Recommendations and Critical Source Areas (CSA)

Source: *Salt Creek Watershed Plan - HUC 0512011402 Cumberland, Effingham, and Jasper Counties, Illinois.* Prepared by Regina Cassidy as a Master of Urban and Regional Planning Capstone Project. University of Illinois at Urbana-Champaign
Advisor: Professor Daniel Schneider
Submitted March 15, 2021

Recommendations

Watershed-wide BMPs

All municipalities would benefit from decreasing impervious surfaces. Stakeholders may be eligible for funding that will only be available to permeable-type pavement projects, and it is encouraged that this be taken up where possible, particularly in SW3, which has the greatest amount of impermeable surface areas. Elected town officials can lead by example in reducing flooding in urban areas by installing permeable paving projects in public areas.

Increased use of cover crops and conservation tillage in all agricultural areas would decrease pollutant loads in waterways. These strategies have already proven to be popular among Illinois farmers. It is hoped that in addition to continuing to implement tried-and-true BMPs, stakeholders will be inspired to implement lesser-known actions as well.

Property owners can beautify their surroundings and help prevent flooding by installing rain gardens with native, long-rooted grass species.

Multiple, simultaneous BMPs and treatment trains (successive BMPs) may be employed to amplify the effectiveness of any BMP measures.

When working on highway construction projects, the Illinois Department of Transportation (IDOT) must follow federal and state required storm water pollution control measures, including BMPs recommended in this plan, outlined in its Bureau of Design and Environment Manual (2000).

Critical Source Areas (CSAs)

The US EPA has determined that remedying impaired watersheds is best addressed by targeting areas where efforts are most likely to produce the most dramatic improvements. These areas contribute disproportionately to watershed pollution, and when BMPs are applied in these areas, the greatest improvements may be achieved. These areas are called Critical Source Areas (CSAs). Possible criteria for selection of CSAs includes: the magnitude of the pollutant source; the distance to the water resource; the location, type, and severity of the water resource impairment or threat; the type of pollutant; present conservation (i.e., management) status; and on-site evaluation (Dressing, 2018). Critical Source Areas may also be areas that are ecologically healthy and in need of protection from degradation. This plan prioritizes nutrient load reduction in waterways, as outlined int the NLRS; therefore, sources responsible for the greatest amounts of N and P loading have been chosen as CSAs.

For N, the five greatest nutrient loading sources are: point sources and farm animals in SW3 and cropland in all three subwatersheds. The five greatest nutrient pollutant loading sources of the subwatersheds for P are: point sources and farm animals in SW3 and cropland in all three Subwatersheds.

Amounts of Nutrient Loading by Greatest Sources in Salt Creek Subwatersheds

Nitrogen	Lbs/Yr	SW
Point Sources	98,923.70	3
Cropland	48,951.50	2
Cropland	46,382.30	3
Cropland	38,858.10	1
Farm Animals	33,245.90	3
Total	266,361.50	

Phosphorus	Lbs/Yr	SW
Point Sources	27,480.60	3
Farm Animals	11,104.90	3
Cropland	9,293.50	2
Cropland	8,407.10	3
Cropland	7,439.50	1
Total	63,725.60

The overlap of locations in Table 15 suggests that it is best to concentrate nutrient load reduction effort in these 5 areas: point sources in SW3 (which contains 7 outfall locations, as noted in the Point Source section of this plan), farm animals in SW3 (which contains more than half of all livestock in the Watershed), and cropland in SW1, SW2, and SW3. These 5 sources contribute a total of 266,361.5 lbs of N and 63,725.6 lbs of P to the Watershed.

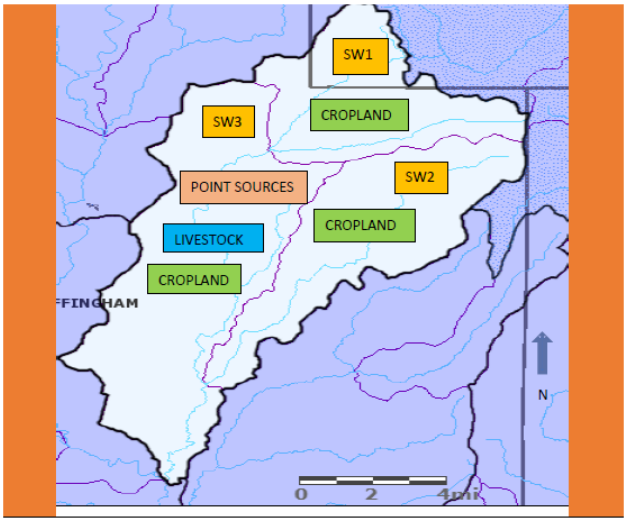

Figure 33 - Critical Source Areas (CSAs) for Nutrient Load Reduction in the Salt Creek Watershed by Subwatershed

SW3 contributes, by far, the greatest amount of sediment to the waterways, and this would be significantly reduced with Hay/Pasture, Cropland, and Streambank Erosion control. Although it is recommended that sediment be reduced in SW3, this is not a chosen CSA for this plan, as nutrient reduction has taken priority.

A reduction of 15% of the present total Watershed N loading of 377,379.4 lbs/yr would amount to a decrease of 56,606.91 lbs. A reduction of the total Watershed P load by 25% over the present loading of 83,579 lbs/yr would amount to a decrease of 20,894.75 lbs.

If BMPs were applied only to the sources listed in Table 15 to eliminate 15% of the N loading, the first year would see a reduction of 39,967.34 lbs. In two years, this effort would easily exceed the total 2025 target.

If BMPs were applied only to the sources listed in Table 15 to eliminate 25% of the P loading, the first year would see a reduction of 15,931.4 lbs. The 25% overall goal would then be met in less than four years.

CSAs are subject to approval and participation by stakeholders. Once BMPs are decided upon, progress should be monitored periodically to confirm their effectiveness and/or to make changes as needed to reduce pollutant loading. Applying the most appropriate BMPs to the CSAs is the next step.

One scheme for achieving targeted nutrient reduction is shown in Table 16, as modeled by Model My Watershed. Each year, these BMPs, applied together, would reduce N by 4.6% and P by 6.1%. Over the course of five years, N would be reduced by 23% and P would be reduced by 30%. These targets have a few extra points built-in, just in case any one project may be unsuccessful or less successful than anticipated.

Agricultural BMPs to be to Applied to CSAs Annually to Reach Nutrient Loading Reduction Targets in the Salt Creek Subwatershed

Acreage	Cover Crops	Conservation Tillage	Nutrient Management	Animal Waste Management
SW1	2,070	2,070	2,070	n
SW1%	24	24	24	n
SW2	2,070	2,070	2,070	n
SW2%	18	18	18	n
SW3	2,070	2,070	2,070	339
SW3%	19	19	19	
				5% of total Watershed acreage

Source: Model My Watershed
R. Cassidy November 14, 2020

Other agricultural BMPs that can be modeled through Model My Watershed are: Riparian Forest Buffers, Floodplain Restoration, Grazing Land Management, Cropland Retirement, Streambank Stabilization, Agricultural Erosion and Sediment Control, Streambank Fencing, Contour Farming/Strip Cropping, and Dirt and Gravel Road Repair. Additional BMPs (including urban BMPs) discussed in the BMP section of this plan, may also be used to meet these targets, at the preference of Salt Creek watershed stakeholder participants.
