used for the area ratio flow calculations are provided in **Appendix D**.

7.2.2 Total Phosphorus Load Duration Curves

No numeric standard exists for TP in streams, however, Illinois has developed a NLRS that contains an interim goal of reducing TP loads within the state by 25 percent. TP concentration data for the impaired segments were paired with the corresponding flows for the sampling dates and plotted against the load duration curve representing average conditions. **Figure 7-2** through **Figure 7-7** show the existing average load duration curves for the impaired segments as a solid blue line and the observed pollutant loads as points on the graphs. The average load was reduced by 25 percent and the resulting load duration curve is also plotted on each figure as a solid red line. No TP data were available for segments IL_CPD-03 and IL_CPD-04, and load duration curves were not developed. **Appendix E** contains the spreadsheets used for calculating the load duration curves presented on the pages that follow.

Section 8

Water Quality Goals for the Salt Creek Watershed (Little Wabash River Basin)

8.1 Load Reduction Targets

The load reduction targets for TP impairments in the Salt Creek watershed (Little Wabash River basin) are summarized in **Table 8-1**. A TMDL was not developed for manganese in Second Salt Creek (IL_CPD-01). This segment was assessed as impaired based on a previous water quality standard for total manganese. The previous standard was replaced in 2012 by the current hardness-dependent standards developed for the dissolved fraction of manganese in water. Available data presented in Section 5.1.1.1 show that dissolved manganese concentrations in the segment support the aquatic life use and the segment was removed from the 2020/2022 303(d) list for impairment caused by manganese.

TP load reduction targets were determined by reducing the average historical loads on each segment by 25 percent. This method was used because of the lack of existing numeric criteria and to meet the Illinois NLRS interim goal. The calculated load reduction targets are intended to serve as planning tools for overall water quality improvement strategies in the watershed and may be met through phased point source reductions and/or voluntary nonpoint source management practices. A WPP to meet water quality goals in the Salt Creek watershed (Little Wabash River basin) is included in Section 9.

Table 8-1 Load Reduction Targets for Impaired Constituents in the Salt Creek Watershed (Little Wabash River Basin)

Segment ID	Segment Name	Cause of Impairment	Average Concentration (mg/L)	Load Reduction Target (mg/L)
IL_CPD-01	Second Salt Creek	TP	0.51	0.38
IL_CPD-03	Second Salt Creek	TP	No segment-specific data available	0.38[1]
IL_CPD-04	Second Salt Creek	TP		
IL_CPC-TU-C1	First Salt Creek	TP	2.36	1.8
IL_CP-04	Salt Creek	TP	0.76	0.6
IL_CP-EF-C2	Salt Creek	TP	1.54	1.2
IL_CP-EF-C4	Salt Creek	TP	1.71	1.3
IL_CP-TU-C3	Salt Creek	TP	1.05	0.8

Note:

[1] A load reduction target was applied based on a shared subbasin.

8.2 Pollutant Sources and Linkages

Potential pollutant sources for impaired streams in the Salt Creek watershed (Little Wabash River basin) include both point and nonpoint sources as described in Section 5. The sources identified for each segment, based on data gathered and documented during Stage 1 and modeling completed in Stage 3, are presented in **Table 8-2**.

Table 8-2 Sources of Pollutants in the Salt Creek Watershed (Little Wabash River Basin)

Segment ID	Segment Name	Cause of Impairment	Potential Pollutant Source(s)
IL_CPD-01	Second Salt Creek	TP	Livestock
IL_CPD-03	Second Salt Creek	TP	Livestock, Crop Production
IL_CPD-04	Second Salt Creek	TP	Livestock, Crop Production
IL_CPC-TU-C1	First Salt Creek	TP	Municipal Point Source Discharges, Crop Production
IL_CP-04	Salt Creek	TP	Crop Production, Agriculture
IL_CP-EF-C2	Salt Creek	TP	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-EF-C4	Salt Creek	TP	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
IL_CP-TU-C3	Salt Creek	TP	Municipal Point Source Discharges, Crop Production

Load duration curves for each segment were presented in Section 7 and are useful in that they visually display historical sampling values along with hydraulic condition. **Table 8-3** shows the example source area/hydrologic condition consideration developed by EPA.[32]

Table 8-3 Example Source Area/Hydrologic Condition Considerations

Contributing Source Area	Duration Curve Zone[1]				
	High Flow	Moist	Mid-Range	Dry	Low Flow
Point Source				M	H
On-Site Wastewater System			H	M	
Riparian Areas		H	H	H	
Stormwater: Impervious Areas		H	H	H	
CSOs	H	H	H		
Stormwater: Upland	H	H	M		
Bank Erosion	H	M			

Note:

[1] The potential relative importance of a source area to contribute loads under given hydrologic conditions (H: high, M: medium).

8.2.1 Sources of Nutrients

The load duration curves indicate that higher periodic loads of phosphorus occur under both low- and high-flow conditions for most segments with sufficient data. This suggests that loads of TP

[32] EPA. 2007. An Approach for Using Load Duration Curves in the Development of TMDLs. EPA 841-B-07-006. https://www.epa.gov/sites/default/files/2015-07/documents/2007_08_23_tmdl_duration_curve_guide_aug2007.pdf

likely originate from a range of external sources such as municipal point sources, septic systems, and watershedwide livestock and agricultural practices. Nutrients bound in eroded soils and plant materials are introduced to the waterbodies through runoff from precipitation events. Potential stormwater-related inputs of phosphorus include runoff from agricultural areas, park lands, and developed areas. In addition, inputs are often caused by nutrient applications in agricultural and urban settings such as fertilizer inputs on crops, lawns, golf courses, and other intensively used and maintained landscapes. Nutrients adsorb to soils and enter waterways with runoff and erosion, resulting in excessive growth of algae and other aquatic plants, which impairs aesthetics, water quality, and recreational potential. Potential point sources of nutrient loads include NPDES permitted facilities as described in Section 5.2.

8.3 Total Maximum Daily Load Allocation

As described in Section 1.2, TMDLs are presented with the following equation:

$$\mathbf{TMDL = LC = \Sigma WLA + \Sigma LA + MOS + RC}$$

where:

	LC	=	Loading capacity – the maximum amount of pollutant loading a water body can receive without violating water quality standards
	WLA	=	Waste load allocation – the portion of the TMDL allocated to existing or future point sources
	LA	=	Load allocation – the portion of the TMDL allocated to existing or future nonpoint sources and natural background
	MOS	=	Margin of safety – an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
	RC	=	Reserve capacity – the portion of the load explicitly set aside for future population growth and additional development in the watershed

Because there is no water quality standard for TP in streams in Illinois, the LC is being used as an equivalent to meet the load reduction target. This allows for a similar process to be employed for parameters without current numeric criteria and WBPs or WPPs can be developed using the parameter-specific reduction goals that have been established by Illinois EPA.

8.3.1 Total Phosphorus Load Reduction Targets

The LCs of impaired stream segments are the pounds of TP that can be assimilated by the streams per day (units of pounds per day [lb/day]) and still meet the water quality target value. The water quality target values were presented in **Table 8-1** and were calculated by reducing the average historical TP load by 25 percent as guided by the Illinois NLRS.

8.3.1.1 Loading Capacity

The LC is the maximum amount of TP that the stream segment can receive and while achieving the 25 percent load reduction target established by the Illinois NLRS. These LCs were determined for each segment using the methodology discussed in Section 7. The TP LC for each impaired segment at various flow ranges is presented in **Table 8-4**.

Table 8-4 Total Phosphorus Loading Capacity in the Salt Creek Watershed

Zone	Flow Exceedance Range (%)	Second Salt Creek IL_CPD-04[1] (lb/day)	Second Salt Creek IL_CPD-03[1] (lb/day)	Second Salt Creek IL_CPD-01 (lb/day)	First Salt Creek IL_CPC-TU-C1 (lb/day)	Salt Creek IL_CP-04 (lb/day)	Salt Creek IL_CP-EF-C2 (lb/day)	Salt Creek IL_CP-EF-C4 (lb/day)	Salt Creek IL_CP-TU-C3 (lb/day)
High Flow	0–10	43	76	101	429	428	5,450	5,994	799
Moist	10–20	13	24	31	128	126	1,738	1,897	236
	20–30	6.4	11	15	63	61	934	1,010	114
	30–40	3.8	6.8	9.0	38	36	630	674	68
Mid-Range	40–50	2.5	4.5	6.0	25	23	474	502	44
	50–60	1.7	3.0	4.0	17	14	368	385	28
Dry	60–70	1.1	1.9	2.5	10	8.2	292	301	16
	70–80	0.6	1.1	1.4	6.4	4.1	240.8	244.4	8.6
	80–90	0.3	0.5	0.7	3.9	1.7	210.8	211.3	4.0
Low Flow	90-100	0.1	0.1	0.2	2.7	0.4	195.2	194.1	1.7

Note:

[1] No TP data were available for these segments so LC was estimated based on site data and load reduction targets from downstream segment IL_CPD-01.

8.3.1.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. The TP water quality target is not seasonal and the full range of expected flows are represented in the LC table; therefore, the LC represents conditions throughout the year.

8.3.1.3 Waste Load Estimates

Further allocation within the LCs into allowable point and nonpoint source loads was not completed for TP in streams. Municipal treatment plants were identified as potential sources of nutrients within the watershed. The wastewater treatment plants in the watershed collect TP data as part of their effluent permit requirements but do not currently have effluent limits for TP. These available effluent concentration data were used to estimate the existing waste load under the facilities' discharge average flows (DAFs) for reference (**Table 8-5**).

Table 8-5 Loading Estimates for NPDES Permitted Sewage Treatment Facility in the Salt Creek Watershed

NPDES Permit Number	Facility Name	Receiving Water	Design Average Flow (mgd)	Estimated Load Under DAF (lb/day)
IL0028622	Effingham Sewage Treatment Plant (STP)	Salt Creek IL_CP-EF-C2	3.75	38.5
ILG582024	Village of Teutopolis STP	First Salt Creek IL_CPC-TU-C1	0.372	17.2

8.3.1.4 Margin of Safety

The MOS can be implicit (incorporated into the analysis through conservative assumptions), or explicit (expressed as a portion of the loadings), or a combination of both. No explicit MOS of was

included for the TP analyses as the load reduction goals have been developed to guide implementation strategies rather than to impose regulated enforcement.

8.3.1.5 Reserve Capacity

An explicit RC was also not included in the assessment. Large future population growth or land use changes associated with increased nutrient loading is not anticipated in the area. In addition, potential future regulation and technology implementation are likely to encourage nutrient load reduction.

8.3.1.6 Load Allocations and Calculation Summaries

Table 8-6 through **Table 8-11** present TP LCs for each segment in the Salt Creek Watershed (Little Wabash River basin) along with historical observed loads and the reductions needed to meet interim goals under various flow conditions. Actual loads were calculated using the 90th percentile of observed concentrations in a given flow range.[33]

Table 8-6 Total Phosphorus Target Load Reductions for Second Salt Creek (IL_CPD-01)

Section 9

Watershed Protection Plan for the Salt Creek Watershed (Little Wabash River Basin)

9.1 Implementation Overview

The goal of this WPP is to identify the BMPs to be implemented in the Salt Creek watershed (Little Wabash River basin). The BMPs will provide reasonable assurance that impaired waters in the watershed will meet water quality goals developed to ensure waterbodies are able to support designated uses.

EPA has identified nine minimum elements that a watershed plan for impaired waters is expected to include. The nine elements are defined in **Table 9-1**. The table also indicates where each element is discussed in this report.

Table 9-1 EPA's Nine Elements of a Watershed Plan for Impaired Waters

Element	Element Description	Report Section
1	Identify causes and sources of pollution that will need to be controlled to achieve pollutant load reduction requirements estimated within the watershed plan.	Sections 5 and 8
2	Estimate pollutant load reductions expected as a result of implementation of management measures described in element 3.	Sections 8 and 9
3	Describe the nonpoint source BMPs that will need to be implemented to achieve load reductions estimates and identify the critical areas where measures need to be implemented.	Section 9.3
4	Estimate the level of technical assistance, associated costs, potential funding sources and parties that will be relied upon to implement the prescribed measures.	Section 9.4
5	Include a public information/education component designed to change social behavior.	Section 9.6
6	Develop an implementation schedule for the plan.	Section 9.7
7	Develop a description of interim, measurable milestones.	Section 9.7
8	Identify indicators that can be used to determine whether pollutant loading reductions are being achieved over time.	Section 9.8
9	Develop a monitoring component to evaluate the effectiveness of the implementation efforts over time.	Section 9.8

9.2 Adaptive Management

Watershed planning is an iterative and adaptive process that requires continuous monitoring and evaluation of success criteria to help improve results as lessons are learned throughout implementation. This adaptive management approach is recommended for the implementation of management practices designed to meet the load reduction targets developed for the Salt Creek watershed (Little Wabash River basin). Adaptive management conforms to the EPA guidelines outlined in **Table 9-1** as it is a systematic process for continually improving management policies

and practices through learning from the outcomes of operational programs. Some defining characteristics of an adaptive management approach include:

- Acknowledgement of uncertainty about what policy or practice is "best" for the particular management issue.
- Thoughtful selection of the policies or practices to be applied (the assessment and design stages of the cycle).
- Careful implementation of a plan of action designed to reveal the critical knowledge that is currently lacking.
- Monitoring of key response indicators.
- Analysis of the management outcomes in consideration of the original objectives and incorporation of the results into future decisions.

Implementation actions, management measures, available assistance programs, and recommended continued monitoring are all discussed throughout the remainder of this section to assist in development of an adaptive management program.

9.3 Best Management Practice Recommendations

Implementation actions, point source controls, management measures, and/or BMPs are used to control the generation or distribution of pollutants within a watershed. BMPs are either structural, such as wetlands, sediment basins, fencing, or filter strips, or managerial, such as conservation tillage practices, nutrient management plans (NMPs), or crop rotation. Both structural and managerial BMPs require effective management to be successful in reducing pollutant loading to water resources.[34]

It is typically most effective to install a combination of point source controls and BMPs or a BMP system. A BMP system is a combination of two or more individual BMPs that are used to control pollutants from a single critical source. If the watershed has more than one identified pollutant, but the transport mechanism is the same, then a BMP system that establishes controls for the transport mechanism can be employed.[35]

The following subsections describe recommended BMPs for the reduction of TP loads within the impaired segments of the Salt Creek watershed (Little Wabash River basin). As discussed in Sections 5 and 6, although the available data show that Second Salt Creek segment IL_CPD-01 may once have been impaired based on a previous standard established for total manganese (1.0 mg/L), it is no longer impaired when compared to the currently applicable hardness-dependent water quality standard developed for dissolved manganese. The segment has been removed from the 2020/2022 303(d) list for aquatic life use impairment by dissolved manganese. As such, no further evaluation of recommended manganese reduction BMPs are included in this plan.

---

[35] Osmond et al. 2015.

9.3.1 Recommendations for Total Phosphorus Reduction

Phosphorus is a nutrient critical to healthy ecosystems at low concentrations; however, over enrichment of phosphorus can result in aquatic ecosystem degradation when nitrogen is also available in sufficient quantities. Nutrient enrichment can result in rapid algal growth as available nutrients and carbon dioxide are consumed. This response can alter pH, decrease DO (which is critical to other aquatic biota), alter the diurnal DO pattern, and even create anoxic conditions. In addition, nutrient enrichment can reduce water clarity and light penetration and is aesthetically displeasing.

Inputs of phosphorus originate from both point and nonpoint sources. Most of the phosphorus discharged by point sources is soluble and originates from anthropogenic sources. For example, effluent from municipal sewage treatment plants is often a contributor of phosphorous loads to area waterways. Contributions from failed on-site wastewater treatment (septic) systems can also be a significant source (nonpoint), especially if they are concentrated in a small area. Phosphorus from nonpoint sources is generally insoluble or particulate. Most of this phosphorus is bound tightly to soil particles and enters streams from erosion although some may come from sources such as tile drainage in the dissolved form. The impact from phosphorus discharged by nonpoint sources is typically intermittent and is most often associated with stormwater runoff. Sedimentation can impact the physical attributes of the stream and act as a transport mechanism for phosphorus.

Table 9-2 lists all the stream segments currently impaired for TP according to the 2018 EPA 303(d) list of impaired waters. Impaired stream segments are listed from upstream to downstream.

Table 9-2 Salt Creek Watershed (Little Wabash River Basin) Streams Impaired for Total Phosphorus on the EPA 303(d) List from the Upstream to the Downstream Segment

Impaired Stream Segment	Segment ID	Segment Length (miles)[1]
Second Salt Creek	IL_CPD-04	3.08
Second Salt Creek	IL_CPD-03	1.46
Second Salt Creek	IL_CPD-01	2.9
First Salt Creek	IL_CPC-TU-C1	1.54
Salt Creek	IL_CP-TU-C3	0.89
Salt Creek	IL_CP-04	1.97
Salt Creek	IL_CP-EF-C2	2.4
Salt Creek	IL_CP-EF-C4	1.87

Note:
[1] Cassidy, R. 2021.

As presented in previous sections, possible external sources of TP in the Salt Creek watershed (Little Wabash River basin) include agricultural activity (cropping practices and animal operations), municipal and industrial point sources, and/or failing septic systems. To achieve a reduction of TP for the Salt Creek watershed (Little Wabash River basin), management measures can be implemented to address a range of potential sources.

9.3.1.1 Point Sources of Phosphorus

There are two municipal sanitary treatment plant dischargers (Effingham and Teutopolis) within the Salt Creek watershed (Little Wabash River basin) that discharge to or upstream of the impaired stream segments, and one landfill that contributes intermittent point source discharges during storm events. The Watson WTP discharges within the watershed, downstream of the impaired segments. Three of the four dischargers currently have general permits that do not require the monitoring or reporting of TP. The Effingham STP facility is required to monitor for TP through monthly grab samples although the current discharge permit does not include an effluent limitation for TP.

Landfill 33 is an active landfill within the Salt Creek watershed (Little Wabash River basin) and accepts municipal and nonhazardous special waste from the State of Illinois. The site has had a history of Illinois Code violations resulting in water pollution, various NPDES permit violations, and associated fish kills. The landfill entered into a compliance commitment agreement with Illinois EPA in 2018. The agreement certified that the facility would take additional actions to address some of these concerns. However, it is still likely that landfill practices are a significant source contributing to the nutrient impairments within the Salt Creek watershed (Little Wabash River basin).[36]

Point source loads were estimated for each facility for informational purposes using DAF and relevant DMR data and permit limitations where available. **Table 9-3** summarizes existing permit requirements and calculated WLAs for dischargers with the potential to impact TP-impaired streams within the Salt Creek watershed (Little Wabash River basin).

Table 9-3 Estimated Total Phosphorus Load from Wastewater Effluent Dischargers within the Salt Creek watershed (Little Wabash River Basin)

Facility Name	Facility ID	TP Monitoring/ Permit Limit	DAF (mgd)	Estimated TP Concentration (mg/L)[1]	Load Estimate (lb/day)
Effingham STP	IL0028622	Monthly/No Limit	3.75	7.15	38.5
Landfill 33	IL0075680	None	Intermittent Stormwater	Unknown	Unknown
Village of Teutopolis STP	ILG582024	None	0.263	3.2	17.2
Watson WWTP[2]	ILG580056	None	0.109	Unknown	Unknown

Notes:

[1] Based on DMR data submitted in 2021.

[2] The Watson WWTP does not discharge into a 303(d)-listed segment.

TP loads being contributed by point source dischargers may be significant in some impaired segments. Facilities that are not currently monitoring for TP may be advised to do so and submit the data along with their NPDES permit renewal applications in the future. Illinois EPA Permits Section will evaluate the monitoring data and decide whether additional monitoring and/or effluent limits may be warranted. Permits are reviewed and renewed on a 5-year cycle and any

[36] Cassidy, R. 2021.

new requirements would be issued for public review and comment and may be accompanied by a compliance schedule as needed.

Development of a water quality trading (WQT) program may also be a feasible way to promote TP reductions on a watershed scale. EPA conducted a WQT feasibility study for the Wabash River watershed, which determined there is high potential for a successful WQT program that would provide substantial economic and environmental benefits including large-scale nutrient reductions for the greater Wabash River watershed.[37] Illinois EPA can evaluate the feasibility study report and work directly with managers of point source discharge facilities to evaluate WQT programmatic decisions based on site-specific information.

9.3.1.2 Nonpoint Sources of Phosphorus

There are many potential nonpoint sources of phosphorus within the Salt Creek watershed (Little Wabash River basin). The following section presents information on watershed cropping practices, animal operations, and area septic systems. Data were collected, where available, through communications with the local NRCS, SWCDs, and public health departments.

BMPs that could be used for treatment of these nonpoint sources include:

- Nutrient management
- Conservation tillage practices
- Filter strips and riparian buffers
- Farming/soil retention practices
- Wetlands
- Water and sediment control basins (WASCOBs)
- Phosphorus-based lawn fertilizer restrictions

Nutrient Management: Nutrient management programs could result in reduced nutrient loads to impaired stream segments within the Salt Creek watershed (Little Wabash River basin). Crop management of nitrogen and phosphorus originating in the agricultural portions of the watershed can be accomplished through NMPs that focus on increasing the efficiency with which applied nutrients are used by crops, thereby reducing the amount of nutrients available to be transported to both surface water and groundwater.

The overall goal of nutrient reduction from agriculture should be to increase the efficiency of nutrient use by balancing nutrient inputs in feed and fertilizer with outputs in crops and animal produce, and manage the concentration of nutrients in the soil. The four "Rs" of nutrient management are applying the right fertilizer source at the right rate at the right time and in the right place. It is not unusual for crops in fields or portions of fields to show nutrient deficiencies during periods of the growing season, even where an adequate NMP is followed. The fact that

[37] Conservation Technology Information Center, Tetra Tech, Inc., and Kieser & Associates, LLC. 2011. *Wabash River Watershed Water Quality Trading Feasibility Study*. EPA-WS-00E71501-0. http://kieser-associates.com/uploaded/wabash_wqt_feasibility_study_091411_final_report.pdf

nutrients are applied does not necessarily mean they are available. Plants obtain most of their nutrients and water from the soil through their root system. Any factor that restricts root growth and activity has the potential to restrict nutrient availability and result in increased nutrient runoff.

Reducing nutrient loss in agricultural runoff may be brought about by source and transport control measures such as filter strips or grassed waterways. NMPs account for all inputs and outputs of nutrients to determine reductions. NMPs typically include the following measures:

- Review of aerial photography and soil maps.
- Regular soil testing to determine areas where adequate or excessive fertilization has taken place, monitor where nutrient buildup in soils occurs, and aid in determining fertilization maintenance requirements. Appropriate soils sampling and analysis techniques are described in the *Illinois Agronomy Handbook*.[38]
- Review of current and/or planned crop rotation practices.
- Establishment of yield goals and associated nutrient application rates, which can help minimize the potential for excessive buildup of phosphorus and reallocate phosphorus sources to fields or areas where the greatest agronomic benefits can be produced.
- Development of nutrient budgets with planned application rates, application methods, and timing and form of nutrient application.
- Identification of sensitive areas and restrictions on application when land is snow covered, frozen, or saturated.

Regional differences in phosphorus-supplying power are shown in Figure 8-4 of the Illinois Agronomy Handbook.[39] The differences were broadly defined primarily based on variability in parent material, degree of weathering, native vegetation, and natural drainages. For example, soils developed under forest cover appear to have more available subsoil phosphorus than those developed under grass. Soil test values are used to determine when buildup and maintenance of soil phosphorus is needed to supplement soils with low phosphorus-supplying power. Specific application amounts should be determined by periodic soil testing. Subsoil levels of phosphorus in the southern Illinois region may be rather high by soil test in some soils, but this is partially offset by conditions that restrict rooting.

However, excessively high phosphorus soil test levels should not be maintained. While soil test procedures were designed to predict where phosphorus was needed and not to predict environmental problems, the likelihood of phosphorus loss increases with high phosphorus test levels. Environmental decisions regarding phosphorus applications should include such factors as distance from a significant lake or stream, infiltration rate, slope, and residual cover. One possible problem with using soil test values to predict environmental problems is in sample depth.

---

[38] University of Illinois Urbana-Champaign. 2021. *Illinois Agronomy Handbook.* http://extension.cropsciences.illinois.edu/handbook/

[39] Fernandez, F.G., and R.G. Hoeft. Under Revision. "Managing Soil pH and Crop Nutrients." Chapter 8 in: *Illinois Agronomy Handbook.* chapter08.pdf (illinois.edu)

Normally, samples are collected to a 7-inch depth for predicting nutritional needs. For environmental purposes, it is often necessary to collect samples from a 1- or 2-inch depth, which is the depth that will influence phosphorus runoff. Another potential problem is variability in soil test levels within fields in relation to the dominant runoff- and sediment-producing zones. Several fertilizer placement recommendations are described in the *Illinois Agronomy Handbook*. However, given the propensity of phosphorus to bind tightly to soil particles and subsequently enter streams through erosion, the deep fertilizer placement technique may be most appropriate in phosphorus impaired areas. Under the deep placement technique, the fertilizer is placed 4 to 8 inches deep into the soil rather than being spread near the surface.

Conservation Tillage Practices: Conservation tillage practices could help reduce nutrient and sediment loads into the impaired segment by reducing erosion of soils. **Table 9-4** shows the areas (acres) in each subbasin that are under cultivation, along with the percent of the corresponding watershed area that is cultivated. The areas shown in the table are for the impaired segment subbasin only and do not include upstream subbasins to avoid double counting the acreage across the entire Salt Creek watershed. Crop residuals or living vegetation cover on the soil surface protects against soil detachment from water and wind erosion.

Table 9-4 Cultivated Areas for the Salt Creek Watershed (Little Wabash River Basin) Subbasins

Impaired Stream Segment	Segment ID	Land Cover Area (acres)	Cultivated Area (acres)	Percent Cultivated
Second Salt Creek	IL_CPD-04	2,920	2,523	86%
Second Salt Creek	IL_CPD-03	2,236	1,667	75%
Second Salt Creek	IL_CPD-01	1,699	753	44%
First Salt Creek	IL_CPC-TU-C1	7,698	5,763	75%
Salt Creek	IL_CP-TU-C3	882	307	35%
Salt Creek	IL_CP-04	6,516	2,799	43%
Salt Creek	IL_CP-EF-C2	2,864	426	15%
Salt Creek	IL_CP-EF-C4	2,575	1,124	44%

Conservation tillage practices are no till and reduced till. No till is the practice of limiting soil disturbance to manage the amount, orientation, and distribution of crop and plant residue on the soil surface year-round.[40] Reduced till is managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year-round while limiting the soil-disturbing activities used to grow and harvest crops in systems where the field surface is tilled prior to planting.[41]

The no till practice consists only of an in-row soil tillage operation during the planting activities and a seed row/furrow closing device. No full-width tillage is performed from the time of harvest or termination of one cash crop to the time of harvest/termination of the next cash crop in the rotation regardless of the depth of the tillage operation. Limited tillage is allowed to close or level

[40] NRCS. 2016a. Conservation Practice Standard (CPS). Residue and Tillage Management, No Till. Code 329. https://www.nrcs.usda.gov/resources/guides-and-instructions/residue-and-tillage-management-no-till-ac-329-conservation

[41] NRCS. 2016b. CPS. Residue and Tillage Management, Reduced Till. Code 345. https://www.nrcs.usda.gov/resources/guides-and-instructions/residue-and-tillage-management-reduced-till-ac-345-conservation

ruts from harvesting equipment; however, no more than 25 percent of the field may be tilled for this purpose.

As discussed, the reduced till practice consists of managing plant residue on the soil surface while limiting soil-disturbing activities. The practice includes tillage methods commonly referred to as mulch tillage or conservation tillage, where the entire soil surface is disturbed by tillage operations such as chisel plowing, field cultivating, tandem disking, or vertical tillage. It also includes tillage/planting systems with few tillage operations (e.g., ridge till) but which do not meet the criteria for the no till practice as described herein and in Illinois NRCS CPS 329.[42]

In both the no till and reduced till practices, removal of residue from the row area prior to or as part of the planting operation is acceptable. In no till, however, the disturbed portion of the row width should not exceed one-third of the crop row width. In either practice, none of the residue should be burned. To reduce erosion to the targeted level, the current approved water and/or wind erosion prediction technology should be used to determine the amount of randomly distributed surface residue needed, the period of the year the residue needs to be present in the field, and the amount of surface soil disturbance allowed. All residues will be uniformly distributed over the entire field. Residue should not be shredded after harvest because shredding makes it susceptible to movement by wind or water, and areas where the shredded residue accumulates may interfere with planting of the next crop.

If the no till BMP is selected for use by a landowner, a separate plan will be prepared for each area that will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 329.[43] If the reduced till BMP is selected for use by a landowner, a separate plan will be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 345.[44]

Conservation tillage practices can remove up to 45 percent of the phosphorus from runoff. The 2018 IDA Soil Transect Survey estimated that conventional till currently accounts for 95 percent of corn, 29 percent of soybeans, and 33 percent of small grain tillage practices in Effingham County. To achieve TMDL load reductions, tillage practices already in place should be continued, and practices should be assessed and improved upon for all agricultural areas in the Salt Creek watershed (Little Wabash River basin) subbasins.

Filter Strips: Filter strips can be used as a control to reduce both sediment and phosphorus pollutant loads from runoff. Filter strips are strips or areas of permanent herbaceous vegetation situated between cropland, grazing land, or disturbed land and environmentally sensitive areas, such as waterways. The filter strips are permanently designated plantings to treat runoff and are not part of an adjacent cropland's rotation.

The filter strip vegetation may consist of a single species or a mixture of grasses, legumes, and/or other forbs that are appropriately adapted to the soil and climate, as well as to the farm chemicals used in the adjacent land. Approved seed listings are provided in the Illinois NRCS CPS 393.[45]

---

[42] NRCS. 2016a.
[43] NRCS. 2016a.
[44] NRCS. 2016b.
[45] NRCS. 2017a. CPS. Filter Strip. Code 393. https://efotg.sc.egov.usda.gov/api/CPSFile/5609/393_IL_CPS_Filter_Strip_2017

Applicable maintenance will be performed, as needed, to ensure the strips continue to function properly, including removal of state-listed noxious weeds, gully repair, removal of excess sediment, and reseeding. Overland flow entering the filter strip should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the filter strip. Harvesting of the filter strip vegetation, where appropriate, will help to encourage dense growth, maintain an upright growth habit, and remove contaminants and unwanted nutrients contained in the plant tissue. Prescribed burning may be used to manage and maintain the filter strip when an approved burn plan has been developed.

The installation of filter strips adjacent to the impaired stream segments, as well as any contributing tributaries, can result in considerable reduction of overland contributions of sediments, suspended solids, and nutrients to an impaired waterbody. Filter strips implemented along impaired streams and their tributaries slow and filter runoff and provide bank stabilization thereby decreasing erosion and re-sedimentation; however, they should not be installed on unstable channel banks already eroding due to undercutting of the bank toe. When used in support of a riparian forest buffer, filter strips can also restore or maintain sheet flow.

The Illinois NRCS CPS 393 describes filter strip requirements based on land slope; the requirements are designed to achieve a minimum flow through time of 15 to 30 minutes at a one-half inch depth. **Table 9-5** provides a summary of the guidance for filter strip width, or flow length, as a function of slope.[46]

Table 9-5 Filter Strip Flow Lengths Based on Land Slope

Percent Slope	Filter Strip Flow Length (feet)	
	Minimum	Maximum
0.5 %	36	72
1.0 %	54	108
2.0 %	72	144
3.0 %	90	180
4.0 %	108	216
5.0 % or greater	117	234

In conjunction with the available land use, topography, and soil information discussed in Section 2, mapping software was used to buffer impaired segments and their major tributaries to an appropriate and reasonable width to determine the total area found in the subbasin. Due to the wide range of soil types and slopes found throughout the watershed, the appropriate buffer widths estimated in GIS were based on the average slope of land within the maximum buffer areas of the impaired segment's major tributaries. These average slopes were then used to calculate approximate buffer distances based on the NRCS guidance using a best-fit equation to interpolate between the slope percentages to buffer width relationships provided in the NRCS guidance.

Not all land use types within the buffer areas are candidates for conversion to filter strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of

[46] NRCS. 2017a.

developed residential or commercial lands is often not feasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips and will likely provide the greatest benefit to water quality once converted. Therefore, GIS software was used to extract the approximate acreage of agricultural lands surrounding potential tributaries and buffer areas of the impaired stream segments within the Salt Creek watershed (Little Wabash River basin). The calculated overall buffer areas and acreage of agricultural land within the buffer distances for the impaired segments and its tributaries are provided in **Table 9-6**. These data represent an approximation of the maximum acreage of land potentially available for conversion to filter strips. A more detailed assessment of a given property is necessary to determine the exact size and extent of convertible lands likely to provide the greatest benefit to surface water quality following conversion to filter strips.

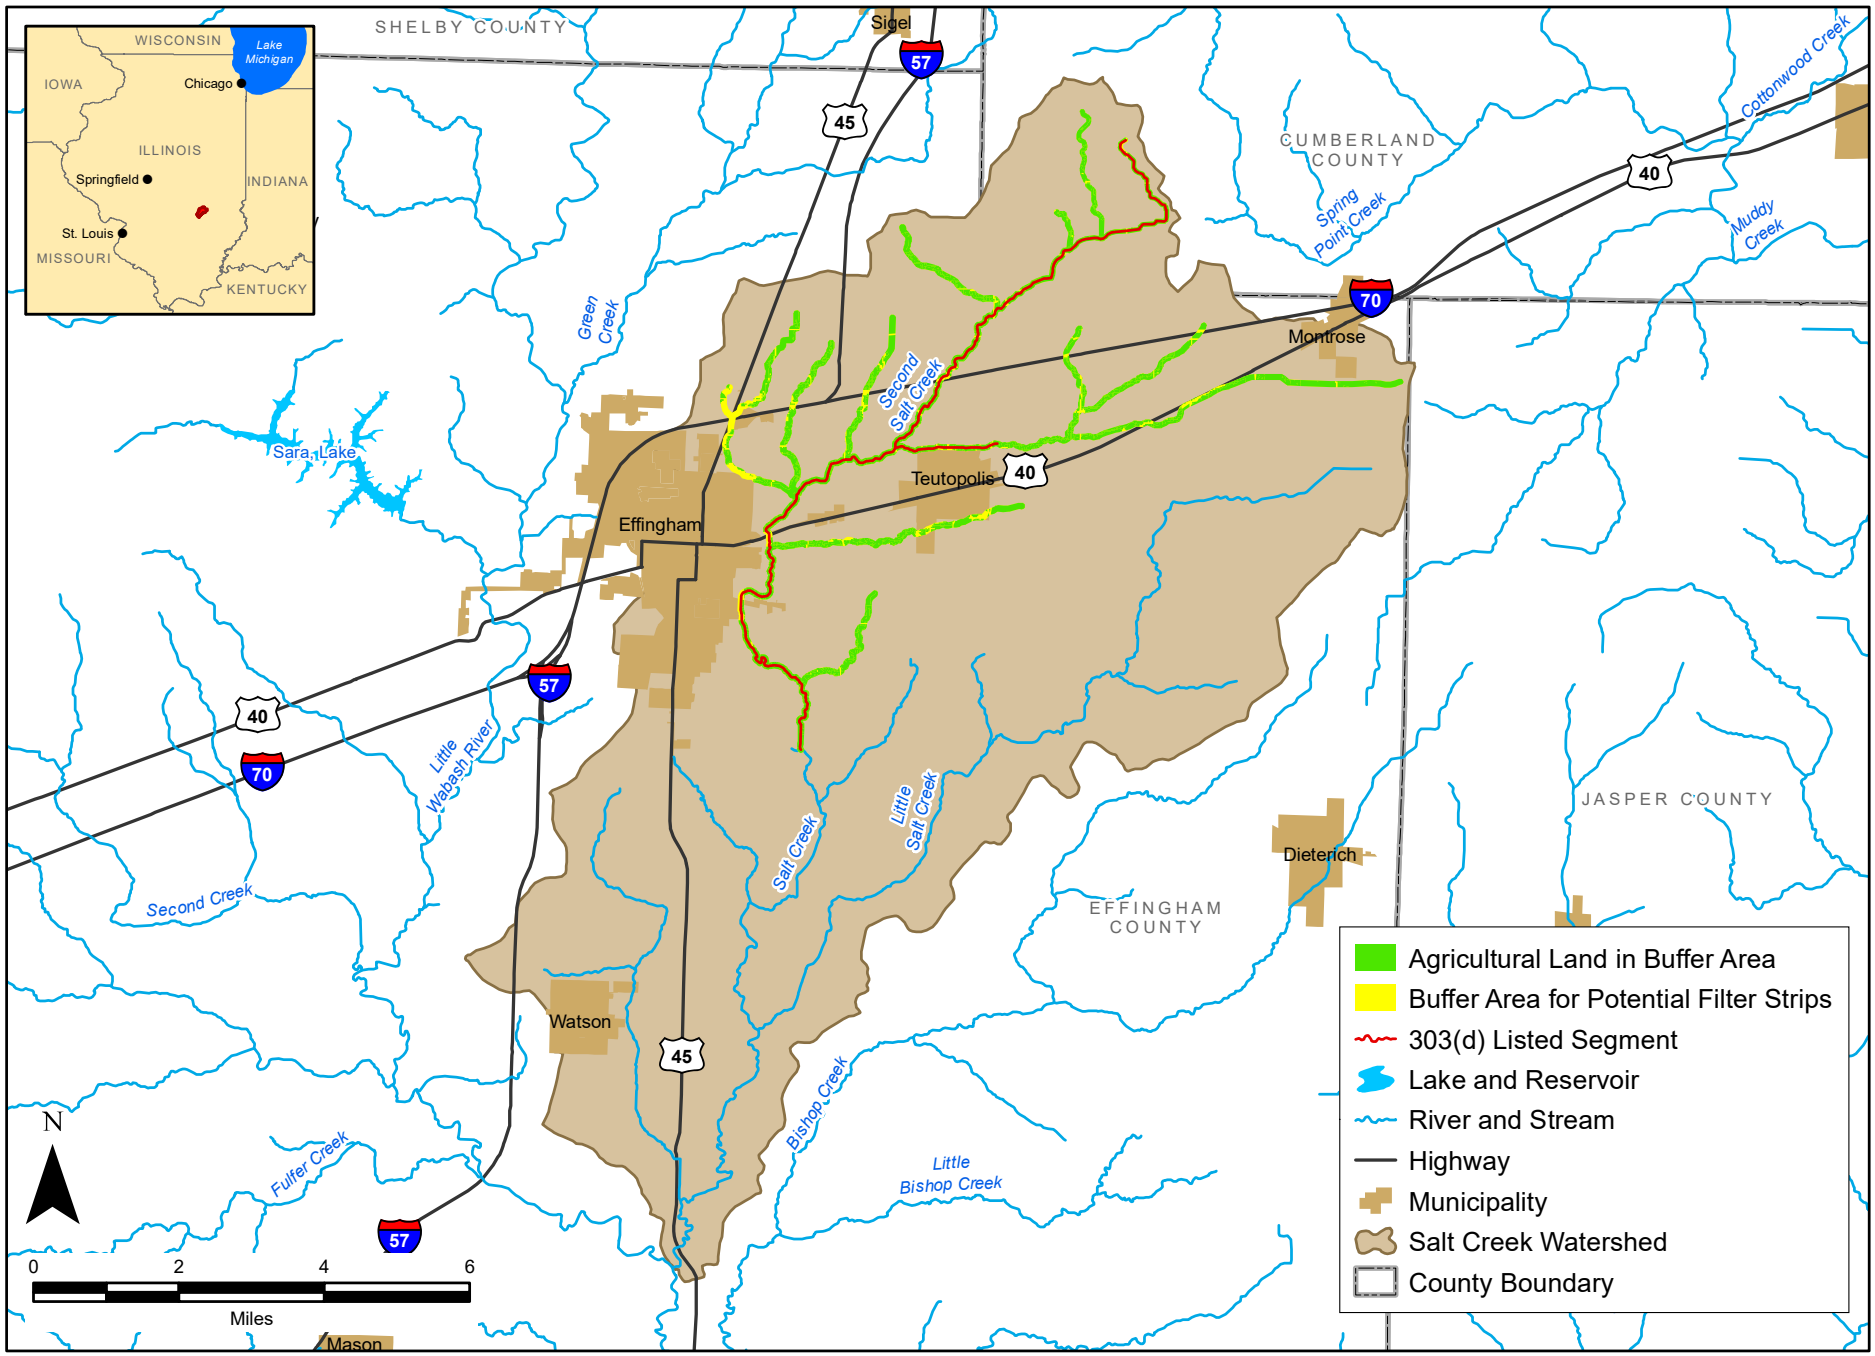
Table 9-6 Average Slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land within Buffers Potentially Suitable for Conversion to Filter Strips within the Salt Creek watershed (Little Wabash River Basin)

Impaired Stream Segment	Segment ID	Avg Stream Slope (%)	Filter Strip Flow Length (feet)	Total Buffer Area (acres)	Agricultural Land in Buffer (acres)
Second Salt Creek	IL_CPD-04	3	180	219	211
Second Salt Creek	IL_CPD-03	4	216	109	104
Second Salt Creek	IL_CPD-01	9	234	266	244
First Salt Creek	IL_CPC-TU-C1	4	216	594	540
Salt Creek	IL_CP-TU-C3	8	234	50	48
Salt Creek	IL_CP-04	11	234	609	471
Salt Creek	IL_CP-EF-C2	6	234	347	295
Salt Creek	IL_CP-EF-C4	13	234	215	211

There are a total of approximately 2,124 acres of agricultural land within the various buffer distances of the impaired stream segments where filter strips could potentially be installed. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table 9-5**. **Figure 9-1** shows the buffered areas and agricultural lands suitable for conversion to filter strips within the watershed.

If this BMP is selected for use by a landowner, a separate plan should be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 393,[47] including site preparation; seed, seeding rates, and mixtures; lime and fertilizer; seedbed preparation and seeding; and operation and maintenance.

[47] U.S. Census Bureau. 2010 Census – Block Maps.



DRAFT

CDM Smith

Figure 9-1: Salt Creek Buffer Areas and Agricultural Lands Potentially Suitable for Conversion to Filter Strips

Riparian Buffers: Similar to filter strips described above, riparian vegetation buffers enhance infiltration of runoff and subsequent trapping of nonpoint source pollutants such as phosphorus. The vegetation also serves to reinforce streambank soils, which helps minimize erosion. The primary difference between filter strips and riparian buffers are the types of vegetation plantings used within the buffer area. Riparian buffers leverage woody vegetation such as trees and shrubs. Grassland, forest, and agricultural areas within the appropriate buffer zones for each impaired stream segment within the Salt Creek watershed (Little Wabash River basin) are shown in **Table 9-6**. There are 2,409 acres within 234 feet of impaired stream segments. Approximately 2,124 of these acres are currently classified as agricultural. Landowners should assess parcels adjacent to the stream channels and maintain or improve existing riparian areas or potentially convert cultivated lands.

Soil Retention: Soil retention practices could help reduce nutrient loads into the impaired stream segments by reducing erosion of soils. As indicated above, approximately 80,166 acres of the Salt Creek watershed (Little Wabash River basin) are under cultivation, which accounts for about 71 percent of the watershed area. Farming practices in the watershed should be assessed to determine methods being used, where they can be improved upon, and what additional practices might be appropriate to reduce nutrient loads through soil retention.

Any farming/soil retention methods with the capability to reduce sediment and suspended solids entering impaired waterways also have the potential to reduce nutrient loads. In addition to conservation tillage and buffer strips (riparian or filter strips) as described above, other examples of soil retention methods may include:

- Field borders: A minimum 30-foot strip of permanent vegetation such as stiff-stemmed, upright grasses, grass/legumes, forbs, and/or shrubs established at the edge or around the perimeter of a cropland or grazing fields to reduce erosion from wind and water and protect soils and water quality.
- Contour farming: Aligning ridges, furrows, and roughness formed by tillage, planting, and other operations to alter the velocity and/or direction of water flow to or around hillslopes in areas where crops are grown on sloping lands.[48]
- Conservation crop rotation: A planned sequence of at least two different crops grown on the same ground over a period of time (i.e., the rotation cycle), and applies to all cropland where at least one annually planted crop is included in the rotation. To recover excess nutrients from the soil profile and reduce water quality degradation, crops with quick germination and root system formation, a rooting depth sufficient to reach the nutrients not removed by the previous crop, and nutrient requirements that readily utilize the excess nutrients should be used.

[48] NRCS. 2021a. CPS. Contour Farming. Code 330. https://efotg.sc.egov.usda.gov/api/CPSFile/32990/330_IL_CPS_(Con)tour_Farming_2021

- Stripcropping: A practice of growing planned rotations of erosion-resistant and erosion-susceptible crops or fallow in a systematic arrangement of approximately equal strips (two or more) across a field. Stripcropping can reduce sheet, rill, and wind erosion as well as the transport of sediment and other water- and wind-borne contaminants. Stripcropping can be applicable on steeper slopes but is less effective on slopes exceeding 12 percent.[49]

- Cover cropping: A cover crop consists of grasses, legumes, and forbs planted for seasonal vegetative cover that may either be established between successive production crops, or companion-planted or relay-planted into production crops. The cover crop should be established as soon as practical prior to or after harvest of the production crop and terminated as late as practical to maximize plant biomass production and nutrient uptake while allowing time to prepare the field for the next production crop.[50]

- Terracing: A soil conservation practice that may consist of an earthen embankment, channel, or combination of ridges and channels constructed across high-gradient slopes that can prevent runoff of precipitation from causing serious erosion. Terraces reduce both the volume and velocity of water moving across the soil surface which reduces peak discharge rates by temporarily storing runoff and allowing associated sediment and other contaminants to settle out behind the terrace ridge rather than directly entering receiving waters.[51]

- Critical area planting: The establishment of permanent vegetation on sites that have or are expected to have high erosion rates, and/or on sites that have physical, chemical, or biological conditions that prevent the establishment of vegetation using normal practices.[52]

- Sediment basins: A basin formed by an embankment or excavation, or combination of these, with a constructed engineered outlet that captures and detains sediment-laden runoff or other debris for a sufficient length of time. Sediment basins act as the last line of defense for capturing sediment when erosion has already occurred and must have sediment storage capacity, detention storage, and temporary flood storage capacities. For maximum sediment retention, the basin should be designed so that the detention storage remains full of water between storm events. If site conditions, safety concerns, or local laws preclude a permanent pool of water, all or a portion of the detention and sediment storage may be designed to be dewatered between storm events.

Wetlands: The use of wetlands as a structural control is applicable to nutrient reduction. To treat loads from agricultural runoff, such as phosphorus, wetlands could potentially be constructed at select locations where more focused runoff from fields occurs; e.g., downstream of a tile drainage system. Wetlands are effective BMPs for phosphorus and sediment control because they:

---

[49] NRCS. 2017b. CPS. Stripcropping. Code 585. https://www.nrcs.usda.gov/wps/portal/nrcs/detailfull/national/technical/cp/ncps/?cid=nrcs143_026849

[51] NRCS. 2021b. Conservation Practice Standard. Terrace. Code 600. https://efotg.sc.egov.usda.gov/api/CPSFile/31209/600_IL_CPS_Terrace_2021

[52] NRCS. 2010. CPS. Critical Area Planting. Code 342. NRCS. 2022. Conservation Practice Standard. Critical Area Planting. Code 342. https://efotg.sc.egov.usda.gov/api/CPSFile/35815/342_IL_CPS_Critical_Area_Planting_2022

- Prevent floods by temporarily storing water, allowing the water to evaporate or percolate into the ground
- Improve water quality through natural pollution control such as plant nutrient uptake
- Filter sediment
- Slow overland flow of water, thereby reducing soil erosion

A properly designed and functioning wetland can provide very efficient treatment of pollutants, such as phosphorus. Design of wetland systems is critical to the sustainable functionality of the system and should consider soils in the proposed location, hydraulic retention time, and space requirements. In general, soils classified as hydric are most suitable for wetland construction. There are approximately 24,593 acres of soils classified as at least 90 percent hydric within the Salt Creek watershed (Little Wabash River basin), which makes up about 40 percent of the entire watershed area.[53] Areas near waterways that are not currently classified as wetlands but have hydric soils present are typically strong candidates for potential wetland construction. Existing wetland areas may also be candidates for reconstruction or enhancement to improve their nutrient uptake capacity. **Figure 9-2** highlights the areas along stream segments within the Salt Creek watershed (Little Wabash River basin) that are comprised of hydric soils or wetlands which would be suitable for conversion or enhancement to help reduce nutrient loads into area waterways. These data layers are developed on a large-scale and on-site soil investigation and wetland delineation is typically necessary for verification of the suitability of a given area for wetland construction.

Constructed wetlands, which comprise the second or third stage of a nonpoint source treatment system, can be very effective at improving water quality. Studies have shown that artificial wetlands designed and constructed specifically to remove pollutants from surface water runoff have removal rates of greater than 90 percent for suspended solids, up to 90 percent for TP, 20 to 80 percent of orthophosphate, and 10 to 75 percent for nitrogen species.[54],[55],[56],[57] Although the removal rate for phosphorus is low in long-term studies, the rate can be improved if sheet flow is maintained to the wetland and vegetation and substrate are monitored to ensure the wetland is operation optimally. Sediment or vegetation removal may be necessary if the wetland removal efficiency is lessened over time.[58] Guidelines for wetland design suggest a wetland to watershed ratio of 0.6 percent for nutrient and sediment removal from agricultural runoff.

DRAFT

CDM Smith

Figure 9-2: Salt Creek Hydric Soils, Existing Wetlands, and Potential for Wetland Construction

WASCOBs: WASCOBs are earth embankments or combination ridge and channel systems constructed across the slopes of minor watercourses to reduce watercourse and gully erosion. These basins act as water detention basins and trap sediments (and the pollutants bound to the sediment) prior to them reaching a receiving water. The WASCOB reduces gully erosion by controlling flow within the drainage area, and the basins may be installed singly or in series as part of a system. The practice applies to sites where the topography is generally irregular, runoff and sediment damage land and improvements, and watercourse or gully erosion is a problem. Adequate and stable outlets from the basin are required to convey runoff water to a point where it will not cause damage. Additionally, sheet and rill erosion should be controlled by other conservation practices; i.e. the WASCOB would be part of another conservation system that adequately addresses resource concerns both above and below the basin. However, if land ownership or physical conditions preclude treatment of the upper portion of a slope, a WASCOB may be used to separate the upper area from and permit treatment of the lower slope.

WASCOBS should, at a minimum, be designed to be large enough to control runoff from at least a 10-year, 24-hour storm using a combination of flood storage and discharge through the outlet. Additionally, the WASCOB must be designed to have the capacity to store at least the anticipated 10-year sediment accumulation. Otherwise, periodic sediment removal is required as part of the maintenance activities to maintain the required capacity. Locations are determined based on slopes, erosion areas, crop management, and soil survey data.

When using a WASCOB, a separate plan will be prepared for each treatment unit which will use this practice. Local NRCS personnel can often provide information and advice for design and installation. Illinois NRCS CPS 638[59] also provides additional information on the design and maintenance requirements for WASCOBs, as well as information on cropping activity recommendations and requirements around the basin. Maintenance includes reseeding or planting the basins in to maintain vegetation, where specified, and periodically checking them, especially after large storms, to determine the need for embankment repairs or mechanical removal of excess sediment. Inlets and outlets should be cleaned regularly. Damaged components should be replaced promptly.

Fertilizer Restrictions: Runoff from urban areas may include phosphorus-based fertilizers applied to residential lawns, golf courses, and other surfaces. If used too close to a receiving waterbody, phosphorus present in stormwater runoff will enter the waterbody. Illinois has a statute in place which governs the use of phosphorus-based fertilizers in urban areas: Lawn Care Products Application and Notice Act (415 Illinois Compiled Statutes [ILCS] 65).[60] This act includes the following prohibitions for phosphorus-based fertilizers (see the act for limited exceptions):

- They will not be applied to lawns unless it can be demonstrated by soil test that the lawn is lacking in phosphorus when compared against the standard established by the University of Illinois; see the act for exceptions.

---

[59] NRCS. 2018. Conservation Practice Standard. Water and Sediment Control Basin. Code 638. https://efotg.sc.egov.usda.gov/api/CPSFile/5838/638_IL_CPS_Water_and_Sediment_(Con)trol_Basin_2018

[60] ILCS. 415 ILCS 65. Environmental Safety. Lawn Care Products Application and Notice Act. https://www.ilga.gov/legislation/ilcs/ilcs3.asp?ActID=1597&ChapterID=36

- They will not be applied to impervious surfaces.
- They will not be applied within 3 feet of any waterbody if a spray, drop, or rotary spreader is used. If other equipment is used, the fertilizer may not be applied within 15 feet of a water body.
- They will not be applied when the ground is frozen or saturated.
- Appropriate lawn markers for the application event and notifications to potentially affected adjacent properties are required.

9.4 Costing Estimates and Funding Opportunities

The following sections provide an overview of costing estimates and funding opportunity considerations that are important when evaluating the feasibility of implementing phosphorus reducing BMPs within the Salt Creek watershed (Little Wabash River basin).

9.4.1 Best Management Practice Cost Estimates

The most recent cost estimates for a number of suggested BMPs were gathered through Illinois EPA from SWCDs in 2017 (**Table 9-7**). Cost information for additional BMPs not included in the table are discussed below.

Table 9-7 Fiscal Year 2017 Soil and Water Conservation Districts Best Management Practice Cost Data

Practice	Component	Units	Average Cost
329A	No Till	Acre	$33.33
329C	Strip Till	Acre	$33.33
340A	Cover Crops	Acre	$66.67
340B	Temporary Cover	Acre	$266.66
342	Critical Area Planting	Acre	$350
412	Grassed Waterway Earthwork	Acre	$2,900
512	Pasture + Hayland Planting (applies to land not in pasture or hayland within the past 5 years)	Acre	$300
590A	NMP	Acre	$4
590B	NMP Implementation	Acre	$12
600	Terrace, less than 3 feet (earthwork for narrow base or grass ridge)	Foot	$3.30
600	Terrace, greater than 3 feet (earthwork for narrow base or grass ridge)	Foot	$3.80
638	WASCOB, less than 3 feet (earthwork for narrow base)	Foot	$3.30
638	WASCOB, greater than 3 feet (earthwork for narrow base)	Foot	$3.80

Filter Strips and Riparian Buffers: Several types of filter strip practices are available, including areas for native herbaceous vegetation with or without fertility measures required and areas of introduced species, with or without fertility measures required. Filter strip implementation that includes seedbed preparation and native seed application ranges from $520 per acre to $639 per acre depending on the type used, with an average cost of approximately $594 per acre.

Riparian buffers consisting of bare-root shrubs cost approximately $1.10 to $1.65 each, while direct seeding of trees and/or shrubs costs approximately $741 per acre. The direct-seeding scenario includes a planting rate of approximately 3,000 to 4,800 seeds per acre and the foregone income for the land taken out of crop production. Land preparation, including removing undesirable vegetation and improving site conditions, is estimated at $38 per acre. For cases where an herbaceous cover is preferable, such as native grass or certain species of forbs and/or shrubs, costs average $642 per acre.

Wetlands: The price to establish a wetland is site-specific and depends on factors such as the size and type of vegetation used. Examples of costs associated with constructed wetlands include excavation, vegetation removal, and revegetation costs. Costs for wetlands created on a flat-mineral uplands where surface runoff may be intercepted and ponded by excavation range from $3,186 (no embankment) to $3,680 (with embankment). Some areas may favor a wetlands setting that just needs to be enhanced or restored. In an area of natural depression fed by surface runoff, enhancement/restoration is approximately $2,557 per acre.

Enhancing or restoring a wetland on a floodplain site that has existing levees and/or ditches may consist of regrading or shaping the land, potentially including levee removal, for $1,167 per acre. Constructed wetlands to reduce the pollution potential of runoff and wastewater average $7,725 per acre where natural regeneration of wetland plants will be a major contributor to the working vegetation and $10,286 per acre where wetland vegetation in the pool area is planted at a denser grid (3-foot by 3-foot or closer). As needed, embankments, water control and grade stabilization structures, and filter strips should be added.

9.4.2 Project Funding

Cost-share and incentive programs at the state and federal level are available to landowners, homeowners, and farmers in the watershed to help offset costs of implementing many of the BMPs recommended in this report. Some of these programs are discussed below. When reviewing the programs, it should be noted that some of the programs are only meant to provide incentives to encourage operators or landowners to try the practice. These incentive programs are not intended to cover the entire cost associated with implementing a practice. Additionally, some practices have many variables to consider that will affect both the cost of the program and the incentive or cost-share amount to be received (e.g., NMPs).

9.4.2.1 State-Level Funding

State-level programs to encourage landowners to implement resource-conserving practices for water quality and erosion control purposes are discussed in the following paragraphs. Contact your local county representatives for more information about available state funding opportunities (**Table 9-8**).

Table 9-8 Local SWCD, NRCS, and Farm Service Agency Contact Information

County	Address	Phone	Contact and Email
Effingham	2201 N Willenborg St Suite 10 Effingham, IL 62401	(217) 500-3032	Bart Pals – District Conservationist bart.pals@usda.gov
Cumberland	201 E Main Toledo, IL 62468	(217) 849-2201 ext. 3	Laura Klingler – District Conservationist laura.klingler@usda.gov

IDA and Illinois EPA NMP Project: The IDA and Illinois EPA co-sponsor a cropland NMP project in watersheds that have developed or are developing TMDLs. This voluntary project supplies incentive payments to producers to have NMPs developed and implemented. Additionally, watersheds that have sediment or phosphorus identified as a cause for impairment (as is the case in this watershed) are eligible for cost-share assistance in implementing traditional erosion control practices through the NMP project.

Partners for Conservation Program: The Partners for Conservation Program (PFC)[61] provides cost sharing on a variety of practices such as no till systems, WASCOBs, pasture/hayland establishment, critical area planting, cover crops, temporary cover (if added to another practice to extend the construction season), filter strips, rain gardens, terrace systems, diversions, well decommissioning, NMPs, and grade stabilization structures. The PFC is funded through the IDA and administered by the local SWCDs. Life/maintenance contracts can be 1 to 10 years in duration depending on the practice; costs per acre vary significantly from project to project.

Soils and Water Conservation District Grants Program: SWCDs assist local landowners improve their natural resource management practices by providing technical assistance and grants that support soil conservation, water quality protection, wetland management, flood control, soil erosion control at urban construction sites, stream bank stabilization, recycling, soil interpretation, land use and site suitability, and conservation education.[62]

Conservation Fund Program: The Illinois Department of Natural Resources Conservation Fund Program helps landowners experiencing erosion on their property. Eligible BMPs covered under this program include no till or strip till, cover crops, temporary cover, critical-area plantings, filter strips, diversions, grate stabilization structures, grassed waterways, pasture and hay planting, terraces, and WASCOBs. Funding assistance of up to 50 percent of the cost of the project is available, with grant awards up to $750,000.[63]

Division of Forestry Resources Forestry Assistance Program: Resources are available through the Rural Forest Landowner Assistance and Urban and Community Forestry Programs to help private landowners and cities, respectively, address forest stewardship practices.[64]

Green Infrastructure Grant Opportunities: Illinois EPA provides funding through the Green Infrastructure Grant Opportunities (GIGO) program for water quality improvement projects that

---

[61] IDNR. 2023a. https://dnr.illinois.gov/conservation/pfc.html
[62] IDNR. 2023b. https://dnr.illinois.gov/conservation/crep.html
[63] Cassidy, R. 2021.
[64] IDNR.2023c. https://dnr.illinois.gov/conservation/forestry/forestry-assistance-program.html

decrease stormwater runoff. Examples of eligible projects include grassed waterways, permeable pavement, and downspout disconnection. The GIGO program offers up to $2,500,000 per funding cycle, with a minimum grant of $75,000. The program is a reimbursement program where Illinois EPA issues reimbursement for eligible costs expended after project implementation.[65]

Illinois Green Infrastructure Grant Program for Stormwater Management: The Illinois Green Infrastructure Grant Program for Stormwater Management provides funding to local government entities and organizations to implement green infrastructure practices that control stormwater runoff to protect water quality. Practices such as permeable pavements and other urban BMPs are eligible for funding.[66]

Water Pollution Control Loan Program: Illinois EPA helps local public or private entities implement wastewater and stormwater projects through the Water Pollution Control Loan Program State Revolving Fund loan program. Funding through this program is appropriated annually and combines federal capitalization funding with state matching funds, interest earnings, repayment money, and the sale of bonds to form a source of financing for infrastructure projects. Eligible projects include new or upgraded wastewater infrastructure construction, stormwater-related projects that benefit water quality, and a variety of other projects that improve the quality of Illinois' rivers, streams, and lakes. More information is available at https://epa.illinois.gov/topics/water-quality/surface-water/green-infrastructure.html.

9.4.2.2 Federal Funding

There are several voluntary conservation programs established by various federal agencies that encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs apply to crop fields and rural grasslands that are presently used for livestock grazing. Federal-level programs are discussed in the paragraphs that follow. EPA manages CWA Section 319 grants. The Farm Service Agency (FSA) oversees the Conservation Reserve Program (CRP) and the Grasslands Reserve Program (GRP). Voluntary conservation programs established through the 2018 U.S. Farm Bill and managed by the NRCS include the Agricultural Conservation Easement Program (ACEP), the Conservation Stewardship Program (CSP), and the Environmental Quality Incentives Program (EQIP).

CWA 319 Grants: Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the Section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive EPA 319(b) grants upon EPA's approval of the state's Nonpoint Source Assessment Report and Nonpoint Source Management Program. States may reallocate funds through subawards (e.g., contracts, subgrants) to both public and private entities including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

---

[65] Illinois EPA. 2023. https://epa.illinois.gov/topics/grants-loans/water-financial-assistance/gigo.html
[66] Illinois EPA. 2023.

EPA designates incremental funds, a $178 million award in 2022, for the restoration of impaired water through the development and implementation of WBPs, WPPs, and/or TMDLs for impaired waters. Base funds (funds other than incremental funds) are used to provide staffing and support to manage and implement the state Nonpoint Source Management Program. Section 319 funding can be used to implement activities that improve water quality such as filter strips and streambank stabilization.[67,68]

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement the Illinois Nonpoint Source Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling nonpoint source pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale. Funding is also available for BMPs on a nonwatershed scale and the development of information/education nonpoint source pollution control programs.

The maximum federal funding available is 60 percent of the total cost, with the remaining 40 percent coming from local match. The program period is 2 years unless otherwise approved. This is a reimbursement program. Section 319(h) funds are awarded for the purpose of implementing approved nonpoint source management projects. Funding is directed toward activities that result in the implementation of appropriate BMPs for the control of nonpoint source pollution or to enhance the public's awareness of nonpoint source pollution. Applications are accepted June 1 through August 1.

Refer to the Illinois EPA Section 319(h) Nonpoint Source Pollution Control Financial Assistance Program website for more information: https://epa.illinois.gov/topics/water-quality/watershed-management/nonpoint-sources/grants.html.

Conservation Reserve Program: The CRP is a voluntary program administered through FSA that encourages landowners to agree to remove environmentally sensitive land from agricultural production and plant long-term resource-conserving cover to improve water quality, prevent soil erosion, and reduce loss of wildlife habitat. The program was initially established in the Food and Security Act of 1985 and is the largest private-lands conservation program in the United States.

The duration of contracts under CRP range from 10 to 15 years. Participants can enroll in CRP in two ways. The first enrollment method is through a competitive process known as the CRP General Sign-Up. These are announced on a periodic basis by the Secretary of Agriculture but do not occur on any fixed schedule. The second enrollment method is through CRP Continuous Sign-Up, which is offered on a continuous basis. Continuous sign-up provides management flexibility to farmers and ranchers to implement certain high-priority conservation practices on eligible land. All enrollment offers are processed through the local FSA office. Certain conditions must be met for land to be eligible for CRP enrollment. These conditions include the following:

---

[67] EPA. 2003.

[68] EPA. Historic 319 Grant Funding Spreadsheet for Fiscal Year 2022. https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fwww.epa.gov%2Fsystem%2Ffiles%2Fdocuments%2F2022-07%2F319_historic_funding_FY22.xlsx&wdOrigin=BROWSELINK

- The farmer applying for enrollment must have owned or operated the land for at least 12 months prior to the previous CRP sign-up period (except in cases of changed ownership because of death of the previous owner, foreclosure, or land purchase by the new owner without the sole intention of placing it in the CRP).
- Cropland that is planted or considered planted to an agricultural commodity for four of the six most recent crop years (including field margins) and must be physically and legally capable of being planted in a normal manner to an agricultural commodity.
- Certain marginal pastureland suitable for use as any of the following conservation practices: buffer for wildlife habitat, wetlands buffer or restoration, filter strips, riparian buffer, grass waterway, shelter belt, living snow fence, contour grass strip, salt tolerant vegetation, or shallow water area for wildlife.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted average erosion index of 8 or higher
- Be expiring CRP acreage
- Be in a national or state CRP conservation priority area

FSA bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or cash-rent equivalent. The maximum rental rate for each offer is calculated in advance of enrollment. Producers may offer land at the maximum rate or at a lower rental rate to increase likelihood of offer acceptance. In addition, FSA provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation practices. FSA offers several financial incentives opportunities for certain sign-up practices. In 2020, FSA increased the practice incentive payment from 5 to 20 percent of annual rental payment rate and added a 10 percent incentive payment for water quality practices on land enrolled in CRP's continuous sign-up.[69]

A signing incentive payment is a one-time incentive payment of 32.5 percent of the amount of the first annual rental payment.[70] Eligible practices include field windbreaks; grassed waterways; shelter belts; living snow fences; filter strips; riparian buffers; marginal pastureland wildlife and wetland buffers; bottom timber establishment; field borders; longleaf pine establishment; duck nesting habitat; State Acres for Wildlife Enhancement (SAFE) buffers, wetlands, trees, longleaf pine, and grass; pollinator habitat; and several wetlands practices. A performance incentive payment is a one-time incentive payment made to participants who enroll land in the CRP to be committed to all continuous sign-up practices except establishment of permanent vegetative cover on terraces, wetland restoration (including nonfloodplain), bottomland timber establishment, and duck nesting habitat establishment. Finally, in 2021, FSA enacted a Climate-Smart Practice Incentive for CRP General and Continuous Sign-Ups. This incentive encourages

---

[69] FSA. 2020. USDA Announces Increase to Certain Incentive Payments for Continuous Conservation Reserve Program. https://www.fsa.usda.gov/news-room/news-releases/2020/usda-announces-increase-to-certain-incentive-payments-for-continuous-conservation-reserve-program

[70] eCFR Part 1410 – Conservation Reserve Program. https://www.ecfr.gov/current/title-7/subtitle-B/chapter-XIV/subchapter-B/part-1410

CRP practices that increase carbon sequestration and reduced greenhouse gas emissions through things like establishment of trees and permanent grasses, development of wildlife habitat, and wetland restoration. The Climate-Smart Practice Incentive is annual, and the amount is based on the benefits of each practice type.[71]

The maximum annual noncost share payment that an eligible "person" can receive under the CRP is $50,000 per fiscal year. This is a separate payment limitation applying only to CRP noncost share payment.

Refer to the FSA CRP website for more information: https://www.fsa.usda.gov/programs-and-services/conservation-programs/conservation-reserve-program/.

Grassland Reserve Program: The purpose of the GRP, which is administered by FSA, is to prevent grazing and pasture land from being converted into cropland, used for urban development, or developed for other nongrazing uses. Participants in the program voluntarily limit future development of the land while still being able to use the land for livestock grazing and activities related to forage and seed production. Some restrictions on activities may apply during the nesting season of certain bird species that are in decline or protected under federal or state law.

The GRP has several enrollment options, including a rental contract for 10, 15, or 20 years or enrollment of the land in a conservation easement for an indefinite period. Applications are accepted any time and are processed through the local FSA office. To be eligible for a rental agreement, the applicant must own or have control of the land for the length of the contract. To enroll in a conservation easement, the applicant must own and be willing to restrict use of the land either in perpetuity or under the maximum length of time under state law. Persons enrolled in the GRP receive an annual rental payment for their enrolled acres. Further information about the program, including payment amounts, eligibility and maintenance criteria, and land requirements may be obtained from the local FSA office.

Refer to the FSA CRP website for more information: https://www.fsa.usda.gov/programs-and-services/conservation-programs/conservation-reserve-program/.

Agricultural Conservation Easement Program: The ACEP provides financial and technical assistance to help conserve agricultural lands and wetlands and their related benefits. Under the Agricultural Land Easements component, NRCS helps American Indian tribes, state and local governments, and nongovernmental organizations protect working agricultural lands and limit nonagricultural uses of the land. Land protected by agricultural land easements provides additional public benefits, including environmental quality, historic preservation, wildlife habitat, and protection of open space. Under its wetland reserve easements component, NRCS helps to restore, protect, and enhance enrolled wetlands. Wetland reserve easements provide habitat for fish and wildlife, including threatened and endangered species, improve water quality by filtering sediments and chemicals, reduce flooding, recharge groundwater, protect biological diversity, and provide opportunities for educational, scientific, and limited recreational activities.

---

[71] FSA. 2022. Conservation Reserve Program Monthly Summary – May 2022. https://www.fsa.usda.gov/Assets/USDA-FSA-Public/usdafiles/Conservation/PDF/Summary%20May%202022%20CRPMonthly.pdf

- Agricultural Land Easements: NRCS provides financial assistance to eligible partner's purchase agricultural land easements that protect the agricultural use and conservation values of eligible land. In the case of working farms, the program helps farmers and ranchers keep their land in agriculture. The program also protects grazing uses and related conservation values by conserving grassland including rangeland, pastureland, and shrubland. Land eligible for agricultural easements includes cropland, rangeland, grassland, pastureland, and nonindustrial private forest land. NRCS will prioritize applications that protect agricultural uses and related conservation values of the land and those that maximize the protection of contiguous acres dedicated to agricultural use.

- To enroll land through agricultural land easements, NRCS enters into cooperative agreements with eligible partners. Each easement is required to have an agricultural land easement plan that promotes the long-term viability of the land. Under the Agricultural Land component, NRCS may contribute up to 50 percent of the fair market value of the agricultural land easement. Where NRCS determines that grasslands of special environmental significance will be protected, NRCS may contribute up to 75 percent of the fair market value of the agricultural land easement.

  Refer to the NRCS ACEP website for more information: https://www.nrcs.usda.gov/programs-initiatives/acep-agricultural-conservation-easement-program.

- Wetland Reserve Easements: NRCS also provides technical and financial assistance to restore, protect, and enhance wetlands through the purchase of a wetland reserve easement. These agreements include the right for NRCS to develop and implement a wetland reserve restoration easement plan to restore, protect, and enhance the wetland's functions and values. Land eligible for wetland reserve easements includes farmed or converted wetland that can be successfully and cost-effectively restored. NRCS prioritizes applications based the easement's potential for protecting and enhancing habitat for migratory birds and other wildlife. For acreage owned by an Indian tribe, there is an additional enrollment option of a 30-year contract. Through the wetland reserve enrollment options, NRCS may enroll eligible land through one of the following:

  - *Permanent Easements* – These are conservation easements in perpetuity. NRCS pays 100 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 75 to 100 percent of the restoration costs.

  - *30-Year Easements* – These expire after 30 years. Under 30-year easements, NRCS pays 50 to 75 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.

  - *Term Easements* – Term easements are easements made for the maximum duration allowed under applicable State laws. NRCS pays 50 to 75 percent of the easement value for the purchase of the term easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.

  - *30-Year Contracts* – 30-year contracts are only available to enroll acreage owned by Indian tribes, and program payment rates are commensurate with 30-year easements.

For wetland reserve easements, NRCS pays all costs associated with recording the easement in the local land records office, including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Refer to the NRCS Wetland Reserve Easements website for more information: https://www.nrcs.usda.gov/programs-initiatives/wre-wetland-reserve-easements.

Wetland Reserve Enhancement Partnership: The Wetland Reserve Enhancement Partnership (WREP) is an enrollment option under the ACEP. The WREP continues to be a voluntary program through which NRCS signs agreements with eligible partners to leverage resources to carry out high-priority wetland protection, restoration, and enhancement and to improve wildlife habitat. Partner benefits through WREP agreements include:

- Wetland restoration and protection in critical areas
- Ability to cost-share restoration or enhancement beyond NRCS requirements through leveraging
- Ability to participate in managing or monitoring selected project locations
- Ability to use innovative restoration methods and practices

For 2022, NRCS announced $17 million available in financial and technical assistance to help eligible conservation partners leverage local resources to voluntarily protect, restore, and enhance critical wetlands on private and tribal agricultural land nationwide. The funding is provided through the WREP, a special enrollment option under the ACEP. Proposals for funding must be limited to $5 million and were due by August 15, 2021, with funding announcements released in October 2021. Landowners should check with their local NRCS state office to see about applying in future years. To enroll land eligible partners may submit proposals to the local NRCS office.

Refer to the NRCS WREP website for more information: https://www.nrcs.usda.gov/programs-initiatives/wrep-wetland-reserve-enhancement-partnership.

Conservation Stewardship Program: The CSP helps agricultural producers maintain and improve their existing conservation systems and adopt additional conservation activities to address priority resources concerns. Participants earn CSP payments for conservation performance—the higher the performance, the higher the payment.

Through the CSP, participants take additional steps to improve resource conditions including soil quality, water quality and quantity, air quality, habitat quality, and energy. The CSP provides two types of payments through 5-year contracts: annual payments for installing new conservation activities and maintaining existing practices; and supplemental payments for adopting a resource-conserving crop rotation. Producers may be able to renew a contract if they have successfully fulfilled the initial contract and agree to achieve additional conservation objectives. Payments are made soon as practical after October 1 of each fiscal year for contract activities installed and maintained in the previous year.

Eligible lands include private and Tribal agricultural lands, cropland, grassland, pastureland, rangeland and nonindustrial private forest land. CSP is available to all producers, regardless of operation size or type of crops produced, in all 50 states, the District of Columbia, and the Caribbean and Pacific Island areas. Applicants may include individuals, legal entities, joint operations, or Indian tribes that meet the stewardship threshold for at least two priority resource concerns when they apply. They must also agree to meet or exceed the stewardship threshold for at least one additional priority resource concern by the end of the contract. Producers must have effective control of the land for the term of the proposed contract, which include all eligible land in the agricultural operation. Some additional restrictions and program requirements may apply and interested applicants should contact the local NRCS office for more information.

Refer to the NRCS CSP website for more information: https://www.nrcs.usda.gov/programs-initiatives/csp-conservation-stewardship-program.

Environmental Quality Incentive Program: The EQIP is a voluntary program that provides financial and technical assistance to agricultural producers to plan and implement conservation practices that improve soil, water, plant, animal, sir, and related natural resources on agricultural land and nonindustrial private forestland. Through the EQIP, NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Persons engaged in livestock or agricultural production and owners of nonindustrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private nonindustrial forestland, and other farm or ranch lands. Eligible applicants must, at a minimum, meet the following criteria; additional program requirements may apply:

- Be agricultural producer (person, legal entity, or joint operation who has an interest in the agricultural operation, or who is engaged in agricultural production or forestry management)
- Control or own eligible land
- Comply with adjusted gross income for less than $900,000 (federally recognized Native American Indian Tribes or Alaska Native corporations are exempt from the adjusted gross income payment limitations)
- Be in compliance with the highly erodible land and wetland conservation requirements
- Develop an NRCS EQIP plan of operations that addresses at least one natural resource concern

Persons interested in entering into a cost-share agreement with the NRCS for EQIP assistance may file an application at any time; however, each state may establish deadlines for one or more application periods in which to consider eligible applications for funding. Applications submitted after the deadlines will be evaluated and considered for funding during later funding opportunities.

As part of the program, a conservation activity plan (can be developed for producers to address a specific natural resource concern on their agricultural operation. Each plan is developed by a

certified technical service provider, who is selected by the EQIP participant. Technical assistance payments for technical service providers do not count against the financial assistance aggregate payment limitation or the contract financial assistance payment limitation. The plan becomes the basis of the EQIP contract between NRCS and the participant, and the contracts can be up to 10 years in duration. Financial assistance payments are made to eligible producers once conservation practices are completed according to NRCS requirements. Payment rates are set for each fiscal year and are attached to the EQIP contract when it is approved.

Historically underserved producers (limited resource farmers/ranchers, beginning farmers/ranchers, socially disadvantaged producers, Indian tribes, and veteran farmer or ranchers) who self-certify on Form NRCS-CPA-1200, Conservation Program Application, are eligible for a higher practice payment rate to support implementation of contracted conservation practices and activities. Historically underserved producers may also be issued advance payments up to 50 percent of the established payment rate to go toward purchasing materials or contracting services to begin installation of approved conservation practices. Self-certified socially disadvantaged farmer/rancher, beginning farmer/rancher, and veteran farmer/rancher producers may elect to be evaluated in special EQIP funding pools. More information can be obtained from the local NRCS office.

EQIP provides payments up to 75 percent of the incurred costs and 100 percent estimated income foregone of certain conservation practices and activities. Conservation practices eligible for EQIP funding, which are recommended BMPs for this watershed TMDL, include filter strips, conservation tillage, grade stabilization structures, grass waterways, riparian buffers, streambank/shoreline protection, terraces, and wetland restoration.

Refer to the NRCS EQIP website for more information: https://www.nrcs.usda.gov/programs-initiatives/eqip-environmental-quality-incentives.

Regional Conservation Partnership Program: The Regional Conservation Partnership Program (RCPP) is a stand-alone USDA program funded at $300 million annually. The RCPP website states that the program "promotes coordination of NRCS conservation activities with partners that offer value-added contributions to expand our collective ability to address on-farm, watershed, and regional natural resource concerns. Through RCPP, NRCS seeks to co-invest with partners to implement projects that demonstrate innovative solutions to conservation challenges and provide measurable improvements and outcomes tied to the resource concerns they seek to address." Information on eligibility, project types, funding, and how to apply can be found at https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/programs/financial/rcpp/.

9.4.3 Planning-Level Cost Estimates for Implementation Measures

Cost estimates for different implementation measures are presented in **Table 9-9**. The "Program" and "Sponsor" columns list the financial assistance program or sponsor, respectively, available for various BMPs (as discussed in Section 9.13). Illinois EPA 319 grants are applicable to all of the practices.

Table 9-9 Cost Estimates of Various Best Management Practice Measures

BMP	Units	Installation Cost	Program	Sponsor(s)
Filter strip (seeded)	Per acre	$520–$639 (average of $594)	CRP	NRCS, IDA
Riparian buffer – bare-root shrubs	Each	$1.10–$1.65	CRP	NRCS, IDA
Riparian buffer – forested	Per acre	$741	CRP	NRCS, IDA
Riparian buffer – herbaceous cover	Per acre	$642	CRP	NRCS, IDA
Riparian buffer – land preparation	Per acre	$38	CRP	NRCS, IDA
Nutrient management	Per acre	$16	EQIP	NRCS, IDA, Illinois EPA
WASCOB less than 3 feet	Per foot	$3.30	CPP	IDA
WASCOB greater than 3 feet	Per foot	$3.80	CPP	IDA
Terraces less than 3 feet	Per foot	$3.30	CPP	IDA
Terraces greater than 3 feet	Per foot	$3.80	CPP	IDA
Conservation tillage – no till/strip till	Per acre	$133.33	EQIP	NRCS, IDA
Contour farming	Per acre	$6.06	EQIP	NRCS
Cover crops	Per acre	$66.67	EQIP	NRCS
Wetland – enhancement/restoration	Per acre	$1,167–$3,680	ACEP	NRCS
Wetland – constructed	Per acre	$7,725–$10,286	ACEP	NRCS
Septic system maintenance	Per event	$250–$350	Private system owner	

9.5 Watershed-Specific Priority Areas and Projects

Illinois EPA is soliciting information from local stakeholders, watershed groups, and the SWCDs to identify and document any previous or in-progress watershed projects that target the parameters of concern. Information received during the public meeting process will be documented in this section of the final report.

Additionally, Section 5.4 of this report summarized previous watershed studies that have been completed within the watershed along with reference information to find addition details. In 2021, Regina Cassidy developed the Salt Creek Watershed Plan[72] as her capstone project for the Master of Urban and Regional Planning from University of Illinois. The goals of the plan are to (1) improve water quality; (2) prevent and reduce flood damage; (3) protect and enhance natural resources; (4) restore and improve water-based recreational opportunities; and (5) support sustainable watershed communities. A suggested implementation schedule, interim measurable milestones, evaluation criteria, and a monitoring component are included. The plan also includes recommendations and identifies critical source areas (CSAs) where targeted BMPs may be most effective at nutrient reduction. An excerpt from the document with this information is included as **Appendix F**.

[72] Cassidy, R. 2021. *Salt Creek Watershed Plan –HUC 0512011402 Cumberland, Effingham, and Jasper Counties, 2020*. University of Illinois at Urbana-Champaign. https://www.ideals.illinois.edu/items/119490

9.6 Information and Education

Public outreach and education campaigns that support TMDL implementation plans should take on a holistic approach that consider more than just water quality problems within a watershed. Stakeholder engagement and cooperation improves when outreach strategies also address broader stakeholder concerns such as water supply availability and aesthetics. Watershed plans that incorporate this holistic approach are more successful in changing social behaviors and implementing multibenefit BMPs that help with attaining water quality standards while also protecting other important resources such as drinking water sources, agricultural resources, forests and rangeland, and parks and open space.

Additionally, implementation plans are usually more successful if stakeholders are brought into the process early in the planning process and have the opportunity to share their concerns. Transparency throughout the planning and implementation process encourages continued support and a higher likelihood of participation in developing management options and supporting implementation of BMPs. A WBP was developed by Cassidy in 2020 (and submitted in 2021), which included stakeholder meetings where issues of concern were discussed. Primary stakeholder issues of concern included:

- Nitrogen, phosphorus, and manganese loading
- Depleted oxygen levels and excess siltation/sedimentation and TSS in water
- Erosion
- Dumping
- Trash burning
- Increased rain and flooding
- Impermeable areas of surface development
- Septic tank leakage and well water quality
- Human health problems and diminished quality of life that arises from the problems listed above
- Potential for more regulation and government intervention as a result of WBP development

Small incremental improvements and individual adoption of BMPs can be achieved at a much lower cost compared to large-scale BMPs implemented watershedwide. Moving forward, outreach and education efforts should focus on activities that support the watershed plan goals, including:

- Continued regular meetings of local stakeholder groups with intent of broadening audience/attendance
- Field visit days with demonstrations of agricultural conservation practices

- Continued outreach and messaging to landowners to encourage implementation of edge of field BMPs, nutrient management, conservation tillage, cover crops, and livestock/pasture management
- Soil testing
- Reducing the use of lawn chemicals (pesticides and phosphorus fertilizers)
- Education/outreach for rural residence on proper septic system maintenance
- Periodic updates on watershed health/monitoring results

A virtual public meeting was held for the watershed in June 2021 to present Stage 1 TMDL development with an additional meeting planned to present all stages of TMDL development completed within the watershed. Feedback received from stakeholders and the county SWCD staff in attendance was incorporated throughout this plan to include local information and the BMPs thought to be the most effective and implementable in this watershed. Additional recommended activities to support public outreach and education include:

- Websites and social media to publicize meetings, upcoming events, and links to resources
- E-mail updates
- Brochures or fact sheets with information on household pollutant reduction, fertilizer use, and proper septic tank maintenance
- Educational signs, school visits, or participation in local events such as the CWA anniversary celebration to educate the public on water quality issues, the purpose of BMPs, and environmental stewardship
- Public service announcements
- Informational meetings on state and federal cost-share programs
- Watershed group development through the University of Illinois College of Agricultural and Consumer Economics Extension office

9.7 Milestones and Success Criteria

The primary objective of this plan is to improve water quality conditions in impaired stream segments within the Salt Creek Watershed (Little Wabash River basin). In support of this primary objective, ongoing involvement of stakeholders and community members to participate in BMPs described herein is also crucial to achieving water quality improvement within the watershed. **Table 9-10** provides the milestones and supporting success criteria that can be used to assess the effectiveness of implementation plan actions.

Table 9-10 Plan Milestones And Success Criteria

Milestone Objective	Success Criteria
Water quality improvement	Reduce TP levels by 25% within impaired streams within 10 years[1]
	A 50% decrease in algal blooms in watershed streams within 10 years[1]
	Reduced or eliminated violations of NPDES point source dischargers
	Monitor and assess TP loads from NPDES point source dischargers
	A 30% increase in no till or reduced till farming within 10 years[1]
	A 20% increase in buffer areas around agricultural lands or impaired waterways (e.g., riparian buffers, filter strips, grassed waterways) within 10 years[1]
	Secure funding for identified near-term and midterm BMP projects
	Delisting of impaired stream segments
Stakeholder involvement	Establishment of a Salt Creek Watershed (Little Wabash River Basin) Action Committee[1]
	Initiate regularly scheduled meetings of the Salt Creek Watershed (Little Wabash River Basin) Action Committee once established
	Periodic self-assessment of effectiveness of watershed groups and partnerships[1]
	Increased traffic on social media platforms and websites
	Increased participation in grass-roots outreach activities, including information sharing at local schools[1]
	Increased participation and funding from local municipalities toward watershed improvement and protection activities[1]
	Secure funding for priority stakeholders to implement BMPs on their property within 5 years

Note:
[1] Cassidy, R. 2021.

9.8 Plan Monitoring and Schedule

Successful plan implementation relies on establishing a plan schedule that tracks progression toward achieving established milestones and success criteria. The following subsections provide an overview of a monitoring plan and recommended plan schedule for achieving established milestone objectives. Stakeholders should evaluate schedule/milestone progress on an annual basis and implement adaptive management to modify management measures, milestones, and schedule as necessary.

9.8.1 Monitoring Plan

The purpose of the monitoring plan is to assess the overall implementation of management actions outlined above. This can be accomplished by conducting the monitoring programs designed to:

- Track implementation of BMPs in the watershed
- Estimate effectiveness of BMPs
- Further monitor point source discharges in the watershed
- Continued monitoring of impaired stream segments and tributaries

- Monitor storm-based high-flow events
- Low- flow monitoring of TP throughout the watershed

Tracking the implementation of management measures can be used to:

- Determine the extent to which management measures and practices have been implemented compared to action needed to meet the TMDL endpoints
- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support workload and costing analysis for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

Estimating the effectiveness of the BMPs implemented in the watershed could be completed by monitoring before and after the BMP is incorporated into the watershed. Additional monitoring could be conducted on specific structural systems such as a sediment control basin. Inflow and outflow measurements could be conducted to determine site-specific removal efficiency.

Illinois EPA conducts Intensive Basin Surveys every 5 years. Additionally, select ambient sites are monitored nine times a year. Continuation of this state monitoring program will assess stream water quality as improvements in the watershed are completed. This data will also be used to assess whether water quality standards in the impaired segments are being attained.

9.8.2 Implementation Schedule

Table 9-11 identifies an implementation schedule for meeting plan milestones. Implementation of the management actions outlined in this section should occur in phases, often over the course of several years, with effectiveness assessments made as improvements are completed. The process of obtaining funding and developing and implementing projects designed to improve water quality can take months or years to complete, and once in place, improvements in water quality as a result of BMPs may not be detectable for several years. Continued monitoring and reevaluation of the implementation measures during this time will allow for more expedient adjustment to BMP implementation measures that may result in earlier attainment of water quality targets.

Table 9-11 Implementation Schedule

Milestone Objective	Schedule Category	Description	Recommended Schedule
Water quality improvement	Assess existing BMPs	Asses existing BMPs within the watershed for effectiveness	Short-term (1–5 years)
	Monitoring	Monitor results of pilot studies to measure success and adapt/adjust wider-scale implementation	Short-term (1–5 years)
	Monitoring	Implement monitoring plan	Continuous (1–20 years)
	Implement identified near-term projects	Work with the local SWCD to use TMDL priority to secure funding and implement “ready-to-go” projects	Short-term (1–5 years)
	Implement larger projects	Implement larger projects that require multiple funding sources and stakeholders	Midterm (5–10 years)
	Erosion control measures	Work with the local SWCD to identify areas throughout the watershed where no till or reduced till practices would be beneficial to reducing TP loads in impaired watersheds	Midterm (5–10 years)
	Nonpoint-source controls	Work with the local SWCD to identify and fund projects throughout the watershed where buffers can be implemented around waterways or agricultural operations	Midterm (5–10 years)
	Point-source evaluation	Additional monitoring and evaluation of point source contributions to more accurately assess impacts to nutrient loading	Midterm (5–10 years)
Stakeholder involvement	Establish watershed group	Work with the University of Illinois College of Agricultural and Consumer Economics Extension to establish a Salt Creek watershed (Little Wabash River Basin) Action Committee	Short-term (1–5 years)
	Annual stakeholder meetings	Once established, convene Salt Creek watershed (Little Wabash River Basin) Action Committee for annual stakeholder meetings to gauge progress and discuss evolving needs and planned activities. Conduct periodic self-assessments for members to evaluate effectiveness of watershed groups and partnerships.	Continuous (1–10 years)
	Funding	Develop grant applications and work with landowners to secure funding for implementing BMPs discussed in this plan	Short-term (1–5 years)
	Education and outreach	Work with the University of Illinois College of Agricultural and Consumer Economics Extension regularly publish Salt Creek watershed (Little Wabash River Basin) News on a variety of platforms	Short-term (1–5 years)
	Education and outreach	Partner with Future Farmers of America to bring regular watershed programming to local high schools and to spread knowledge of watershed matters	Short-term (1–5 years)
	Funding	Work with local municipalities to establish line items in their annual budgets allocated toward watershed improvement and protection projects	Short-term (1–5 years)

Appendix D

Public Comments

A summary of comments received following the Stage 1 Public Meeting (June 30, 2021) are provided below. Original emails are included following the summary for reference. Relevant information has been included in the report. This section will be updated following the Stage 3 Public Meeting and the appendix will be updated if additional information is provided.

- July 14, 2021 Email from Jennifer Jones, Extension Watershed Outreach Associate with the University of Illinois College of Agriculture, Consumer and Environmental Sciences, to transmit a 2020 watershed plan for Salt Creek.

From: Jones, Jennifer Diane
To: Haile, Abel; Ristau, Allison; Podlewski, Drew

FINAL_VERSION_WATERSHED_PLAN.pdf

Hello,
I am attaching a watershed plan for the Salt Creek Watershed (HUC 0512011402) that was developed in 2020-2021 by Regina Cassidy as her capstone project for the Master of Urban and Regional Planning from University of Illinois. I hope this can useful to you as you continue developing the TMDL for the Salt Creek.
Please let me know if you have any questions. Thank you,

JENNIFER JONES, CCA
