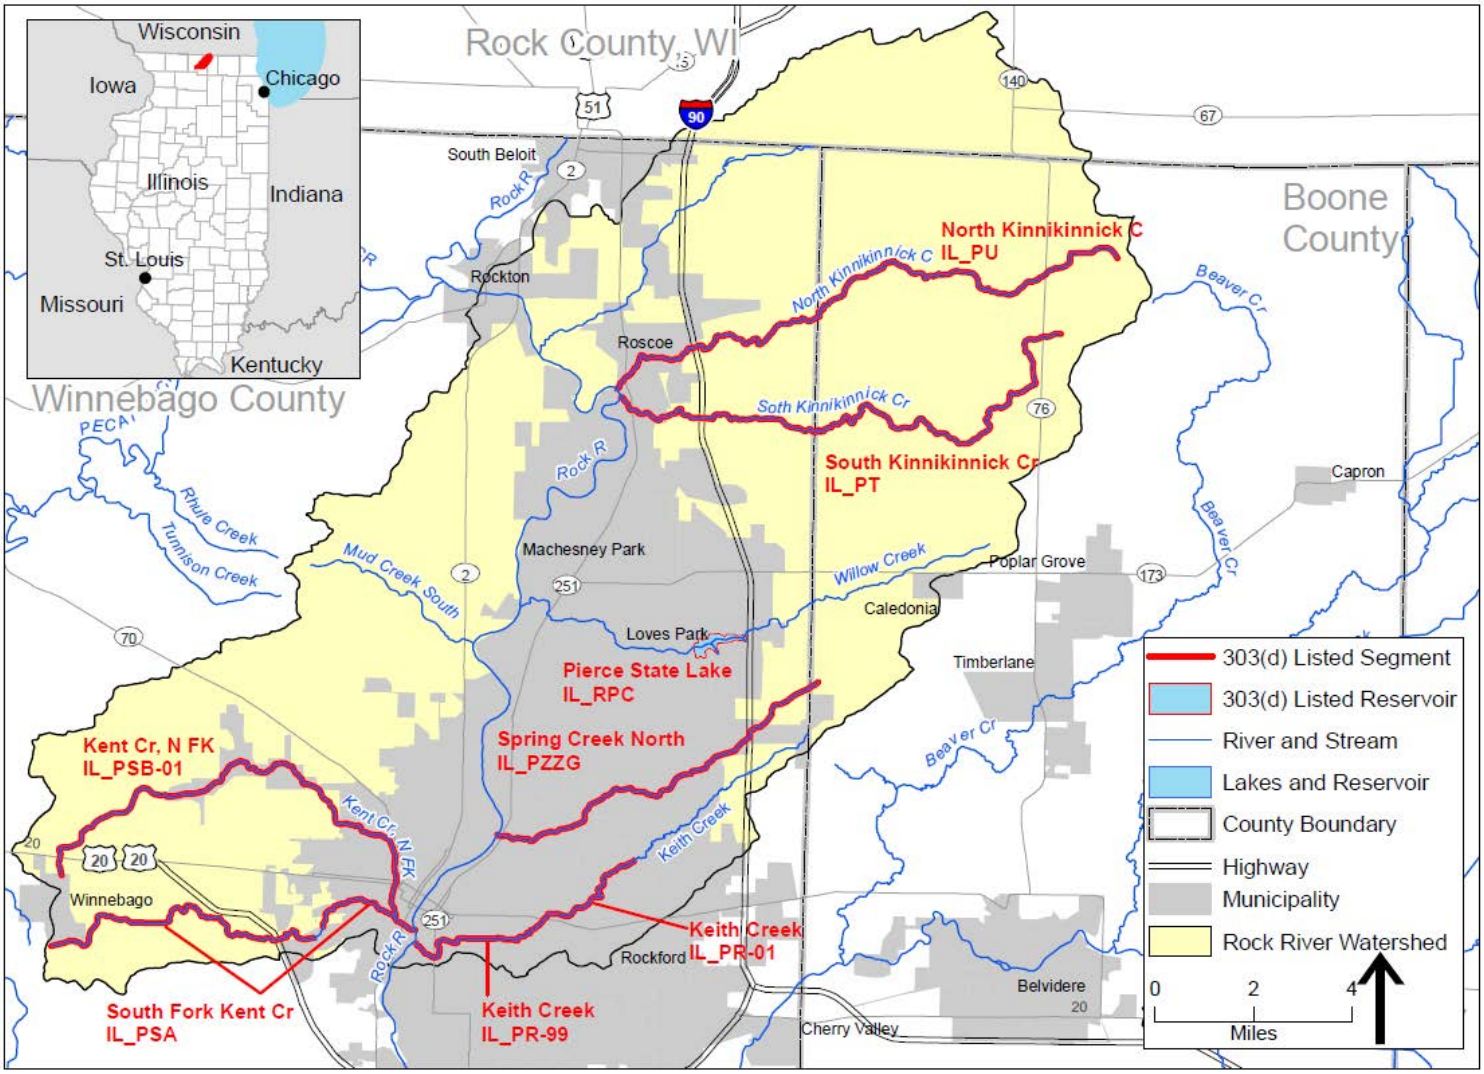
Rock River/Pierce Lake Watershed Total Maximum Daily Load and Watershed-based Implementation Plan



THIS PAGE LEFT INTENTIONALLY BLANK

TMDL Development for the Rock River/Pierce Lake Watershed in Illinois. This file contains the following documents:

1) U.S. EPA Approval Letter and Decision Document for the Final TMDL Report
2) TMDL Report

THIS PAGE LEFT INTENTIONALLY BLANK

REGION 5
CHICAGO, IL 60604

September 17, 2024

Ms. Joey L. Logan-Pugh, Bureau Chief
Bureau of Water
Illinois Environmental Protection Agency
1021 North Grand Avenue East, P.O. Box 19276
Springfield, Illinois 62794-9276

Dear Ms. Logan-Pugh:

The U.S. Environmental Protection Agency completed its review of the final Total Maximum Daily Loads (TMDL) for the Rock River/Pierce Lake Watershed (RRPLW), including supporting documentation. The RRPLW encompasses parts of Boone and Winnebago counties in northern central Illinois. The RRPLW TMDLs address impaired recreation use due to excessive bacteria and impaired aesthetic quality due to excessive total phosphorus.

The RRPLW bacteria and total phosphorus TMDLs meet the requirements of Section 303(d) of the Clean Water Act and the EPA's implementing regulations set forth at 40 C.F.R. Part 130. Therefore, the EPA approves Illinois's seven bacteria TMDLs and one total phosphorus TMDL. The EPA describes Illinois's compliance with the statutory and regulatory requirements in the enclosed decision document.

The EPA acknowledges Illinois's efforts in submitting this TMDL and look forward to future TMDL submissions by the State of Illinois. If you have any questions, please contact Mr. Paul Proto, at proto.paul@epa.gov.

Sincerely,

9/17/2024

X

Tera L. Fong
Director, Water Division
Signed by: TERA FONG

TMDL: Rock River/Pierce Lake Watershed bacteria and total phosphorus TMDLs in portions of Boone and Winnebago Counties, Illinois
Date: September 17, 2024

DECISION DOCUMENT
FOR THE ROCK RIVER/PIERCE LAKE WATERSHED TMDLS, BOONE & WINNEBAGO COUNTIES, IL

Section 303(d) of the Clean Water Act (CWA) and the EPA's implementing regulations at 40 C.F.R. Part 130 describe the statutory and regulatory requirements for approvable Total Maximum Daily Loads (TMDLs). Additional information is generally necessary for the EPA to determine if a submitted TMDL fulfills the legal requirements for approval under Section 303(d) and the EPA regulations and should be included in the submittal package. Use of the verb "must" below denotes information that is required to be submitted because it relates to elements of the TMDL required by the CWA and by regulation. Use of the term "should" below denotes information that is generally necessary for the EPA to determine if a submitted TMDL is approvable. The guidelines provided under each heading in this decision document are an attempt to summarize and provide information regarding currently effective statutory and regulatory requirements relating to TMDLs, but are not a substitute for statutory requirements or the EPA's regulations.

1. Identification of Water body, Pollutant of Concern, Pollutant Sources, and Priority Ranking

The TMDL submittal should identify the water body as it appears on the State's/Tribe's 303(d) list. The water body should be identified/georeferenced using the National Hydrography Dataset (NHD), and the TMDL should clearly identify the pollutant for which the TMDL is being established. In addition, the TMDL should identify the priority ranking of the water body and specify the link between the pollutant of concern and the water quality standard (see Section 2 below).

The TMDL submittal should include an identification of the point and nonpoint sources of the pollutant of concern, including location of the source(s) and the quantity of the loading, e.g., lbs/per day. The TMDL should provide the identification numbers of the NPDES permits within the water body. Where it is possible to separate natural background from nonpoint sources, the TMDL should include a description of the natural background. This information is necessary for the EPA's review of the load and wasteload allocations, which are required by regulation.

The TMDL submittal should also contain a description of any important assumptions made in developing the TMDL, such as:

(1) the spatial extent of the watershed in which the impaired water body is located;
(2) the assumed distribution of land use in the watershed (e.g., urban, forested, agriculture);
(3) population characteristics, wildlife resources, and other relevant information affecting the characterization of the pollutant of concern and its allocation to sources;
(4) present and future growth trends, if taken into consideration in preparing the TMDL (e.g., the TMDL could include the design capacity of a wastewater treatment facility); and

(5) an explanation and analytical basis for expressing the TMDL through *surrogate measures*, if applicable. *Surrogate measures* are parameters such as percent fines and turbidity for sediment impairments; chlorophyll *a* and phosphorus loadings for excess algae; length of riparian buffer; or number of acres of best management practices.

EPA Review of the Rock River/Pierce Lake Watershed TMDL:

The Rock River/Pierce Lake Watershed (RRPLW) (HUC-8 #07090005 and HUC-10 #07090005-01) is located in northern central Illinois in portions of Boone and Winnebago counties. The RRPLW drains approximately 149,300 acres (i.e., 233.3 square miles) in Illinois and Wisconsin. Within Illinois, the RRPLW encompasses 139,100 (i.e., 217.3 square miles) with the majority of that acreage in Winnebago County (approx. 72 percent of the RRPLW in Illinois). Surface waters in the RRPLW generally flow southward within the portion of the watershed that is covered by the RRPLW TMDL (see Figure 2-1 of the Stage 1 Rock River and Pierce Lake Watershed TMDL Report, February 2021). Tributaries to the mainstem of the Rock River (e.g., North Kinnikinnick Creek (IL_PU)) are the main focus of TMDL efforts in this project. The Rock River begins in southern-central Wisconsin and flows south-southwesterly through northern and northwestern Illinois before joining the Mississippi River south of Rock Island, Illinois.

The RRPLW TMDLs address impaired tributaries to the mainstem Rock River in Winnebago and Boone counties in Illinois. The segments addressed by the RRPLW TMDL include seven bacteria (i.e., fecal coliform) impaired segments and one phosphorus impaired segment (Table 1 of this Decision Document).

Table 1: Rock River/Pierce Lake Watershed impaired waters addressed by this TMDL

Water body name	Assessment Unit ID	Affected Use	Pollutant or stressor	TMDL
Bacteria TMDLs				
Keith Creek	IL_PR-99	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL
Keith Creek	IL_PR-01	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL
North Fork Kent Creek	IL_PSB-01	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL
South Fork Kent Creek	IL_PSA	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL
North Kinnikinnick Creek	IL_PU	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL

Spring Creek - North	IL_PZZG	Primary Contact Recreation	Fecal Coliform	Fecal Coliform TMDL
Total Phosphorus TMDLs				
Pierce Lake	IL_RPC	Aesthetic quality	Phosphorus	TP TMDL

Land Use:

Land use in the RRPLW is predominantly agricultural as approximately 44% of the land use is devoted to agricultural practices (i.e., corn, soybeans, grass/pasture of Table 2 of this Decision Document). Developed lands, forested areas, open water and shrublands are the next greatest land uses according to the U.S. Department of Agriculture's National Agriculture Statistics Survey (NASS) 2018 Cropland Data Layer (CDL).

Table 2: Rock River/Pierce Lake Watershed Land Cover - based on U.S. Department of Agriculture's National Agriculture Statistics Survey (NASS) 2018 Cropland Data Layer (CDL)

Land Use / Land Cover Category	Acreage	Percentage
Corn	34,695	23.22%
Developed, Low Intensity	24,538	16.43%
Soybeans	22,030	14.75%
Deciduous Forest	16,110	10.78%
Developed, Open Space	14,494	9.70%
Developed, Medium Intensity	9,777	6.54%
Grass/Pasture	9,453	6.33%
Background	8,908	5.96%
Developed, High Intensity	3,239	2.17%
Open Water	1,528	1.02%
Shrubland	1,379	0.92%
All Others	1,058	0.71%
Alfalfa	914	0.61%
Winter Wheat	676	0.45%
Herbaceous Wetlands	595	0.40%
TOTALS	**149,394**	**100%**

Problem Identification:

Bacteria TMDLs: Seven bacteria (i.e., fecal coliform) impaired segments in the RRPLW (see Table 1 of this Decision Document) were included on the 2020/2022 Illinois 303(d) list due to excessive bacteria. Water quality monitoring within the RRPLW indicated that these tributaries to the mainstem of the Rock River did not attain their designated primary contact recreation use due to exceedances of the bacteria criteria. Excessive bacteria can negatively impact recreational uses (e.g., swimming, wading, boating, fishing etc.) and public health. At elevated levels, bacteria may cause illness within humans who have contact with or ingest bacteria laden water. Recreation-based contact can lead to ear, nose, and throat infections, and stomach illness.

Total phosphorus TMDL: Pierce Lake (IL_RPC) identified in Table 1 of this Decision Document was included on the 2020/2022 Illinois 303(d) list due to excessive nutrients (phosphorus). Water quality monitoring demonstrated that Pierce Lake was not attaining its designated aquatic life and aesthetic quality uses due to excessive nutrients. Water quality monitoring within the RRPLW was completed at several locations and the data collected during these efforts served as the foundation for modeling efforts completed in this TMDL study.

While total phosphorus (TP) is an essential nutrient for aquatic life, elevated concentrations of TP can lead to nuisance algal blooms that negatively impact aquatic life and recreation (e.g., swimming, boating, fishing, etc.). Algal decomposition can deplete dissolved oxygen levels within the water column. Depletion of dissolved oxygen within a water column can stress benthic macroinvertebrates and fish as well as lead to conditions where phosphorus is released from bottom sediments (i.e., internal loading). Excessive algae in the upper layers of surface waters may prevent sunlight from reaching aquatic vegetation which can result in deleterious conditions for aquatic vegetation and the aquatic species that rely on that vegetation for food and/or shelter. Aquatic vegetation also stabilizes bottom sediments and is an important habitat for macroinvertebrates and fish.

Priority Ranking:
The water bodies addressed by the RRPLW TMDLs were given a priority ranking for TMDL development due to: the impairment impacts on primary contact recreation and aesthetic quality, the public value of the impaired water resource and the timing as part of the Illinois basin monitoring process.

Pollutants of Concern:
The pollutants of concern are bacteria (fecal coliform) and nutrients (TP).

Source Identification (point and nonpoint sources):

Point Source Identification: The potential point sources to the RRPLW are:

RRPLW bacteria TMDLs:
National Pollutant Discharge Elimination Systems (NPDES) permitted facilities: NPDES permitted facilities may contribute bacteria loads to surface waters through discharges of treated wastewater. Permitted facilities must discharge treated wastewater according to their NPDES permit. The Illinois Environmental Protection Agency (IEPA) determined that there are NPDES permitted facilities in the RRPLW (see Table 5-7 of the final TMDL document) but none of these identified facilities contribute bacteria to the bacteria impaired stream segments of Table 1 of this Decision Document.

Municipal Separate Storm Sewer (MS4): IEPA identified four MS4 communities that contribute stormwater runoff to surface waters in the RRPLW. Stormwater from MS4s can transport bacteria to surface water bodies during or shortly after storm events. IEPA identified MS4 permittees in the RRPLW (Table 3 of this Decision Document) which were assigned a portion of the wasteload allocation (WLA).

Table 3: MS4 communities that contribute bacteria loading to bacteria impaired segments in the RRPLW

MS4 Community (Permit #)	*Impaired segments with WLAs*	*WLAs*
Loves Park MS4 (LIR400379)	Keith Creek (IL_PR-01), Spring Creek - North (IL_PZZG)	WLAs calculated for the High Flows regime (0 - 10), Moist Flows regimes (10 - 20, 20 - 30, 30 - 40) and Mid-Range Flows regime (40 - 50)
Rockford Township MS4 (ILR400118)	Keith Creek (IL_PR-01), Keith Creek (IL_PR-99), North Fork Kent Creek (IL_PSB-01), South Fork Kent Creek (IL_PSA), Spring Creek - North (IL_PZZG)	
Winnebago County MS4 (ILR400505)	North Fork Kent Creek (IL_PSB-01), South Fork Kent Creek (IL_PSA)	
Roscoe Township MS4 (ILR400120)	North Kinnikinnick Creek (IL_PU), South Kinnikinnick Creek (IL_PT)	

Concentrated Animal Feedlot Operations (CAFOs): IEPA determined that the RRPLW does not have CAFOs that contribute bacteria to the surface waters of the RRPLW in Boone or Winnebago counties (Section 5.4.2 of the final TMDL document).

Combined Sewer Overflows (CSOs) and Sanitary Sewer Overflows (SSOs): IEPA determined that the RRPLW does not have CSOs nor SSOs that contribute bacteria to the surface waters of the RRPLW.

RRPLW total phosphorus TMDL: IEPA did not recognize any point source contributions to Pierce Lake (IL_RPC) and therefore, the WLA was set to 0 lbs/day.

CAFOs: IEPA determined that the RRPLW does not have CAFOs that contribute phosphorus to the surface waters of the RRPLW in Boone or Winnebago Counties (Section 5.4.2 of the final TMDL document).

CSOs and SSOs: IEPA determined that the RRPLW does not have CSOs nor SSOs that contribute phosphorus to the surface waters of the RRPLW.

Nonpoint Source Identification: The potential nonpoint sources to the RRPLW are:

RRPLW bacteria TMDLs:

Stormwater from agricultural land use practices and feedlots near surface waters: Animal Feeding Operations (AFOs) in close proximity to surface waters can be a source of bacteria to water bodies in the RRPLW. These areas may contribute bacteria via the mobilization and transportation of pollutant laden waters from feeding, holding and manure storage sites. Runoff from agricultural lands may contain amounts of bacteria that may lead to impairments in the RRPLW.

Feedlots generate manure which may be spread onto fields. Runoff from fields with spread manure can be exacerbated by tile drainage lines, which channelize the stormwater flows to surface waters. Nutrients, such as fertilizers which contain phosphorus, organic material and organic-rich sediment may be added via surface runoff from upland areas which are being used for Conservation Reserve Program (CRP) lands, grasslands, and agricultural lands used for growing hay or other crops. Stormwater runoff may contribute nutrients and organic-rich sediment to surface waters from livestock manure, fertilizers, vegetation and erodible soils.

Wet weather event runoff from cropland areas may move overland or via subsurface agricultural drainage tiles. Agricultural drain tiles transport stormwater runoff directly into ditches and streams and can exacerbate the transport of pollutants (e.g., bacteria) downstream. Overland runoff may also drain into surface waters, but overland runoff presents an opportunity for stormwater infiltration into soils and/or riparian areas adjacent to streams and ditches.

Unrestricted livestock access to streams: Livestock with access to stream environments may add bacteria directly to the surfaces waters or resuspend particles that had settled on the stream bottom. Direct deposition of animal wastes can result in very high localized bacteria counts and may contribute to downstream impairments. Smaller animal facilities may add bacteria to surface waters via wastewater from these facilities or stormwater runoff from near-stream pastures.

Discharges from onsite wastewater treatment systems (i.e., septic systems) or unsewered communities: Failing septic systems are a potential source of bacteria within the RRPLW. Septic systems generally do not discharge directly into a water body, but effluents from septic systems may leach into groundwater or pond at the surface where they can be washed into surface waters via stormwater runoff events. Age, construction and use of septic systems can vary throughout a watershed and influence the bacteria contribution from these systems.

Non-regulated urban runoff (i.e., areas not covered by a MS4 NPDES permit): Runoff from urban areas (e.g., urban, residential, commercial or industrial land uses) can contribute bacteria to local water bodies. Stormwater from urban areas, which drain impervious surfaces, may introduce bacteria derived from wildlife or pet droppings to surface waters.

Wildlife: Wildlife is a known source of bacteria in water bodies as many animals spend time in or around water bodies. Deer, geese, ducks, raccoons, and other animals all create potential sources of bacteria via contaminated runoff from animal habitats, such as urban park areas, forest, and rural areas.

RRPLW total phosphorus TMDL:

Stormwater from areas not covered under a MS4 NPDES permit: Stormwater runoff from areas outside the boundaries of MS4 areas, such as non-permitted urban, residential, commercial or industrial areas, can contribute nutrients, organic material and organic rich sediment during stormwater runoff events. Runoff from urban/developed areas can include phosphorus derived from fertilizers, leaf and grass litter, pet wastes, and other sources of anthropogenic derived nutrients.

Stormwater runoff from agricultural land use practices: Runoff from agricultural lands may contain significant amounts of nutrients, organic material and organic-rich sediment which may lead to impairments in the RRPLW. Manure spread onto fields is often a source of phosphorus, and can be exacerbated by tile drainage lines, which channelize the stormwater. Tile lined fields and channelized ditches enable particles to move more efficiently into surface waters. Phosphorus, organic material and organic-rich sediment may be added via surface runoff from upland areas which are being used for CRP lands, grasslands, and agricultural lands used for growing hay or other crops. Stormwater runoff may contribute nutrients and organic-rich sediment to surface waters from livestock manure, fertilizers, vegetation and erodible soils.

Internal loading: The release of phosphorus from lake sediments contributes internal phosphorus loading to Pierce Lake. Phosphorus may build up in the bottom waters of the lake and may be resuspended or mixed into the water column when the thermocline decreases, and the lake water mixes.

Wetland and Forest Sources: Phosphorus, organic material and organic-rich sediment may be added to surface waters by stormwater flows through wetland and forested areas in the RRPLW. Storm events may mobilize phosphorus through the transport of suspended solids and other organic debris.

Discharges from septic systems or unsewered communities: Failing septic systems are a potential source of nutrients within the RRPLW. Septic systems generally do not discharge directly into a water body, but effluents from septic systems may leach into groundwater or pond at the surface where they can be washed into surface waters via stormwater runoff events. Age, construction and use of septic systems can vary throughout a watershed and influence the nutrient contribution from these systems.

Wildlife: Wildlife is a known source of nutrients in water bodies as many animals spend time in or around water bodies. Deer, geese, ducks, raccoons, and other animals all create potential sources of

nutrients via contaminated runoff from animal habitats, such as urban park areas, forest, and rural areas.

Future Growth:
IEPA considered U.S. Census information for Boone and Winnebago counties. Population trends in these two counties indicated that there was a slight decrease in overall population in these areas over the previous 30 years. IEPA calculated a reserve capacity (RC) of 10% of the loading capacity for the bacteria TMDLs but did not include a RC for the phosphorus TMDL for Pierce Lake. IEPA's justification for including the RC carve out of the total loading capacity RC was to account for any future growth in the RRPLW. The WLA and load allocations (LA) for the RRPLW TMDLs were calculated for all current and future sources. Any expansion of point or nonpoint sources will need to comply with the respective WLA and LA values calculated in the RRPLW TMDLs.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this first element.

2. Description of the Applicable Water Quality Standards and Numeric Water Quality Target

The TMDL submittal must include a description of the applicable State/Tribal water quality standard, including the designated use(s) of the water body, the applicable numeric or narrative water quality criterion, and the antidegradation policy (40 C.F.R. §130.7(c)(1)). The EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

The TMDL submittal must identify a numeric water quality target(s) – a quantitative value used to measure whether or not the applicable water quality standard is attained. Generally, the pollutant of concern and the numeric water quality target are, respectively, the chemical causing the impairment and the numeric criteria for that chemical (e.g., chromium) contained in the water quality standard. The TMDL expresses the relationship between any necessary reduction of the pollutant of concern and the attainment of the numeric water quality target. Occasionally, the pollutant of concern is different from the pollutant that is the subject of the numeric water quality target (e.g., when the pollutant of concern is phosphorus and the numeric water quality target is expressed as Dissolved Oxygen (DO) criteria). In such cases, the TMDL submittal should explain the linkage between the pollutant of concern and the chosen numeric water quality target.

EPA Review of the RRPLW TMDL:
Section 2 of the final TMDL document explains that water bodies in the RRPLW are not meeting their General Use designation. The Illinois Pollution Control Board (IPCB) defines General Use standards as those that:

> *These standards protect for aquatic life, wildlife, agricultural uses, primary contact (where physical configuration of the waterbody permits it, any recreational or other water use in which there is prolonged and intimate contact with the water involving considerable risk of ingesting water in quantities sufficient to pose a significant health hazard, such as swimming and water skiing), secondary contact (any recreational or other water use in which contact with the water is either incidental or accidental and in which the probability of ingesting appreciable quantities*

of water is minimal, such as fishing, commercial and recreational boating, and any limited contact incident to shoreline activity), and most industrial uses. These standards are also designed to ensure the aesthetic quality of the state's aquatic environment.

The applicable General Use water quality standards (WQS) for the RRPLW TMDL water bodies are established in Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards, Subpart B.

Table 4 of this Decision Document includes the water quality standards and the TMDL targets employed by IEPA in the calculation of loading capacities for RRPLW TMDLs.

Table 4: Water quality standards and targets utilized within the RRLW TMDL

Parameter	Units	TMDL Targets
Numeric Water Quality Standards for addressing the Bacteria (fecal coliform) impaired segments within the RRPLW		
Total Fecal Coliform[1]	cfu / 100 mL	400 in < 10% of samples[2]
		Geometric Mean[3] < 200
Numeric Water Criterion for addressing the Nutrient impaired segment within the RRPLW		
Total Phosphorus (TP)	mg/L	0.05

[1] = Fecal Coliform standards apply only between May 1 and October 31

[2] = Standard shall not be exceeded by more than 10% of the samples collected during any 30-day period

[3] = Geometric mean based on minimum of 5 samples taken over not more than a 30-day period

Bacteria TMDL target: The fecal coliform TMDL target employed for the RRPLW bacteria TMDLs is the **200 colony forming units (cfu) per 100 mL** (200 cfu/100 mL) portion of the standard. IEPA believes that using the 200 cfu/100 mL portion of the standard for TMDL calculations will result in the greatest bacteria reductions within the RRPLW and will result in the attainment of the 400 cfu/100 mL portion of the standard. While the bacteria TMDLs will focus on the geometric mean portion of the water quality standard, attainment of both parts of the water quality standard is required.

Phosphorus TMDL target: The phosphorus TMDL target for the Pierce Lake phosphorus TMDL is **0.05 mg/L**.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this second element.

3. Loading Capacity - Linking Water Quality and Pollutant Sources

A TMDL must identify the loading capacity of a water body for the applicable pollutant. The EPA regulations define loading capacity as the greatest amount of a pollutant that a water can receive without violating water quality standards (40 C.F.R. § 130.2(f)).

The pollutant loadings may be expressed as either mass-per-time, toxicity or other appropriate measure (40 C.F.R. § 130.2(i)). The TMDL submittal should describe the method used to establish the cause-and-effect relationship between the numeric target and the identified pollutant sources. In many instances, this method will be a water quality model.

The TMDL submittal should contain documentation supporting the TMDL analysis, including the basis for any assumptions; a discussion of strengths and weaknesses in the analytical process; and results from any water quality modeling. The EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

TMDLs must take into account *critical conditions* for steam flow, loading, and water quality parameters as part of the analysis of loading capacity (40 C.F.R. § 130.7(c)(1)). TMDLs should define applicable *critical conditions* and describe their approach to estimating both point and nonpoint source loadings under such *critical conditions*. In particular, the TMDL should discuss the approach used to compute and allocate nonpoint source loadings, e.g., meteorological conditions and land use distribution.

EPA Review of the RRPLW TMDL:

RRPLW bacteria TMDL: IEPA used the geometric mean (**200 cfu/100 mL**) of the bacteria (fecal coliform) WQS to calculate loading capacity values for the bacteria TMDLs. IEPA believes the geometric mean of the bacteria WQS provides the best overall characterization of the status of the watershed. The EPA agrees with this assertion, as stated in the preamble of, *"The Water Quality Standards for Coastal and Great Lakes Recreation Waters Final Rule"* (69 FR 67218-67243, November 16, 2004) on page 67224, "…the geometric mean is the more relevant value for ensuring that appropriate actions are taken to protect and improve water quality because it is a more reliable measure, being less subject to random variation, and more directly linked to the underlying studies on which the 1986 bacteria criteria were based." IEPA stated that the bacteria TMDLs will focus on the geometric mean portion of the water quality standard (200 cfu/100 mL) and that it expects that by attaining the 200 cfu/100 mL portion of the bacteria (fecal coliform) WQS the 400 cfu/100 mL portion of the bacteria (fecal coliform) WQS will also be attained. The EPA finds these assumptions to be reasonable.

Typically loading capacities are expressed as a mass per time (e.g., pounds per day). However, for fecal coliform loading capacity calculations, mass is not always an appropriate measure because fecal coliform is expressed in terms of colony forming units. This approach is consistent with the EPA's regulations which define "load" as "an amount of matter that is introduced into a receiving water" (40 CFR §130.2). To establish the loading capacities for the RRPLW bacteria TMDLs, IEPA used Illinois's WQS for fecal coliform (200 cfu/100 mL). A loading capacity is, "the greatest amount of loading that a water can receive without violating water quality standards." (40 CFR §130.2). Therefore, a loading capacity set at the WQS will assure that the water does not violate WQS. IEPA's bacteria (fecal coliform) TMDL approach is based upon the premise that all discharges (point and nonpoint) must meet the WQS when entering the water body. If all sources meet the WQS at discharge, then the water body should meet the WQS and the designated use.

Flow duration curves (FDC) were created for the bacteria impaired segments of the RRPLW TMDL using flow data from three U.S. Geological Survey (USGS) flow gages in the RRPLW (Table 5 of this Decision Document).

Table 5: USGS gages and flow data used in the calculation of flow based TMDLs in the RRPLW

Gage Number	Name	Period of Record
USGS 05437641	Rock River at Auburn St. in Rockford	2002–2020
USGS 05437610	Rock River at Latham Park, IL	2002–2020
USGS 05437500	Rock River at Rockton, IL	1903–2020

Flow data from each of these USGS gages were used to estimate flows for the bacteria impaired segments of the RRPLW TMDL. IEPA explained that estimates of flow values for individual impaired segments were corrected for watershed seize using a drainage area ratio (DAR) calculation.

$Q_{ungaged} = (A_{ungaged} / A_{gaged}) * Q_{gaged}$

Where for example,

$Q_{ungaged}$ = Flow at the ungaged location
Q_{gaged} = Flow at USGS gage station (e.g., #05437641)
$A_{ungaged}$ = Drainage area of the ungaged location
A_{gaged} = Drainage area of the USGS gage location (e.g., #05437641)

Flow data focused on dates within the recreation season (May 1 to October 31). Daily stream flows were necessary to implement the load duration curve (LDC) approach.

FDCs graphs have flow duration interval (percentage of time flow exceeded) on the X-axis and discharge (flow per unit time) on the Y-axis. The FDC were transformed into LDC by multiplying individual flow values by the WQS (200 cfu/100 mL) and then multiplying that value by a conversion factor. The resulting points are plotted onto a load duration curve graph. LDC graphs, for the RRPLW bacteria TMDLs, have flow duration interval (percentage of time flow exceeded) on the X-axis and bacteria (fecal coliform) concentrations (number of bacteria per unit time) on the Y-axis. The curved line on a LDC graph represents the TMDL of the respective flow conditions observed at that location.

Water quality monitoring was completed for the bacteria impaired segments of the RRPLW and measured fecal coliform concentrations were converted to individual sampling loads by multiplying the sample concentration by the instantaneous flow measurement observed/estimated at the time of sample collection. The individual sampling loads were plotted on the same figure with the created LDC. Individual LDCs are found in Section 7.2.2 (e.g., Figures 7-2 to 7-8) of the final TMDL document.

The LDC plots were subdivided into five flow regimes; high flow conditions (exceeded 0–10% of the time), moist flow conditions (exceeded 10–40% of the time), mid-range flow conditions (exceeded 40–50% of the time), dry flow conditions (exceeded 50–90% of the time), and low flow conditions (exceeded 90–100% of the time). LDC plots can be organized to display individual sampling loads with the calculated LDC. Watershed managers can interpret LDC graphs with individual sampling points plotted alongside the LDC to understand the relationship between flow conditions and water quality exceedances within the watershed. Individual sampling loads which plot above the LDC represent violations of the WQS and the allowable load under those flow conditions at those locations. The difference between individual sampling loads plotting above the LDC and the LDC, measured at the same flow, is the amount of reduction necessary to meet WQS.

The strengths of using the LDC method are that critical conditions and seasonal variation are considered in the creation of the FDC by plotting hydrologic conditions over the flows measured during the recreation season. Additionally, the LDC methodology is relatively easy to use and cost-effective. The weaknesses of the LDC method are that nonpoint source allocations cannot be assigned to specific sources, and specific source reductions are not quantified. Overall, IEPA believes, and the EPA concurs that the strengths outweigh the weaknesses for the LDC method.

Implementing the results shown by the LDC requires watershed managers to understand the sources contributing to the water quality impairment and which Best Management Practices (BMPs) may be the most effective for reducing bacteria loads based on flow magnitudes. Different sources will contribute bacteria loads under varying flow conditions. For example, if exceedances are significant during high flow events this would suggest storm events are the cause and implementation efforts can target BMPs that will reduce stormwater runoff and consequently bacteria loading into surface waters. This allows for a more efficient implementation effort.

Bacteria TMDLs for the RRPLW were calculated and those results are found in Table 6 of this Decision Document. The load allocations were calculated after the determination of the WLA, and the Margin of Safety (MOS) (10% of the loading capacity). Load allocations (e.g., stormwater runoff from agricultural land use practices and feedlots, septic systems, wildlife inputs etc.) were not split among individual nonpoint contributors. Instead, load allocations were combined together into a categorical LA to cover all nonpoint source contributions.

Table 6: Bacteria (*E. coli*) TMDLs for the RRPLW are located at the end of this Decision Document

Table 6 of this Decision Document reports multiple points (the midpoints of the designated 10% flow regime) on the loading capacity curve. However, it should be understood that the components of the TMDL equation could be illustrated for any point on the entire loading capacity curve. The LDC method can be used to display collected bacteria monitoring data and allows for the estimation of load reductions necessary for attainment of the bacteria water quality standard. Using this method, daily loads were developed based upon the flow in the water body. Loading capacities were determined for the segment for multiple flow regimes. This allows the TMDL to be represented by an allowable daily load across all flow conditions. Table 6 of this Decision Document identifies the loading capacity for the water body at each flow regime. Although there are numeric loads for each flow regime, the LDC is what is being approved for this TMDL.

Table 6 of the Decision Document presents IEPA's loading reduction estimates for the bacteria TMDLs. These loading reductions (i.e., the percent reduction row at the bottom of each TMDL table) were calculated from field sampling data collected in the RRPLW. IEPA explained that its load reduction estimates are likely more conservative since they are based on a limited water quality data set.

The EPA concurs with the data analysis and LDC approach utilized by IEPA in its calculation of loading capacities, wasteload allocations, load allocations and the margin of safety for the RRPLW bacteria TMDLs. The methods used for determining the TMDL are consistent with U.S. EPA technical memos.[1]

[1] U.S. Environmental Protection Agency. August 2007. *An Approach for Using Load Duration Curves in the Development of TMDLs*. Office of Water. EPA-841-B-07-006. Washington, D.C.

RRPLW phosphorus TMDL: IEPA used the Simplified Lake Analysis Model (SLAM) to determine allocations for phosphorus for Pierce Lake. The SLAM model provides modeling for lake and sediment interactions which simulate lake nutrient and phytoplankton dynamics by using data inputs from several different sources (e.g., online databases and GIS-compatible data) (Sections 7.1.2 and 7.3 of the final TMDL document). A more traditional method for lake analysis, such as the BATHTUB lake model, was not used for the Pierce Lake phosphorus TMDL because IEPA determined that SLAM could also integrate the sediment dynamics and characteristics within lakes to determine phosphorus loading by using lake and sediment interactions. Parameter inputs considered in the calculations include: lake morphology, hydraulics, and thermal stratification; segmentation and flow direction; watershed inflows via runoff and point source discharge into the reservoir watershed; in-lake nutrients, settling velocity and nutrient uptake and burial; and sediment layer dynamics. Confirmatory analysis was also completed to document that the observed and simulated values supported the methodology (Section 7.3.1.6 of the final TMDL document).

IEPA subdivided the loading capacity among the WLA, LA, and MOS components of the TMDL (Table 7 of this Decision Document). These calculations were based on the critical condition, the summer growing season, which is typically when the water quality in Pierce Lake is typically degraded and phosphorus loading inputs are the greatest.

Table 7: Total Phosphorus TMDL for Pierce Lake (IL_RPC)

Source	Wasteload Allocation	Load Allocation	MOS (10%)	Loading Capacity		Current Load	Percent Reduction Needed
	(lbs/day)	*(lbs/day)*	*(lbs/day)*	*(lbs/day)*		*(lbs/day)*	*(%)*
Internal Sources	0.0	3.6	0.4	4.0		8.5	52.9%
External Sources	0.0	4.4	0.5	4.9		10.9	55.0%
Total	0.0	8.0	0.9	8.9		19.4	54.1%

Table 7 of this Decision Document communicate IEPA's estimate of the reduction required for Pierce Lake to meet its phosphorus water quality target (0.05 mg/L). This loading reduction (i.e., the percent reduction row) were estimated from existing and TMDL load calculations. IEPA expects that this reduction will result in the attainment of the water quality target and that the lake water quality will return to a level where the aesthetic quality designated use is no longer considered impaired.

The EPA supports the data analysis and modeling approach utilized by IEPA in its calculation of WLA, LA and MOS for the Pierce Lake TP TMDL. Additionally, the EPA concurs with the loading capacities calculated by the IEPA in its Pierce Lake TP TMDL. The EPA finds IEPA's approach for calculating the loading capacity for its Pierce Lake TP TMDL to be reasonable and consistent with the EPA's guidance.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this third element.

4. Load Allocations (LA)

The EPA regulations require that a TMDL include LAs, which identify the portion of the loading capacity attributed to existing and future nonpoint sources and to natural background. Load allocations may range from reasonably accurate estimates to gross allotments (40 C.F.R. § 130.2(g)). Where possible, load allocations should be described separately for natural background and nonpoint sources.

EPA Review of the RRPLW TMDL:
IEPA determined the LA calculations for each of the TMDLs based on the applicable WQS. IEPA recognized that LAs for each of the individual TMDLs addressed by the RRPLW TMDLs can be attributed to different nonpoint sources.

RRPLW bacteria and phosphorus TMDLs: The calculated LA value for the bacteria and phosphorus TMDLs are applicable across all flow conditions in the RRPLW (Tables 6 and 7 of this Decision Document). IEPA identified several nonpoint sources which contribute bacteria and or phosphorus loads to the surface waters of the RRPLW, including; non-regulated urban stormwater runoff, stormwater from agricultural areas, failing septic systems and wildlife (e.g., deer, geese, ducks, raccoons, turkeys and other animals). IEPA did not determine individual load allocation values for each of these potential nonpoint source considerations but aggregated the nonpoint sources into a categorical LA value.

The EPA finds IEPA's approach for calculating the LA to be reasonable and consistent with the EPA's guidance.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this fourth element.

5. Wasteload Allocations (WLAs)

The EPA regulations require that a TMDL include WLAs, which identify the portion of the loading capacity allocated to individual existing and future point source(s) (40 C.F.R. § 130.2(h), 40 C.F.R. § 130.2(i)). In some cases, WLAs may cover more than one discharger, e.g., if the source is contained within a general permit.

The individual WLAs may take the form of uniform percentage reductions or individual mass based limitations for dischargers where it can be shown that this solution meets WQSs.

EPA Review of the RRPLW TMDL:
RRPLW bacteria TMDLs: IEPA explained that WLAs from MS4s represent runoff from municipal areas with permitted separate stormwater sewer systems (Section 8.3.1.3 of the final TMDL document). WLAs for MS4s were estimated by determining the total area within an MS4-permitted municipality's boundaries that lies within the target watershed using GIS analyses and geographic data for municipal boundaries. MS4 WLA calculations for individual segments were based on MS4 area(s) within the contributing watersheds to that segment. IEPA analyzed the proportion of the total MS4 area to the total watershed area and used this proportion to assign a portion of the loading capacity to individual

MS4 communities. IEPA explained that the MS4 WLAs were only applied to the upper 50% of flow regimes in the LDCs for each segment (e.g., high flow regime, moist flow regime and mid-range flow regime of the LDC).

RRPLW total phosphorus TMDL: IEPA concluded that there are no point source contributions of phosphorus to Pierce Lake. Therefore, no wasteload allocations were calculated nor assigned as part of the Pierce Lake total phosphorus TMDL calculation.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this fifth element.

6. Margin of Safety (MOS)

The Clean Water Act, § 303(d)(1)(c), and 40 C.F.R. 130.7 (c)(1) require that a TMDL include a margin of safety (MOS) "which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality." The EPA's 1991 TMDL Guidance explains that the MOS may be implicit, i.e., incorporated into the TMDL through conservative assumptions in the analysis, or explicit, i.e., expressed in the TMDL as loadings set aside for the MOS. If the MOS is implicit, the conservative assumptions in the analysis that account for the MOS must be described. If the MOS is explicit, the loading set aside for the MOS must be identified. The MOS may include both explicit and implicit components.

EPA Review of the RRPLW TMDL:

RRPLW bacteria TMDLs: The bacteria TMDLs incorporate an implicit MOS in the TMDL calculations (Table 6 of this Decision Document). The WLA calculations were based upon the 200 cfu/100 mL as a 30-day geometric mean portion of the WQS to determine the daily load. This significantly overestimates the bacteria reductions needed to attain WQS in the RRPLW. IEPA did not use a rate of decay, or die-off rate of pathogen species, in the TMDL calculations or in the creation of load duration curve for fecal coliform which is a conservative approach that ultimately overestimates the concentration of fecal coliform in the waterbody. Bacteria have a limited capability of surviving outside their hosts, and normally a rate of decay would be incorporated into the TMDL development process. IEPA determined that it was more conservative to use the WQS (200 cfu/100 mL) and not to apply a rate of decay because applying the rate of decay would increase the assimilative capacity in the stream and potentially result in higher limits being authorized NPDES permits.

As stated in *EPA's Protocol for Developing Pathogen TMDLs* (EPA 841-R-00-002), many different factors affect the survival of pathogens, including the physical condition of the water. These factors include, but are not limited to sunlight, temperature, salinity, and nutrient deficiencies. These factors vary depending on the environmental condition/circumstances of the water, and therefore it would be difficult to assert that the rate of decay caused by any given combination of these environmental variables was sufficient to meet the WQS of 200 cfu/100 mL. Thus, it is more conservative to apply the State's WQS as the MOS, because this standard must be met at all times under all environmental conditions.

RRPLW total phosphorus TMDL: IEPA employed an explicit margin of safety (MOS) set at 10% of the loading capacity. The explicit MOS was applied by reserving 10% of the total loading capacity, and then allocating the remaining loads to point and nonpoint sources (Table 7 of this Decision Document). The MOS was set at 10% to account for uncertainty due to field sampling error, basing assumptions on water quality monitoring with low sample sizes. A 10% MOS was considered appropriate, because the target values used in this TMDL had a firm technical basis and the estimated flows are believed to be relatively accurate because they were estimated based on a USGS gage located just outside of the subwatershed with the impaired segments.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this sixth element.

7. Seasonal Variation

The statute and regulations require that a TMDL be established with consideration of seasonal variations. The TMDL must describe the method chosen for including seasonal variations. (CWA § 303(d)(1)(C), 40 C.F.R. § 130.7(c)(1)).

EPA Review of the RRPLW TMDL:

RRPLW bacteria TMDLs: The bacteria TMDLs accounted for seasonality via the LDC framework which inherently accounts for seasonal variation by using daily flows over a multi-year period. The LDC process used streamflows over a wide range of flow conditions across the entire water year. For the LDC-based TMDLs in the RRPLW, runoff is the main transport mechanism which delivers pollutant loading into the surface water environment. LDC graphs can provide insight toward understanding under which flow regimes/conditions exceedances of the WQS or water quality targets are occurring, and whether or not there is any seasonal flow component to those flow conditions (i.e., spring melt, summer precipitation events during lower flow periods, etc.). Figures in Section 7.2.2 of the final TMDL document plot water quality data against the LDCs and provide insight on the flow conditions that should be targeted for implementation (e.g., the high flow regime of Figure 7-2 of the final TMDL document).

RRPLW total phosphorus TMDL: Loading and time assumptions (e.g., average annual loads converted to daily loads) that factored into the set-up of the phosphorus model were cited by IEPA as part of its consideration of seasonal variations observed in the RRPLW. The timing assumptions and the use of a daily simulation over an extended multi-year period within the model helped IEPA consider seasonal variation and critical conditions. Additionally, IEPA explained that modeling results indicated that critical conditions for Pierce Lake were likely to occur annually during the fall months when the lake water column overturned/destratification (Section 8.3.2.2 of the final TMDL document).

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this seventh element.

8. Reasonable Assurance

When a TMDL is developed for waters impaired by point sources only, the issuance of a NPDES permit(s) provides the reasonable assurance that the wasteload allocations contained in the TMDL will be achieved. This is because 40 C.F.R. § 122.44(d)(1)(vii)(B) requires that effluent limits in permits be consistent with, "the assumptions and requirements of any available wasteload allocation" in an approved TMDL.

When a TMDL is developed for waters impaired by both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur, the EPA's 1991 TMDL Guidance states that the TMDL should provide reasonable assurances that nonpoint source control measures will achieve expected load reductions in order for the TMDL to be approvable. This information is necessary for the EPA to determine that the TMDL, including the load and wasteload allocations, has been established at a level necessary to implement water quality standards.

EPA Review of the RRPLW TMDL:

The RRPLW bacteria and phosphorus TMDLs provide reasonable assurance that actions identified in the implementation section of the final TMDL (i.e., Section 9 of the final TMDL document), will be applied to attain the loading capacities and allocations calculated for the impaired reaches within the RRPLW. The recommendations made by IEPA will be successful at improving water quality if the appropriate local groups work to implement these recommendations. Those mitigation suggestions, which fall outside of regulatory authority, will require commitment from state agencies and local stakeholders to carry out the suggested actions.

IEPA outlines its reasonable assurance efforts in Section 9 of the final TMDL document and describes management measures and programs which will be employed to attain the loading capacities and allocations calculated for the impaired reaches within the RRPLW.

IEPA explained that Section 9 of the final TMDL document also incorporates many elements of a Section 319 watershed management plan, which can be used to apply for a Section 319 nonpoint source grant. Section 9 of the TMDL discusses various approaches that, when implemented, will significantly reduce bacteria and phosphorus inputs to surface waters of the RRPLW. In Tables 9-7 and 9-9 as well as Sections 9.4.2 and 9.4.3 of the final TMDL document, IEPA provides suggestions on Federal and State funding resources that implementers could potentially pursue in order to acquire financial assistance (e.g., grant programming from U.S. EPA, grant programming from U.S. Department of Agriculture (USDA) Farm Service Agency (FSA), USDA Natural Resources Conservation Service's (NRCS) Environmental Quality Incentives Program (EQIP), etc.) for BMPs to address bacteria and phosphorus inputs in the RRPLW. Additionally, IEPA explained that efforts to address the pollutant inputs to the RRPLW need to be grounded in a robust public education and outreach effort (i.e., Section 9.6 of the final TMDL document). Improving landowner awareness and developing strategies to alter landowner behaviors in regard to bacteria and phosphorus usage patterns is an essential component of implementation action in the RRPLW. IEPA recommended communication approaches for reaching different audiences in Section 9.6 of the final TMDL document. Tables 9-10 and 9-11 of the final TMDL document provide an estimated implementation schedule of actions and activities in the watershed that can reduce bacteria and phosphorus loads into waterbodies in the RRPLW. These

actions address short term (1-5 years), mid-term (5-10 years) and long-term or continuous (1-10 or 1-20 year) timeframes.

IEPA outlined various benchmarks to evaluate progress and adaptive management strategies in Section 9.8.2 of the final TMDL document. The EPA understands that IEPA is committing through an adaptive management process to identify critical areas that contribute greater loads of bacteria and phosphorus to the landscape, to deploy suites of BMPs to mitigate those source contributions, to use water quality data to measure the effectiveness of implementation efforts, and to use adaptive management to evaluate and hone implementation strategies, in coordination with its implementing partners.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this eighth element.

9. Monitoring Plan to Track TMDL Effectiveness

The EPA's 1991 document, *Guidance for Water Quality-Based Decisions: The TMDL Process* (EPA 440/4-91-001), recommends a monitoring plan to track the effectiveness of a TMDL, particularly when a TMDL involves both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur. Such a TMDL should provide assurances that nonpoint source controls will achieve expected load reductions and, such TMDL should include a monitoring plan that describes the additional data to be collected to determine if the load reductions provided for in the TMDL are occurring and leading to attainment of water quality standards.

EPA Review of the RRPLW TMDL:

The final TMDL document contains discussion on future monitoring within the RRPLW and milestones (Section 9.8.1 of the final TMDL document). Continued water quality monitoring within the basin is supported by IEPA. Additional water quality monitoring results could provide insight into the success or failure of BMP systems designed to reduce bacteria and phosphorus loading into the surface waters of the watershed. Local watershed managers would be able to reflect on the progress of the various pollutant removal strategies and would have the opportunity to change course if observed progress is unsatisfactory.

Progress of TMDL implementation will be measured through monitoring efforts focused on:

- Tracking implementation of BMPs in the watershed;
- Estimating the effectiveness of BMPs;
- Additional monitoring of point source discharges in the watershed;
- Continued monitoring of impaired stream segments and tributaries;
- Monitoring storm-based high flow events; and
- Low flow monitoring in impaired stream segments.

IEPA anticipates continuing to measure water quality in the RRPLW via its Intensive Basin Survey water quality monitoring which occurs every 5 years. Additionally, IEPA explained that select ambient water quality locations are sampled nine times a year. Continuation of these programs will enable IEPA to evaluate water quality improvements in the RRPLW over time.

Water quality monitoring is a critical component of the adaptive management strategy employed as part of the implementation efforts utilized in the RRPLW. Water quality information will aid watershed managers in understanding how BMP pollutant removal efforts are impacting water quality. Water quality monitoring combined with an annual review of BMP efficiency will provide information on the success or failure of BMP systems designed to reduce pollutant loading into water bodies of the RRPLW. Watershed managers will have the opportunity to reflect on the progress or lack of progress, and will have the opportunity to change course if progress is unsatisfactory.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this ninth element.

10. Implementation

The EPA policy encourages Regions to work in partnership with States/Tribes to achieve nonpoint source load allocations established for 303(d)-listed waters impaired by nonpoint sources. Regions may assist States/Tribes in developing implementation plans that include reasonable assurances that nonpoint source LAs established in TMDLs for waters impaired solely or primarily by nonpoint sources will in fact be achieved. In addition, the EPA policy recognizes that other relevant watershed management processes may be used in the TMDL process. The EPA is not required to and does not approve TMDL implementation plans.

EPA Review of the RRPLW TMDL:
The findings from the RRPLW TMDLs will be used to inform the selection of implementation activities in the watershed. The TMDL outlined some implementation strategies in Section 9 of the final TMDL document. IEPA outlined the importance of prioritizing areas within the RRPLW, education and outreach efforts with local partners, and partnering with local stakeholders to improve water quality within the watershed. The reduction goals for the bacteria and phosphorus TMDLs may be met via the following strategies:

RRPLW bacteria TMDLs: The potential BMPs which, if installed and maintained, would likely result in decreases of bacteria in surface waters of the RRPLW are:

- ***Stormwater volume control and infiltration BMPs:*** To mitigate the impact of stormwater in the RRPLW, IEPA recommends the installation of stormwater BMPs, including some combination of; rain gardens, vegetated swales/bioswales/bioretention areas, detention ponds, rain barrels, pervious pavement and infiltration trenches. Reducing peak flow stormwater inputs within the RRPLW may be accomplished via reducing impervious cover or employing other low impact development/green technologies which allow stormwater to infiltrate, evaporate or transpire before reaching the stormwater conveyance system.
- ***Filter strips/riparia area management practices:*** Protection of streambanks within the watershed through planting of vegetated/buffer areas with grasses, legumes, shrubs or trees will mitigate bacteria inputs into surface waters. These areas will filter stormwater runoff before the runoff enters into the surface waters of the RRPLW.
- ***Private septic system inspection and maintenance program*** - Septic systems are believed to be a source of bacteria to waters in the RRPLW. Failing systems are expected to be identified and addressed via upgrades to those septic systems not meeting local health ordinances. Septic

system improvement priority should be given to those failing systems adjacent to surface waters (i.e., streams or lakes).

- ***Pasture management and fencing*** - Reducing livestock access to stream environments will lower the opportunity for direct transport of bacteria to surface waters. The installation of exclusion fencing near stream and river environments to prevent direct access for livestock, installing alternative water supplies, and installing stream crossings between pastures, would work to reduce the influxes of bacteria and improve water quality within the watershed. Additionally, introducing rotational grazing to increase grass coverage in pastures, and maintaining appropriate numbers of livestock per acre for grazing, can also aid in the reduction of bacteria inputs.

RRPLW total phosphorus TMDL: The potential BMPs which, if installed and maintained, would likely result in decreases of phosphorus in surface waters of the RRPLW are:

- ***Filter strips, riparian buffers, bank stabilization and erosion control*** – Protection of streambanks within the watershed through planting of vegetated/buffer areas with grasses, legumes, shrubs or trees will mitigate phosphorus inputs into surface waters. These areas will filter stormwater runoff before the runoff enters the main stem or tributaries of the RRPLW. An assessment of stream channel, river channel, and lakeshore erosional areas should be completed to evaluate areas where erosion control strategies could be implemented in the RRPLW. Implementation actions (e.g., planting deep-rooted vegetation near water bodies to stabilize streambanks) could be prioritized to target areas which are actively eroding. This strategy could prevent additional sediment inputs into surface waters of the RRPLW and minimize or eliminate degradation of habitat.
- ***Urban/Residential Nutrient Reduction Strategies:*** These strategies involve reducing stormwater runoff from lakeshore homes and other residences within the RRPLW. These practices would include; rain gardens, lawn fertilizer reduction, lake shore buffer strips, vegetation management and replacement of failing septic systems. Municipal programs, such as street sweeping, can also aid in the reduction of nutrients to surface water bodies within the RRPLW. Municipal partners can team with local watershed groups or water district partners to assess how best to utilize their monetary resources for installing new stormwater BMPs (e.g., vegetated swales) or retrofitting existing stormwater BMPs.
- ***Nutrient management*** – These strategies involve reducing nutrient transport from fields and minimizing soil loss. Specific practices would include; erosion control through conservation tillage, reduction of winter spreading of fertilizers, elimination of fertilizer spreading near open inlets and sensitive areas, installation of stream and lake shore buffer strips, streambank stabilization practices (gully stabilization and installation of fencing near streams), and nutrient management planning.
- ***Phosphorus-based lawn fertilizer restrictions*** – Runoff from urban and suburban areas may include phosphorus-based fertilizers. Reducing stormwater input from residential lawns, golf courses and other urban/suburban surfaces will reduce the phosphorus inputs to surface waters. Some of these practices could include; rain gardens, municipal street sweeping efforts, lake shore buffer strips, vegetation management and water quality educational programs which aim to inform the general public on nutrient reduction efforts and their impact on water quality.
- ***Private septic system inspection and maintenance program*** - Septic systems are believed to be a source of nutrients to waters in the RRPLW. Failing systems are expected to be identified and

addressed via upgrades to those septic systems not meeting local health ordinances. Septic system improvement priority should be given to those failing systems adjacent to surface waters (i.e., streams or lakes).

- ***In-lake phosphorus loading (internal loading)*** - Internal nutrient loads may be addressed to meet the TMDL allocations outlined in the RRPLW phosphorus TMDLs.
    - *Hypolimnetic aeration:* Increasing oxygen at selected depths in a lake may enhance oxygen transfer efficiencies and reduce internal loading from phosphorus laden lake bottom sediments.
    - *Phosphorus inactivation from aluminum addition (i.e., aluminum sulfate or alum):* The addition of chemical reactants (e.g., aluminum sulfate) to lakes of the RRPLW in order for those reactants to permanently bind phosphorus into the lake bottom sediments. This effort could decrease phosphorus releases from sediment into the lake water column during anoxic conditions.
    - *Dredging of lake bottom sediments:* IEPA explained that phosphorus release from lake bottom sediments is greatest from the recently deposited phosphorus rich layers of lake sediments. Removing this material, via dredging efforts, will contribute to reductions in internal loading.

Education and Outreach Efforts - Increased education and outreach efforts to the general public bring greater awareness to the issues surrounding bacteria and phosphorus contamination and strategies for reducing loading and transport of these pollutants should be prioritized as part of the overall implementation strategy (Section 9.6 of the final TMDL document). Section 9.6 of the final TMDL document outlines several strategies for communicating with local farmers and landowners, e.g., continued regular meetings with local stakeholder groups with the intent of broadening the audience/ attendance, field visit days with demonstration farms, continuing messaging efforts for outreach to individual famers/landowners to encourage NPS implementation efforts, etc. (see bullet points in Section 9.6 of the final TMDL document).

The EPA finds that this criterion has been adequately addressed. The EPA reviews but does not approve implementation plans.

11. Public Participation

The EPA policy is that there should be full and meaningful public participation in the TMDL development process. The TMDL regulations require that each State/Tribe must subject calculations to establish TMDLs to public review consistent with its own continuing planning process (40 C.F.R. §130.7(c)(1)(ii)). In guidance, the EPA has explained that final TMDLs submitted to the EPA for review and approval should describe the State's/Tribe's public participation process, including a summary of significant comments and the State's/Tribe's responses to those comments.

Provision of inadequate public participation may be a basis for disapproving a TMDL. If the EPA determines that a State/Tribe has not provided adequate public participation, the EPA may defer its approval action until adequate public participation has been provided for, either by the State/Tribe or by the EPA.

EPA Review of the RRPLW TMDL:

The public participation section of the TMDL submittal is found in Section 3 of the final TMDL document. Throughout the development of the RRPLW TMDLs the public was given various opportunities to participate. IEPA hosted a virtual meeting to discuss the draft Stage 1 report on June 17, 2021. During this meeting IEPA described the watershed plan and TMDL process as well as took any comments on the Stage 1 Report. IEPA explained in Appendix D of the final TMDL report that all comments on the Stage 1 Report were incorporated into the Stage 3 Report (i.e., the Final TMDL submittal document). IEPA also hosted a virtual Stage 3 public meeting on January 17, 2024. The public comment period for the draft TMDL was held between December 21, 2023 and February 16, 2024. IEPA posted the draft TMDL online at (https://www2.illinois.gov/epa/public-notices/Pages/general-notices.aspx) for the public comment period.

IEPA received comments on the Rock River/Pierce Lake Watershed TMDLs and Watershed Protection Plans (WPPs) and those comments, as well as IEPA's responses to those comments, are summarized in Appendix D of the final TMDL document. The EPA reviewed IEPA's responses to the comments shared on Rock River/Pierce Lake Watershed TMDLs and Watershed Protection Plans and has determined that IEPA responded appropriately to the comments on these documents. IEPA submitted the comments received during the public notice period and its responses to those comments within Appendix D of the final RRPLW TMDL submittal packet received by the EPA on August 30, 2024.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this eleventh element.

12. Submittal Letter

A submittal letter should be included with the TMDL submittal and should specify whether the TMDL is being submitted for a *technical review* or *final review and approval*. Each final TMDL submitted to the EPA should be accompanied by a submittal letter that explicitly states that the submittal is a final TMDL submitted under Section 303(d) of the Clean Water Act for the EPA review and approval. This clearly establishes the State's/Tribe's intent to submit, and the EPA's duty to review, the TMDL under the statute. The submittal letter, whether for technical review or final review and approval, should contain such identifying information as the name and location of the water body, and the pollutant(s) of concern.

EPA Review of the RRPLW TMDL:

The EPA received the final Rock River/Pierce Lake Watershed TMDL document, submittal letter and accompanying documentation from IEPA on August 30, 2024. The submittal letter explicitly stated that the final TMDLs referenced in Table 1 of this Decision Document were being submitted to the EPA pursuant to Section 303(d) of the Clean Water Act for the EPA review and approval. The submittal letter also included the name and location of the water bodies and the causes/pollutants of concern. This TMDL was submitted per the requirements under Section 303(d) of the Clean Water Act and 40 C.F.R. 130.

The EPA finds that the TMDL document submitted by IEPA satisfies the requirements of this twelfth element.

13. Conclusion

After a full and complete review, the EPA finds that the 7 bacteria TMDLs and the 1 total phosphorous TMDL satisfy all elements for approvable TMDLs. This TMDL approval is for **eight (8) TMDLs**, addressing segments for primary contact recreation use and aesthetic quality use impairments (Table 1 of this Decision Document).

The EPA's approval of these TMDLs extends to the water bodies which are identified above with the exception of any portions of the water bodies that are within Indian Country, as defined in 18 U.S.C. Section 1151, and as further discussed in our Decision Document. The EPA is taking no action to approve or disapprove TMDLs for those waters at this time. The EPA, or eligible Indian Tribes, as appropriate, will retain responsibilities under the CWA Section 303(d) for those waters.

Executive Summary

A total maximum daily load (TMDL) is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA develops a list, known as the 303(d) list, of water bodies not meeting water quality standards every 2 years, which is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. In accordance with U.S. Environmental Protection Agency (EPA) guidance, the report assigns all waters of the state to one of five categories; 303(d)-listed water bodies make up category five in the Integrated Report.

Water bodies listed as impaired in the 2018 Integrated Water Quality Report and 303(d) List[1] were originally targeted for TMDL development in 2019. A Stage 1 TMDL report was initiated for the Rock River/Pierce Lake watershed based on the 2018 303(d) list. Stage 1 of TMDL development reviews and documents the physical characteristics of a watershed as well as available historical data in comparison to applicable water quality standards. **Table ES-1** contains information on the 2018 impaired water bodies that were investigated for this report:

Table ES-1 Impaired Water Bodies in the Rock River/Pierce Lake Watershed (2018 303(d) List)

Segment ID	Segment Name	Potential Cause of Impairment	Impaired Use	Potential Source(s) of Impairment (as identified by the 2018 303(d) list)
IL_PR-01	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
IL_PR-99	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
		Arsenic	Aquatic Life	Channelization, Urban Runoff/Storm Sewers, Contaminated Sediments
		pH	Aquatic Life	Channelization, Urban Runoff/Storm Sewers
		Zinc	Aquatic Life	Channelization, Urban Runoff/Storm Sewers, Contaminated Sediments
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PSA	South Fork Kent Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PU	North Kinnikinnick Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PT	South Kinnikinnick Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PZZG	Spring Creek – North	Fecal Coliform	Primary Contact Recreation	Source Unknown

[1] Illinois EPA. 2018. *Illinois Integrated Water Quality Report and Section 303(d) List, 2018*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2018-cycle-integrated-report-final-20210201.pdf

Segment ID	Segment Name	Potential Cause of Impairment	Impaired Use	Potential Source(s) of Impairment (as identified by the 2018 303(d) list)
IL_RPC	Pierce Lake	Total Phosphorus (TP)	Aesthetic Quality	Internal Nutrient Recycling, On-Site Treatment Systems, Waterfowl, Crop Production (Crop Land or Dry Land), Runoff from Forest/Grassland/Parkland

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[2] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for pH, zinc, and arsenic from the 2020/2022 303(d) list. Appendix C-4 of the Integrated Report[3] provides information for segments and causes that were removed from the 2018 303(d) list. The appendix notes that there were no standard violations in the new data for the 2020 assessment cycle for pH and zinc and that new data allowed for delisting of arsenic as a legacy cause. Because of these delistings, TMDL development did not continue for these parameters in Keith Creek beyond Stage 1. The remaining impairments shown in **Table ES-1** have not changed during the most recent listing cycle and TMDL development is documented in this report.

Section 1

Goals and Objectives for the Rock River/Pierce Lake Watershed

1.1 Total Maximum Daily Load Overview

A total maximum daily load (TMDL) is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Every 2 years, Illinois EPA develops a list known as the 303(d) list of water bodies that do not meet water quality standards. The list is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. In accordance with Illinois EPA guidance, the report assigns all waters of the state to one of five categories. The 303(d)-listed water bodies make up category five in the integrated report.

In general, a TMDL is a quantitative assessment of water quality impairments, contributing potential sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a water body.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters
- Where attainable, achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water

Water quality standards consist of three elements:

- Designated beneficial use or uses of a water body or segment of a water body
- Water quality criteria necessary to protect the use or uses of that particular water body
- Antidegradation policy

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a

narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 Total Maximum Daily Load Goals and Objectives

Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

Water bodies listed as impaired in the 2018 Integrated Water Quality Report and 303(d) List[4] were originally targeted for Stage 1 TMDL development in 2019. Illinois EPA uses the U.S. Geologic Survey (USGS) 10-digit hydrologic unit code (HUC) to group subbasins into TMDL watersheds. This report addresses Stages 1 and 3 TMDL development for the Rock River/Pierce Lake watershed (HUC 0709000501). Stage 2 was not performed as data collection was not necessary to support Stage 3 work. The data gathered and presented during Stage 1 (Sections 1 through 6 of this document) were used to calculate TMDLs in the watershed.

Following this process, TMDL goals and objectives for the Rock River/Pierce Lake watershed included developing TMDLs for impaired water bodies within the watershed, describing the necessary elements of the TMDL, developing a watershed-based implementation plan (WBP) to attain water quality goals, and gaining public acceptance of the process. The impaired water body segments in the Rock River/Pierce Lake watershed are:

- Keith Creek (IL_PR-01 and IL_PR-99)
- North Fork Kent Creek (IL_PSB-01)
- South Fork Kent Creek (IL_PSA)
- North Kinnikinnick Creek (IL_PU)
- South Kinnikinnick Creek (IL_PT)
- Spring Creek – North (IL_PZZG)
- Pierce Lake (IL_RPC)

The impaired water body segments are shown on **Figure 1-1**. There are seven impaired stream segments and one impaired lake within the Rock River/Pierce Lake watershed addressed in this report. **Table 1-1** lists the water body segment, potential cause of impairment, use description, and potential sources of impairment for the water body as listed in 2018.

Table 1-1 Impaired Water Bodies in the Rock River/Pierce Lake Watershed (2018 303(d) List)

Segment ID	Segment Name	Potential Cause of Impairment	Impaired Use	Potential Source(s) of Impairment (as identified by the 2018 303(d) list)
IL_PR-01	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
IL_PR-99	Keith Creek	Fecal Coliform	Primary Contact Recreation	Urban Runoff/Storm Sewers
		Arsenic[1]	Aquatic Life	Channelization, Urban Runoff/Storm Sewers, Contaminated Sediments
		pH[1]	Aquatic Life	Channelization, Urban Runoff/Storm Sewers
		Zinc[1]	Aquatic Life	Channelization, Urban Runoff/Storm Sewers, Contaminated Sediments
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PSA	South Fork Kent Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PU	North Kinnikinnick Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PT	South Kinnikinnick Creek	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_PZZG	Spring Creek – North	Fecal Coliform	Primary Contact Recreation	Source Unknown
IL_RPC	Pierce Lake	Total Phosphorus (TP)	Aesthetic Quality	Internal Nutrient Recycling, On-Site Treatment Systems, Waterfowl, Crop Production (Crop Land or Dry Land), Runoff from Forest/Grassland/Parkland

Note:

[1] **These parameters were included on the 2018 303(d) list when this TMDL report was initiated. The parameters have since been removed from the 2020/2022 303(d) list.**

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[5] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for pH, zinc, and arsenic from the 2020/2022 303(d) list. Because of these delistings, TMDL development did not continue for these parameters in Keith Creek beyond Stage 1 (Sections 1 through 6 of this report). The remaining impairments shown in **Table 1-1** have not changed during the most recent listing cycle.

The TMDLs for the segments listed above will specify the following elements:

- Loading capacity (LC), or the maximum amount of pollutant loading a water body can receive without violating water quality standards
- Waste load allocation (WLA), or the portion of the TMDL allocated to existing or future point sources
- Load allocation (LA), or the portion of the TMDL allocated to existing or future nonpoint sources and natural background

[5] Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

- Margin of safety (MOS), or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- Reserve capacity (RC), or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\mathbf{TMDL = LC = \Sigma WLA + \Sigma LA + MOS + RC}$$

TMDLs also consider the seasonal variability of pollutant loads so that applicable water quality standards are met during all seasons of the year. Also, reasonable assurance that TMDLs will be achieved is described in the WBP. The WBP for the Rock River/Pierce Lake watershed describes how water quality standards and goals will be met and attained. The WBP includes recommendations for implementing best management practices (BMPs), cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completion of implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Rock River/Pierce Lake Watershed Description** describes the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Rock River/Pierce Lake Watershed Public Participation** discusses public participation activities that will occur throughout TMDL development.
- **Section 4 Rock River/Pierce Lake Watershed Water Quality Standards** defines the water quality standards and water quality guidelines for the impaired water bodies.
- **Section 5 Rock River/Pierce Lake Watershed Data and Potential Pollutant Sources** presents the available water quality data needed to develop TMDLs, discusses the characteristics of the impaired stream segments in the watershed, and describes the point and nonpoint sources with the potential to contribute to the watershed load.
- **Section 6 Approach to Developing Total Maximum Daily Loads and Identifying Data Needs** makes recommendations for the models and analysis that are needed for TMDL development and suggests segments for Stage 2 data collection.
- **Section 8 Total Maximum Daily Loads for the Rock River/Pierce Lake Watershed** provides the results of the water quality modeling and analyses for the impaired segments within the watershed.
- **Section 9 Watershed-Based Implementation Plan for the Rock River/Pierce Lake Watershed** includes implementation actions, point source monitoring, management measures, and BMPs to address water quality issues in the watershed.

This page intentionally left blank.

Section 2

Rock River/Pierce Lake Watershed Description

2.1 Location

The Rock River/Pierce Lake watershed (HUC 0709000501 shown on **Figure 1-1**) is in north central Illinois and drains approximately 149,300 acres,[6] roughly 139,100 acres of which drain land within Illinois. The remaining 10,200 acres drain areas within Wisconsin. In Illinois, approximately 107,000 acres (71.7 percent of the total watershed) lie in Winnebago County and 32,100 acres (21.5 percent of the total watershed) lie in Boone County. The scope of this report is largely limited to the Illinois portion of the watershed, and the impaired water bodies addressed are all in Illinois.

2.2 Topography

Topography is an important factor in watershed management because stream types, precipitation, and soil types can vary dramatically by elevation. Elevation data are available from USGS[7] for each 1:24,000 topographic quadrangle in the United States. Elevation data for the Rock River/Pierce Lake watershed were obtained by overlaying USGS grid data onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed.

Elevation in the Rock River/Pierce Lake watershed ranges from approximately 1,000 feet above sea level in the north central portion of the watershed to 670 feet above sea level near the confluence of Keith Creek and the Rock River.

2.3 Land Use

Land use data for the Rock River/Pierce Lake watershed were extracted from the U.S. Department of Agriculture's (USDA's) National Agriculture Statistics Service (NASS) 2018 Cropland Data Layer (CDL).[8] The CDL is a raster-based, georeferenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities and to produce digital, crop-specific, categorized georeferenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2018 and includes 33 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters.

---

6 Acres have been rounded to the nearest hundred.

8 NASS CDL. https://www.nass.usda.gov/Research_and_Science/Cropland/Release/index.php

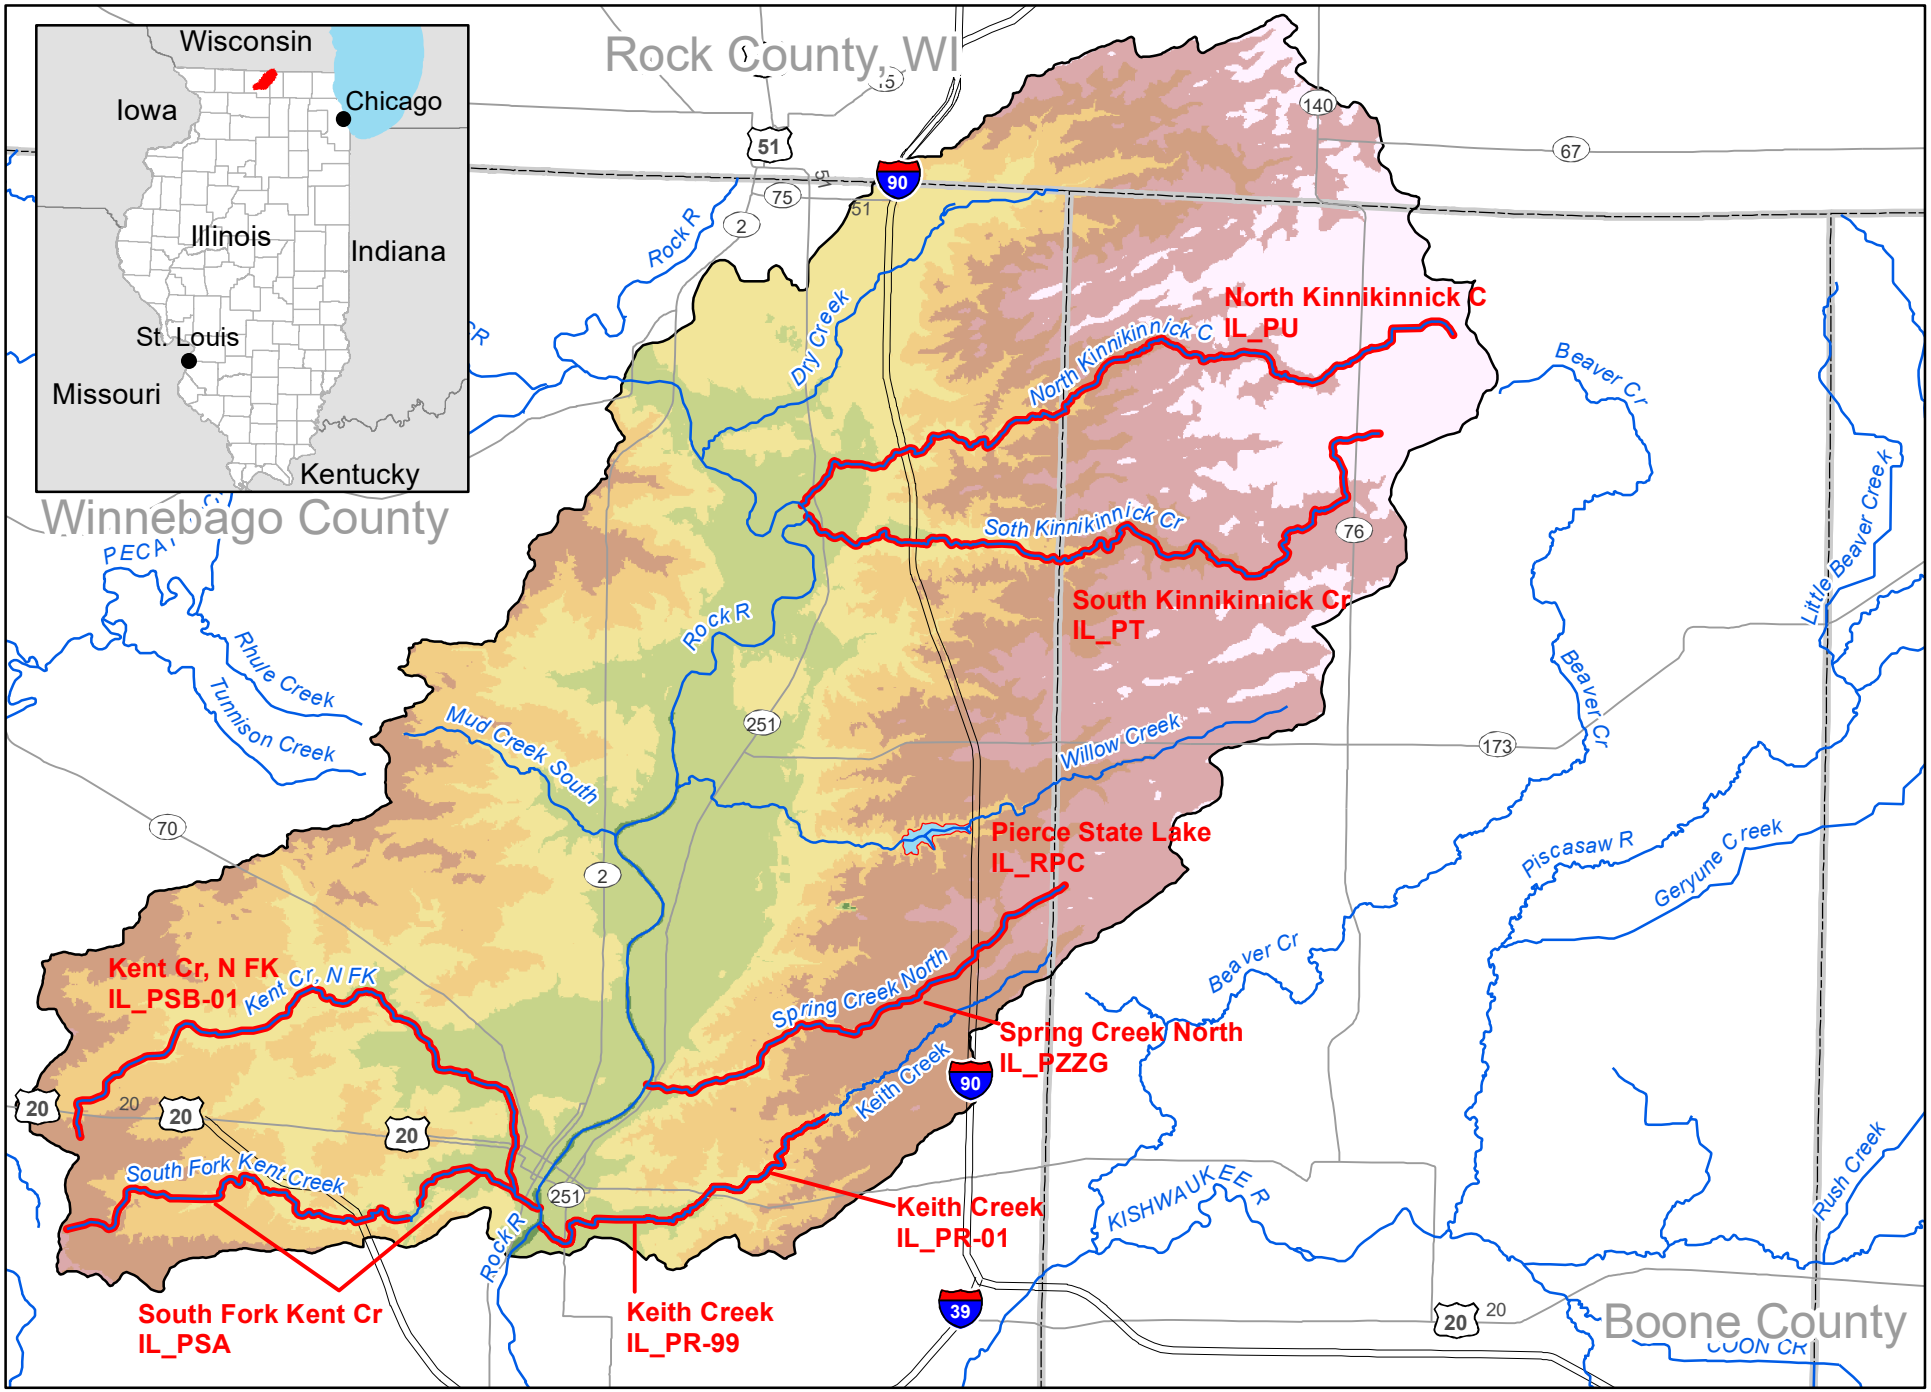

Figure 2-1: Rock River/Pierce Lake Watershed Elevation

CDM Smith

Land use characteristics of the watershed were determined by overlaying the Illinois Statewide 2018 CDL data layers onto the GIS-delineated watershed. **Table 2-1** contains the main categories of land uses in the Rock River/Pierce Lake watershed, based on the 2018 CDL land cover categories. The table also includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed. **Appendix A** contains a table of all land uses in the watershed.

Table 2-1 Land Cover in the Rock River/Pierce Lake Watershed

Land Cover Category	Acres	Percentage[1]
Corn	34,695	23.2%
Developed/Low Intensity	24,538	16.4%
Soybeans	22,030	14.7%
Deciduous Forest	16,110	10.8%
Developed/Open Space	14,494	9.7%
Developed/Med Intensity	9,777	6.5%
Grass/Pasture	9,453	6.3%
Background	8,908	6.0%
Developed/High Intensity	3,239	2.2%
Open Water	1,528	1.0%
Shrubland	1,379	0.9%
Alfalfa	914	0.6%
Winter Wheat	676	0.5%
Herbaceous Wetlands	595	0.4%
All Others	1,058	0.7%
Total	**149,394**	**100%**

Note:
[1] Percentages have been rounded to the nearest tenth.

The land cover data reveal that 58,315 acres, representing 39 percent of the total watershed area, are dedicated to agricultural activities. Corn and soybean make up 97.3 percent of the agricultural land use within the watershed. Forests and woodlands cover 11.7 percent of the watershed (17,489 acres), and grasslands or pastures cover 6.3 percent (9,453 acres). Approximately 35 percent of the watershed area (52,048 acres) is developed, urbanized land. The remaining watershed area is wetland or open water.

2.3.1 Subbasin Land Use

The subbasin areas draining to each impaired segment within the Rock River/Pierce Lake watershed were further delineated through GIS. Land cover data were then intersected with the subbasin boundaries to determine the land uses contributing runoff to each impaired water body, as shown in **Table 2-2** through **Table 2-9**. Each table includes data on all lands upgradient of an impaired segment, including areas that may contribute to other impaired segments upgradient.

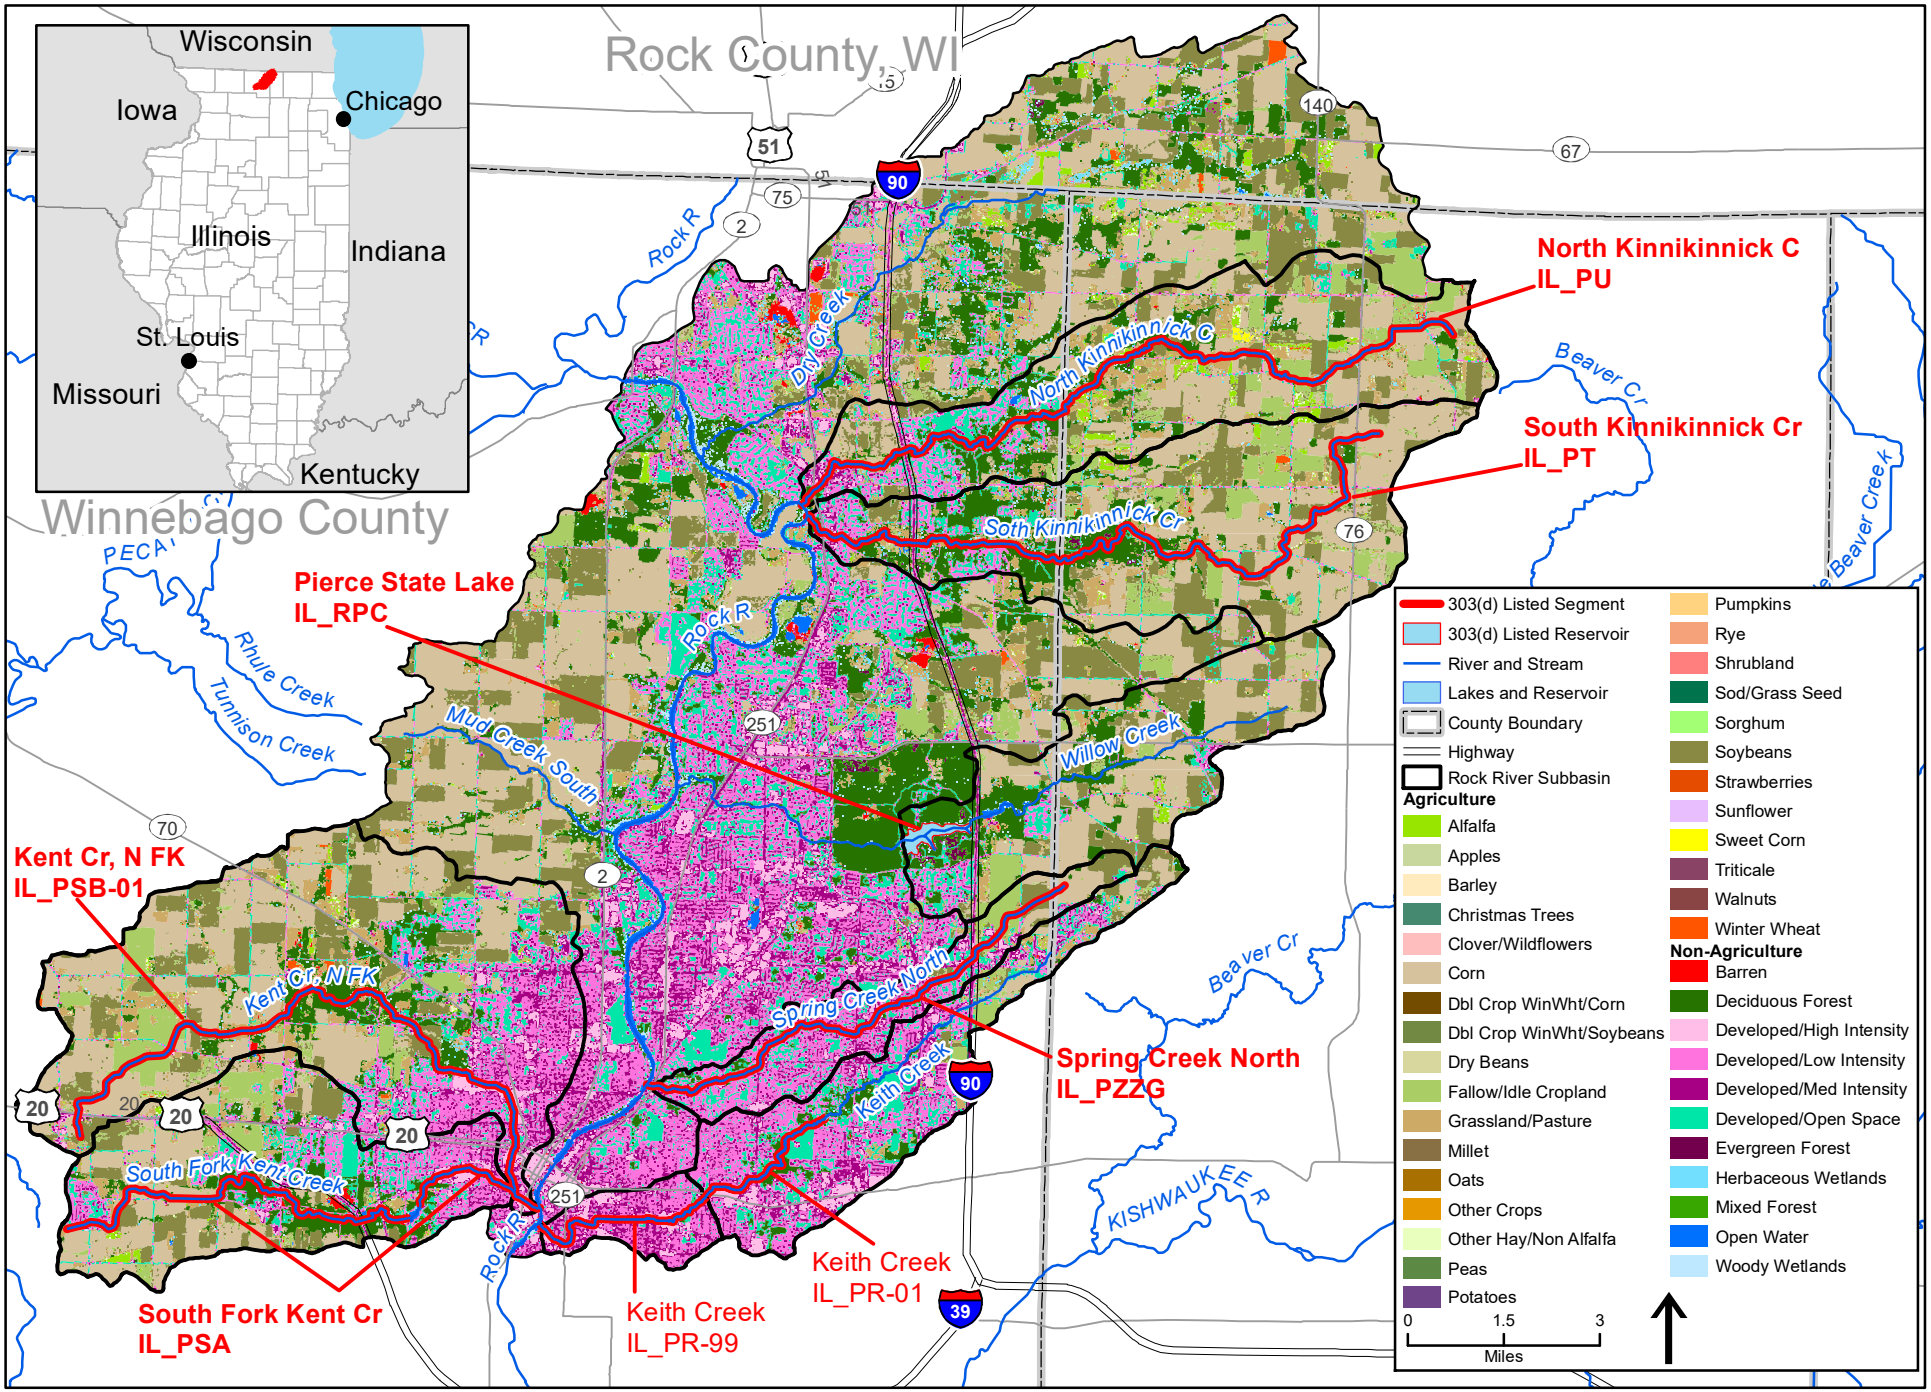

Figure 2-2: Rock River/Pierce Lake Watershed Land Use

2.4 Soils

Soils data are available through the Natural Resources Conservation Service (NRCS) Soil Survey Geographic (SSURGO) database.[9] For SSURGO data, field mapping methods using national standards are used to construct the soil maps. Mapping scales generally range from 1:12,000 to 1:63,360, making SSURGO the most detailed level of soil mapping done by NRCS.

Attributes of the spatial coverage can be linked to the SSURGO database, which provides information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups and the K-factor of the Universal Soil Loss Equation. This section discusses the soil characteristics of the Rock River/Pierce Lake watershed.

[9] NRCS SSURGO. https://www.nrcs.usda.gov/resources/data-and-reports/soil-survey-geographic-database-ssurgo

2.4.1 Soil Characteristics

Appendix B contains a table of the SSURGO soil series for the Rock River/Pierce Lake watershed. A total of 162 soil types exist in the watershed. The most common type, Griswold loam (6 to 12 percent slopes), covers 8 percent of the watershed. The second and third most common types, Comfrey loam (0 to 2 percent slopes) and Flagler sandy loam (0 to 2 percent slopes), respectively, each cover 4 percent of the watershed. All other soil types each represent less than 4 percent of the total watershed area. The table in **Appendix B** also contains the area, dominant hydrologic soil group, and K-factor range. The two characteristics are described in more detail below.

Figure 2-3 shows the hydrologic soils groups found within the Rock River/Pierce Lake watershed. Hydrologic soil groups are used to estimate runoff from precipitation. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

While hydrologic soil groups A, B, C, D, A/D, and B/D are all found within the Rock River/Pierce Lake watershed, group B soils are the most common type, representing about 61 percent of the watershed. Groups A/D and B/D are dual hydrologic soil group. Dual hydrologic soil groups can be adequately drained. The first letter applies to the drained condition and the second letter to the undrained condition. For the purpose of hydrologic soil grouping, adequately drained means that the seasonal high-water table is kept at 24 inches below the surface.[10]

A commonly used soil attribute is the K-factor, which is a measure of soil erodibility and quantifies the relative susceptibility of soil to sheet and rill erosion. Values of K range from 0.02 to 0.69, from least erodible to most erodible, respectively, and are influenced by elements including texture, organic matter content, structure, and saturated hydraulic conductivity.[11] The distribution of K-factor values in the Rock River/Pierce Lake watershed range from 0.20 to 0.47 (**Figure 2-4**).

CDM Smith

2.5 Population

The Census TIGER/Line data[12] from the U.S. Census Bureau were reviewed along with shapefiles of census blocks[13] for the entire state of Illinois. All census blocks that have geographic center points (centroids) within the watershed were selected and tallied to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Given that the optimal size of a census block group is 1,500 people, and 178 block group centroids are within the watershed, it is estimated that approximately 267,000 people reside in the Rock River/Pierce Lake watershed. The major municipalities in the watershed are shown in **Figure 1-1**. The largest urban development in the watershed is the City of Rockford, which lies partially within the watershed and had an estimated population of approximately 146,120 according to 2023 census data.[14] The City of Rockford population has decreased slightly (-4%) since the 1990 census.

2.6 Climate and Streamflow

2.6.1 Climate

Northern Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly temperature and precipitation data from Greater Rockford Airport in Illinois (station USW00094822), approximately 3.5 miles south of the watershed, were extracted from the National Centers for Environmental Information database for 1951 through 2019.[15] This station was selected because of its proximity to the watershed and completeness of its dataset.

Table 2-10 contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is approximately 37 inches. Summer months are historically the wettest months while January and February are the driest.

December	2.0	33.0	17.8
Total	**36.8[1]**	**58.3**	**38.5**

Note:
[1] Average annual total.

2.6.2 Streamflow

Analysis of the Rock River/Pierce Lake watershed requires an understanding of flow throughout the drainage area. There are three active USGS stream gages[16] throughout the watershed that may be used to estimate stream flows for all impaired segments (**Figure 2-5**). **Table 2-11** summarizes the station information.

[16] USGS. National Water Information System. Daily Streamflow Data for Illinois. https://waterdata.usgs.gov/IL/nwis/current/?type=dailydischarge&group_key=basin_cd

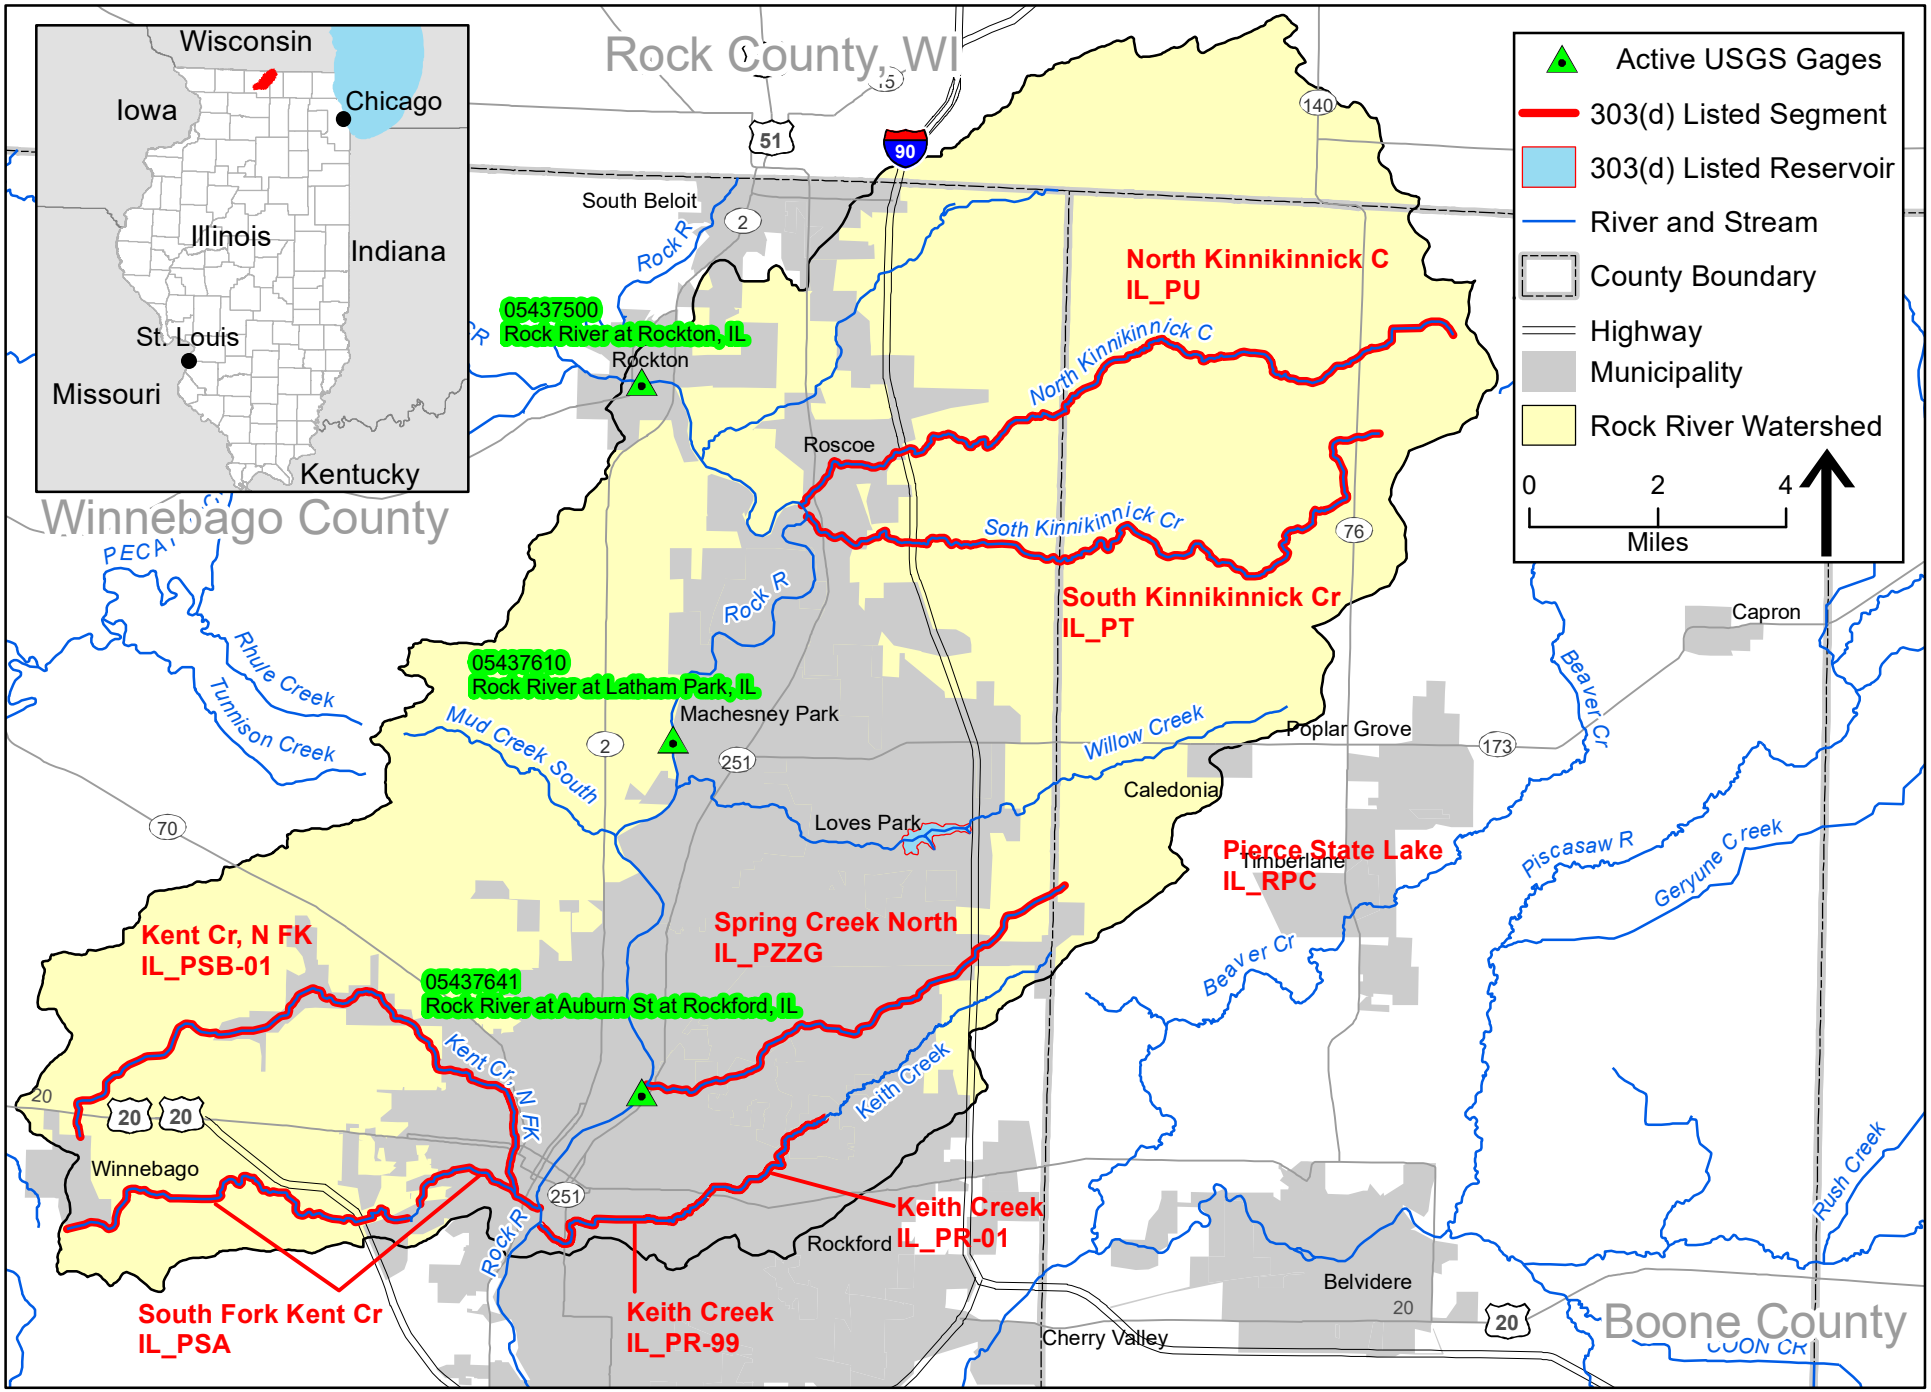

Figure 2-5: Rock River/Pierce Lake Watershed Active USGS Gages

Table 2-11 USGS Stream Gages

Gage Number	Name	Period of Record
USGS 05437641	Rock River at Auburn St. in Rockford[1]	2002–2020
USGS 05437610	Rock River at Latham Park, IL[1]	2002–2020
USGS 05437500	Rock River at Rockton, IL	1903–2020

Note:
[1] Gaging station data includes gage height measurements only; no discharge values were reported.

Data from these gages can be used to estimate flow values for each impaired stream segment within the Rock River/Pierce Lake watershed for purposes of TMDL development. Estimates of flow values for impaired segments are corrected for each segment's watershed size using the drainage area ratio method represented by the following equation:

$$Q_{gaged}\left(\frac{Area_{ungaged}}{Area_{gaged}}\right) = Q_{ungaged}$$

Where,

Q_{gaged} = Streamflow of the gaged basin

$Q_{ungaged}$ = Streamflow of the ungaged basin

$Area_{gaged}$ = Area of the gaged basin

$Area_{ungaged}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Section 3

Rock River/Pierce Lake Watershed Public Participation

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet recommended TMDLs and WBPs. It is important to involve the public as early in the process as possible to achieve maximum cooperation and counter concerns regarding the purpose of the process and the regulatory authority to implement any recommendations.

Illinois EPA and CDM Smith held a virtual public meeting on June 30, 2021, to present Stage 1 of TMDL development (Sections 1 through 6 of this report). An additional virtual public meeting was held on January 17, 2024 at the completion of Stage 3 (Sections 7 through 9 of this report). Comments received through the public meeting process and additional information on the public comment period are included in a Responsiveness Summary in **Appendix D**.

This page intentionally left blank.

Section 4

Rock River/Pierce Lake Watershed Water Quality Standards

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the designated uses of the state's waterways. In Illinois, the Illinois Pollution Control Board (IPCB) is responsible for setting the water quality standards. Illinois is required to update water quality standards every 3 years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA in conjunction with EPA. New standards are then developed or revised during the 3-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to the IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards.[17]

4.2 Designated Uses

The waters of Illinois are classified by designated uses, which include General Use, Public and Food Processing Water Supplies, Lake Michigan Basin, and Secondary Contact and Indigenous Aquatic Life Use.[18] The General Use designation applies to the impairments within the Rock River/Pierce Lake watershed.

4.2.1 General Use

The General Use classification is defined by the IPCB as standards that "are intended to protect aquatic life, wildlife, agricultural, primary contact, secondary contact, and most industrial uses." They are also intended to "ensure the aesthetic quality of the state's aquatic environment and to protect human health from disease or other harmful effects that could occur from ingesting aquatic organisms taken from surface waters of the state."[19] Primary contact uses are protected for all General Use waters whose physical configuration permits such use.

4.3 Water Quality Criteria

According to the 2018 and 2020/2022 Illinois EPA Integrated Report[20], aquatic life use assessments in streams are typically based on the interpretation of biological information, physicochemical water data, and physical habitat. The primary biological measures used are the Fish Index of Biotic Integrity, the Macroinvertebrate Index of Biotic Integrity, and the Macroinvertebrate Biotic Index. Physical habitat information used in assessments includes quantitative or qualitative measures of stream-bottom composition and qualitative descriptors of channel and riparian conditions. Physicochemical water data used include measures of conventional parameters (e.g., dissolved oxygen [DO], pH, and temperature), priority pollutants, nonpriority pollutants, and other pollutants.

Table 4-1 and **Table 4-2** present the numeric water quality standards of the potential causes of impairment for both lakes and streams in the Rock River/Pierce Lake watershed based on the 2018 303(d) list. Note that arsenic, pH, and zinc have been delisted from the 2020/2022 Integrated Water Quality Report. Data and discussion presented in Section 5 compares available water quality data to the standards presented in the following tables and provides additional information regarding the delisting.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of Lake Impairment in the Rock River/Pierce Lake Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
TP	mg/L	0.05[1]	302.205

Note:

[1] The standard applies to inland lakes and reservoirs (greater than 20 acres) and in any stream at the point where it enters any such lake or reservoir.

mg/L = milligrams per liter

[20] Illinois EPA, *Integrated Report*, 17. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

Table 4-2 Summary of Numeric Water Quality Standards for Potential Causes of Stream Impairments in the Rock River/Pierce Lake Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Arsenic**	µg/L	*Trivalent, dissolved:* Acute = 360 × 1.0* = 360 Chronic = 190 × 1.0* = 190	302.208(e)
pH**	Standard units (SU)	6.5–9.0	302.204
Total Fecal Coliform	Count per 100 mL	*May through October* 200(1), 400(2)	302.209
Zinc*	µg/L	*Dissolved:* Acute = $e^{A+B\ln(H)} \times 0.978$* where A = 0.9035 and B = 0.8473 Chronic = $e^{A+B\ln(H)} \times 0.986$* where A = -0.4456 and B = 0.8473	302.208(e)

Notes:
(1) The geometric mean based on a minimum of five samples collected over not more than a 30-day period.
(2) The standard shall not be exceeded by more than 10 percent of the samples collected during any 30-day period.
** These parameters have been delisted from the 303(d) list in the 2020/2022 Integrated Water Quality Report.
* Conversion factor multiplier for dissolved metals
H = hardness; µg/L – micrograms per liter

This page intentionally left blank.

Section 5

Rock River/Pierce Lake Watershed Data and Potential Pollutant Sources

To further characterize the Rock River/Pierce Lake watershed, a wide range of data were collected and reviewed. Water quality data for streams and lakes, and information on potential point and nonpoint sources within the watershed were compiled from a variety of data sources. This information is discussed further in this section.

5.1 Water Quality Data

Illinois EPA monitoring programs that contribute data to the assessment of streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program.[21] Data from numerous historical water quality stations within the Rock River/Pierce Lake watershed were located and reviewed for this report (**Figure 5-1**). These water quality data were primarily provided by Illinois EPA. Stations RPC-1, RPC-2, and RPC-3 on Pierce Lake are part of the Illinois EPA Ambient Lakes Program and were sampled multiple times a year in 2001, 2004, 2011, and 2016. Stations on the impaired stream segments are part of Illinois EPA's Intensive Basin Survey Program, which monitors stations on a 5-year cycle. Additional information on Illinois EPA's monitoring programs can be found in the Water Monitoring Strategy report.[22]

The impaired water body segments in the Rock River/Pierce Lake watershed were presented in Section 1. **Table 1-1** provides impairment information for each segment. Recent and historical data are included in this section and document historical trends and observations. The subsections address both stream and lake impairments, discussing data for the impaired stream segments in the Rock River/Pierce Lake watershed followed by data for the impaired lake in the watershed. Data are summarized by impairment and discussed in relation to the relevant Illinois water quality standard. The data summaries include all available date ranges of data.

5.1.1 Stream Water Quality Data

Seven impaired stream segments exist within the Rock River/Pierce Lake watershed (Keith Creek segments IL_PR-01 and IL_PR-99, North Fork Kent Creek segment IL_PSB-01, South Fork Kent Creek segment IL_PSA, North Fork Kinnikinnick Creek segment IL_PU, South Fork Kinnikinnick Creek segment IL_PT, and Spring Creek – North segment IL_PZZG). Data summaries are presented for the 2018 parameters of concern for stream impairments in this watershed: pH, zinc, arsenic, and fecal coliform. Historical water quality data for the impaired segments of the Rock River/Pierce Lake watershed are provided in **Appendix C**.

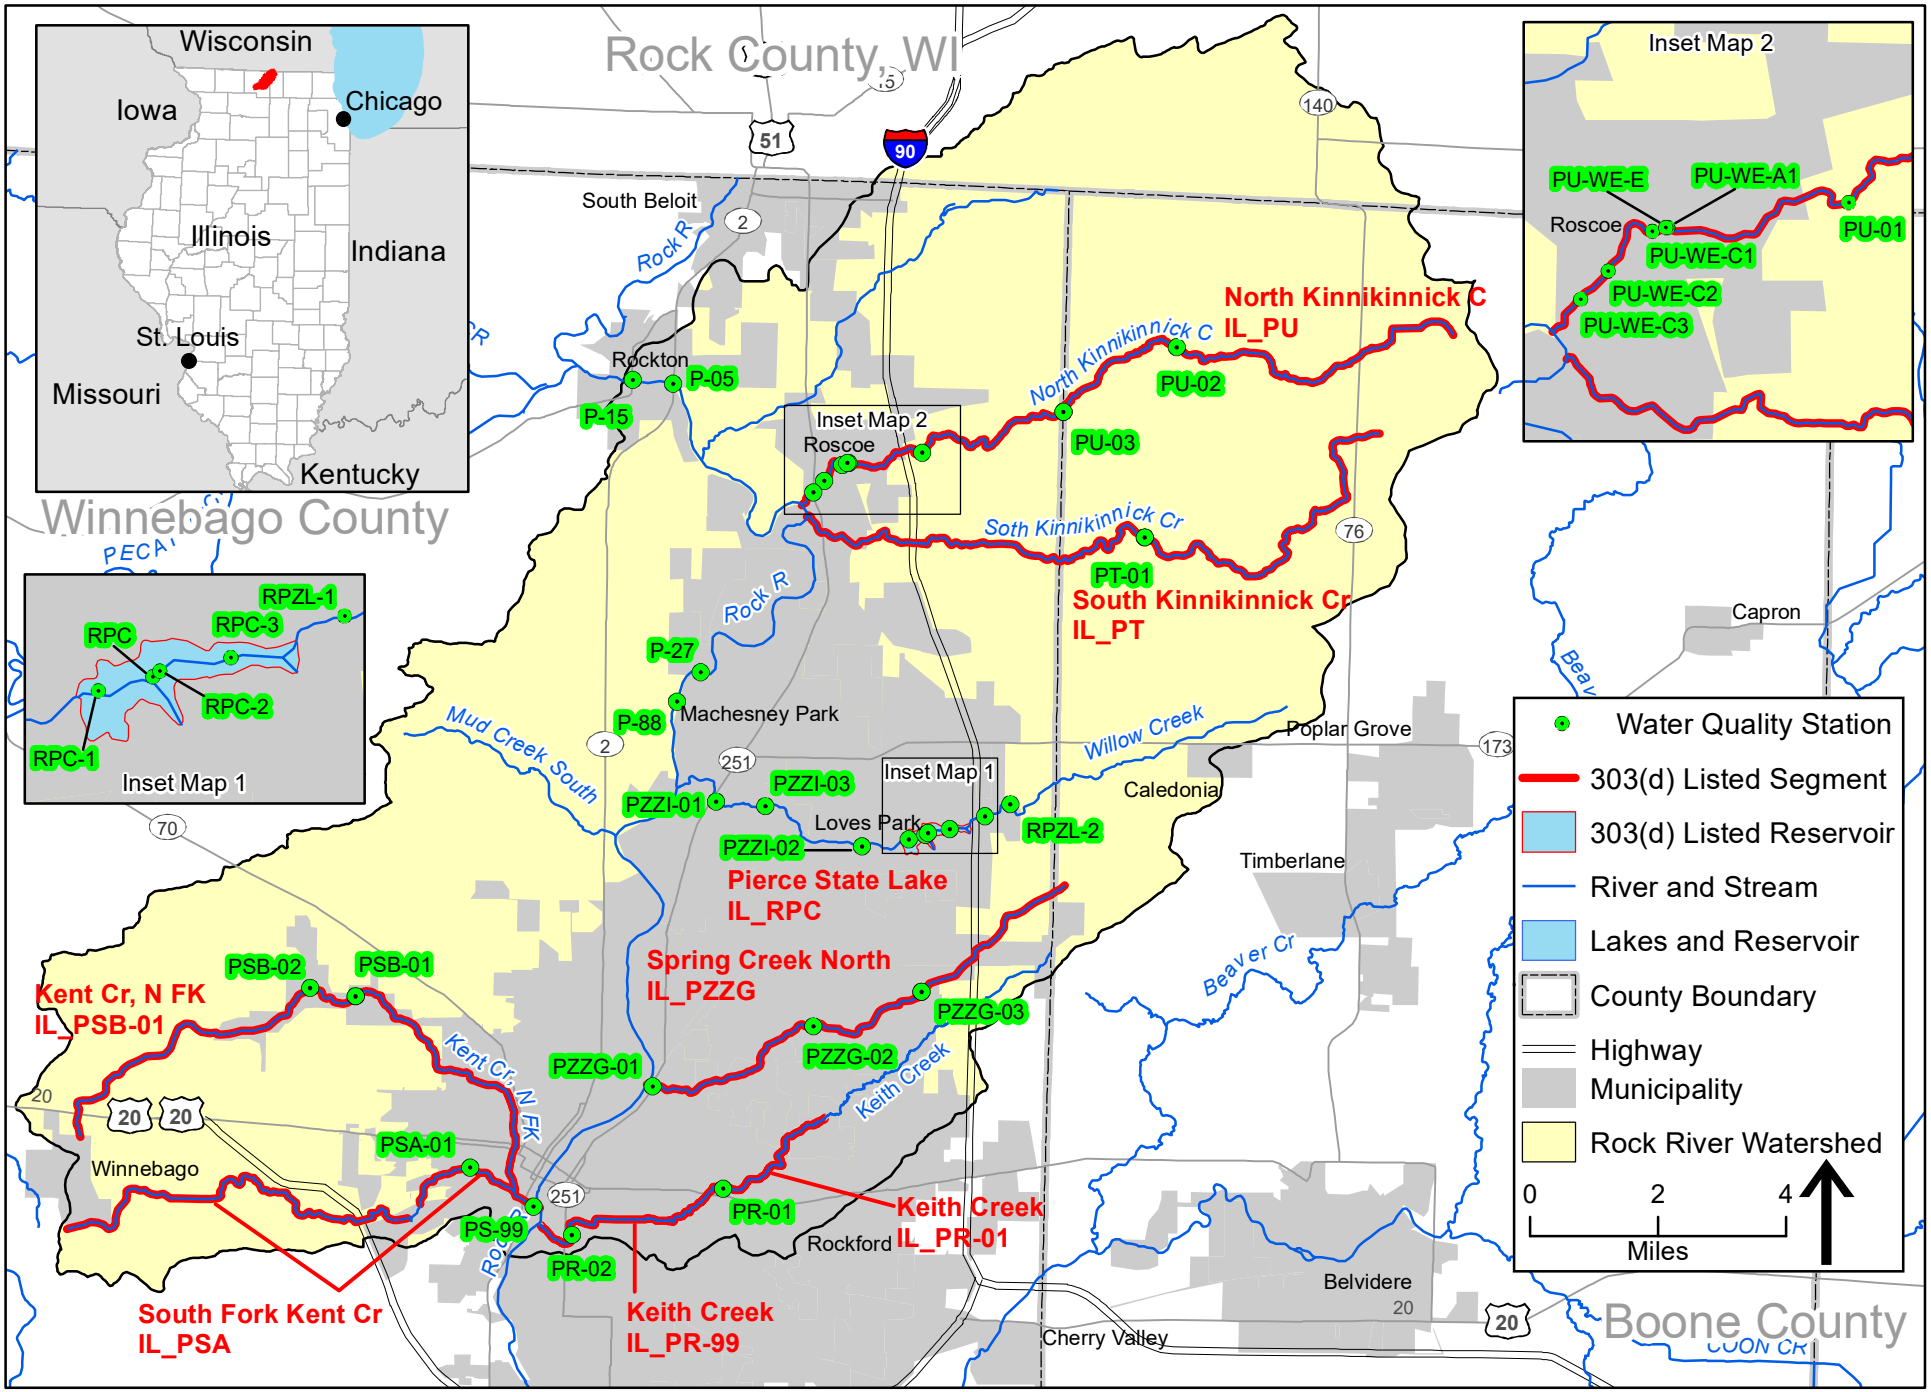

Figure 5-1: Rock River/Pierce Lake Watershed Water Quality Stations

5.1.1.1 Fecal Coliform

All seven of the impaired stream segments (IL_PR-01, IL_PR-99, IL_PSB-01, IL_PSA, IL_PU, IL_PT, and IL_PZZG) are listed for impairment of the primary contact recreation use caused by elevated fecal coliform concentrations. **Table 5-1** summarizes historical fecal coliform data for this segment. The general use water quality standard for fecal coliform states that the standard of 200 colony forming units (cfu) per 100 milliliters (mL) shall not be exceeded by the geometric mean of at least five samples, nor can 10 percent of the samples collected exceed 400 cfu per 100 mL in protected waters, except as provided in 35 Ill. Adm. Code 302.209(b). Samples must have been collected over a 30-day period or less during May through October. Samples collected between September and October 2019 exceeded the current standard at all locations as shown in **Figure 5-2**. **Figure 5-2** shows single sample results compared to statistics-based standards.

Table 5-1 Existing Fecal Coliform Data for Impaired Stream Segments

Stream Segment Name and ID	Period of Record and Number of Data Points[1]	Geometric Mean of All Results (cfu/100 mL)	Maximum Result (cfu/100 mL)	Minimum Result (cfu/100 mL)	Number of Exceedances of the 200 cfu/100 mL Standard[1]	Number of Exceedances of the 400 cfu/100 mL Standard[1]
Keith Creek Segment IL_PR-01	2019; 5	1,500	11,200	602	5	5
Keith Creek Segment IL_PR-99[2]	2019; 5	856	1,870	450	5	5
North Fork Kent Creek Segment IL_PSB-01	2019; 5	645	4,610	72	5	5
South Fork Kent Creek Segment IL_PSA	2019; 5	943	6,490	134	4	3
North Kinnikinnick Segment IL_PU	2019; 5	915	2,480	295	5	4
South Kinnikinnick Segment IL_PT	2019; 5	322	631	189	4	2
Spring Creek – North Segment IL_PZZG	2019; 5	413	1,720	108	4	3

Notes:

[1] Samples were collected May through October.

[2] Samples were collected at station PR-02.

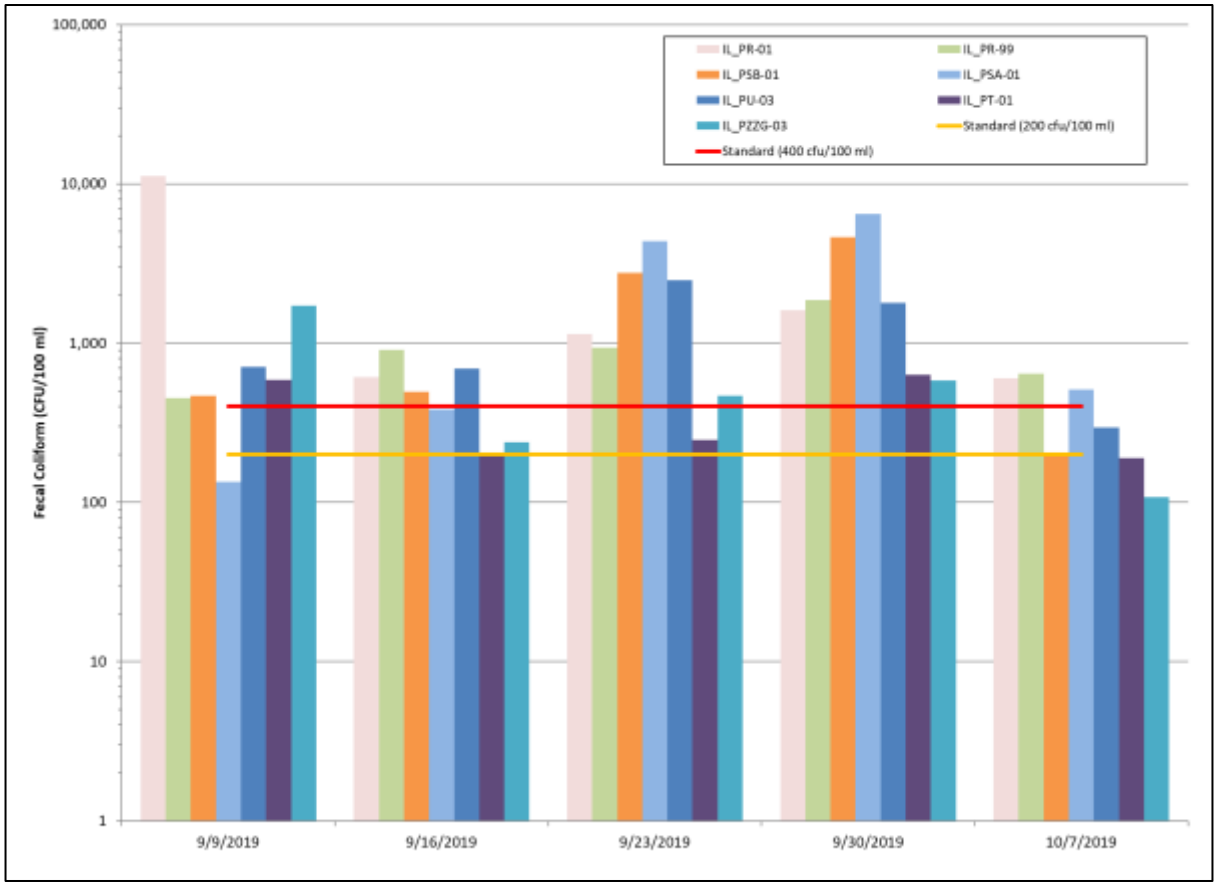

Figure 5-2 Fecal Coliform in Impaired Stream Segments in the Rock River/Pierce Lake Watershed

5.1.1.2 Arsenic

Keith Creek segment IL_PR-99 was listed in 2018 for impairment of the aquatic life use because of elevated arsenic concentrations. **Table 5-2** summarizes, and **Figure 5-3** presents historical arsenic data for this segment. The general use water quality standard for arsenic consists of acute and chronic thresholds. Sampling results for dissolved arsenic at this location are reported as nondetect; therefore, the detection limit value for each sample was applied for the purpose of calculation. However, no results exceeded the acute or chronic water quality standards.

Table 5-2 Existing Arsenic Data for Keith Creek Segment IL_PR-99

Impaired Stream Segment Name and ID	Period of Record and Number of Data Points	Mean Result (µg/L)	Maximum Result (µg/L)	Minimum Result (µg/L)	Number of Acute Exceedances	Number of Chronic Exceedances
Keith Creek Segment IL_PR-99	2008, 2013; 6	3.05[1]	4.45[1]	1.65[1]	0	0

Note:

[1] All dissolved arsenic sample results were reported as nondetect; therefore, the detection limit value was applied for the purpose of calculation.

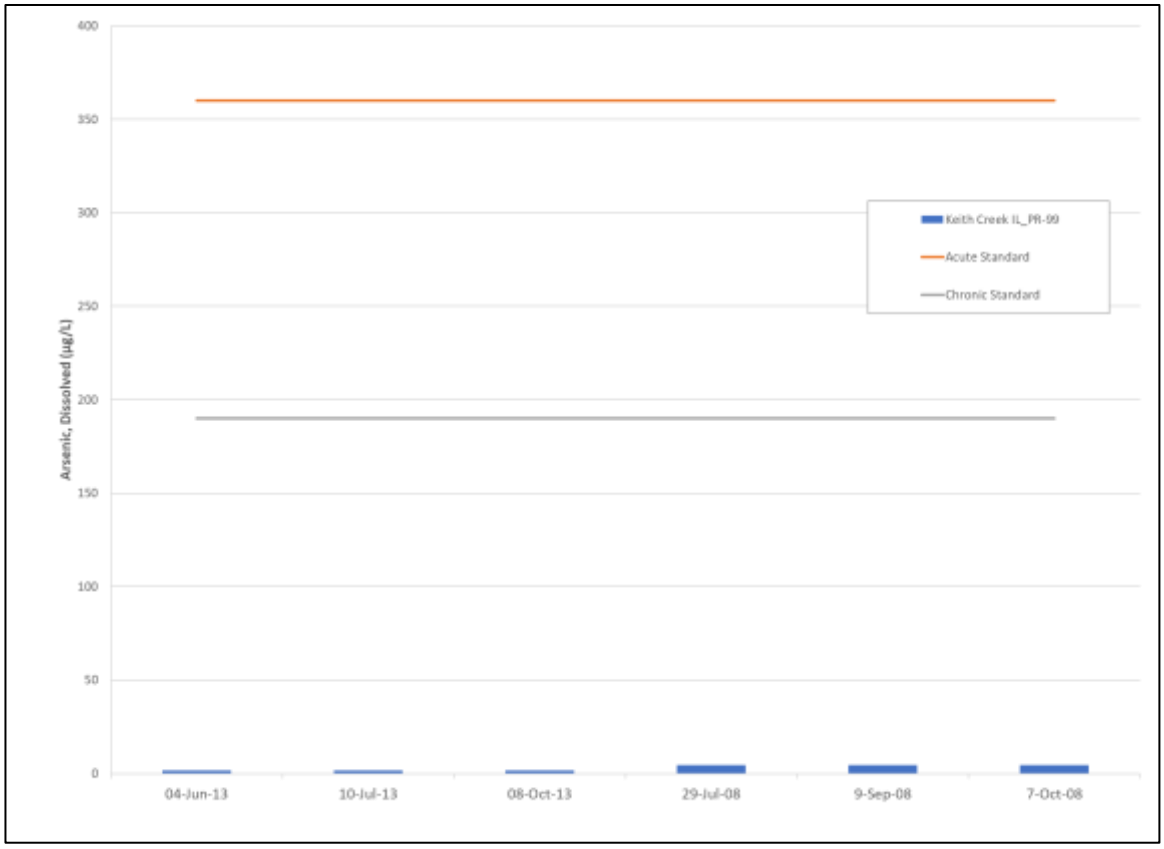

Figure 5-3 Arsenic in Impaired Stream Segment IL_PR-99 of Keith Creek

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[23] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for arsenic from the 2020/2022 303(d) list. Because of the delisting, TMDL development for arsenic in Keith Creek did not continue beyond Stage 1.

5.1.1.3 pH

Keith Creek segment IL_PR-99 was also listed in 2018 for impairment of the aquatic life use because of pH. **Table 5-3** summarizes, and **Figure 5-4** presents historical pH data for this segment. A sample result is considered an exceedance if it is below 6.5 or above 9.0 SU at any time. Only three samples were available for review on this segment. The samples were from 2013 and none of the results were outside the allowable pH range.

Table 5-3 Existing pH Data for Keith Creek Segment IL_PR-99

Impaired Stream Segment Name & ID	Period of Record and Number of Data Points	Mean Result (SU)	Maximum Result (SU)	Minimum Result (SU)	Number of Exceedances
Keith Creek Segment IL_PR-99	2013; 3	8.04	8.34	7.84	0

[23] Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

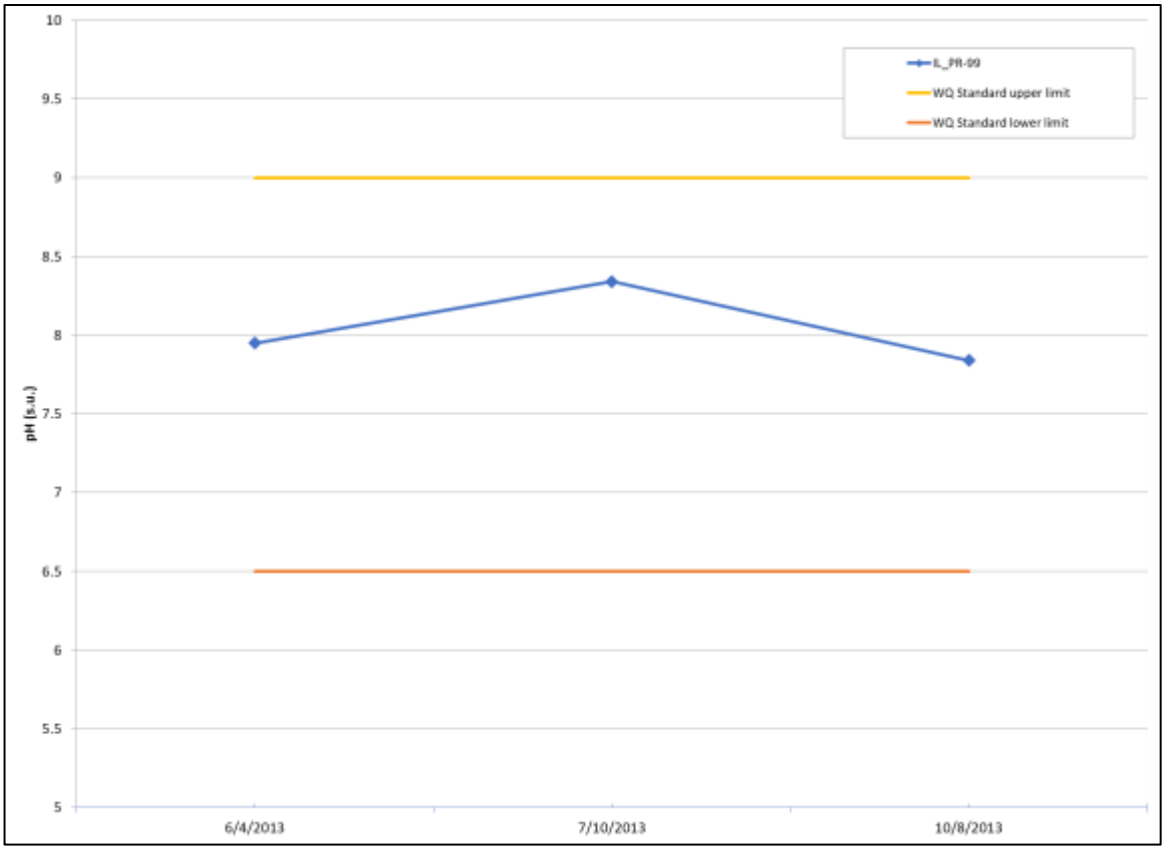

Figure 5-4 pH in Impaired Stream Segment IL_PR-99 of Keith Creek

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[24] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for pH from the 2020/2022 303(d) list. Because of the delisting, TMDL development for pH in Keith Creek did not continue beyond Stage 1.

5.1.1.4 Zinc

Keith Creek segment IL_PR-99 was listed for impairment of aquatic life use because of elevated dissolved zinc concentrations in 2018. **Table 5-4** summarizes historical zinc data for this segment. Both the acute and chronic general use water quality standards for dissolved zinc are calculated standards that vary with the total hardness of the sampled water. The data presented in **Table 5-4** reflect single sample results from the segment compared to the hardness-dependent standard. No exceedances were noted in the dataset for Keith Creek. Three of the six sample results indicate zinc concentrations were below the detection limit of the analytical method employed. For nondetect results, method detection limits were applied. **Figure 5-5** shows the dissolved zinc measurements collected over time on the segment.

[24] Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

Table 5-4 Existing Zinc Data for Keith Creek Segment IL_PR-99

Illinois Water Quality Standard (µg/L)	Period of Record and Number of Data Points	Mean Result (µg/L)	Maximum Result (µg/L)	Minimum Result (µg/L)	Number of Acute Exceedances	Number of Chronic Exceedances
Varies[1]	2008, 2013; 6	2.9[2]	8.8	<0.35[2]	0[2]	0[2]

Notes:

1 The standards are hardness dependent.

2 Method detection limits were applied for nondetect results (half of the samples).

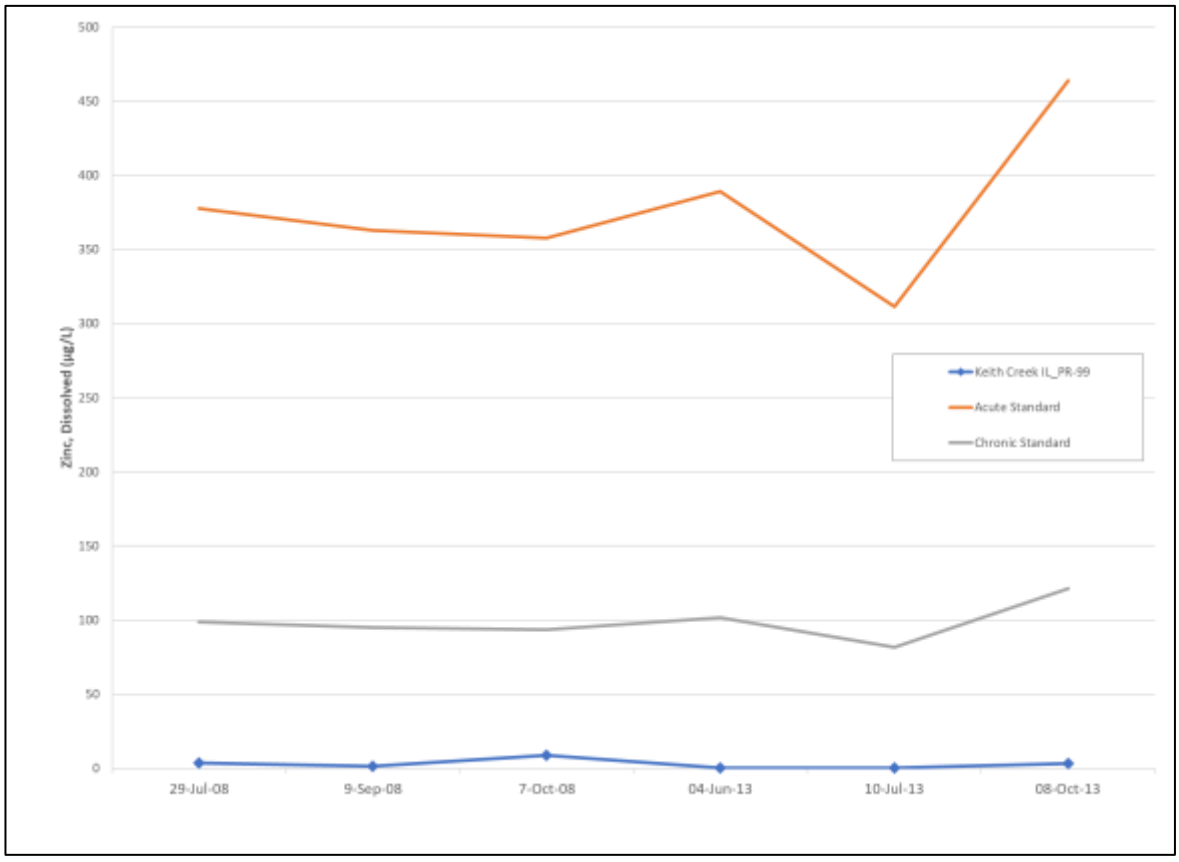

Figure 5-5 Dissolved Zinc in Impaired Stream Segment IL_PR-99 of Keith Creek

Since the completion of Stage 1, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List[25] was approved by EPA on June 30, 2022. Segment IL_PR-99 of Keith Creek was delisted for zinc from the 2020/2022 303(d) list. Because of the delisting, TMDL development for zinc in Keith Creek did not continue beyond Stage 1.

[25] Illinois EPA. 2022a. *Illinois Integrated Water Quality Report and Section 303(d) List, 2020/2022*. https://epa.illinois.gov/content/dam/soi/en/web/epa/topics/water-quality/watershed-management/tmdls/documents/2020-2022-ir-final-6-01-22.pdf

5.1.2 Pierce Lake Water Quality Data

Pierce Lake is listed for impairment of aesthetic quality use due to elevated TP concentrations. Data are available from three separate water quality monitoring locations within Pierce Lake. The data associated with the impairments in Pierce Lake is presented in **Table 5-5**.

Table 5-5 Data Related to Impairment at Pierce Lake

Pierce Lake Segment IL_RPC; Sample Locations RPC-1, RPC-2, RPC-3		
RPC-1	**Period of Record**	**Number of Samples**
TP	1998, 2001, 2004, 2011, 2016	40
Dissolved Phosphorus	2001, 2004, 2011, 2016	34
Phosphorus in Bottom Deposits	1999, 2001, 2011	3
RPC-2		
TP	1998, 2001, 2004, 2011, 2016	19
Dissolved Phosphorus	2001, 2004, 2011, 2016	16
Phosphorus in Bottom Deposits	No data	No data
RPC-3		
TP	1998, 2001, 2004, 2011, 2016	19
Dissolved Phosphorus	2001, 2004, 2011, 2016	17
Phosphorus in Bottom Deposits	2001, 2011	2

5.1.2.1 Total Phosphorus in Pierce Lake

The applicable water quality standard for TP in Pierce Lake is 0.05 mg/L. Compliance with the TP standard is assessed using samples collected at a 1-foot depth from the lake surface. The number of samples, count of exceedances, and average TP concentrations at a 1-foot depth for each year of data at each monitoring location in Pierce Lake are summarized in **Table 5-6** and shown on **Figure 5-6**. Based on the dataset, TP concentrations collected at a 1-foot depth in Pierce Lake are consistently above the 0.05 mg/L water quality standard. Annual average phosphorus concentrations at all sampling stations decreased from 2011 to 2016. However, annual average phosphorus data from sampling station RPC-3 are consistently above the 0.05 mg/L water quality standard.

Table 5-6 Total Phosphorus at a 1-Foot[1] Depth in Pierce Lake (IL_RPC)

Station ID	Period of Record and Number of Data Points	Mean Result (mg/L)	Maximum Result (mg/L)	Minimum Result (mg/L)	Number of Exceedances
RPC-1	2001, 2004, 2011, 2016; 13	0.094	0.584	0.026	5
RPC-2	2001, 2004, 2011, 2016; 17	0.053	0.115	0.01	7
RPC-3	2001, 2004, 2011, 2016; 17	0.069	0.128	0.029	12

Note:

[1] Excludes samples from 1998 and 1999 that did not specify the collection depth.

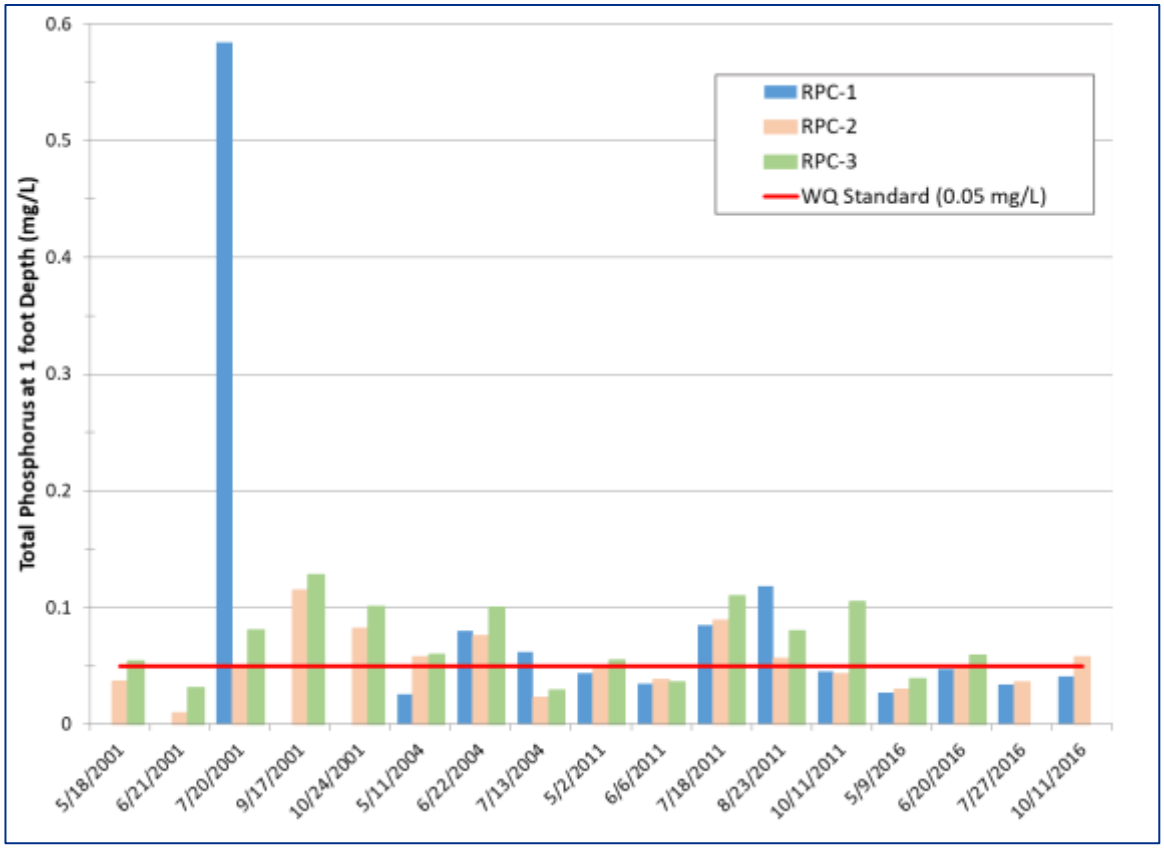

Figure 5-6 Total Phosphorus in Pierce Lake

5.2 Lake Characteristics

Pierce Lake is in Winnebago County, approximately 7 miles northeast of Rockford, Illinois. Pierce Lake is fed by Willow Creek, a tributary of the Rock River. As groundwater is the sole source of water supply for Rockford, the city does not use Pierce Lake as a source for its drinking water.

Pierce Lake has a surface area of 157 acres and a reported maximum depth of 36 feet. The overland watershed draining into Pierce Lake is approximately 8,150 acres. The lake is in a park setting and is adjacent to campgrounds and just downstream of Olson Lake (**Figure 5-7**). The areas immediately adjacent to the lake are primarily grass and forest land. Further to the south, west, and northwest of the lake there is low- and medium-density development; the other surrounding areas are primarily farmland. The lake is used for boating and fishing.

CDM Smith

Figure 5-7: Pierce Lake

5.3 Point Sources

Table 5-7 contains permit information for permitted dischargers in the watershed. **Figure 5-8** shows the locations of each facility. Not all facilities within the watershed discharge upstream of impaired segments. In general, facilities discharging treated domestic wastewater have the potential to affect pathogen, metals, and nutrient concentrations in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain metals, nutrients, and/or pathogens. National Pollutant Discharge Elimination System (NPDES) facilities with permit limits are required to submit discharge monitoring reports to Illinois EPA and report effluent flows and concentrations.

Table 5-7 Permitted Facilities Discharging within the Rock River/Pierce Lake Watershed

Facility ID	Permittee/Facility Name	Design Average Flow/Design Maximum Flow (million gallons per day)	Receiving Water

Notes:

[1] Design flow values are based on the current NPDES permit on file.

[2] Value represents the total DAF from outfalls 001 through 006.

[3] Permit terminated in 2021.

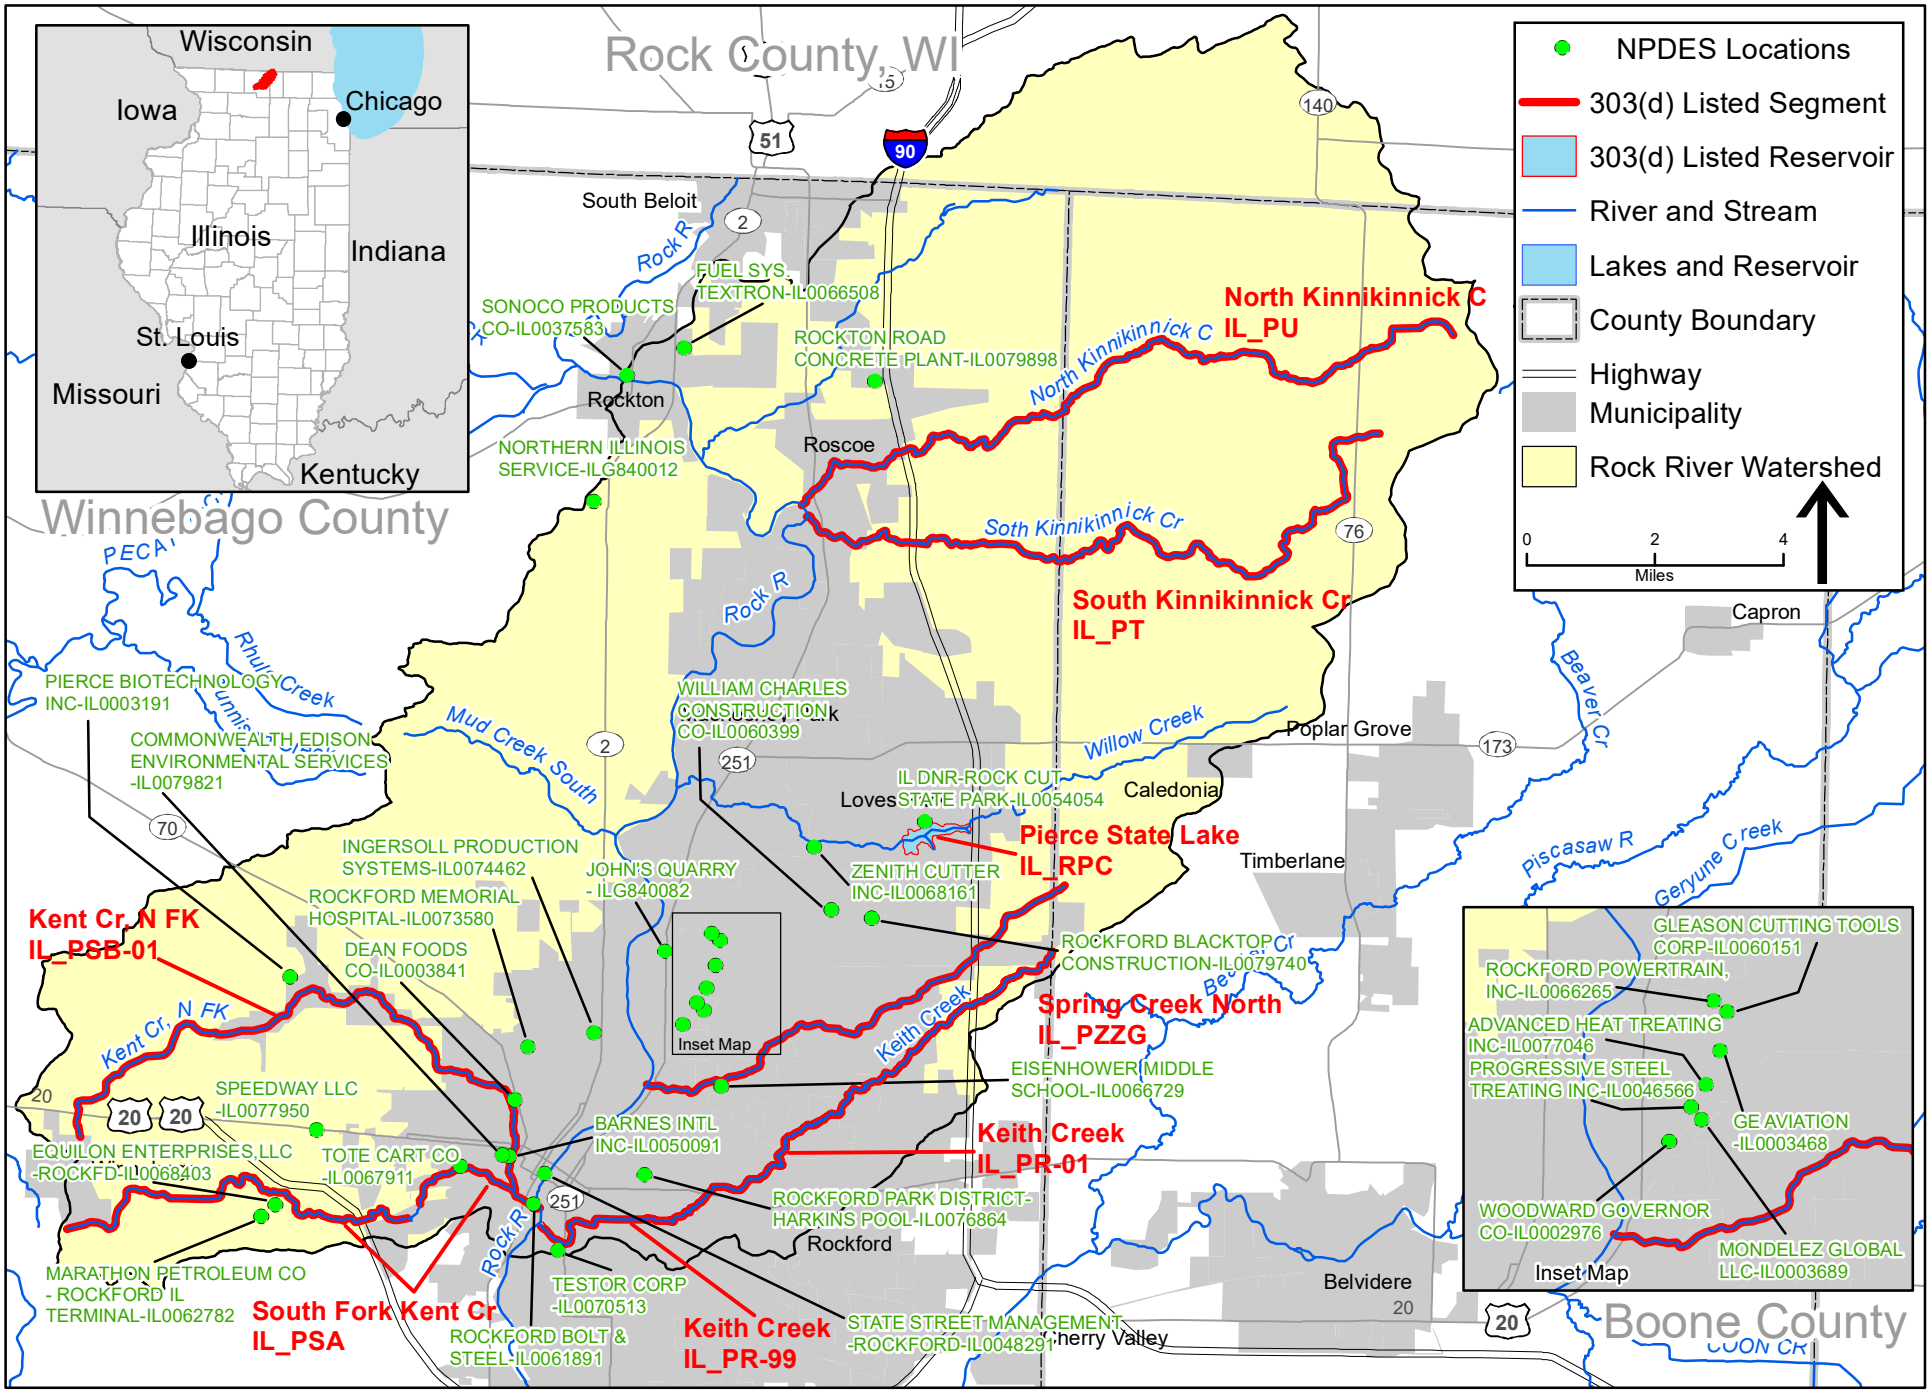

Figure 5-8: Rock River/Pierce Lake Watershed NPDES Discharge Locations

CDM Smith

Municipal separate storm sewer (MS4) permits within the watershed exist for the areas of Loves Park, Rockford Township, Roscoe Township, and Winnebago County. **Table 5-8** shows the acreage in each subbasin covered by each municipality's MS4 permit. MS4 discharges have the potential to impact impaired segments within the watershed and storm sewers/urban runoff were listed as potential sources of fecal coliform on the 303(d) list. Urban runoff through MS4 systems can contribute fecal coliform from urban animal and pet waste, illicit sewer connections and overflows.

Table 5-8 Subbasin Acres Covered by MS4 Permits in the Rock River/Pierce Lake Watershed

Subbasin	Loves Park	Rockford Township	Winnebago County	Roscoe Township
	ILR400379	ILR400118	ILR400505	ILR400120
Keith Creek IL_PR-01	570	4,845		
Keith Creek Segment IL_PR-99		1,603		
South Fork Kent Creek Segment IL_PSA		1,910	660	
North Fork Kent Creek Segment IL_PSB-01		5,761	196	
South Kinnikinnick Creek Segment IL_PT				692
North Kinnikinnick Creek Segment IL_PU				1,094
Spring Creek Segment IL_PZZG	629	2,278		

5.4 Nonpoint Sources

There are many potential nonpoint sources of pollutant loading to the impaired segments in the Rock River/Pierce Lake watershed. This section will discuss site-specific cropping practices, animal operations, and area septic systems. Data were collected through communications with the local NRCS, Illinois Soil and Water Conservation Districts (SWCDs), and public health departments.

5.4.1 Crop Information

Approximately 39 percent of the land within the Rock River/Pierce Lake watershed is dedicated to agriculture. Because a portion of the watershed is under cultivation, soil loss from fields is likely a source of sediment and any pollutant attached to the sediment such as nutrients, pathogens, and, potentially, naturally occurring metals. Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. The percentage of each tillage practice for corn, soybeans, and small grains by county are generated from County Transect Surveys by the Illinois Department of Agriculture (IDA).[26] Data from 2015 and 2018 surveys are presented in **Table 5-9** through **Table 5-10** for Boone and Winnebago Counties, respectively. Although Rock County in Wisconsin does not have an IDA Transect Survey, the USDA 2017 Census of Agriculture for Wisconsin indicates that of the 302,797 acres of total crop land in Rock County, 39.6 percent used no till practices in 2017 (compared to 25.5 percent in 2012); 31.7 percent used reduced till practices in 2017 (compared

[26] IDA. 2018. Illinois Soil Conservation Transect Surveys. https://agr.illinois.gov/resources/landwater/illinois-soil-conservation-transect-survey-reports.html

to 36.4 percent in 2012); and 17.0 percent used intensive till practices in 2017 (compared to 26.3 percent in 2012).

Table 5-9 Tillage Practices in Boone County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	44.6%	62.5%	4.7%	10.8%	81.8%	NA
Reduced Till	22.5%	18.7%	24.0%	17.6%	0.0%	NA
Mulch Till	27.9%	15.1%	34.5%	46.6%	0.0%	NA
No Till	5.0%	3.6%	36.8%	25.0%	18.2%	NA

Note: NA – not available (or zero survey data points); however, the 2017 survey indicates that only no till practices were applied for small grain.

Table 5-10 Tillage Practices in Winnebago County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	10.8%	9.6%	1.8%	0.8%	0.0%	0.0%
Reduced Till	39.6%	27.2%	15.9%	10.0%	11.1%	40.0%
Mulch Till	24.3%	29.5%	27.4%	36.4%	88.9%	20.0%
No Till	25.3%	33.7%	54.9%	52.8%	0.0%	40.0%

According to the County Transect Survey Summary Report,[27] fields planted conventionally leave less than 15 percent of the soil surfaced covered with crop residue after planting, while mulch till leaves at least 30 percent of the residue from the previous crop remaining on the soil surface after being tilled and planted. Reduced till falls between conventional and mulch (greater than 15 percent but less than 30 percent), and no till practices leave the soil virtually undisturbed from harvest through planting. Residue is important because it shields the ground from the eroding effects of rain and helps retain moisture for crops.

Information on field drain tile practices was also sought as field drain tiles can influence the timing and amounts of water delivered to area streams and reservoirs and can deliver dissolved nutrients from fields to receiving waters. Local NRCS offices reported that they currently do not keep records on which farms use tile drainage.

5.4.2 Animal Operations

Information on commercial animal operations is available from the NASS. Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals have the potential to increase erosion and contribute nutrients and pathogens through manure. Although watershed-specific data are not available, countywide data for Boone, Rock, and Winnebago

Winnebago Counties under the general NPDES permit for CAFOs in Illinois (NPDES Permit No. ILA01),[30] and there are no documented CAFOs within the watershed.

5.4.3 Septic Systems

Most households in rural areas of Illinois that are not connected to municipal sewers make use of on-site sewage disposal systems or septic systems. There are several types of septic systems, but the most common is composed of a septic tank draining to a septic field, where nutrient removal occurs. The degree of nutrient removal is limited by local soils and the extent of system upkeep and maintenance. Across the United States, septic systems have been found to be a significant source of phosphorus pollution.

Information on the extent of sewered and nonsewered municipalities in the Rock River/Pierce Lake watershed was obtained from the county health departments. The Boone County Health Department in Illinois was contacted and a response regarding properties with private septic systems is pending. Additionally, the Winnebago County Health Department in Illinois stated that it does not have a method for geographically searching for septic systems and provided countywide private septic system installations for 2015 to 2018. Health department officials in Rock County, Wisconsin, stated that other than areas within the City of Beloit, properties within the watershed area in Rock County likely rely on private septic systems with a nearly one-to-one relationship between houses and private septic systems. Rock County, however, represents only a small portion of the watershed area.

5.4.4 Internal Phosphorus Loading in Lakes

An additional potential nonpoint source of pollutants for Pierce Lake is in-lake sediments. Nutrients can be bound to soils and as soils erode throughout the drainage area, they accumulate at the bottom of receiving lakes. Internal phosphorus loading can occur when the water above the sediments becomes anoxic, causing the release of phosphorus from the sediment in a form that is available for plant uptake. The addition of bioavailable phosphorus in the water column stimulates more plant growth and die-off, which may perpetuate or create anoxic conditions and enhance the subsequent release of phosphorus into the water. Internal phosphorus loading can also occur in shallow lakes through release from sediments by the physical mixing and reintroduction of sediments into the water column as a result of wave action, winds, boating activity, and other means.

5.5 Watershed Studies and Other Watershed Information

Previous efforts completed within the watershed are listed below. Reports have been reviewed and incorporated into Stage 3 where appropriate and relevant.

1996 – ISWS Miscellaneous Publication 174, *Rock River Basin: Historical Background, Illinois EPA Targeted Watersheds, and Resource-Rich Areas*, April 1996 – The report notes that in 1971, the Wisconsin Department of Natural Resources' Environmental Protection Division indicated that streams within the Wisconsin portion of the Rock River basin receive organic wastes from treated sewage and industrial wastes. In 1994, ISWS reported decreasing nitrate-nitrogen levels in the

[30] Illinois EPA. 2009. NPDES Permit No. ILA01. https://epa.illinois.gov/content/dam/soi/en/web/epa/documents/water/permits/cafo/general-npdes-permit.pdf

basin, which may be because of improved agricultural practices and reduced septic tank use by lakefront communities.[31]

2002 – The Rockford Park District, through a grant from Illinois Department of Natural Resources (IDNR) Conservation 2000 Program, performed an assessment of the morphology, hydrology, aquatic biota, and community use potential of the North Fork of Kent Creek. A copy of the report was provided to Illinois EPA during the Stage 1 public meeting.

2006 – *Illinois EPA Rock River Basin Assessment*, March 2006 – The report identified the phosphorus impairment in Pierce Lake, although none of the other impaired stream segments were identified in the report. Illinois EPA determined that the Rock River and associated tributaries in Winnebago County do not support the designated water uses of swimming and fish consumption. Grant funds were awarded to the City of Rockford to supplement a joint project between the city, Illinois EPA, the Rock River Water Reclamation District, and other Winnebago County communities. The project began in 2003.[32]

2008 – Baetis Environmental performed a watershed modeling study for South Kinnikinnick Creek and North Fork Kent Creek for the Winnebago County Forest Preserve District. The study was funded through a grant from IDNR under the Conservation 2000 Program. The grant was administered on behalf of the Upper Rock River Ecosystem Partnership. A copy of the draft report was provided to Illinois EPA during the Stage 1 public meeting.

2013 – Hay and Associates completed the Buckbee Creek Watershed Plan as part of the Winnebago County Watershed Improvement Plan.[33] The Buckbee Creek watershed is a smaller drainageway/watershed just south of the Keith Creek watershed. The watershed plan identified flooding issues as the stream itself is intermittent in flow and much of it is channelized. The plan identified priority areas to address water quality.

2019 – Olson Ecological Solutions' *South Fork Kent Creek Watershed Resource Inventory*, December 2019 – The report identifies the fecal coliform impairment for South Fork Kent Creek. Olson Ecological Solutions performed an evaluation of riparian buffer conditions, erosion rates, and channelization throughout the South Fork Kent Creek subwatershed. Surveys were performed in late October and early November 2019 along approximately 22,000 feet of stream segments for South Fork Kent Creek and its tributaries. About 57 percent of the surveyed segments were found to have poor riparian conditions, 42 percent good condition, and 3 percent fair condition. Streambank erosion was also noted for surveyed stream segments. Mapping and modeling efforts identified low-intensity developed areas as a significant source for bacteria pollutants in the subwatershed.[34]

Section 6

Approach to Developing Total Maximum Daily Loads and Identifying Data Needs

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass-balance, load duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches and therefore these are the analyses recommended for the Rock River/Pierce Lake watershed. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL. As discussed above, this link can be established through a variety of techniques. The remainder of this section recommends approaches for establishing these links for the constituents of concern in the Rock River/Pierce Lake watershed.

6.1 Additional Data Needs for Total Maximum Daily Load Development in the Rock River/Pierce Lake Watershed

Table 6-1 summarizes information regarding data availability for all impairments to be addressed by TMDLs in the Rock River/Pierce Lake watershed. The datasets for fecal coliform and/or phosphorus impairments on Keith Creek, North Fork Kent Creek, South Fork Kent Creek, North Kinnikinnick Creek, South Kinnikinnick Creek, Spring Creek – North, and in Pierce Lake are generally sufficient for basic TMDL calculations and model development. Additional data collection is not needed for impairment confirmation for the remaining parameters listed for Keith Creek (IL_PR-99) because these parameters have been removed from the 2020/2022 303(d) list and TMDL development did not progress beyond Stage 1 investigations.

Table 6-1 Data Availability for Total Maximum Daily Load Development in the Rock River/Pierce Lake Watershed

Impaired Segment	Impairment Parameter	Period of Record	Data Count	Additional Data Needs
Keith Creek (IL_PR-01)	Fecal Coliform	2019	5	None
Keith Creek (IL_PR-99)	Fecal Coliform	2019	5	None
	Arsenic[1]	2008, 2013	6	**None – parameter removed from 2020/2022 303(d) list**
	pH[1]	2013	3	**None – parameter removed from 2020/2022 303(d) list**
	Zinc[1]	2008–2013	3	**None – parameter removed from 2020/2022 303(d) list**
North Fork Kent Creek (IL_PSB-01)	Fecal Coliform	1985, 2019	8	None
South Fork Kent Creek (IL_PSA)	Fecal Coliform	2019	5	None
North Kinnikinnick Creek (IL_PU)	Fecal Coliform	2019	5	None

Impaired Segment	Impairment Parameter	Period of Record	Data Count	Additional Data Needs
South Kinnikinnick Creek (IL_PT)	Fecal Coliform	2019	5	None
Spring Creek – North (IL_PZZG)	Fecal Coliform	2019	5	None
Pierce Lake (IL_RPC)	TP	1998–2004	43	None

Note:

[1] **These parameters were included on the 2018 303(d) list when this TMDL report was initiated. The parameters have since been removed from the 2020/2022 303(d) list.**

6.2 Approaches for Developing Total Maximum Daily Loads for Stream Segments

The recommended approach for developing TMDLs for fecal coliform in streams in the Rock River/Pierce Lake watershed is the load duration curve (LDC) method. The LDC methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a water body.

6.3 Approach for Developing Total Maximum Daily Load for Pierce Lake

Pierce Lake is listed for impairment of the aesthetic quality use because of elevated TP concentrations. The BATHTUB model[35] is typically recommended for TMDL development for lake and reservoir impairments such as those in Pierce Lake. The BATHTUB model performs steady-state water and nutrient balance calculations in a spatially segmented hydraulic network that accounts for advective and diffusive transport, and nutrient sedimentation. The model relies on empirical relationships to predict lake trophic conditions and subsequent DO conditions as functions of TP and nitrogen loads, residence time, and mean depth. Oxygen conditions in the model are simulated as meta- and hypolimnetic depletion rates, rather than explicit concentrations. Watershed loadings to the lakes will be estimated using event mean concentration data, precipitation data, and estimated flows within the watershed.

Another option for the TP TMDL for Pierce Lake is CDM Smith's Simplified Lake Analysis Model (SLAM). SLAM was developed specifically to address an identified need for a practical and low-cost water quality model focused on lake eutrophication that could be easily and simply applied in planning studies by a wide range of end-users. The model was originally developed as an enhanced version of the BATHTUB model and retains many of the core algorithms of that model.

SLAM calculates lake mass and flow balances on a daily time step assuming one or more well-mixed lake zones. Each zone follows the conceptual model, often referred to as a continuously stirred tank reactor, whereby complete and immediate mixing is assumed for each zone in both the vertical and horizontal directions. The model targets the key parameters important for eutrophic lakes: phytoplankton (as chlorophyll a), phosphorus (P), and nitrogen (N), and can be

[35] Walker, W.W. 1996. Software for Eutrophication Assessment and Prediction: FLUX, PROFILE, BATHTUB. http://www.wwwalker.net/bathtub/

easily modified to aid in assessment of unrelated conservative parameters such as total suspended solids (TSS).

SLAM also includes a state-of-the-art dynamic sediment nutrient flux module. This module calculates internal nutrient loads from the sediments to the water column as a function of shallow sediment nutrient dynamics and diffusive exchanges between sediment pore water and the overlying water column. Internal nutrient loads are a key component of many eutrophic lakes, particularly small and/or shallow lakes with large catchment areas. The inclusion of dynamic and rigorous sediment nutrient calculations within a practical planning level water quality model distinguishes SLAM from most other published lake water quality models and is a particularly appealing feature for this application.

Section 7

Methodology Development for Load Reduction Calculations in the Rock River/Pierce Lake Watershed

7.1 Methodology Overview

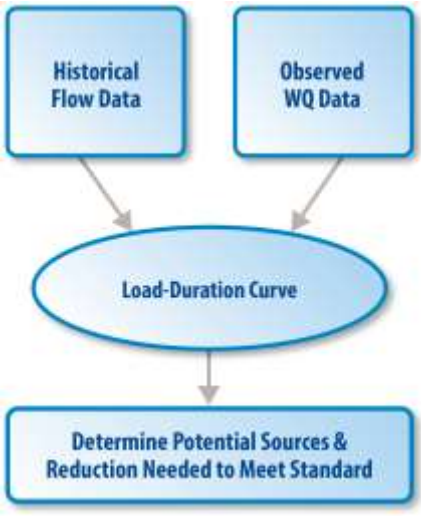
Table 7-1 contains information on the methodologies selected and used to develop TMDLs for impaired segments within the Rock River/Pierce Lake watershed.

Table 7-1 Methodologies Used to Develop Calculated Reduction Goals in the Rock River/Pierce Lake Watershed

Segment ID	Segment Name	Cause of Impairment	Methodology
IL_PR-99	Keith Creek	Fecal Coliform	LDC TMDL
IL_PR-01	Keith Creek	Fecal Coliform	LDC TMDL
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	LDC TMDL
IL_PSA	South Fork Kent Creek	Fecal Coliform	LDC TMDL
IL_PU	North Kinnikinnick Creek	Fecal Coliform	LDC TMDL
IL_PT	South Kinnikinnick Creek	Fecal Coliform	LDC TMDL
IL_PZZG	Spring Creek – North	Fecal Coliform	LDC TMDL
IL_RPC	Pierce Lake	TP	SLAM TMDL

7.1.1 Load Duration Curve Overview

A LC analysis was performed for fecal coliform in the impaired segments through the development of LDCs. An LDC is developed to show a graphical representation of the maximum load of a pollutant that a stream segment can assimilate over a range of flow scenarios while still meeting the instream water quality standard. As discussed in Section 4 of this report, assessment of fecal coliform data against the water quality standard is based on the geometric mean of a minimum of five samples collected in a 30-day period. Because of limited data, and as a conservative measure, individual sample values are shown on the LC curves and used to calculate the load reductions needed.



7.1.2 Simplified Lake Assessment Model (SLAM) Overview

Historically, the BATHTUB model has been a commonly used tool for simplified assessments of nutrient (TP, ammonia) and nutrient-related impairments (chlorophyll a, pH, DO) in lakes. However, the BATHTUB model may not be the most efficient approach to developing this type of TMDL as it does not provide explicit modeling of the major lake and sediment interactions that

are important drivers of nutrient issues in Pierce Lake. The BATHTUB model also relies on a dated platform that is less user friendly than other options and is primarily setup to model nutrient fate and transport on an annual basis. While annual time step models have their place, they can often miss important seasonal dynamics that drive lake water quality.

As an alternative to BATHTUB, CDM Smith's SLAM software was used to develop the TMDL for the TP impairment in Pierce Lake. SLAM calculates lake mass and flow balances on a daily time step, assuming one or more well-mixed lake zones. Each zone follows the conceptual model often referred to as a "continuously stirred tank reactor", whereby complete and immediate mixing is assumed for each zone in both the vertical and horizontal directions. This assumption makes the model well suited for Pierce Lake, which is generally well-mixed and can justifiably be divided into a limited number of small zones.

SLAM also includes a state-of-the-art dynamic sediment nutrient flux module. This module calculates internal nutrient loads from the sediments to the water column as a function of shallow sediment nutrient dynamics and diffusive exchanges between sediment pore water and the overlying water column. Internal nutrient loads are a key component of many eutrophic lakes, particularly small and/or shallow lakes with large catchment areas, as is the case with Pierce Lake.

7.2 Methodology Development – Load Duration Curves

LDCs are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. This approach was used to characterize the current loading of fecal coliform for the impaired segments within the Rock River/Pierce Lake watershed.

7.2.1 Watershed Delineation and Flow Estimation

Watersheds contributing directly to the impaired stream segments at the data collection stations were delineated with GIS analyses through use of elevation data, as discussed in Section 2.2. The watershed delineations result in the following estimates of directly contributing subbasin areas used for each impaired segment's LDC development:

- Keith Creek IL_PR-99: 13.8 square miles
- Keith Creek IL_PR-01: 11.3 square miles
- North Fork Kent Creek IL_PSB-01: 30.4 square miles
- South Fork Kent Creek IL_PSA: 15.7 square miles
- North Kinnikinnick Creek IL_PU: 20.2 square miles
- South Kinnikinnick Creek IL_PT: 21.2 square miles
- Spring Creek – North IL_PZZG: 6.4 square miles

Figure 7-1 shows the location of the water quality stations on each segment and the boundaries of the GIS-delineated watersheds.

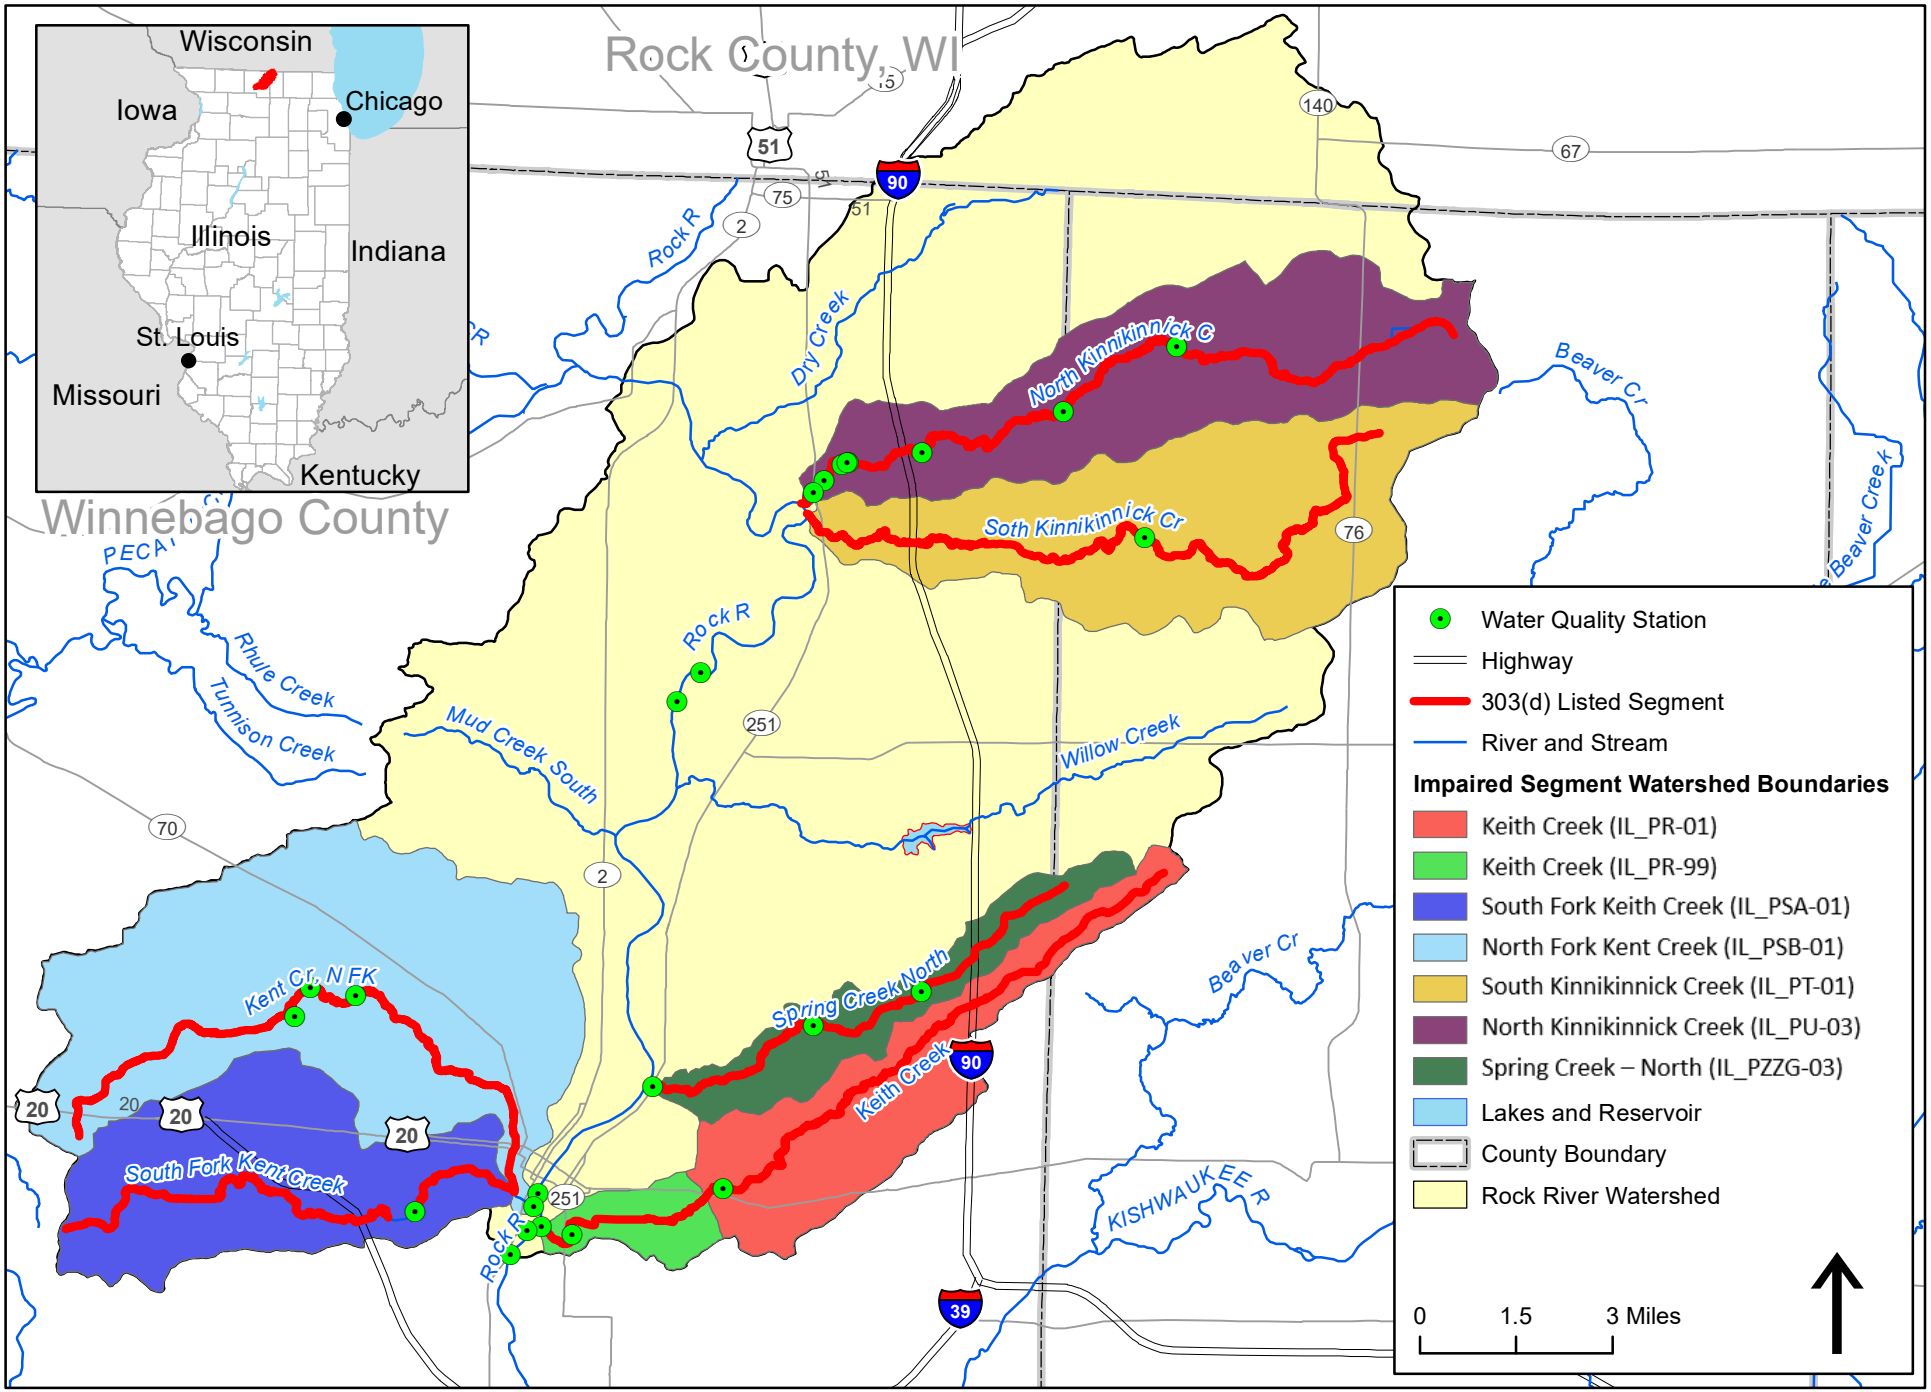


Figure 7-1: Watershed Boundaries and Water Quality Sampling Locations for Impaired Stream Segments within the Rock River/Pierce Lake Watershed

CDM Smith

Flow data corresponding to each water quality sample is needed to create an LDC. As discussed in Section 2.6.2, there were three active USGS stream gages in the Rock River/Pierce Lake watershed. However, all three of the active gages in the watershed are on the mainstem of the Rock River and have very large contributing areas (greater than 6,000 square miles), whereas the impaired basins within the watershed have much smaller drainage areas (less than 50 square miles). More accurate subbasin flows were estimated using a surrogate gage in a nearby subbasin with a similar drainage area (78 square miles) and land use characteristics as the impaired segments. The South Branch Kishwaukee River at Dekalb, Illinois gage (05437500) was used as the surrogate gage to estimate stream flows for the impaired stream segments within the Rock River/Pierce Lake watershed using the drainage area ratio method.

Data downloaded through USGS for the surrogate gage from 1990 to 2021 were adjusted to account for point source influences in the watershed upstream of the gaging station. Average daily flows from all NPDES permitted facilities upstream of the surrogate USGS gage were subtracted from the gaged flow prior to flow per unit area calculations. The resulting estimates account for flows associated with precipitation and overland runoff only. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Rock River/Pierce Lake watershed were then added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment. Spreadsheets used for the area ratio flow calculations are provided in **Appendix E**.

7.2.2 Fecal Coliform Load Duration Curves

The general use water quality standard for fecal coliform states that the standard of 200 cfu/100 mL shall not be exceeded by the geometric mean of at least five sample results, nor can 10 percent of the samples collected exceed 400 cfu/100 mL in protected waters, except as provided in 35 Illinois Administrative Code 302.209(b). Fecal coliform concentration data for the Rock River/Pierce Lake impaired segments obtained during TMDL development were paired with the corresponding flows for the sampling dates and plotted against the LDC, representing the most restrictive instream standard of 200 cfu/100 ml.

Figure 7-2 through **Figure 7-8** show the 200 cfu/100 ml LDC for the impaired segments within the watershed as a solid blue line, and the observed pollutant loads as points on the graph. **Appendix E** contains the spreadsheets used for the calculation of fecal coliform LDCs for impaired segments within the Rock River/Pierce Lake watershed.

7.3 Methodology Development – Simplified Lake Assessment Model

SLAM relies on the following primary categories of inputs:

- Model segmentation: number of geographically distinct segments of a lake to be modeled, flow direction, and an estimate of longitudinal dispersion between segments.
- Lake morphology and hydraulics: surface area, average and maximum depth, volume, inflows, mixing lengths, thermal stratification.
- Watershed inflows: dynamic or steady loads and flows to the lake from the draining watershed.
- In-lake nutrients dynamics: initial water column concentrations, particulate phosphorus nutrient settling velocities, dissolved nutrient uptake rates, and settled nutrient burial fractions. Note that seasonality factors may be included to account for expected variations in settling velocity and nutrient uptake.
- Sediment layer dynamics: sediment characteristics and kinetic rates used for calculating nutrient fluxes.

Input parameters specific to the Pierce Lake model are described in the section that follows. Model documentation can be found in **Appendix F**.

7.3.1 Pierce Lake Model Construction

A numerical model of Pierce Lake phosphorus dynamics was constructed, using SLAM, to quantify a TMDL for the lake. The constructed model simulates a recent 11-year period (2010 to 2020) with a daily time step. The model was roughly calibrated using site-specific data and subsequently applied to calculate a total load reduction required to achieve the TMDL target. The TMDL target for TP in Pierce Lake is 0.05 mg/L.

7.3.1.1 Model Segmentation

Pierce Lake was simulated with a single well-mixed zone. Although well-mixed laterally, water quality observations suggest seasonal stratification in the lake. Therefore, seasonal stratification was prescribed in the model, occurring from May through September. An assumed hypolimnion depth of 30 percent of the total lake depth was prescribed for this period, based on the limited available water quality data measured at depth.

The sampling locations and watershed boundary are shown on **Figure 7-9.**

7.3.1.2 Lake Hydraulics

Lake hydraulics are defined in SLAM via either internal calculation or user prescription. Data needs for internal calculations of lake hydraulics are somewhat greater as the model performs dynamic water balance calculations of lake volumes at each time step based on user-defined or calculated inflows, outflows, and evaporative losses. Corresponding lake depths, surface areas, and releases are calculated as a function of user-defined bathymetry tables. For the prescribed hydraulics option, users specify monthly variable lake volumes, areas, and depths. Hydraulics are assumed static within a month, and lake outflows are set equal to total lake inflows at each time step. Evaporative losses are not explicitly included in the calculations but rather should be implicitly reflected in the prescribed volumes.

Due to low data availability and the limited fluctuation of water levels of Pierce Lake in a typical year, the prescribed hydraulics option was used for this analysis, with an assumption of steady lake hydraulics. Prescribed lake hydraulics are summarized in **Table 7-2**.

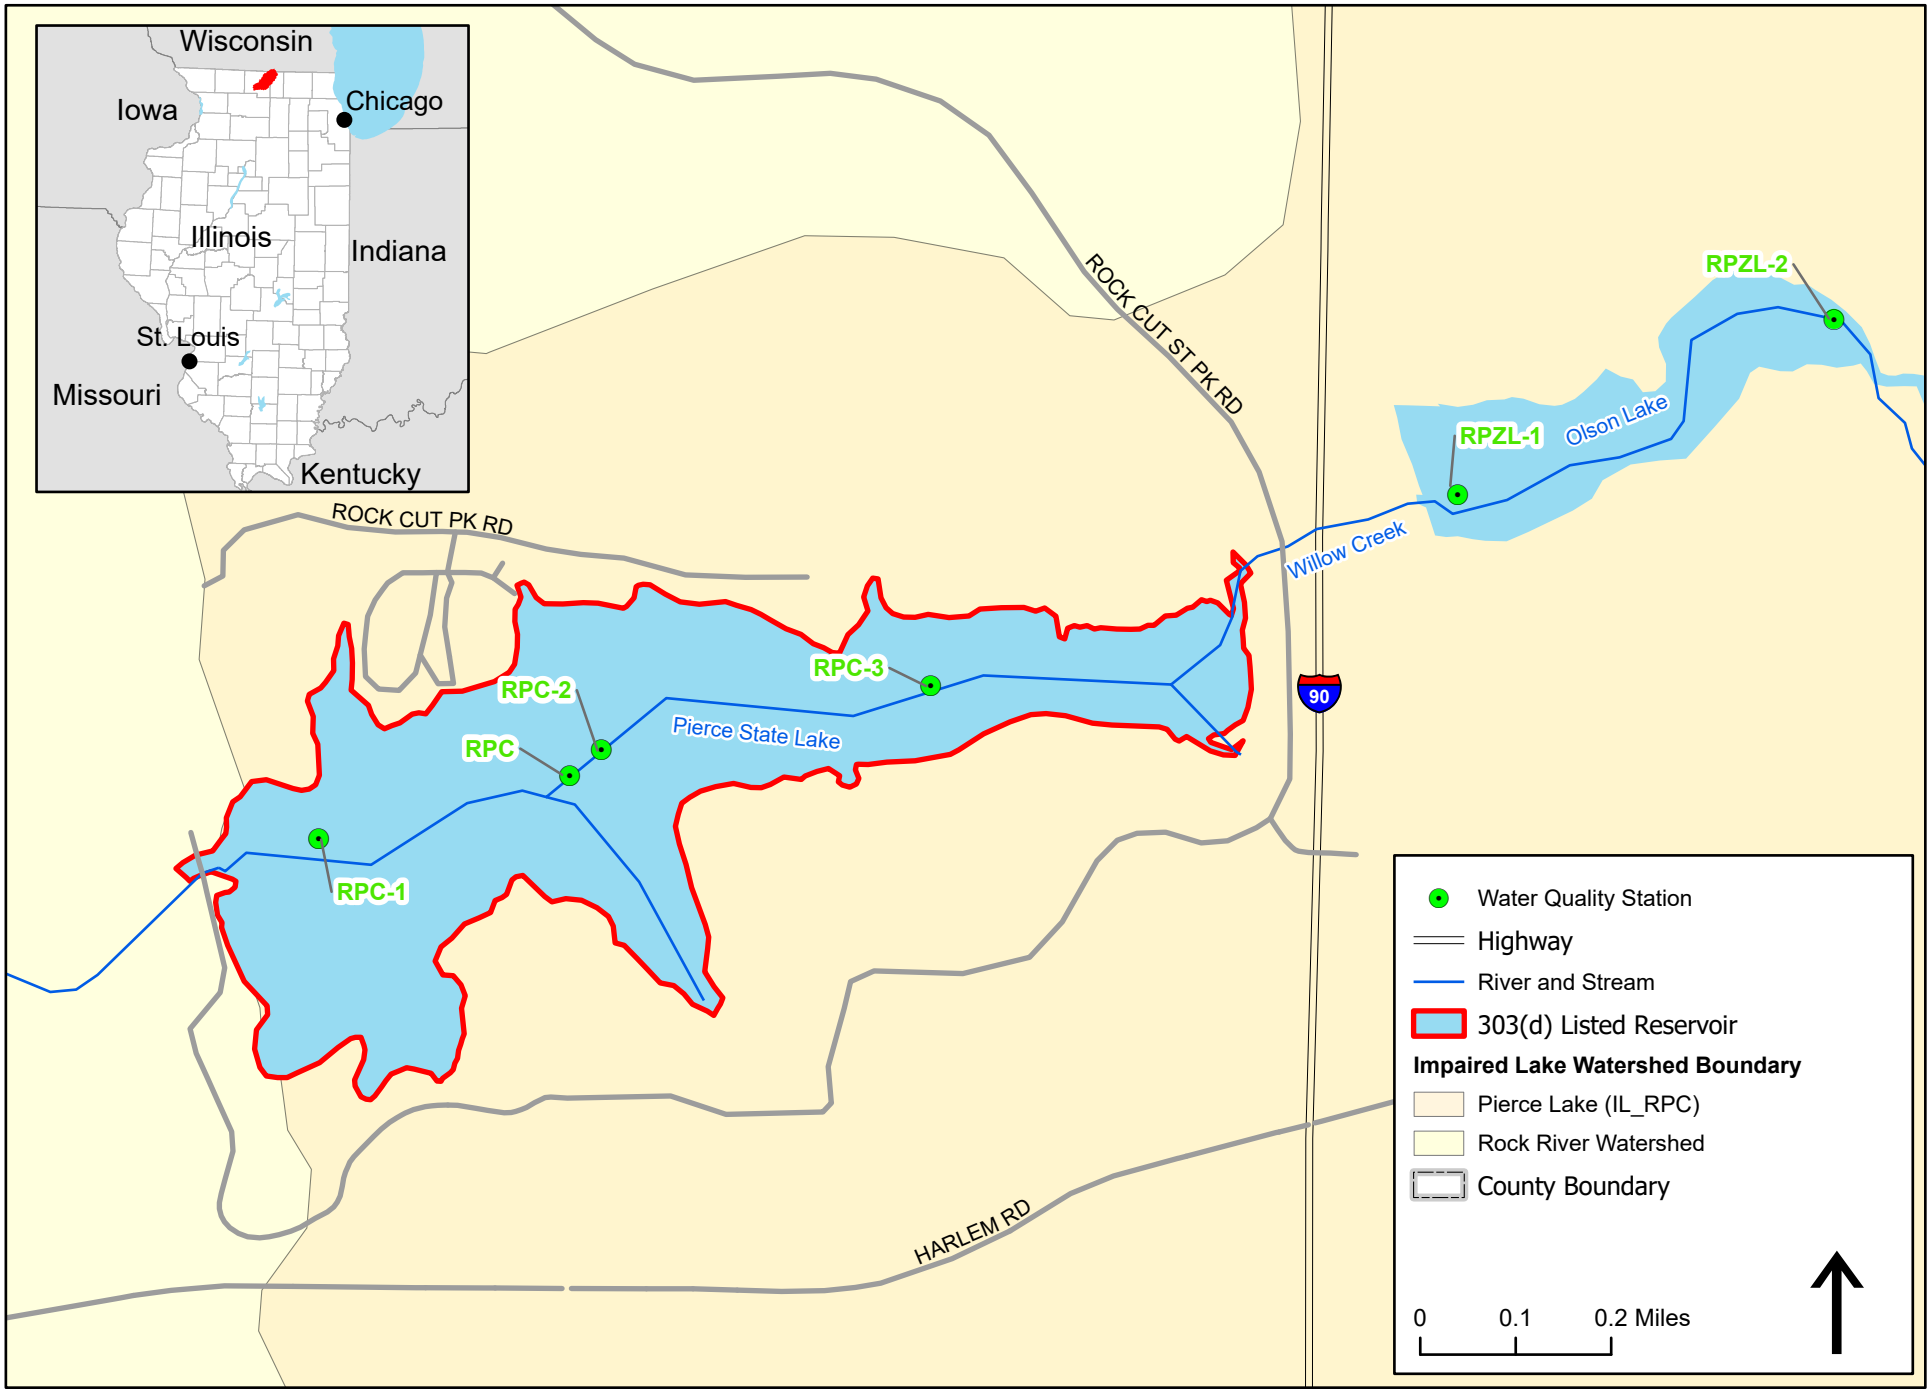

Figure 7-9: Watershed Boundaries and Water Quality Sampling Locations for Pierce Lake (IL_RPC)

Table 7-2 Pierce Lake (IL_RPC) Lake Hydraulics Data

Segment	Surface Area (acres)	Volume (acre-feet)	Average Depth (feet)
IL_RPC	162	2,025	12.5

7.3.1.3 Watershed Parameters

Watershed loadings to the lake were estimated using limited measured data and a surrogate flow gage. Willow Creek phosphorus data from two sampling events in 2017 were used to quantify lake inflow quality. The Willow Creek sampling location (RPZL-1) is just above its discharge to Pierce Lake. Based on this small data set, a steady inflow concentration of 0.15 mg/L was prescribed in the model. Lake inflows were estimated from a regional continuous flow gage using the area ratio method described in Section 7.2.1. The steady concentration was combined with the daily time series of estimated lake inflows for the 11-year simulation period to construct a daily time series of lake phosphorus loads for the model.

In addition to watershed inflow loads, direct depositions of phosphorus to the lake, both wet (precipitation) and dry (atmospheric), were explicitly included in the model. Literature-based model default values for both a steady dry deposition rate (pounds per acre per day) and rainwater concentration (mg/L) were used in combination with site-specific reported daily precipitation rates for the lake to generate daily direct deposition phosphorus loads in the model.

The inclusion of point source phosphorus loads into SLAM was not applicable as there are no NPDES permitted discharges in the Pierce Lake subbasin.

7.3.1.4 Lake Nutrient Parameters

Lake nutrient parameters support the simulation of lake water column nutrient dynamics and include nutrient uptake kinetic and settling rates and lake water quality initial conditions. Uptake kinetics are defined by first order rate constants, applied to dissolved nutrients only. These rate constants represent the transformation of dissolved nutrient into organic particulate fraction via phytoplankton uptake.

Model default nutrient parameter values were adjusted slightly as part of the model calibration exercise described in Section 7.3.1.6. All rates were held within reasonable recommended ranges, as supported by literature.

7.3.1.5 Sediment Layer Parameters

SLAM allows for the calculation of dynamic sediment nutrient fluxes, quantifying the movement of phosphorus from the shallow sediments to the water column or vice versa. Key user-input parameters for this calculation include lake shallow sediment physical characteristics and first order adsorption and desorption/mineralization rate constants. These rate constants can vary seasonally according to user-prescribed levels of sediment anoxia. For the Pierce Lake model, rate constants were adjusted slightly from model default values as part of the calibration exercise described below.

7.3.1.6 Pierce Lake Model Calibration

Historical water quality data for Pierce Lake were used to guide model parameterization and confirm the model's ability to simulate current lake water quality. The historical data set is limited to a small number of samples collected at varying depths from May through October in 2011 and 2016 only. Consequently, the model calibration should be considered coarse. Additional data collection could be used to strengthen the calibration in the future.

The primary calibration parameters in this exercise were the water column dissolved phosphorus uptake rate constant, the seasonally varying particulate phosphorus settling velocity, and the sediment phosphorus desorption rate constant. Lake stratification conditions were prescribed based on observed temperature vertical profiles in the lake during the sampling periods.

Results of the calibration exercise are shown in **Figures 7-10** through **Figure 7-12**. An adequate match between observed and predicted in-lake phosphorus values was achieved in both the epilimnion and the hypolimnion. The modeled partitioning between particulate and dissolved phosphorus in the water column also agrees well with measured data (not shown). Last, modeled sediment phosphorus flux rates (milligrams per square meter per day) fall well within the expected plausible ranges for eutrophic lakes. These results, considered in total, lend significant support to the predictive ability of the model. **Appendix F** contains additional information regarding the model setup and inputs.

Section 8

Total Maximum Daily Loads for the Rock River/Pierce Lake Watershed

8.1 Total Maximum Daily Load Endpoints for the Rock River/Pierce Lake Watershed

The TMDL endpoints for impairments in the Rock River/Pierce Lake watershed are summarized in **Table 8-1**. Parameters with numeric water quality standards are assessed via the TMDL process and the TMDL endpoints directly correlate to the lowest applicable water quality standard established for a given parameter.

Table 8-1 Total Maximum Daily Load Endpoints for the Rock River/Pierce Lake Watershed

Segment Name/ID	Potential Cause of Impairment	Designated Use	Assessment Type	TMDL/Modeling Endpoint
Keith Creek (IL_PR-99)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
Keith Creek (IL_PR-01)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
North Fork Kent Creek (IL_PSB-01)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
South Fork Kent Creek (IL_PSA)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
North Kinnikinnick Creek (IL_PU)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
South Kinnikinnick Creek (IL_PT)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
Spring Creek – North (IL_PZZG)	Fecal Coliform	Primary Contact Recreation	TMDL	200 cfu/mL[1]
Pierce Lake (IL_RPC)	TP	Aesthetic Quality	TMDL	0.05 mg/L

Note:

[1] Geometric mean based on a minimum of five samples taken over a 30-day period between May and October.

8.2 Pollutant Sources and Linkages

Potential fecal coliform sources for the impaired segments in the Rock River/Pierce Lake watershed include on-site treatment systems, agricultural runoff, and urban sewers. Sources of TP in Pierce Lake include nonpoint sources and internal nutrient cycling as described in Section 5. The sources identified for each parameter of concern as described in the 2018 Integrated Report, are presented in **Table 8-2**.

Table 8-2 Sources of Pollutants in the Rock River/Pierce Lake Watershed

Segment ID	Segment Name	Cause of Impairment	Source(s) of Pollutants in the Rock River/Pierce Lake Watershed
IL_PR-99	Keith Creek	Fecal Coliform	Urban runoff/storm sewers
IL_PR-01	Keith Creek	Fecal Coliform	Urban runoff/storm sewers
IL_PSB-01	North Fork Kent Creek	Fecal Coliform	Agricultural activity (cropping practices and animal operations), municipal and industrial point sources, and/or urban runoff and storm sewer discharges
IL_PSA	South Fork Kent Creek	Fecal Coliform	
IL_PU	North Kinnikinnick Creek	Fecal Coliform	
IL_PT	South Kinnikinnick Creek	Fecal Coliform	
IL_PZZG	Spring Creek – North	Fecal Coliform	
IL_RPC	Pierce Lake	TP	Internal nutrient recycling, septic systems, waterfowl, crop production (crop land or dry land), runoff from forest/grassland/parkland

Table 8-3 shows the example source area/hydrologic condition considerations developed by EPA that may impact nutrient and fecal coliform levels in water. Based on the available fecal coliform data and LDC analyses, fecal coliform concentrations exceeding water quality standards occur across flow conditions, with data being limited to the Dry and High Flow categories. This suggests that stormwater runoff, riparian areas, and, potentially, on-site wastewater systems are the primary contributors to fecal coliform loads in the watershed.

Table 8-3 Example Source Area/Hydrologic Condition Considerations (EPA 2007)

Contributing Source Area	Duration Curve Zone				
	High Flow	Moist	Mid-Range	Dry	Low Flow
Point Source				M	H
On-Site Wastewater System			H	M	
Riparian Areas		H	H	H	
Stormwater: Impervious Areas		H	H	H	
Combined Sewer Overflows	H	H	H		
Stormwater: Upland	H	H	M		
Bank Erosion	H	M			

Note: potential relative importance of source area to contribute loads under given hydrologic conditions (H: High, M: Medium).

8.3 Total Maximum Daily Load Allocation

As explained in Section 1, the TMDLs for impaired segments in the Rock River/Pierce Lake watershed will address the following equation:

$$TMDL = LC = \Sigma WLA + \Sigma LA + MOS + RC$$

where: LC = Loading capacity – the maximum amount of pollutant loading a water body can receive without violating water quality standards

WLA = Waste load allocation – the portion of the TMDL allocated to existing or future point sources

LA = Load allocation – the portion of the TMDL allocated to existing or future nonpoint sources and natural background

MOS = Margin of safety – an additional load reduction term to account for the uncertainty associated with the relationship between pollutant loads and receiving water quality

RC = Reserve capacity – the portion of the load explicitly set aside for future population growth and additional development in the watershed

Each of these elements will be discussed in this section as well as consideration of seasonal variation in the TMDL calculation.

8.3.1 Fecal Coliform Total Maximum Daily Loads

The LCs of impaired stream segments are equal to the number of fecal coliform forming units assimilated by the streams per day while still meeting the general use water quality standard. The general use water quality standard for fecal coliform was presented in **Table 8-1** and was used as the basis for calculating target loads of fecal coliform that can be generated using LDC analysis, as discussed in Section 7.

8.3.1.1 Loading Capacity

The fecal coliform LC for each impaired segment according to flow is presented in **Table 8-4**.

Table 8-4 Fecal Coliform Loading Capacity (million colonies/day) in the Rock River/Pierce Lake Watershed

Zone	Flow Exceedance Range	Keith Creek IL_PR-99	Keith Creek IL_PR-01	North Fork Kent Creek IL_PSB-01	South Fork Kent Creek IL_PSA	North Kinnikinnick Creek IL_PU	South Kinnikinnick Creek IL_PT	Spring Creek – North IL_PZZG
High Flow	0–10%	234,544	192,108	513,261	266,070	342,566	359,611	108,747
Moist	10–20%	106,373	87,127	234,522	121,248	155,365	163,095	49,991
	20–30%	68,009	55,704	149,943	77,258	99,332	104,274	31,694
	30–40%	47,347	38,922	104,252	53,731	68,895	72,323	21,992
Mid-Range	40–50%	33,133	27,138	73,601	37,716	48,392	50,800	15,362
Dry	50–60%	20,926	17,140	46,780	23,877	30,564	32,084	9,702
	60–70%	10,550	8,641	23,983	12,113	15,409	16,176	4,851
	70–80%	5,484	4,492	12,872	6,369	8,010	8,409	2,476
	80–90%	2,354	1,928	5,975	2,820	3,438	3,609	1,049
Low Flow	90-100%	349	286	1,569	547	509	535	141

8.3.1.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. The fecal coliform water quality target was applied to the full range of expected flows; therefore, the LC represents conditions throughout the year as well as during the applicable period for the seasonal water quality standard for fecal coliform (May through October).

8.3.1.3 Waste Load Allocation

WLAs generally are applied to individually permitted facilities and MS4 discharges that may exist in the watershed, as described in the paragraphs that follow.

Individual NPDES Permitted Facilities

There are currently no individual permitted point sources within the Rock River/Pierce Lake watershed with reasonable potential to discharge fecal coliform to or immediately upstream of impaired segments. While there are several individually permitted discharges in the watershed, none of those that potentially influence impaired segments are required to monitor or report fecal coliform concentrations because of the nature of the facility operations and effluent quality assessments performed as part of the NPDES permitting process. No WLA for individual point source discharges are included in the TMDL calculations.

MS4 Discharges

MS4s represent runoff from municipal areas with permitted separate stormwater sewer systems. Several permitted MS4s exist within the watershed that potentially discharge urban runoff to impaired segments. MS4 permits for each permittee cover varying proportions of the subbasin area contributing loads to the impaired segments. MS4s are regulated discharges and therefore, are allocated through WLAs, rather than LAs. WLAs for MS4s are calculated by first determining the total area within an MS4-permitted municipality's boundaries that lies within the target watershed using GIS analyses and geographic data for municipal boundaries.

As MS4 discharges are not regularly assigned effluent limits as part of the NPDES permitting process and discharge at highly variable flow rates in response to high runoff events, WLA allocations for MS4s are based on existing load estimates rather than being calculated based on water quality standards. The proportion of total MS4 area to total watershed area was calculated for each municipality in the watershed. This proportion was then used to migrate loads from previously calculated LAs for overland runoff to WLAs for MS4 areas in each flow category. This process effectively transfers MS4 load allocations for overland runoff from non-regulated sources described as LAs to the WLA for regulated sources of fecal coliform. As MS4 allocations are tied to overland runoff in urban areas, they are therefore related to higher flow conditions in the stream. As a result, the WLAs for MS4s are only applied to the upper 50 percent of flow categories (mid-range to high flows). The total MS4 load allocations for fecal coliform are applied to the proportion of each municipality within the impaired reach's subbasin are shown in **Table 8-5** through **Table 8-11.**

8.3.1.4 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings), or a combination of both. The MOS incorporated into the fecal coliform TMDL analyses is implicit as the analyses used the more conservative 200 cfu/100 mL standard and did not consider die-off of bacteria, which is likely occurring in the system but is unquantified.

8.3.1.5 Reserve Capacity

A portion of each of the fecal coliform TMDL's LC may be set as a RC to allow for future population growth and development. A RC set to 10% of the LC was included to allow for potential future point source discharge. Although population increases are not anticipated in within the subbasin, additional development may occur within the watershed's urban areas and setting aside a small RC allows for easier accommodation of future point source contributions within the existing TMDL.

8.3.1.6 Load Allocation and Total Maximum Daily Load Summary

Tables 8-13 through **Table 8-19** summarize the fecal coliform TMDLs for the impaired segments in the Rock River/Pierce Lake watershed.

Table 8-13 Fecal Coliform Total Maximum Daily Load for Keith Creek (IL_PR-99)

Zone	Flow Exceedance Range	LC (million colonies/day)	LA (million colonies/day)	WLA (million colonies/ day)	RC	MOS	Actual Load[1] (million colonies/day)	Percent Reduction Needed

8.3.2 Total Phosphorus Total Maximum Daily Load for Pierce Lake

8.3.2.1 Loading Capacity

The LC of Pierce Lake represents the pounds of TP that can be allowed as input to the lake per day and still meet the applicable water quality standard. The water quality standard for TP is 0.05 mg/L, to be met at all times. The allowable loads of TP that can be generated in the watershed and still maintain water quality standards were determined using SLAM, as discussed in Section 7. To calculate the LC, the current watershed TP loads into the lake, as quantified by the calibrated model of current conditions, were iteratively reduced until the water quality standard was met.

8.3.2.2 Seasonal Variation

Seasonal variation is accounted for in the TP TMDL through the development of the model and all calculations of load being for an annual basis. Modeling on an annual basis takes into account the

seasonal effects each lake will undergo during a given year. Since the pollutant source can be expected to contribute loadings in different quantities during different periods (e.g., various agricultural processes occurring at different times of the year combined with seasonal changes in precipitation result in different runoff characteristics at different times of the year), the loadings for this TMDL are focused on average annual loads converted to daily loads, rather than specifying different loadings by season. Pierce Lake will experience critical conditions pertaining to phosphorus concentrations every year, primarily during fall destratification (or overturn) (as modeled). Because a continuous daily simulation for an extended multi-year period was performed to calculate the Pierce Lake TMDL, the critical condition for the lake is accounted for within the analysis.

8.3.2.3 Waste Load Allocation

There are no NPDES permitted facilities in the Pierce Lake watershed, therefore, a WLA was not included in the TMDL calculation for this TMDL.

8.3.2.4 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions), explicit (expressed in the TMDL as a portion of the loadings), or a combination of both. The MOS for the Pierce Lake TMDL is explicit. An explicit MOS of 10 percent was included to account for the lack of site-specific data available within the subbasin.

8.3.4.5 Reserve Capacity

A portion of a TMDL's LC may be set as an RC to allow for future population growth and development potentially leading to increased pollutant loads in the future. In the case of this TMDL for TP, an explicit RC was not included in the TMDL calculations because of the lack of projected population growth in the area.

8.3.4.6 Load Allocation and Total Maximum Daily Load Summary

The TP TMDL developed for Pierce Lake is provided in **Table 8-20**. A total reduction of approximately 53.5 percent of existing watershed TP loads will result in compliance with the applicable water quality standard of 0.05 mg/L TP throughout the year and with the requisite MOS in Pierce Lake. As modeled, this reduction in watershed (external) loads will ultimately result in a similar reduction in lake internal loads of approximately 53.5 percent. Internal loads will naturally decrease as external loads are decreased and sediment phosphorus replenishment is reduced.

Table 8-20 Total Maximum Daily Load Summary for Pierce Lake

Source	LC (lb/day)	LA (lb/day)	MOS (lb/day, 10% of LC)	Current Load (lb/day)	Percent Reduction Needed
Internal[1]	4.0	3.6	0.4	8.5	52.9%
External	4.9	4.4	0.5	10.9	55.0%
Total	8.9	8.0	0.9	19.4	54.1%

Notes:

[1] Internal loads will ultimately be reduced as a consequence of targeted external load reductions.

lb/day – pounds per day

Section 9

Watershed-Based Implementation Plan for the Rock River/Pierce Lake Watershed

9.1 Implementation Overview

The goal of this watershed plan is to identify BMPs to be implemented in the Rock River/Pierce Lake watershed. The BMPs will provide reasonable assurance that impaired waters in the watershed will meet water quality goals developed to ensure water bodies are able to support designated uses.

EPA has identified nine minimum elements that a watershed plan for impaired waters is expected to include. The nine elements are defined in **Table 9-1** along with additional information about where each element is addressed in this report.

Table 9-1 EPA's Nine Elements of a Watershed-Based Implementation Plan for Impaired Waters

Element	Element Description	Report Section
1	Identify causes and sources of pollution that will need to be controlled to achieve pollutant load reduction requirements estimated within the watershed plan.	Sections 5 and 8
2	Estimate pollutant load reductions expected as a result of implementation of management measures described in element 3.	Sections 8 and 9
3	Describe the nonpoint source BMPs that will need to be implemented to achieve load reductions estimates and identify the critical areas where measures need to be implemented.	Section 9.3
4	Estimate the level of technical assistance, associated costs, potential funding sources and parties that will be relied upon to implement the prescribed measures.	Section 9.4
5	Include a public information/education component designed to change social behavior.	Section 9.6
6	Develop an implementation schedule for the plan.	Section 9.7
7	Develop a description of interim, measurable milestones.	Section 9.7
8	Identify indicators that can be used to determine whether pollutant loading reductions are being achieved over time.	Section 9.8
9	Develop a monitoring component to evaluate the effectiveness of the implementation efforts over time.	Section 9.8

9.2 Adaptive Management

Watershed planning is an iterative and adaptive process that requires continuous monitoring and evaluation of success criteria to help improve results as lessons are learned throughout implementation. This adaptive management approach is recommended for the implementation of management practices designed to meet the load reduction targets developed for the Rock River/Pierce Lake watershed. Adaptive management conforms to the EPA guidelines outlined in **Table 9-1** as it is a systematic process for continually improving management policies and practices through learning from the outcomes of operational programs. Some defining characteristics of an adaptive management approach include:

- Acknowledgment of uncertainty about what policy or practice is "best" for the particular management issue
- Thoughtful selection of the policies or practices to be applied (the assessment and design stages of the cycle)
- Careful implementation of a plan of action designed to reveal the critical knowledge that is currently lacking
- Monitoring of key response indicators
- Analysis of the management outcomes in consideration of the original objectives and incorporation of the results into future decisions

Implementation actions, management measures, available assistance programs, and continued monitoring are all discussed throughout the remainder of this section to assist in development of an adaptive management program. Nonpoint source BMPs are voluntary based on landowner preferences.

9.3 Best Management Practices

Implementation actions, management measures, and/or BMPs are used to control the generation or distribution of pollutants within a watershed. BMPs are either structural, such as wetlands, sediment basins, fencing, and filter strips; or managerial, such as conservation tillage practices, nutrient management plans (NMPs), and crop rotation. Both structural and managerial BMPs require effective management to be successful in reducing pollutant loading to water resources.[36]

It is typically most effective to install a combination of nonpoint source controls and BMPs or a BMP system. A BMP system is a combination of two or more individual BMPs that are used to control pollutants from a single critical source. If the watershed has more than one identified pollutant, but the transport mechanism is the same, then a BMP system that establishes controls for the transport mechanism can be employed.

9.3.1 Best Management Practices for Fecal Coliform Reduction

Inputs of fecal coliform primarily originate from overland runoff associated with precipitation events. Fecal coliform contributions from failed on-site wastewater treatment (septic) systems can also be a source, especially if they are concentrated in a small area. Fecal coliform can be bound to soil particles and enter streams from erosion. The impact from fecal coliform discharged by nonpoint sources is typically intermittent and is most often associated with stormwater runoff that carries things like animal waste, fertilizers, or other pathogenic sources. Sedimentation can impact the physical attributes of the stream and act as a transport mechanism for fecal coliform contamination.

Table 9-2 lists all the stream segments currently impaired for fecal coliform according to the 2018 EPA 303(d) list of impaired waters. Impaired stream segments are listed from upstream to downstream segment.

Table 9-2 Rock River/Pierce Lake Watershed Streams Impaired for Fecal Coliform on the EPA 303(d) List from Upstream to Downstream Segment

Impaired Stream Segment	Segment ID	Segment Length (miles)
Keith Creek	IL_PR-99	3.34
Keith Creek	IL_PR-01	10.43
North Fork Kent Creek	IL_PSB-01	12.13
South Fork Kent Creek	IL_PSA	9.6
North Kinnikinnick Creek	IL_PU	15.28
South Kinnikinnick Creek	IL_PT	14.43
Spring Creek – North	IL_PZZG	8.68

As presented in previous sections, possible external sources of fecal coliform in the Rock River/Pierce Lake watershed include agricultural activity (cropping practices and animal operations), municipal and industrial point sources, and/or urban runoff and storm sewer discharges. To achieve a reduction of fecal coliform for the Rock River/Pierce Lake watershed, management measures should be implemented to address a range of potential sources.

9.3.1.1 Point Sources of Fecal Coliform

There are currently no permitted point sources within the Rock River/Pierce Lake watershed with reasonable potential to discharge fecal coliform to or immediately upstream of impaired segments. While there are several individually permitted discharges in the watershed, none of the dischargers potentially influencing impaired segments are required to monitor or report fecal coliform concentrations due to the nature of the facility operations and effluent quality assessments performed as part of the NPDES permitting process.

A number of municipalities and townships within the watershed have MS4s. MS4s represent runoff from municipal areas with permitted separate stormwater sewer systems. Several permitted MS4s exist within the watershed that potentially discharge urban runoff to impaired segments. MS4 permits for each permittee cover varying proportions of the subbasin area contributing loads to the impaired segments. WLAs for the MS4 areas are discussed in Section 8; BMPs for the MS4 areas are discussed along with non-MS4 stormwater and urban runoff in the following section.

9.3.1.2 Nonpoint Sources of Fecal Coliform

There are many potential nonpoint sources of fecal coliform within the Rock River/Pierce Lake watershed. This section presents information on watershed cropping practices, animal operations, urban runoff, and storm sewer discharges. Because fecal coliform can enter waterways through surface runoff and erosion of contaminated soils, sediment management and erosion control BMPs on a watershed scale can help reduce fecal coliform loading to impaired stream segments. Data were collected where available through communications with the local NRCS, Illinois SWCDs, and public health departments.

BMPs for treatment of these nonpoint sources include:

- Conservation tillage practices
- Filter strips and riparian buffers
- Farming/soil retention practices
- Wetlands
- Water and Sediment Control Basins (WASCOBs)
- Streambank Protection
- Faulty Private Septic Systems
- Animal waste management
  - Stream crossings
  - Restrict livestock access to streams and tributaries
  - Pet waste
  - CAFO BMPs (40 Code of Federal Regulations [CFR] 412.4)
- Urban soil/erosion BMPs

Conservation Tillage Practices: Conservation tillage practices reduce sediment loads into impaired segments by reducing erosion of soils. **Table 9-3** shows the areas (acres) in each subbasin that are under cultivation, along with the percent of the corresponding watershed area which is cultivated. Note that the areas shown in the table below are for the impaired segment subbasins only, and do not include upstream subbasins to avoid double counting the acreage across the entire Rock River/Lake Pierce Watershed. Crop residuals or living vegetation cover on the soil surface protects against soil detachment from water and wind erosion.

Table 9-3 Cultivated Areas for the Rock River/Pierce Lake Watershed Subbasins

Impaired Stream Segment	Segment ID	Land Cover Area (acres)	Cultivated Area (acres)	Percent Cultivated
Keith Creek	IL_PR-99	8,854	999	11%
Keith Creek	IL_PR-01	7,251	999	14%
North Fork Kent Creek	IL_PSB-01	19,426	9,924	51%
South Fork Kent Creek	IL_PSA	10,039	4,078	41%
North Kinnikinnick Creek	IL_PU	12,936	7,155	55%
South Kinnikinnick Creek	IL_PT	13,583	7,943	58%
Spring Creek – North	IL_PZZG	4,109	954	23%

Conservation tillage practices are no till and reduced till. No till is the practice of limiting soil disturbance in order to manage the amount, orientation, and distribution of crop and plant

residue on the soil surface year around.[37] Reduced till is managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year round while limiting the soil-disturbing activities used to grow and harvest crops in systems where the field surface is tilled prior to planting.[38]

The no till practice consists only of an in-row soil tillage operation during the planting activities and a seed row/furrow closing device. No full-width tillage is performed from the time of harvest or termination of one cash crop to the time of harvest/termination of the next cash crop in the rotation regardless of the depth of the tillage operation. Limited tillage is allowed to close or level ruts from harvesting equipment; however, no more than 25 percent of the field may be tilled for this purpose.

As noted above, the reduced till practice consists of managing plant residue on the soil surface while limiting soil-disturbing activities. The practice includes tillage methods commonly referred to as mulch tillage or conservation tillage where the entire soil surface is disturbed by tillage operations such as chisel plowing, field cultivating, tandem disking, or vertical tillage. It also includes tillage/planting systems with few tillage operations (e.g., ridge till) but which do not meet the criteria for the no till practice as described above and in Illinois NRCS CPS 329.[39]

In both the no till and reduced till practices, removal of residue from the row area prior to or as part of the planting operation is acceptable. In the no till practice, however, the disturbed portion of the row width should not exceed one-third of the crop row width. In either practice, none of the residue should be burned. To reduce erosion to the targeted level, the current approved water and/or wind erosion prediction technology should be used to determine the amount of randomly distributed surface residue needed, the period of the year the residue needs to be present in the field, and the amount of surface soil disturbance allowed. All residues shall be uniformly distributed over the entire field. Residue should not be shredded after harvest because shredding makes it susceptible to movement by wind or water, and areas where the shredded residue accumulates may interfere with planting of the next crop.

If the no till BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 329.[40] If the reduced till BMP is selected for use by a landowner, a separate plan shall be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 345.[41] To achieve TMDL load reductions, tillage practices already in place should be continued, and practices should be assessed and improved upon for all agricultural areas in the Rock River/Pierce Lake watershed subbasins.

Filter Strips: Filter strips reduce both sediment and bacterial pollutant loads from runoff. Filter strips are strips or areas of permanent herbaceous vegetation situated between cropland, grazing land, or disturbed land and environmentally sensitive areas, such as waterways. The filter strips are permanently designated plantings to treat runoff and are not part of an adjacent cropland's rotation.

The filter strip vegetation may consist of a single species or a mixture of grasses, legumes, and/or other forbs that are appropriately adapted to the soil and climate, as well as to the farm chemicals used in the adjacent land. Approved seed listings are provided in the Illinois NRCS Conservation Practice Standard (CPS) 393.[42] Applicable maintenance shall be performed as needed to ensure the strips continue to function properly, including removal of state-listed noxious weeds, gully repair, removal of excess sediment, and reseeding. Overland flow entering the filter strip should be primarily sheet flow; areas of concentrated flow should be dispersed as part of the maintenance activities so as not to circumvent the filter strip. Harvesting of the filter strip vegetation, where appropriate, will help to encourage dense growth, maintain an upright growth habit, and remove contaminants such as nutrients and microbial pathogens. Prescribed burning may be used to manage and maintain the filter strip when an approved burn plan has been developed.

The installation of filter strips adjacent to the impaired stream segments, as well as any contributing tributaries, can result in considerable reduction of overland contributions of sediments, suspended solids, and fecal coliforms to an impaired water body. Filter strips implemented along impaired streams and their tributaries slow and filter runoff and provide bank stabilization thereby decreasing erosion and re-sedimentation; however, they should not be installed on unstable channel banks already eroding due to undercutting of the bank toe. When used in support of a riparian forest buffer, filter strips can also restore or maintain sheet flow.

The Illinois NRCS CPS 393 describes filter strip requirements based on land slope; the requirements are designed to achieve a minimum flow through time of 15 to 30 minutes at a one-half inch depth. **Table 9-4** provides a summary of the guidance for filter strip width, or flow length, as a function of slope.[43]

Table 9-4 Filter strip flow lengths based on land slope

Percent Slope	Filter Strip Flow Length (feet)	
	Minimum	Maximum
0.5 %	36	72
1.0 %	54	108
2.0 %	72	144
3.0 %	90	180
4.0 %	108	216
5.0 % or greater	117	234

[42] NRCS. 2017a. Conservation Practice Standard. Filter Strip. Code 393. https://efotg.sc.egov.usda.gov/api/CPSFile/5609/393_IL_CPS_Filter_Strip_2017

[43] NRCS. 2017a.

In conjunction with the available land use, topography, and soil information discussed in Section 2, mapping software was used to buffer impaired segments and their major tributaries to an appropriate and reasonable width to determine the total area found in the subbasin. Due to the wide range of soil types and slopes found throughout the watershed, the appropriate buffer widths estimated in GIS were based on the average slope of land within the maximum buffer areas of the impaired segment's major tributaries. These average slopes were then used to calculate approximate buffer distances based on the NRCS guidance using a best-fit equation to interpolate between the slope percentages to buffer width relationships provided in the NRCS guidance.

Not all land use types within the buffer areas are candidates for conversion to filter strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of developed residential or commercial lands is often not feasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips and will likely provide the greatest benefit to water quality once converted. Therefore, GIS software was used to extract the approximate acreage of agricultural lands surrounding potential tributaries and buffer areas of the impaired stream segments within the Rock River/Pierce Lake watershed. The calculated overall buffer areas and acreage of agricultural land within the buffer distances for the impaired segments and its tributaries are provided in **Table 9-5**. These data represent an approximation of the maximum acreage of land potentially available for conversion to filter strips. A more detailed assessment of a given property is necessary to determine the exact size and extent of convertible lands likely to provide the greatest benefit to surface water quality following conversion to filter strips.

Table 9-5 Average slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land within Buffers Potentially Suitable for Conversion to Filter Strips within the Rock River/Pierce Lake Watershed

Impaired Stream Segment	Segment ID	Avg Stream Slope (%)	Filter Strip Flow Length (ft)	Total Buffer Area (acres)	Agricultural Land in Buffer (acres)
Keith Creek	IL_PR-99	3	180	151	0.22
Keith Creek	IL_PR-01	3	180	446	63
North Fork Kent Creek	IL_PSB-01	2	144	412	101
South Fork Kent Creek	IL_PSA	4	216	481	104
North Kinnikinnick Creek	IL_PU	3	180	628	216
South Kinnikinnick Creek	IL_PT	4	216	724	248
Spring Creek – North	IL_PZZG	4	216	447	54

There is a total of approximately 786 acres of agricultural land within the various buffer distances of the impaired stream segments where filter strips could be installed. Landowners are encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table 9-5**. **Figure 9-1** shows the buffered areas and agricultural lands suitable for conversion to filter strips within the watershed.

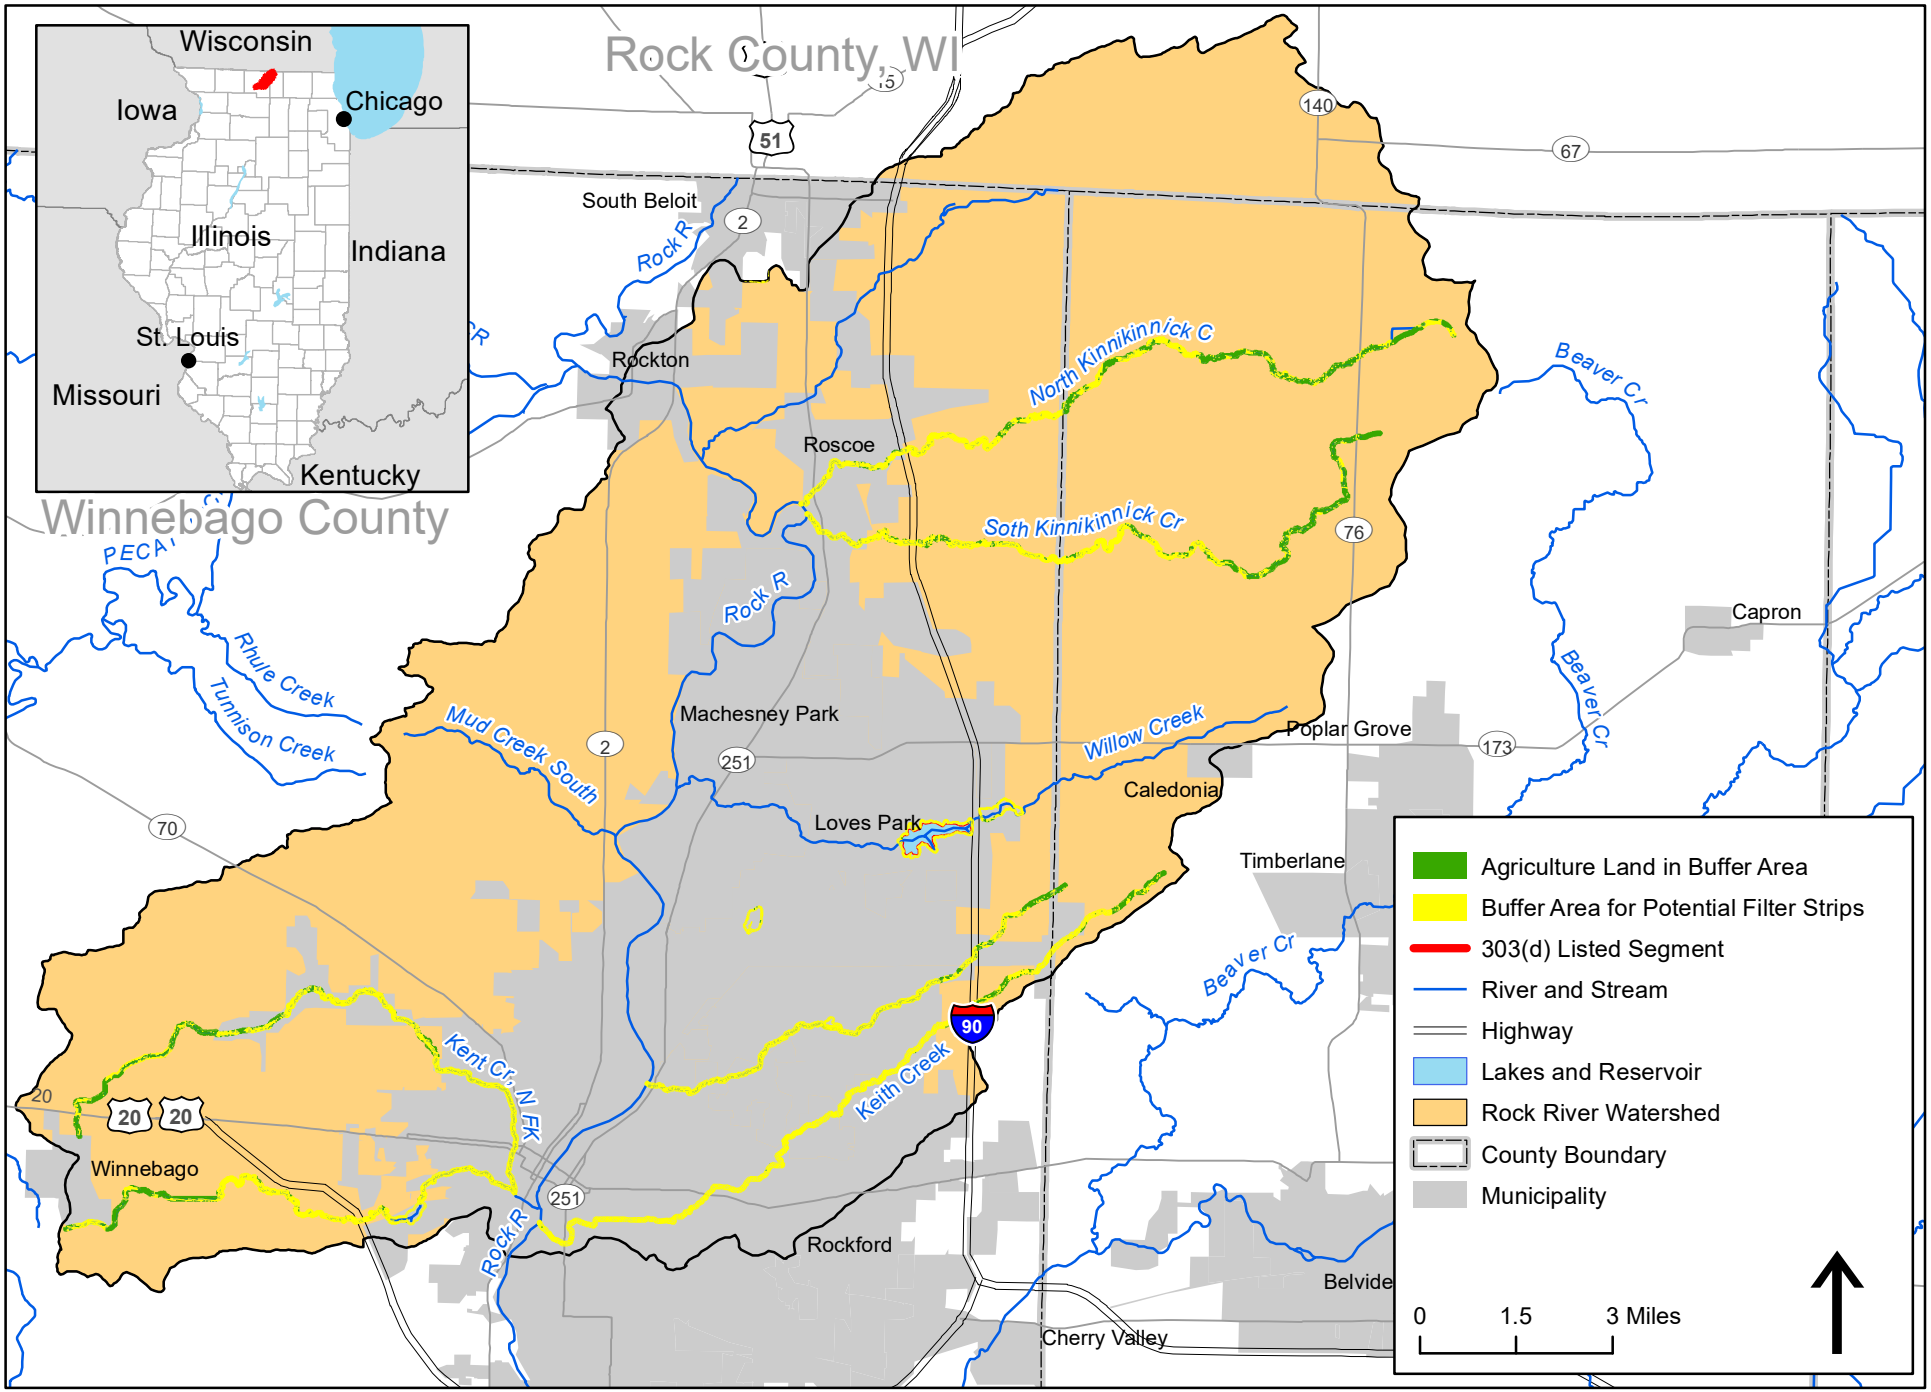

Figure 9-1: Rock River/Pierce Lake
Buffer Areas and Agricultural Lands Potentially Suitable for Conversion to Filter Strips

CDM Smith

If this BMP is selected for use by a landowner, a separate plan should be prepared for each area which will use this practice. Additional guidance and minimum plan elements are discussed in Illinois NRCS CPS 393, including site preparation; seed, seeding rates, and mixtures; lime and fertilizer; seedbed preparation and seeding; and operation and maintenance.

Riparian Buffers: Similar to filter strips described above, riparian vegetation buffers enhance infiltration of runoff and subsequent trapping of nonpoint source pollutants such as fecal coliforms. The vegetation also serves to reinforce streambank soils, which helps minimize erosion. The primary difference between filter strips and riparian buffers are the types of vegetation plantings used within the buffer area. Riparian buffers leverage woody vegetation such as trees and shrubs. Grassland, forest, and agricultural areas within the appropriate buffer zones for each impaired stream segment within the Rock River/Pierce Lake watershed are shown in **Table 9-5**. There are 3,289 acres within the buffer area of impaired stream segments. Approximately 786 of those acres are classified as agricultural. Landowners should assess parcels adjacent to the stream channels and maintain or improve existing riparian areas or potentially convert cultivated lands.

Soil Retention: Soil retention practices reduce bacterial loads into the impaired stream segments by reducing erosion of soils. As indicated above, approximately 58,315 acres of the Rock River/Pierce Lake watershed are under cultivation, which accounts for about 39 percent of the watershed area. Farming practices in the watershed should be assessed to determine methods being used, where they can be improved upon, and what additional practices are appropriate to reduce nutrient loads through soil retention.

Any farming/soil retention methods with the capability to reduce sediment and suspended solids entering impaired waterways also reduce fecal coliform loads. In addition to conservation tillage and buffer strips (riparian or filter strips) as described above, other examples of soil retention methods include:

- Field borders: A minimum 30-foot strip of permanent vegetation such as stiff-stemmed, upright grasses, grass/legumes, forbs, and/or shrubs established at the edge or around the perimeter of a cropland or grazing fields to reduce erosion from wind and water and protect soils and water quality.[44]

- Contour farming: Aligning ridges, furrows, and roughness formed by tillage, planting, and other operations to alter the velocity and/or direction of water flow to or around hillslopes in areas where crops are grown on sloping lands.[45]

- Conservation crop rotation: A planned sequence of at least two different crops grown on the same ground over a period of time (i.e., the rotation cycle), and applies to all cropland where at least one annually planted crop is included in the rotation. To recover excess nutrients from the soil profile and reduce water quality degradation, crops with quick germination and root system formation, a rooting depth sufficient to reach the nutrients

[44] NRCS. 2022a. Conservation Practice Standard. Field Borders. Code 386. https://efotg.sc.egov.usda.gov/api/CPSFile/35382/386_IL_CPS_Field_Border_2022

[45] NRCS. 2021a. Conservation Practice Standard. Contour Farming. Code 330. https://efotg.sc.egov.usda.gov/api/CPSFile/32990/330_IL_CPS_(Con)tour_Farming_2021

not removed by the previous crop, and nutrient requirements that readily utilize the excess nutrients should be used.

- Strip-cropping: A practice of growing planned rotations of erosion-resistant and erosion-susceptible crops or fallow in a systematic arrangement of approximately equal strips (two or more) across a field. Strip-cropping can reduce sheet, rill, and wind erosion as well as the transport of sediment and other water- and wind-borne contaminants. Strip-cropping can be applicable on steeper slopes but is less effective on slopes exceeding 12 percent.[46]

- Cover cropping: A cover crop consists of grasses, legumes, and forbs planted for seasonal vegetative cover that may either be established between successive production crops, or companion-planted or relay-planted into production crops. The cover crop should be established as soon as practical prior to or after harvest of the production crop and terminated as late as practical to maximize plant biomass production and nutrient uptake while allowing time to prepare the field for the next production crop.[47]

- Terracing: A soil conservation practice that may consist of an earthen embankment, channel, or combination of ridges and channels constructed across high gradient slopes that can prevent runoff of precipitation from causing serious erosion. Terraces reduce both the volume and velocity of water moving across the soil surface which reduces peak discharge rates by temporarily storing runoff and allowing associated sediment and other contaminants to settle out behind the terrace ridge rather than directly entering receiving waters.[48]

- Critical area planting: The establishment of permanent vegetation on sites that have or are expected to have high erosion rates, and/or on sites that have physical, chemical, or biological conditions that prevent the establishment of vegetation using normal practices.[49]

- Sediment basins: A basin formed by an embankment or excavation, or combination of these, with a constructed engineered outlet that captures and detains sediment-laden runoff or other debris for a sufficient length of time. Sediment basins act as the last line of defense for capturing sediment when erosion has already occurred and must have sediment storage capacity, detention storage, and temporary flood storage capacities. For maximum sediment retention, the basin should be designed so that the detention storage remains full of water between storm events. If site conditions, safety concerns, or local laws preclude a permanent pool of water, all or a portion of the detention and sediment storage may be designed to be dewatered between storm events.[50]

Wetlands: The use of wetlands as a structural control is applicable to fecal coliform reduction. Wetlands constructed at select locations where more focused runoff from fields occurs treat loads from agricultural runoff, such as from manure. Wetlands are effective BMPs for bacteria and sediment control because they:

- Prevent floods by temporarily storing water, allowing the water to evaporate or percolate into the ground.
- Filter sediment.
- Slow overland flow of water thereby reducing soil erosion and contaminant transport.

A properly designed and functioning wetland provides very efficient treatment of pollutants, such as fecal coliform. Design of wetland systems is critical to the sustainable functionality of the system and should consider soils in the proposed location, hydraulic retention time, and space requirements. In general, soils classified as hydric are most suitable for wetland construction. Areas near waterways that are not currently classified as wetlands but have hydric soils present are typically strong candidates for wetland construction. Existing wetland areas may also be candidates for reconstruction or enhancement to improve their runoff filtration capacity. **Figure 9-2** highlights the areas along stream segments within the Rock River/Pierce Lake watershed that consist of hydric soils or wetlands which are suitable for conversion or enhancement to help reduce nutrient loads into area waterways. These data layers are developed on a large-scale and on-site soil investigation and wetland delineation is typically necessary for verification of the suitability of a given area for wetland construction.

Constructed wetlands, which comprise the second or third stage of a nonpoint source treatment system, are effective at improving water quality. Studies have shown that artificial wetlands designed and constructed specifically to remove pollutants from surface water runoff have removal rates of greater than 90 percent for suspended solids.[51,52,53,54] Contaminant removal rates can be improved if sheet flow is maintained to the wetland and vegetation and substrate are monitored to ensure the wetland is operating optimally. Sediment or vegetation removal may be necessary if the wetland removal efficiency is lessened over time.[55] Guidelines for wetland design suggest a wetland to watershed ratio of 0.6 percent for nutrient and sediment removal from agricultural runoff is optimal.

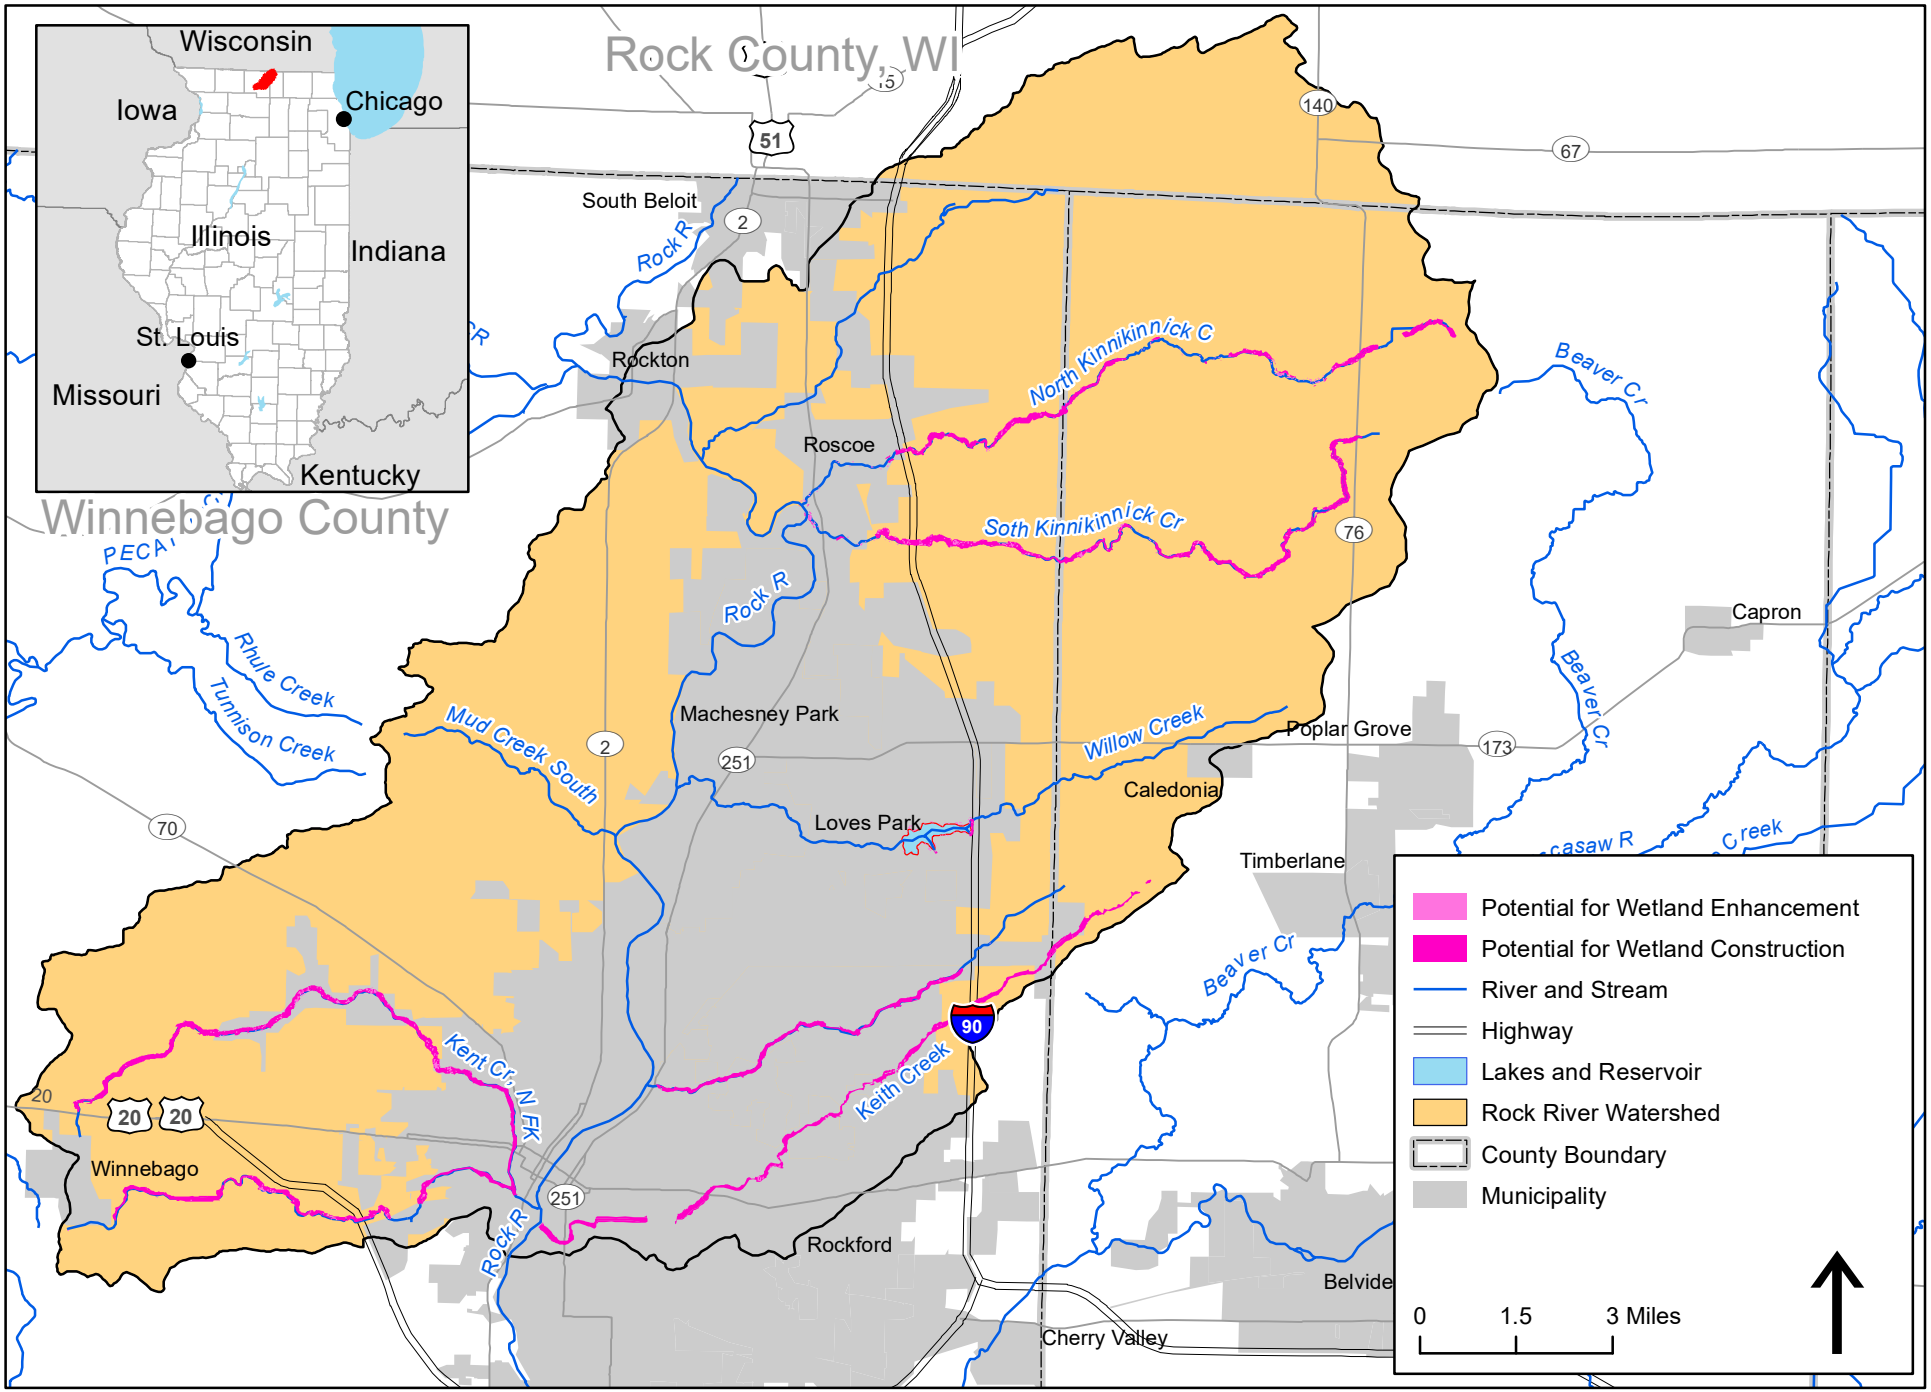

Figure 9-2: Rock River/Pierce Lake
Hydric Soils, Existing Wetlands, and Potential Wetland Construction

CDM Smith

WASCOBs: WASCOBs are earth embankments or combination ridge and channel systems constructed across the slopes of minor watercourses to reduce watercourse and gully erosion. These basins act as water detention basins and trap sediments (and the pollutants bound to the sediment) prior to them reaching a receiving water. The WASCOB reduces gully erosion by controlling flow within the drainage area, and the basins may be installed singly or in series as part of a system. The practice applies to sites where the topography is generally irregular, runoff and sediment damage land and improvements, and watercourse or gully erosion is a problem. Adequate and stable outlets from the basin are required to convey runoff water to a point where it will not cause damage. Additionally, sheet and rill erosion should be controlled by other conservation practices; i.e., the WASCOB would be part of another conservation system that adequately addresses resource concerns both above and below the basin. However, if land ownership or physical conditions preclude treatment of the upper portion of a slope, a WASCOB may be used to separate the upper area from and permit treatment of the lower slope.

WASCOBS should, at a minimum, be designed to be large enough to control runoff from at least a 10-year, 24-hour storm using a combination of flood storage and discharge through the outlet. Additionally, the WASCOB must be designed to have the capacity to store at least the anticipated 10-year sediment accumulation. Otherwise, periodic sediment removal is required as part of the maintenance activities in order to maintain the required capacity. Locations are determined based on slopes, erosion areas, crop management, and soil survey data.

When using a WASCOB, a separate plan shall be prepared for each treatment unit which will use this practice. Local NRCS personnel can often provide information and advice for design and installation. Illinois NRCS CPS 638.[56] also provides additional information on the design and maintenance requirements for WASCOBs, as well as information on cropping activity recommendations and requirements around the basin. Maintenance includes reseeding or planting the basins in order to maintain vegetation, where specified, and periodically checking them, especially after large storms, to determine the need for embankment repairs or mechanical removal of excess sediment. Inlets and outlets should be cleaned regularly. Damaged components should be replaced promptly.

Streambank Protection: Treatments used to stabilize and protect banks of streams or constructed channels are discussed in Illinois NRCS CPS 580.[57] This practice helps maintain the flow capacity of streams or channels, and to reduce the offsite or downstream effects of sediment resulting from bank erosion. Prior to implementation of the practice, an assessment of the unstable streambank sites should be conducted in sufficient detail to identify the causes contributing to the instability (e.g., livestock access, watershed alterations resulting in significant modifications of discharge or sediment production, and in channel modifications such as water level fluctuations and boat-generated waves). Protective treatments need to be compatible with the bank materials, water chemistry, channel hydraulics, and slope characteristics above and below the water line. Treatment area designs should provide for protection of installed

---

[56] NRCS. 2018. Conservation Practice Standard. Water and Sediment Control Basin. Code 638. https://efotg.sc.egov.usda.gov/api/CPSFile/5838/638_IL_CPS_Water_and_Sediment_(Con)trol_Basin_2018

[57] NRCS. 2020. Conservation Practice Standard. Streambank and Shoreline Protection. Code 580. https://www.nrcs.usda.gov/sites/default/files/2022-10/Streambank_Shoreline_Protection_580_CPS_10_2020.pdf

treatments from overbank flows resulting from upslope runoff and flood return flows, and from bank seepage.

Livestock traffic along treated streambanks should be limited to stable access points. All disturbed areas around protective treatments shall be protected from erosion through cultivation or selected vegetation suitable for the site conditions and intended purposes. Streambanks should be assessed to determine whether the causes of instability are local (e.g., poor soils, high water table in banks, alignment, obstructions deflecting flows into the bank, etc.) or systemic (e.g., aggradation due to increased sediment from the watershed, increased runoff due to urban development in the watershed, degradation due to channel modifications, etc.). Bank protection treatment should not be installed in channel systems undergoing rapid and extensive changes in bottom grade and/or alignment unless the treatment is designed to control or accommodate the changes. Bank treatment shall be constructed to a depth at or below the anticipated lowest depth of streambed scour. When appropriate, a buffer strip and/or diversion may be established at the top of the bank protection zone to help maintain and protect installed treatments; improve their function; and filter out sediments, nutrients, and pollutants from runoff. Some available approaches to potentially decrease nonpoint TSS and/or pollutant source loads, as well as help stabilize eroding banks include the following:

- Stone Toe Protection: Non-erodible materials are used to protect the eroding banks of tributary streams that discharge into the lake. Meandering bends found in the watershed are stabilized by placing the hard armor only on the toe of the bank. Stone toe protection is most commonly implemented using stone quarry stone that is sized to resist movement and is placed on the lower one-third of the bank in a windrow fashion.

- Rock Riffle Grade Control: Naturally stable stream systems typically have an alternating riffle-pool sequence that helps to dissipate stream energy. Riffle rock grade control places loose rock grade control structures at locations where natural riffles would occur to create and enhance the riffle-pool flow sequence of stable streams. By installing riffle rock in an incised channel, the riffles will raise the water surface elevation resulting in lower effective bank heights, which increases the bank stability by reducing the tractive force on the banks.

- Floodplain Excavation: Rather than raising the water level, Floodplain Excavation lowers the floodplain to create a more stable stream. Floodplain Excavation uses mechanical means to restore the floodplain by excavating and utilizing the soil that would eventually be eroded away and deposited in the stream.

- Rock chutes: Rock chutes are riprap lined water conveyance structures used to move water down a slope in a non-erosive manner. The main purpose of a rock chute is to reduce channel flow velocity by dissipating energy and to provide a stable grade at the outlet to prevent erosion.

Private Septic System Inspection and Maintenance Program: It is unclear to what extent businesses, residences, and other structures in the watershed are served by septic vs. municipal sewer systems. Most of businesses, residences, and other structures in the developed areas are expected to be served by a municipal sewer district; however, many households in rural areas of Illinois, as well as in some smaller townships, that are not connected to municipal sewers make

use of onsite sewage disposal systems, or septic systems. The degree of nutrient and pathogen removal in these systems is limited by soils and system upkeep and maintenance.

Failing or leaking septic systems can be a source of fecal coliform pollution. A program that actively manages functioning systems and addresses non-functioning systems will reduce the potential phosphorus loads from septic systems in the watershed. The USEPA has developed guidance for managing septic systems, which includes assessing the functionality of systems, public health, and environmental risks.[58] It also introduces procedures for selecting and implementing a management plan.

To reduce the discharge of excessive amounts of contaminants from a faulty septic system, a scheduled maintenance plan that includes regular pumping and maintenance of the septic system should be followed. The majority of failures originate from excessive suspended solids, nutrients, and BOD loading to the septic system. Reduction of solids entering the tank can be achieved by limiting the use of garbage disposals.

Septic system management practices can extend the life, and maintain the efficiency, of a septic system. Water conservation practices, such as limiting daily water use or using low flow toilets and faucets, are the most effective methods to maintain a properly functioning septic system. Additionally, septic systems should not be used for the disposal of solids, such as cigarette butts, cat litter, cotton swabs, coffee grounds, disposable diapers, etc. Physical damage to the drain field can be prevented by:

- Maintaining a vegetative cover over the drain field to prevent erosion
- Avoiding construction over the system
- Protecting the area down slope of the system from excavation
- Landscape the area to divert surface flow away from the drain field (Johnson 1998)

The cost of each management measure is highly variable and site-specific data on septic systems and management practices do not exist for the watershed; therefore, homeowners with septic systems should contact their county health department for septic system management costs.

Current protocols for addressing failing septic systems should adhere to the Illinois Private Sewage Disposal Licensing Act and Code "to prevent the transmission of disease organisms, environmental contamination and nuisances resulting from improper handling, storage, transportation and disposal from private sewage disposal systems". Any new, replaced, or renovated system must be installed by a licensed contractor or the homeowner and permitted through the county health department. The department must receive both an application for permit and the appropriate fee from the contractor/homeowner. Once reviewed and approved, a permit is issued and an inspection of the system is conducted during and after construction. The county health department also investigates private sewage disposal system complaints.

---

[58] USEPA. 2023. Septic System Care and Maintenance. https://www.epa.gov/septic/septic-system-care-and-maintenance

A long-range solution to failing septic systems is connection to a municipal sanitary sewer system. Connection to a sanitary sewer line would reduce fecal coliform and phosphorus sources by replacing failing septic systems with municipal treatment and will allow communities to develop without further contribution of pollutants to impaired waterbodies. Costs for the installation are generally paid over a period of several years (average of 20 years) and help to avoid forcing homeowners to shoulder the entire initial cost of installing a new septic system. In addition, costs are sometimes shared between the community and the utility responsible for treating the wastewater generated from replacing the septic tanks. The planning process is involved and requires participation from townships, cities, counties, businesses, and citizens.

Animal Waste Management: Animal waste from domestic animals or livestock can also be a source of fecal coliform loads into impaired stream segments. A number of animal waste management techniques reduce bacterial loads that enter waterways. Examples of effective animal waste management methods include:

- Stream Crossings: A stream crossing is a stabilized area or structure constructed across a stream to provide a travel way for people, livestock, equipment, or vehicles. Use of established stream crossings reduces streambank and streambed erosion, as well as improves water quality by reducing sediment, nutrient, organic, and inorganic loading downstream. This practice applies to all land uses where an intermittent or perennial watercourse exists and a ford, bridge, or culvert type crossing is needed.

  Stream crossings should be in areas where the streambed is stable or can be stabilized, and preferably where the crossing can be installed perpendicular to the direction of stream flow. Each proposed crossing site should be evaluated for variations in stage and discharge, hydraulics, aquatic organism life stages, fluvial geomorphic impacts, sediment transport and flow continuity, groundwater conditions, and movement of woody and organic material. The crossing should then be designed to account for the known range of factors. Crossings should not be placed where the channel grade or alignment changes abruptly, excessive seepage or instability is evident, overfalls exist (evidence of incision and bed instability), where large tributaries enter the stream, within 300 feet of known spawning areas for listed species, or in wetland areas. The width of the crossing will depend upon its intended purpose.

- Restrict Livestock Access to Streams and Tributaries: Reduction of livestock access to streams limits damage to streambanks and reduces bacterial loads entering the stream. Access of livestock and other animals to streams increases bank erosion, tramples filter strips and riparian buffers causing short circuiting of pollutant treatment, and introduces organic contaminants directly into the stream. Exclusion or restricting pet, livestock, and wildlife access to streams with fencing reduces pollutant loads. Fencing and alternate watering systems are effective ways to restrict livestock from streams; however, fencing emplacement is not always feasible from either a cost or animal management viewpoint. If used, fencing should be placed outside of the filter strips/riparian areas.

- Pet Waste Management: Domestic pet waste contributes bacteria and nutrient loads to impaired streams or lakes through stormwater runoff that picks up and carries pet waste into storm sewers or discharge directly into waterways. Public outreach and education campaigns that encourage pet owners to pick up their dog's waste are tools that help reduce bacteria loading in impaired streams. Installing pet waste disposal systems and offering pet waste bags in residential areas or in parks or open spaces within bacteria impaired watersheds also help reduce fecal coliform loads entering streams.

- CAFO BMPs (40 CFR 412.4): The proper management of waste from commercial animal operations within the watershed will help reduce bacteria loadings to area waterways. BMPs for the land application of manure and other process wastewater from such facilities are defined in 40 § CFR 412.4. Examples of applicable BMPs include using a setback, or specified distance from surface waters or their tributaries, where manure or other waste products are located or applied as well as using vegetated buffers or filter strips to help filter out or intercept contaminated runoff from animal facilities.

Urban Soil/Erosion BMPs: Table 9-6 summarizes the percentage of land that is developed or urban within each impaired stream segment's subbasin. In the developed/urban areas of the watershed, decreased infiltration and increased runoff rates associated with the prevalence of impervious surfaces and increased overland flow can contribute to high sediment and bacterial loads in the impaired stream segments. Most modern developments route runoff from impervious surfaces directly into storm sewers or paved channels which effectively convey the pollutants into receiving water bodies with little to no opportunity for infiltration or filtering. The storm sewers and lined channels then convey the runoff water downstream at a much faster rate than would normally occur in a natural, nonurbanized, setting.

Table 9-6 Urban and Developed Areas for the Rock River/Pierce Lake Watershed Subbasins

Impaired Stream Segment	Segment ID	Land Cover Area (acres)	Developed Area (acres)	Percent Developed
Keith Creek	IL_PR-99	8,854	7,090	80%
Keith Creek	IL_PR-01	7,251	5,499	76%
North Fork Kent Creek	IL_PSB-01	19,426	5,884	30%
South Fork Kent Creek	IL_PSA	10,039	3,837	38%
North Kinnikinnick Creek	IL_PU	12,936	2,157	17%
South Kinnikinnick Creek	IL_PT	13,583	1,739	13%
Spring Creek – North	IL_PZZG	4,109	2,948	72%

The long-term effects of urban development upon water bodies and wetlands primarily results in the elimination of vegetation and other natural materials. The typical consequences of these alterations include reduced shading and a resultant increase in water temperature, reduced capacity for pollutant filtering, and increased stream instability and erosion. The Association of Illinois SWCDs maintains and updates the Illinois Urban Manual, which is "intended for use as a technical reference by developers, planners, engineers, government officials and others involved in land use planning, building site development, and natural resource conservation in rural and

urban communities and developing areas."[59] Below is information on urban stormwater BMPs that can be used within the watershed. Detention basins, rock check dams and/or manufactured tri-dikes, and silt fences are BMPs employed to reduce surface runoff, particularly addressing the reduction of sediments and bacterial loads.

- Detention Basins: A dry detention basin is a vegetated basin designed to hold stormwater runoff, thus reducing peak stormwater flows and reducing flooding. Drainage areas for these basins are typically between 5 and 50 acres, and plans and specifications require the signature of a licensed professional engineer. Design components include basin inflow and outflow control structures, an emergency spillway, and basin planting. Practice standard 809 in the Urban Manual provides additional information.

- Rock Check Dam: A rock check dam is a small dam built across a grass swale or road ditch to slow stormwater flows, reduce erosion, trap sediment, and increase infiltration. The practice is limited to small, grassed swales or open channels that drain 10 acres or less. Practice standard 905 in the Urban Manual provides additional information on criteria, plans/specifications, and operations and maintenance.

- Manufactured tri-dikes: Also known as manufactured ditch checks (reference practice standard 814 in the Urban Manual), this practice involves installing a prefabricated temporary dam or flowthrough device (10 to 15 inches in height) across a swale or road ditch to slow water flow. Similar to a rock check dam, the purpose of manufactured ditch checks is to trap sediment, promote settling of suspended solids, reduce erosion, and promote infiltration. The practice is used where grading activity occurs in areas of concentrated flows with slopes less than 8 percent and flow velocities less than 8 cubic feet per second.

- Silt fence: A silt fence is a temporary barrier of filter fabric stretched between posts to cause sediment deposition from sheet flows from disturbed sites. Maximum drainage areas for overland flow to a silt fence should not exceed 0.5 acres per 100 feet of fence. Practice standard 920 of the Urban Manual provides additional information.

9.3.2 Best Management Practices for Total Phosphorus Reduction

Phosphorus loads in the Rock River/Pierce Lake watershed originate from both internal and external sources. As presented in previous sections, internal nutrient recycling may be a source of TP to the lake in addition to external sources such as septic systems, waterfowl, and agricultural activity.

Phosphorus is a nutrient critical to healthy ecosystems at low concentrations; however, overenrichment of phosphorus can result in aquatic ecosystem degradation when nitrogen is also available in sufficient quantities. Nutrient enrichment can result in rapid algal growth as available nutrients and carbon dioxide are consumed. This response can alter pH, decrease DO (which is critical to other aquatic biota), alter the diurnal DO pattern, and even create anoxic conditions. In

[59] Association of Illinois SWCDs. *Illinois Urban Manual*. https://illinoisurbanmanual.org/

addition, nutrient enrichment can reduce water clarity and light penetration and is aesthetically displeasing.

Inputs of phosphorus can originate from both point and nonpoint sources. Most of the phosphorus discharged by point sources is soluble and originates from anthropogenic sources. For example, effluents from municipal sewage treatment plants are often a contributor of phosphorous loads to area waterways. Contributions from failed on-site wastewater treatment (septic) systems can also be a significant source (nonpoint), especially if they are concentrated in a small area. Phosphorus from nonpoint sources is generally insoluble or particulate. Most of this phosphorus is bound tightly to soil particles and enters streams from erosion. The impact from phosphorus discharged by nonpoint sources is typically intermittent and is most often associated with stormwater runoff.

To achieve a reduction of TP for the Rock River/Pierce Lake watershed, management measures must primarily address loading through sediment and surface runoff controls. BMPs that treat these nonpoint sources include:

- Conservation tillage practices
- Filter strips and riparian buffers
- Farming/soil retention practices
- Wetlands
- WASCOBs
- Streambank Protection
- Septic Systems
- Animal waste management
    - Waterfowl
- Urban soil/erosion BMPs
- Nutrient management
- Phosphorus-based lawn fertilizer restrictions
- Shoreline protection
- In-lake management measures

Section 9.3.1.2 discusses conservation tillage, filter strips, riparian buffers, farming/soil retention, wetlands, WASCOBs, streambank protection, animal waste management and urban soil erosion BMPs, all of which are also applicable to reduction of phosphorus loads into Pierce Lake when applied upgradient of the waterbody. The paragraphs that follow provide detailed explanations for the remaining TP nonpoint source controls listed above.

Nutrient Management: Nutrient management programs result in reduced nutrient loads to impaired segments within the Rock River/Pierce Lake Watershed and help improve DO levels. Crop management of nitrogen and phosphorus originating in the agricultural portions of the watershed can be accomplished through NMPs that focus on increasing the efficiency with which applied nutrients are used by crops, thereby reducing the amount available to be transported to both surface water and groundwater.

The overall goal of nutrient reduction from agriculture should be to increase the efficiency of nutrient use by balancing nutrient inputs in feed and fertilizer with outputs in crops and animal produce and to manage the concentration of nutrients in the soil. The four "Rs" of nutrient management are applying the right fertilizer source at the right rate at the right time and in the right place. It is not unusual for crops in fields or portions of fields to show nutrient deficiencies during periods of the growing season, even where an adequate NMP is followed. The fact that nutrients are applied does not necessarily mean they are available. Plants obtain most of their nutrients and water from the soil through their root system. Any factor that restricts root growth and activity has the potential to restrict nutrient availability and result in increased nutrient runoff.

Reducing nutrient loss in agricultural runoff may be brought about by source and transport control measures such as filter strips or grassed waterways. NMPs account for all inputs and outputs of nutrients to determine reductions. NMPs typically include the following measures:

- Review of aerial photography and soil maps.
- Regular soil testing to determine areas where adequate or excessive fertilization has taken place, monitor where nutrient buildup in soils occurs, and aid in determining fertilization maintenance requirements. Appropriate soils sampling and analysis techniques are described in the Illinois Agronomy Handbook.[60]
- Review of current and/or planned crop rotation practices.
- Establishment of yield goals and associated nutrient application rates, which can help minimize the potential for excessive buildup of phosphorus and reallocate phosphorus sources to fields or areas where the greatest agronomic benefits can be produced.
- Development of nutrient budgets with planned application rates, application methods, and timing and form of nutrient application.
- Identification of sensitive areas and restrictions on application when land is snow covered, frozen, or saturated.

Regional differences in phosphorus-supplying power are shown in Figure 8-4 of the Illinois Agronomy Handbook.[61] The differences were broadly defined primarily based on variability in parent material, degree of weathering, native vegetation, and natural drainages. For example,

---

[60] University of Illinois Urbana-Champaign. 2021. *Illinois Agronomy Handbook.* http://extension.cropsciences.illinois.edu/handbook/

[61] Fernandez, F.G., and R.G. Hoeft. Under Revision. "Managing Soil pH and Crop Nutrients." Chapter 8 in: *Illinois Agronomy Handbook.* chapter08.pdf (illinois.edu)

soils developed under forest cover appear to have more available subsoil phosphorus than those developed under grass. Soil test values are used to determine when buildup and maintenance of soil phosphorus is needed to supplement soils with low phosphorus-supplying power. Specific application amounts should be determined by periodic soil testing. Subsoil levels of phosphorus in the southern Illinois region may be rather high by soil test in some soils, but this is partially offset by conditions that restrict rooting.

Excessively high phosphorus soil test levels should not be maintained. While soil test procedures were designed to predict where phosphorus was needed, not to predict environmental problems, the likelihood of phosphorus loss increases with high phosphorus test levels. Environmental decisions regarding phosphorus applications should include such factors as distance from a significant lake or stream, infiltration rate, slope, and residue cover. One possible problem with using soil test values to predict environmental problems is in sample depth. Normally samples are collected to a 7-inch depth for predicting nutritional needs. For environmental purposes, it would often be better to collect the samples from a 1- or 2-inch depth, which is the depth that will influence phosphorus runoff. Another potential problem is variability in soil test levels within fields in relation to the dominant runoff and sediment-producing zones. Several fertilizer placement recommendations are described in the Illinois Agronomy Handbook. However, given the propensity of phosphorus to bind tightly to soil particles and subsequently enter streams through erosion, the deep fertilizer placement technique may be most appropriate in phosphorus impaired areas. Under the deep placement technique, the fertilizer is placed 4 to 8 inches deep into the soil rather than being spread near the surface.

Fertilizer Restrictions: Runoff from urban areas may include phosphorus-based fertilizers applied to residential lawns, golf courses, and other surfaces. If used too close to a receiving water body, phosphorus present in stormwater runoff will enter the water body. Illinois has a statute in place that governs the use of phosphorus-based fertilizers in urban areas—the Lawn Care Products Application and Notice Act (415 Illinois Compiled Statutes 65).[62] This act includes the following prohibitions for phosphorus-based fertilizers (see the act for limited exceptions):

- They shall not be applied to lawns unless it can be demonstrated by soil test that the lawn is lacking in phosphorus when compared against the standard established by the University of Illinois (see the act for exceptions).
- They shall not be applied to impervious surfaces.
- They shall not be applied within 3 feet of any water body if a spray, drop, or rotary spreader is used. If other equipment is used, the fertilizer may not be applied within 15 feet of a water body.
- They shall not be applied when the ground is frozen or saturated.
- Appropriate lawn markers for the application event and notifications to potentially affected adjacent properties are required.

---

[62] 415 ILCS 65. Environmental Safety. Lawn Care Products Application and Notice Act. https://www.ilga.gov/legislation/ilcs/ilcs3.asp?ActID=1597&ChapterID=36

Shoreline Protection: Treatments used to stabilize and protect shorelines of lakes, reservoirs, or estuaries are also discussed in Illinois NRCS CPS 580.[63] Factors impacting Pierce Lake shoreline erosion include steep slopes of the original ground at the shoreline, saturation of the soils, wind- and boat-induced waves, and/or erosive soil types.

Riprap is human-placed rock or other material used to armor shoreline and/or shoreline structures against scour and water, wave, or ice erosion. Conventional placement of riprap blankets on the existing shorelines from a few feet above water level to a few feet below water level can help in reducing erosion to portions of the Pierce Lake shoreline. Other jurisdictions have installed a line of peaked stone riprap at a water depth of 1.5 feet (the edge of the riprap is about 5 to 10 feet from the edge of water) along lake shorelines. This method breaks the waves that would collide with the eroded bank. The riprap also accumulates soil that erodes from the bank, which in turn allows vegetation to establish in the quiescent zones between the riprap and the eroded shoreline. Another benefit of this method is that boats and barges construct the riprap from the water and the steep eroded shorelines are not disturbed by construction equipment. It can take years for the area between the riprap and the edge of the water to accumulate soil and to become fully vegetated.

Waterfowl: Waterfowl are a known contributor to phosphorus loads in lakes and reservoirs, primarily as a result of sizeable migratory and resident Canada geese populations. The lack of estimates of waterfowl in Pierce Lake made it difficult to account for phosphorus loads from this source explicitly; however, waterfowl and other wildlife uses in the watershed are accounted for implicitly by runoff coefficients developed for land uses.

In-Lake Phosphorus Loading: Modeling, described in Section 8, determined that internal loading of phosphorus is likely a significant contributor to overall watershed loads. A reduction of phosphorus from in-lake cycling through in-lake management strategies is necessary for attainment of the TMDL load allocations. Internal phosphorus loading can occur when the water above the sediments becomes anoxic, causing the release of phosphorus from the sediment in a form that is available for plant uptake. The addition of bioavailable phosphorus in the water column stimulates more plant growth and die-off, which may perpetuate or create anoxic conditions and enhance the subsequent release of phosphorus into the water. Internal phosphorus loading can also occur in shallow lakes through release from sediments by the physical mixing and reintroduction of sediments into the water column as a result of wave action, winds, boating activity, and other means.

For lakes experiencing high rates of phosphorus input from bottom sediments, several management measures are available to control internal loading. Three BMP options for the control of internal loading include the installation of an aerator, the addition of aluminum, and dredging.

---

[63] NRCS. 2020. Streambank and Shoreline Protection. Code 580. https://www.nrcs.usda.gov/sites/default/files/2022-10/Streambank_Shoreline_Protection_580_CPS_10_2020.pdf

- Hypolimnetic (bottom water) aeration involves air release from an aerator that can be positioned at a selected depth or at multiple depths to increase oxygen transfer efficiencies in the water column and reduce internal loading by establishing aerobic conditions at the sediment-water interface.

- Phosphorus inactivation by aluminum addition (specifically aluminum sulfate or alum) to lakes is the most widely used technique to control internal phosphorus loading. Alum forms a polymer that binds phosphorus and organic matter. The aluminum hydroxide-phosphate complex (commonly called alum floc) is insoluble and settles to the bottom, carrying suspended and colloidal particles with it. Once on the sediment surface, alum floc inhibits phosphate diffusion from the sediment to the water.[64]

- Phosphorus release from the sediment is greatest from recently deposited layers. Dredging approximately 1 meter of recently deposited phosphorus–rich sediment can remove approximately 80 to 90 percent of the internally loaded phosphorus without the addition of potentially toxic compounds to the lake. Dredging may also contribute to reductions in internal phosphorus loading by increasing the depth of large portions of the water body, reducing the degree of reintroduction of sediments into the water column through physical mixing. However, dredging is typically more costly than other management options.

9.4 Costing Estimates and Funding Opportunities

This section provides an overview of the costing estimates and funding opportunity considerations that are important when evaluating the feasibility of implementing phosphorus- and fecal coliform-reducing BMPs within the Rock River/Pierce Lake watershed.

9.4.1 Best Management Practice Cost Estimates

Cost estimates for a number of suggested BMPs are available through the SWCD (**Table 9-7**). Cost information for additional BMPs not included in the table is discussed after the table.

Table 9-7 Fiscal Year 2023 NRCS BMP Cost Data[1]

Practice	Component	Units	Program	Average Cost
329	No Till/Strip Till	Acre	CSP	$2.27
340	Cover Crops	Acre	CSP	$18.49
342	Critical Area Planting	Acre	CSP	$134.88
362	Diversions	Foot	EQIP	$13.26
391	Riparian Forest Buffer	Acre	EQIP	$1,103.90
393	Filter Strip	Acre	EQIP	$459.48
410	Grade Stabilization Structures (drop structures, spillways, concrete block chute)	Square foot	CSP	$9.53
410	Grade Stabilization Structure (embankments, rip rap and concrete chutes)	Cubic yard	CSP	$20.13
412	Grassed Waterway Earthwork	Acre	CSP	$514.08
512	Pasture + Hayland Planting (applies to land not in pasture or hayland within the past 5 years)	Acre	CSP	$43.20
590	Nutrient Management	Acre	CSP	$4.65

[64] Cooke, G.D., Welch, E.B., Martin, A.B. et al. 1993. *Effectiveness of Al, Ca, and Fe salts for control of internal phosphorus loading in shallow and deep lakes*. Hydrobiologia 253, 323–335.

Practice	Component	Units	Program	Average Cost
600	Terrace	Foot	EQIP	$3.55
600	Terrace	Acre	EQIP	$1,122.04
638	WASCOB	Foot	EQIP	$3.89
638	WASCOB	Cubic yard	EQIP	$3.04
656	Constructed Wetland (plantings and earthwork)	Acre	EQIP	$8,054.13
657	Wetland Restoration	Acre	EQIP	$6,080.10
658	Wetland Creation	Acre	EQIP	$3,678.71
659	Wetland Enhancement	Acre	EQIP	$6,450.61

Note:

[1] NRCS. Payment Schedules – Illinois. https://www.nrcs.usda.gov/conservation-basics/conservation-state/illinois/payment-schedule.

Filter Strips and Riparian Buffers: Several types of filter strip practices are available, including areas for native herbaceous vegetation with or without fertility measures required and areas of introduced species, also with or without fertility measures required. Filter strip implementation that includes seedbed preparation and native seed application ranges from $520 per acre to $639 per acre depending on the type used, with an average cost of approximately $594 per acre.

Riparian buffers consisting of bare-root shrubs cost approximately $1.10 to $1.65 each while direct seeding of trees and/or shrubs costs approximately $741 per acre. The direct seeding scenario includes a planting rate of approximately 3,000 to 4,800 seeds per acre as well as the foregone income for the land taken out of crop production. Land preparation, including removing undesirable vegetation and improving site conditions, is estimated at $38 per acre. For cases where an herbaceous cover is preferable, such as native grass or certain species of forbs and/or shrubs, costs average $642 per acre.

Wetlands: The price to establish a wetland is very site-specific and depends on factors such as size and type of vegetation used. Examples of costs associated with constructed wetlands include excavation costs, vegetation removal, and revegetation costs. Costs for wetlands created on a flat-mineral uplands where surface runoff may be intercepted and ponded by excavation range from $3,186 (no embankment) to $3,680 (with embankment). Some areas may favor a wetlands setting that just needs to be enhanced or restored. In an area of natural depression fed by surface runoff, enhancement/restoration is approximately $2,557 per acre.

Enhancing or restoring a wetland on a floodplain site that has existing levees and/or ditches may consist of regrading or shaping the land, potentially including levee removal, for $1,167 per acre. Constructed wetlands to reduce the pollution potential of runoff and wastewater average $7,725 per acre where natural regeneration of wetland plants will be a major contributor to the working vegetation, and $10,286 per acre where wetland vegetation in the pool area is planted at a denser grid (3-foot by 3-foot or closer). As needed, embankments, water control and grade stabilization structures, and filter strips should be added.

9.4.2 Project Funding

Cost-share and incentive programs at the state and federal level are available to landowners, homeowners, and farmers in the watershed to help offset the costs of implementing many of the BMPs recommended in this report. Some of these programs are discussed in this section. When

reviewing the programs, it should be noted that some are only meant to provide incentives to encourage operators or landowners to try the practice. These incentive programs are not intended to cover the entire cost associated with implementing a practice. Additionally, some practices have many variables to consider that will affect both the cost of the program and the incentive or cost-share amount to be received (e.g., NMPs).

The local SWCD noted that while these programs are popular and very much in use in the rural areas on the western side of this watershed, funding has been limited in much of the eastern side of the watershed, due to ownership and development pressures, among other factors. These factors typically limit investment in agricultural BMPs in this area.

9.4.2.1 State-Level Funding

State-level programs to encourage landowners to implement resource-conserving practices for water quality and erosion control purposes are discussed in the paragraphs that follow. Local county representatives may be contacted for more information about available state funding opportunities (**Table 9-8**).

Table 9-8 Local SWCD, NRCS, and Farm Service Agency Contact Information

County	Address	Phone
Winnebago	4833 Owen Center Road Rockford, IL 61101	815-965-2392
Boone	211 N Appleton Road Belvidere, IL 61008	815-544-3465 Ext.3

IDA and Illinois EPA NMP Project: The IDA and Illinois EPA co-sponsor a cropland NMP project in watersheds that have developed or are developing TMDLs. This voluntary project supplies incentive payments to producers to have NMPs developed and implemented. Additionally, watersheds that have sediment or phosphorus identified as a cause for impairment (as is the case in this watershed) are eligible for cost-share assistance in implementing traditional erosion control practices through the NMP project.

Partners for Conservation Program: The Partners for Conservation Program (PFC)[65] provides cost sharing on a variety of practices such as no till systems, WASCOBs, pasture/hayland establishment, critical area planting, cover crops, temporary cover (if added to another practice in order to extend the construction season), filter strips, rain gardens, terrace systems, diversions, well decommissioning, NMPs, and grade stabilization structures. The PFC is funded through the IDA and administered by the local SWCDs. Life/maintenance contracts can be 1 to 10 years depending on the practice, and costs per acre vary significantly from project to project.

SWCD Grants Program: SWCDs assist local landowners improve their natural resource management practices by providing technical assistance and grants that support soil conservation, water quality protection, wetland management, flood control, soil erosion control

[65] IDNR. 2023a. https://dnr.illinois.gov/conservation/pfc.html

at urban construction sites, streambank stabilization, recycling, soil interpretation, land use and site suitability, and conservation education.[66]

Conservation Fund Program: The IDNR Conservation Fund Program helps land owners experiencing erosion on their property. Eligible BMPs covered under this program include no till or strip till, cover crops, temporary cover, critical area plantings, filter strips, diversion, grate stabilization structures, grassed waterways, pasture and hayland planting, terraces, and WASCOBs. Funding assistance of up to 50 percent of the cost of the project is available with grant awards of up to $750,000.[67]

Division of Forestry Resources Forestry Assistance Program: Resources are available through the Rural Forest Landowner Assistance Program and the Urban and Community Forestry Program to help private landowners and cities, respectively, address forest stewardship practices.[68]

Green Infrastructure Grant Opportunities: Illinois EPA provides funding through the Green Infrastructure Grant Opportunities (GIGO) program for water quality improvement projects that decrease stormwater runoff. Examples of eligible projects include grassed waterways, permeable pavement, and downspout disconnection. The GIGO offers up to $2,500,000 per funding cycle with a minimum grant of $75,000. The program is a reimbursement program where Illinois EPA issues reimbursement for eligible costs expended after project implementation.[69]

Illinois Green Infrastructure Grant Program for Stormwater Management: The Illinois Green Infrastructure Grant Program for Stormwater Management provides funding to local government entities and organizations to implement green infrastructure practices that control stormwater runoff to protect water quality. Practices such as permeable pavements and other urban BMPs are eligible for funding.[70]

Water Pollution Control Loan Program: Illinois EPA supports local public or private entities implement wastewater and stormwater projects through the Water Pollution Control Loan Program State Revolving Fund loan program. Funding through this program is appropriated annually and combines federal capitalization funding with state matching funds, interest earnings, repayment money, and the sale of bonds to form a source of financing for infrastructure projects. Eligible projects include new or upgraded wastewater infrastructure construction, stormwater-related projects that benefit water quality, and a variety of other projects that improve the quality of Illinois's rivers, streams, and lakes. More information is available at https://epa.illinois.gov/topics/grants-loans/state-revolving-fund.html.

9.4.2.2 Federal Funding

There are several voluntary conservation programs established by various federal agencies that encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs apply to crop fields as well as rural grasslands that are

---

[66] IDNR. 2023b. https://dnr.illinois.gov/conservation/crep.html
[67] IDNR. 2020. https://dnr.illinois.gov/press-release.21619.html
[68] IDNR.2023c. https://dnr.illinois.gov/conservation/forestry/forestry-assistance-program.html
[69] Illinois EPA. 2023. https://epa.illinois.gov/topics/grants-loans/water-financial-assistance/gigo.html
[70] Illinois EPA. 2023.

currently used for livestock grazing. Federal-level programs are discussed in the paragraphs that follow. The EPA manages the CWA Section 319 grants. The Farm Service Agency (FSA) oversees the Conservation Reserve Program (CRP) and the Grasslands Reserve Program (GRP). Voluntary conservation programs established through the 2018 U.S. Farm Bill and managed by NRCS include the Agricultural Conservation Easement Program (ACEP), the Conservation Stewardship Program (CSP), and the Environmental Quality Incentives Program (EQIP).

CWA 319 Grants: Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the Section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive EPA 319(b) grants upon EPA's approval of the state's nonpoint source assessment report and nonpoint source management program. States may reallocate funds through subawards (e.g., contracts, subgrants) to both public and private entities, including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

EPA designates incremental funds, a $178 million award in 2022, for the restoration of impaired water through the development and implementation of WBPs and TMDLs for impaired waters. Base funds (i.e., funds other than incremental funds) are used to provide staffing and support to manage and implement the state nonpoint source management program. Section 319 funding can be used to implement activities that improve water quality such as filter strips and streambank stabilization.[71,72]

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement the Illinois Nonpoint Source Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling nonpoint source pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale; funding is also available for BMPs on a non-watershed scale and for the development of information/education regarding nonpoint source pollution control programs.

The maximum federal funding available is 60 percent of the total cost, with the remaining 40 percent coming from local match. The program period is 2 years unless otherwise approved. This is a reimbursement program. Section 319(h) funds are awarded for the purpose of implementing approved nonpoint source management projects. The funding will be directed toward activities that result in the implementation of appropriate BMPs for the control of nonpoint source pollution or to enhance public awareness of nonpoint source pollution. Applications are accepted June 1 through August 1.

---

[71] EPA. 2003.

[72] EPA. Historic 319 Grant Funding Spreadsheet for Fiscal Year 2022. https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fwww.epa.gov%2Fsystem%2Ffiles%2Fdocuments%2F2022-07%2F319_historic_funding_FY22.xlsx&wdOrigin=BROWSELINK

The Northern Illinois Region 1 Planning Council recently received a 319 grant for two site projects (bioswales) in the Buckbee Creek and the South Fork Kent Creek watersheds. Part of the grant includes a "Watershed Education and Outreach" component, to look at BMPs in the agricultural, suburban, and urban areas to address soil loss, stormwater runoff and nutrient management.

CRP: The CRP is a voluntary program, administered through the FSA, which encourages landowners to agree to remove environmentally sensitive land from agricultural production and plant long-term, resource-conserving cover to improve water quality, prevent soil erosion, and reduce loss of wildlife habitat. The program was initially established in the Food and Security Act of 1985 and is the largest private-lands conservation program in the United States.

Participants can enroll in CRP in two ways and the duration of the contracts under CRP range from 10 to 15 years. The first enrollment method is through a competitive process known as the CRP General Sign-Up. These are announced on a periodic basis by the U.S. Secretary of Agriculture but do not occur on any fixed schedule. The second enrollment method is through CRP Continuous Sign-Up, which is offered on a continuous basis. Continuous sign-up provides management flexibility to farmers and ranchers to implement certain high-priority conservation practices on eligible land. All enrollment offers are processed through the local FSA office. Certain conditions must be met for land to be eligible for CRP enrollment. These conditions include the following:

- The applicant for enrollment must have owned or operated the land for at least 12 months prior to the previous CRP sign-up period (except in cases of a change in ownership because of the previous owner's death, foreclosure, or land purchase by the new owner without the sole intention of placing it in the CRP).
- Cropland that is planted or considered planted to an agricultural commodity for four of the six most recent crop years (including field margins) and must be physically and legally capable of being planted in a normal manner to an agricultural commodity.
- Certain marginal pastureland suitable for use as any of the following conservation practices: wetlands buffer or restoration, filter strips, riparian buffer, grass waterway, or contour grass strip.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted-average erosion index of 8 or higher
- Be expiring CRP acreage
- Be in a national or state CRP conservation priority area

The FSA bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or cash-rent equivalent. The maximum rental rate for each offer is calculated in advance of enrollment. Producers may offer land at the maximum rate or at a lower rental rate to increase likelihood of offer acceptance. In addition, the FSA provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation

practices. FSA offers several financial incentives opportunities for certain sign-up practices. In 2020, FSA increased the practice incentive payment from 5 to 20 percent of annual rental payment rate and added a 10 percent incentive payment for water quality practices on land enrolled in CRP's continuous sign-up.[73]

A signing incentive payment is a one-time incentive payment of 32.5 percent of the amount of the first annual rental payment.[74] Eligible practices include field windbreaks; grassed waterways; shelter belts; living snow fences; filter strips; riparian buffers; marginal pastureland wildlife and wetland buffers; bottom timber establishment; field borders; longleaf pine establishment; duck nesting habitat; State Acres for Wildlife Enhancement (SAFE) buffers, wetlands, trees, longleaf pine, and grass; pollinator habitat; and several wetlands practices. A performance incentive payment is a one-time incentive payment made to participants who enroll land in the CRP to be committed to all continuous sign-up practices except establishment of permanent vegetative cover on terraces, wetland restoration (including nonfloodplain), bottomland timber establishment, and duck nesting habitat establishment. Finally, in 2021, FSA enacted a Climate-Smart Practice Incentive for CRP General and Continuous Sign-Ups. This incentive encourages CRP practices that increase carbon sequestration and reduced greenhouse gas emissions through things like establishment of trees and permanent grasses, development of wildlife habitat, and wetland restoration. The Climate-Smart Practice Incentive is annual, and the amount is based on the benefits of each practice type.[75]

The maximum annual noncost share payment that an eligible "person" can receive under the CRP is $50,000 per fiscal year. This is a separate payment limitation applying only to CRP noncost share payment.

Refer to the FSA CRP website for more information: https://www.fsa.usda.gov/programs-and-services/conservation-programs/conservation-reserve-program/.

GRP: The purpose of the GRP, administered by the FSA, is to prevent grazing and pasture land from being converted into cropland, used for urban development, or developed for other nongrazing uses. Participants in the program voluntarily limit future development of the land while still being able to use the land for livestock grazing and activities related to forage and seed production. Some restrictions on activities may apply during the nesting season of certain bird species that are in decline or protected under federal or state law.

The GRP has several enrollment options including a rental contract for 10, 15, or 20 years, or enrollment of the land in a conservation easement for an indefinite period. Applications are accepted any time and are processed through the local FSA office. To be eligible for a rental agreement, the applicant must own or have control of the land for the length of the contract. To enroll in a conservation easement, the applicant must own and be willing to restrict use of the land either in perpetuity or under the maximum length of time under state law. Persons enrolled

[73] FSA. 2020. USDA Announces Increase to Certain Incentive Payments for Continuous Conservation Reserve Program. https://www.fsa.usda.gov/news-room/news-releases/2020/usda-announces-increase-to-certain-incentive-payments-for-continuous-conservation-reserve-program

[74] eCFR Part 1410 – Conservation Reserve Program. https://www.ecfr.gov/current/title-7/subtitle-B/chapter-XIV/subchapter-B/part-1410

[75] FSA. 2022. Conservation Reserve Program Monthly Summary – May 2022. https://www.fsa.usda.gov/Assets/USDA-FSA-Public/usdafiles/Conservation/PDF/Summary%20May%202022%20CRPMonthly.pdf

in the GRP receive an annual rental payment for their enrolled acres. Further information about the program, including payment amounts, eligibility and maintenance criteria, and land requirements may be obtained from the local FSA office.

ACEP: ACEP provides financial and technical assistance to help conserve agricultural lands and wetlands and their related benefits. Under the Agricultural Land Easements component, NRCS helps American Indian tribes, state and local governments, and nongovernmental organizations protect working agricultural lands and limit nonagricultural uses of the land. Land protected by agricultural land easements provides additional public benefits including environmental quality, historic preservation, wildlife habitat, and protection of open space. Under the Wetlands Reserve Easements component, NRCS helps to restore, protect, and enhance enrolled wetlands. Wetland reserve easements provide habitat for fish and wildlife including threatened and endangered species, improve water quality by filtering sediments and chemicals, reduce flooding, recharge groundwater, protect biological diversity, and provide opportunities for educational, scientific, and limited recreational activities.

- Agricultural Land Easements: NRCS provides financial assistance to eligible partners to purchase agricultural land easements that protect the agricultural use and conservation values of eligible land. In the case of working farms, the program helps farmers and ranchers keep their land in agriculture. The program also protects grazing uses and related conservation values by conserving grassland including rangeland, pastureland, and shrubland. Land eligible for agricultural easements includes cropland, rangeland, grassland, pastureland, and nonindustrial private forest land. NRCS will prioritize applications that protect agricultural uses and related conservation values of the land and those that maximize the protection of contiguous acres dedicated to agricultural use.

  To enroll land through agricultural land easements, NRCS enters into cooperative agreements with eligible partners. Each easement is required to have an agricultural land easement plan that promotes the long-term viability of the land. Under the agricultural land component, NRCS may contribute up to 50 percent of the fair market value of the agricultural land easement. Where NRCS determines that grasslands of special environmental significance will be protected, NRCS may contribute up to 75 percent of the fair market value of the agricultural land easement.

- Wetland Reserve Easements: NRCS also provides technical and financial assistance to restore, protect, and enhance wetlands through the purchase of a wetland reserve easement. These agreements include the right for NRCS to develop and implement a wetland reserve restoration easement plan to restore, protect, and enhance the wetland's functions and values. Land eligible for wetland reserve easements includes farmed or converted wetland that can be successfully and cost-effectively restored. NRCS will prioritize applications based the easement's potential for protecting and enhancing habitat for migratory birds and other wildlife. For acreage owned by an Indian tribe, there is an additional enrollment option of a 30-year contract. Through the wetland reserve enrollment options, NRCS may enroll eligible land through one of the following:

- Permanent Easements – These are conservation easements in perpetuity. NRCS pays 100 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 75 to 100 percent of the restoration costs.
- 30-Year Easements – These expire after 30 years. Under 30-year easements, NRCS pays 50 to 75 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- Term Easements – Term easements are easements made for the maximum duration allowed under applicable state laws. NRCS pays 50 to 75 percent of the easement value for the purchase of the term easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- 30-Year Contracts – 30-year contracts are only available to enroll acreage owned by Indian tribes. Program payment rates are commensurate with 30-year easements.

For wetland reserve easements, NRCS pays all costs associated with recording the easement in the local land records office including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Wetland Reserve Enhancement Partnership: The Wetland Reserve Enhancement Partnership (WREP) is an enrollment option under the ACEP. The WREP continues to be a voluntary program through which NRCS signs agreements with eligible partners to leverage resources to carry out high-priority wetland protection, restoration, and enhancement and to improve wildlife habitat. Partner benefits through WREP agreements include:

- Wetland restoration and protection in critical areas
- Ability to cost-share restoration or enhancement beyond NRCS requirements through leveraging
- Able to participate in the management or monitoring of selected project locations
- Ability to use innovative restoration methods and practices

For 2023, NRCS announced $20 million available in financial and technical assistance to help eligible conservation partners leverage local resources to voluntarily protect, restore, and enhance critical wetlands on private and tribal agricultural land nationwide. The funding is provided through the WREP, a special enrollment option under the ACEP.[76] Proposals for funding must be limited to $5 million and were due by August 15, 2021, with funding announcements released in October 2021. Landowners should check with their local NRCS state office to see about applying in future years. To enroll land, eligible partners may submit proposals to the local NRCS office.

CSP: The CSP helps agricultural producers maintain and improve their existing conservation systems and adopt additional conservation activities to address priority resources concerns.

---

[76] NRCS. WREP Announcement for Fiscal Year 2023. USDA-NRCS Fiscal Year (FY) 2023 Wetland Reserve Enhancement Partnership (WREP) Announcement of Funding, Proposal Requirements and Review Criteria

Participants earn CSP payments for conservation performance—the higher the performance, the higher the payment.

Through the CSP, participants take additional steps to improve resource conditions including soil quality, water quality and quantity, air quality, habitat quality, and energy. The CSP provides two types of payments through 5-year contracts: annual payments for installing new conservation activities and maintaining existing practices; and supplemental payments for adopting a resource-conserving crop rotation. Producers may be able to renew a contract if they have successfully fulfilled the initial contract and agree to achieve additional conservation objectives. Payments are made soon as practical after October 1 of each fiscal year for contract activities installed and maintained in the previous year.

Eligible lands include private and tribal agricultural lands, cropland, grassland, pastureland, rangeland and nonindustrial private forest land. The CSP is available to all producers regardless of operation size or type of crops produced, in all 50 states, the District of Columbia, and the Caribbean and Pacific Island areas. Applicants may include individuals, legal entities, joint operations, or Indian tribes that meet the stewardship threshold for at least two priority resource concerns when they apply. They must also agree to meet or exceed the stewardship threshold for at least one additional priority resource concern by the end of the contract. Producers must have effective control of the land for the term of the proposed contract, which include all eligible land in the agricultural operation. Some additional restrictions and program requirements may apply and interested applicants should contact the local NRCS office for more information.

EQIP: EQIP is a voluntary program that provides financial and technical assistance to agricultural producers to plan and implement conservation practices that improve soil, water, plant, animal, sir, and related natural resources on agricultural land and nonindustrial private forestland. Through EQIP, NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Persons engaged in livestock or agricultural production and owners of nonindustrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private nonindustrial forestland, and other farm or ranch lands. Eligible applicants must, at a minimum, meet the following criteria; additional program requirements may apply:

- Be an agricultural producer (person, legal entity, or joint operation who has an interest in the agricultural operation or who is engaged in agricultural production or forestry management)
- Control or own eligible land
- Comply with adjusted gross income for less than $900,000 (federally recognized Native American Indian tribes or Alaska Native corporations are exempt from the adjusted gross income payment limitations)
- Be in compliance with the highly erodible land and wetland conservation requirements
- Develop an NRCS EQIP plan of operations that addresses at least one natural resource concern

Persons interested in entering into a cost-share agreement with the NRCS for EQIP assistance may file an application at any time; however, each state may establish deadlines for one or more application periods in which to consider eligible applications for funding. Applications submitted after the deadlines will be evaluated and considered for funding during later funding opportunities.

As part of the program, a conservation activity plan can be developed for producers to address a specific natural resource concern on their agricultural operation. Each plan is developed by a certified technical service provider who is selected by the EQIP participant. Technical assistance payments for technical service providers do not count against the financial assistance aggregate payment limitation or the contract financial assistance payment limitation. The plan becomes the basis of the EQIP contract between NRCS and the participant, and the contracts can be up to 10 years long. Financial assistance payments are made to eligible producers once conservation practices are completed according to NRCS requirements. Payment rates are set for each fiscal year and are attached to the EQIP contract when it is approved.

Historically underserved producers (limited resource farmers/ranchers, beginning farmers/ranchers, socially disadvantaged producers, Indian tribes, and veteran farmers or ranchers) who self-certify on Form NRCS-CPA-1200, Conservation Program Application, are eligible for a higher practice payment rate to support implementation of contracted conservation practices and activities. Historically underserved producers may also be issued advance payments up to 50 percent of the established payment rate to go toward purchasing materials or contracting services to begin installation of approved conservation practices. Self-certified socially disadvantaged farmers/ranchers, beginning farmers/ranchers, and veteran farmer/rancher producers may elect to be evaluated in special EQIP funding pools. More information can be obtained from the local NRCS office.

EQIP provides payments up to 75 percent of the incurred costs and 100 percent estimated income foregone of certain conservation practices and activities. Conservation practices that are recommended BMPs for this watershed TMDL and eligible for EQIP funding include filter strips, conservation tillage, grade stabilization structures, grass waterways, riparian buffers, streambank/shoreline protection, terraces, and wetland restoration.

Farmer to Farmer Program: The Farmer to Farmer Program is a potential funding source from EPA that depends upon future funding. Funds are available to improve water quality, habitat, resilience, and environmental education through the demonstration of innovative practices on working agricultural lands. The project supports farmer-led or farm-focused organizations in the Gulf of Mexico watershed, which includes the Wabash River watershed.

Regional Conservation Partnership Program: The Regional Conservation Partnership Program (RCPP) is a stand-alone USDA program funded at $300 million annually. The RCPP website states that the program "promotes coordination of NRCS conservation activities with partners that offer value-added contributions to expand our collective ability to address on-farm, watershed, and regional natural resource concerns. Through RCPP, NRCS seeks to coinvest with partners to implement projects that demonstrate innovative solutions to conservation challenges and provide measurable improvements and outcomes tied to the resource concerns they seek to

address." Information on eligibility, project types, funding, and how to apply can be found at https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/programs/financial/rcpp/.

9.4.3 Planning Level Cost Estimates for Implementation Measures

Cost estimates for different implementation measures are presented in **Table 9-9**. The columns labeled "Program" or "Sponsor" list the financial assistance program or sponsor available for the various BMPs discussed throughout Section 9. Illinois EPA 319 grants are applicable to all of the practices.

Table 9-9 Cost Estimates of Various BMP Measures[1]

Code	Practice	Units	Average Cost	Program
329	No Till/Strip Till	Acre	$2.27	CSP
340	Cover Crops	Acre	$18.49	CSP
342	Critical Area Planting	Acre	$134.88	CSP
362	Diversions	Foot	$13.26	EQIP
391	Riparian Forest Buffer	Acre	$1,103.90	EQIP
393	Filter Strip	Acre	$459.48	EQIP
410	Grade Stabilization Structures (drop structures, spillways, concrete block chute)	Square foot	$9.53	CSP
410	Grade Stabilization Structure (embankments, rip rap and concrete chutes)	Cubic yard	$20.13	CSP
412	Grassed Waterway Earthwork	Acre	$514.08	CSP
512	Pasture + Hayland Planting (Applies to land not in pasture or hayland within the past 5 years)	Acre	$43.20	CSP
590	Nutrient Management	Acre	$4.65	CSP
600	Terrace	Foot	$3.55	EQIP
600	Terrace	Acre	$1,122.04	EQIP
638	WASCOB	Foot	$3.89	EQIP
638	WASCOB	Cubic yard	$3.04	EQIP
656	Constructed Wetland (plantings and earthwork)	Acre	$8,054.13	EQIP
657	Wetland Restoration	Acre	$6,080.10	EQIP
658	Wetland Creation	Acre	$3,678.71	EQIP
659	Wetland Enhancement	Acre	$6,450.61	EQIP
NA	Septic System Maintenance	Per event	$250–$3,350	NA

Note:

[1] NRCS. WREP Announcement for Fiscal Year 2023. USDA-NRCS Fiscal Year (FY) 2023 Wetland Reserve Enhancement Partnership (WREP) Announcement of Funding, Proposal Requirements and Review Criteria

NA – not applicable

The local SWCD noted that cost is often a factor for implementing projects and, in particular, the costs associated with streambank stabilization often far exceed what a landowner can bare, even with cost share assistance. They provided an example of a streambank stabilization grant that was funded for a project upstream of Pierce Lake, but ultimately was cancelled due to excessive cost/burden to the landowner.

9.5 Watershed-Specific Priority Areas and Projects

Section 5.5 of this report summarized previous watershed studies that have been completed within the watershed along with reference information to find addition details. Recently, Olson Ecological Solutions completed the *South Fork Kent Creek Watershed Resource Inventory* in December 2019. The report identifies the fecal coliform impairment for South Fork Kent Creek. Olson Ecological Solutions performed an evaluation of riparian buffer conditions, erosion rates, and channelization throughout the South Fork Kent Creek subwatershed. Surveys were performed in late October and early November 2019 along approximately 22,000 feet of stream segments for South Fork Kent Creek and its tributaries. About 57 percent of the surveyed segments were found to have poor riparian conditions, 42 percent good condition, and 3 percent fair condition. Streambank erosion was also noted for surveyed stream segments. Mapping and modeling efforts identified low-intensity developed areas as a significant source for bacteria pollutants in the subwatershed.[77] This document can be used as guide to perform similar studies in the other impaired subbasins within the watershed to help identify areas of concern and direct targeted implementation that will be most cost-effective.

The Winnebago County SWCD indicated that a number of studies and initiatives are underway within the watershed through the Northern Illinois Region 1 Planning Council. The council is a "special-purpose, regional government agency providing cross-jurisdictional, government-to-government collaborative planning across Northern Illinois". [78] Initiatives and studies planned or underway in 2024 include:

- A "Climate Resiliency Forum" that is developing a "Climate Action Plan" that looks at vulnerabilities regarding increased stormwater runoff, and potential impacts across all sectors
- A "Small Community Water Assessment and Report" that mainly focuses on groundwater, but is also addressing surface water management concerns

The SWCD also hosted an Erosion & Sediment Control workshop (for construction sites) and a Producer workshop (for crop ground) in spring 2024 that included tree, fish, seed and rain barrel sales.

9.6 Information and Education

Public outreach and education campaigns that support TMDL implementation plans should take on a holistic approach that consider more than just water quality problems within a watershed. Stakeholder engagement and cooperation improves when outreach strategies also address broader stakeholder concerns such as water supply availability and aesthetics. Watershed plans that incorporate this holistic approach are more successful in changing social behaviors and implementing multi-benefit BMPs that help with attaining water quality standards while also protecting other important resources such as drinking water sources, agricultural resources, forests and rangeland, and parks and open space.

---

[77] Adams, K., and R. Olson. 2019. South Fork Kent Creek Watershed Resource Inventory. https://wincoil.gov/images/departments/Highway/Plans/sfkc_final_inventory_12.29.2020.pdf

[78] https://r1planning.org/home-1

Additionally, implementation plans are usually more successful if stakeholders are brought into the planning process early and have the opportunity to share their concerns. Transparency throughout the planning and implementation process encourages continued support and a higher likelihood of participation in developing management options and supporting implementation of BMPs. The Northern Illinois Region 1 Planning Council recently received a 319 grant for two site projects (bioswales) in the Buckbee Creek and the South Fork Kent Creek watersheds. Part of the grant includes a "Watershed Education and Outreach" component to look at BMPs in the agricultural, suburban, and urban areas to address soil loss, stormwater runoff and nutrient management. The Winnebago County SWCD indicated that it is working with the planning council on some aspects of the education and outreach for this grant.

Small incremental improvements and individual adoption of BMPs can be achieved at a much lower cost compared to large-scale BMPs implemented watershed-wide. Moving forward, outreach and education efforts should focus on activities that support the watershed plan goals, including:

- Continued regular meetings of local stakeholder groups with intent of broadening audience/attendance
- Field visit days with demonstrations of agricultural conservation practices
- Continued outreach and messaging to landowners to encourage implementation of edge of field BMPs, nutrient management, conservation tillage, cover crops, and livestock/pasture management
- Soil testing
- Reducing the use of lawn chemicals (pesticides and phosphorus fertilizers)
- Education/outreach for rural residence on proper septic system maintenance
- Periodic updates on watershed health/monitoring results

A virtual public meeting was held for the watershed in June 2021 to present Stage 1 TMDL development with an additional meeting held January 2024 at the completion of Stage 3 TMDL development. Feedback received from stakeholders and the county SWCD staff in attendance was incorporated throughout this plan to include local information and discuss BMPs that are thought to be most the effective and implementable in this watershed. Additional activities to support public outreach and education include:

- Websites and social media to publicize meetings and upcoming events and provide links to resources
- Email updates
- Brochures or fact sheets with information on household pollutant reduction, fertilizer use, and proper septic tank maintenance

- Educational signs, school visits, or participation in local events such as the CWA anniversary celebration to educate the public on water quality issues, the purpose of BMPs, and environmental stewardship
- Public service announcements
- Informational meetings on state and federal cost-share programs
- Watershed group development through the University of Illinois College of Agricultural and Consumer Economics Extension office

9.7 Milestones and Success Criteria

The primary objective of this plan is to improve water quality conditions in impaired stream segments within the Rock River/Pierce Lake watershed. In support of this primary objective, ongoing involvement of stakeholders and community members to participate in the BMPs described herein is also crucial to achieving water quality improvement within the watershed. **Table 9-10** provides the milestone objectives and supporting success criteria used to assess the effectiveness of implementation plan actions.

Table 9-10 Plan Milestones and Success Criteria

Milestone Objective	Success Criteria
Water quality improvement	Reduce TP levels to meet calculated TMDLs presented in Section 8
	Reduce fecal coliform levels to meet calculated TMDLs presented in Section 8
	Increase in no till or reduced till farming
	Increase in buffer areas around agricultural lands or impaired waterways (i.e., riparian buffers, filter strips, grassed waterways, etc.)
	Secure funding for identified near- and mid-term BMP projects
	Delisting of impaired stream and lake segments
Stakeholder involvement	Continue regularly scheduled meetings of Rock River/Pierce Lake watershed stakeholder groups
	Increased traffic on social media platforms and websites
	Increased participation in grass-roots outreach activities including information sharing at local schools
	Increased participation and funding from local municipalities toward watershed improvement and protection activities
	Secure funding for priority stakeholders to implement BMPs on their property

9.8 Plan Monitoring and Schedule

Successful plan implementation relies on establishing a plan schedule that tracks progression toward achieving established milestones and success criteria. The following subsections provide an overview of a monitoring plan and plan schedule for achieving established milestone objectives. Stakeholders should evaluate schedule/milestone progress on an annual basis and implement adaptive management to modify management measures, milestones, and schedule as necessary.

9.8.1 Monitoring Plan

The purpose of the monitoring plan is to assess the overall implementation of management actions outlined above. This will be accomplished by conducting the monitoring programs designed to:

- Track implementation of BMPs in the watershed
- Estimate the effectiveness of BMPs
- Further monitor point source discharges in the watershed
- Continue monitoring impaired stream segments and tributaries
- Monitor storm-based, high-flow events
- Monitor TP via low-flow means throughout the watershed

Tracking the implementation of management measures will:

- Determine the extent to which management measures and practices have been implemented compared to action needed to meet the TMDL endpoints
- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support work-load and costing analysis for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

Monitoring before and after a BMP is incorporated into the watershed will establish the effectiveness of load reduction of the BMPs. Inflow and outflow measurements should be used to determine site-specific removal efficiency.

Illinois EPA conducts Intensive Basin Surveys every 5 years. Additionally, select ambient sites are monitored nine times a year. Continuation of this state monitoring program will assess stream water quality as improvements in the watershed are completed. This data will also be used to assess whether water quality standards in the impaired segments are being attained.

9.8.2 Implementation Schedule

Table 9-11 provides an implementation schedule for meeting milestone objectives. Implementing the management actions outlined in this section will occur in phases, often over the course of several years, with effectiveness assessments made as improvements are completed. The process of obtaining funding and developing and implementing projects designed to improve water quality can take months or years to complete. Once in place, improvements in water quality as a result of BMPs may not be detectable for several years. Continued monitoring and reevaluation of the implementation measures during this time will allow for more expedient adjustment to BMP implementation measures that may result in earlier attainment of water quality targets.

Table 9-11 Implementation Schedule

Milestone Objective	Schedule Category	Description	Recommended Schedule
Water quality improvement	Assess existing BMPs	Assess existing BMPs within the watershed for effectiveness	Short-term (1–5 years)
	Monitoring	Monitor results of pilot studies to measure success and adapt/adjust wider-scale implementation	Short-term (1–5 years)
	Monitoring	Implement monitoring plan	Continuous (1–20 years)
	Implement identified near-term projects	Work with local SWCD to use TMDL priority to secure funding and implement "ready-to-go" projects	Short-term (1–5 years)
	Implement larger projects	Implement larger projects that require multiple funding sources and stakeholders	Mid-term (5–10 years)
	Erosion control measures	Work with SWCD to identify areas throughout the watershed where no till or reduced till practices would be beneficial to reducing TP loads in DO-impaired watersheds	Mid-term (5–10 years)
	Nonpoint source controls	Work with SWCD to identify and fund projects throughout the watershed where buffers can be implemented around waterways or agricultural operations	Mid-term (5–10 years)
	Point source controls	Consider implementing TP limits or monitoring requirements on existing NPDES permits to aid in meeting TP reduction goals	Mid-term (5–10 years)
Stakeholder involvement	Annual stakeholder meetings	Watershed stakeholder groups to hold annual meetings to gauge progress and discuss evolving needs and planned activities; conduct periodic self-assessments for members to evaluate effectiveness of watershed groups and partnerships	Continuous (1–10 years)
	Funding	Develop grant applications and work with landowners to secure funding for implementing BMPs discussed in this plan	Short-term (1–5 years)
	Education and outreach	Work with the University of Illinois College of Agricultural, Consumer and Environmental Sciences to regularly to publish Rock River/Pierce Lake watershed news on a variety of platforms	Short-term (1–5 years)
	Education and outreach	Partner with Future Farmers of America to bring regular watershed programming to local high schools and to spread knowledge of watershed matters	Short-term (1–5 years)
	Funding	Work with local municipalities to establish line items in their annual budgets allocated toward watershed improvement and protection projects	Short-term (1–5 years)

Appendix D

Public Comments and Responsiveness Summary

This page intentionally left blank.

Appendix - D

Responsiveness Summary

Total Maximum Daily Load (TMDL) and Watershed Protection Plan (WPP) for:

1. Rock River/Pierce Lake Watershed
2. Kyte River Watershed
3. Saline Branch Watershed
4. Little Wabash River/Green Creek Watershed
5. Big Four Ditch Watershed
6. Kickapoo Creek Watershed
7. Salt Creek Watershed
8. Big Creek Watershed

The responsiveness summary responds to questions and comments received during the Stage 3 public comment period from January 17, 2024, through February 16, 2024.

What is a TMDL?

A Total Maximum Daily Load (TMDL) is the sum of the allowable amount of a pollutant that a water body can receive from all contributing sources and still meet water quality standards or designated uses. TMDL reports contain a plan detailing the actions necessary to reduce pollutant loads to the impaired water bodies and ensure compliance with applicable water quality standards.

A Watershed Protection Plan (WPP) report has been developed for the watersheds where a TMDL could not be developed as the waterbody segment is no longer impaired or recommended for delisting or recategorized to Category 4C (impairment due to non-pollutant).

The Clean Water Act and U.S. Environmental Protection Agency (U.S. EPA) regulations require that states develop TMDLs for waters on the Section 303(d) List. The Illinois Environmental Protection Agency (Illinois EPA) implements the TMDL program in accordance with Section 303(d) of the federal Clean Water Act and regulations thereunder.

Background

The 2018 Cycle TMDLs/ WPPs are as follows:

- **Rock River/Pierce Lake Watershed** (HUC: 0709000501)
  - Location:
    - Northern Illinois (Winnebago and Boon Counties).
  - Headwaters (North and South Kinnikinnick Creek):
    - Northwestern Boone county, over Illinois Route 76.
  - Headwaters (North Fork and South Fork Kent Creek):
    - Near Winnebago, IL.
  - Headwaters (Spring Creek North and Keith Creek):
    - The eastern edge of the city of Rockford, roughly near Interstate 90.
  - Course:
    - All segments untimely flow into the Rock River; North and South Kinnikinnick first, followed downriver by Spring Creek, and then the remainder at the far southern end of the watershed.
  - Downstream End:
    - The Rock River, in the middle of Rockford, IL.

- **Kyte River Watershed** (HUC: 0512011206)
  - Location:
    - Northern Illinois (Ogle and Lee Counties, with a small part in Dekalb County).
  - Headwaters (Kyte River):
    - The Rock River, just south of the Oregon, IL.
  - Headwaters (Beach Creek):
    - Where the Kyte river splits into Beach creek and Steward creek, near the border of Ogle and Lee counties.
  - Course:
    - The Kyte river forms as a branch of the Rock River just south of the city of Oregon and flows in a southeasterly direction.
    - Beach Creek forms after the Kyte river splits near the border between Ogle and Lee County and flows in a southwesterly direction.
  - Downstream end (Kyte river):
    - West of Rochelle at the border of Ogle and Leek County, where the river branches off into Beach creek and Steward creek.
  - Downstream end (Beach creek):
    - West of the village of Ashton.

- **Saline Branch Watershed** (HUC: 0512010902)
  - Location:
    - Northeast central Illinois (Champaign County).
  - Headwaters (Saline Branch):

        - North of Thomasboro and southwest of Rantoul, west of U.S. Route 45.
    - Headwaters (Boneyard Creek):
        - Champaign, IL, along U.S. Route 150.
    - Course:
        - The Saline Branch flows south from Thomasboro roughly along U.S. Route 45 and into the city of Urbana, where it meets with Boneyard Creek and then flows eastward.
    - Downstream end:
        - Confluence of Saline Branch and Boneyard creek in Urbana, IL.

- **Little Wabash River/Green Creek Watershed** (HUC: 0512011401)
    - Location:
        - Southeast central Illinois (Shelby, Effingham, Coles, and Cumberland Counties).
    - Headwaters:
        - Southwestern corner of Coles County, southwest of Mattoon.
    - Course:
        - The Little Wabash River flows southward from near Mattoon, though Paradise Lake, across Coles, Shelby and Effingham Counties, though the far western edge of Effingham, IL.
    - Downstream end:
        - West of Effingham, IL.

- **Big Four Ditch Watershed** (HUC: 0512010901)
    - Location:
        - Northeast Central Illinois (Ford, Livingston, Champaign, and Iroquois Counties)
    - Headwaters:
        - Southeast corner of Livingston County.
    - Course:
        - Flows in a south-easterly direction through Ford County toward the northeast border of Champaign County.
    - Downstream End:
        - Confluence of Prairie Creek and Middle Fork Vermilion River near the northeast border of Champaign County.

- **Kickapoo Creek Watershed** (HUC: 0512011206)
    - Location:
        - Southeast Central Illinois (Coles County)
    - Headwaters:
        - Confluence of Cassell Creek, .23 miles north of Illinois – 16.
    - Course:
        - Flows in an easterly direction in Coles County, between the municipalities of Mattoon and Charleston.

- Downstream end:
  - Confluence of Kickapoo Creek.

- **Salt Creek Watershed** (HUC: 0512011402)
  - Location:
    - Southeast central Illinois (Effingham and Cumberland Counties)
  - Headwaters:
    - Second Salt Creek near Lillyville, IL in the southwest corner of Cumberland County.
  - Course:
    - Primarily flows within Effingham County, with a portion in Cumberland County, and feeds into the Little Wabash River in south central Effingham County.
  - Downstream end:
    - Confluence of Little Water River.

- **Big Creek Watershed** (HUC: 0512011211)
  - Location:
    - Southeast Central Illinois (Crawford and Jasper Counties)
  - Headwaters:
    - Dogwood Creek north of Dogwood, IL in northwest Crawford County.
  - Course:
    - Flows primarily within Crawford County with a small portion in Jasper County, and feeds into Big Creek south of Oblong, IL in Crawford County.
  - Downstream End:
    - Confluence of Brush Creek.

The TMDLs and WPPs were developed for the following waterbody segments:

- **Rock River/Pierce Lake Watershed TMDL**
  - A Fecal Coliform TMDL was developed for the following segments:
    - IL_PR-99
    - IL_PR-01
    - IL_PSB-01
    - IL_PSA
    - IL_PU
    - IL_PT
    - IL_PZZG
  - A Total Phosphorus TMDL was developed for the following segments:
    - IL_RPC

- **Kyte River Watershed TMDL**
  - A Total Phosphorus and DO TMDL were developed for the following segments:

        - IL_PLB-C1
    - A Fecal Coliform TMDL was developed for the following segments:
        - IL_PL-03

- **Saline Branch Watershed TMDL**
    - A Dissolved Copper TMDL was developed for the following segment:
        - IL_BPJCA

- **Little Wabash River/Green Creek TMDL**
    - Dissolved Oxygen TMDLs were developed for the following segments:
        - IL_C-24
        - IL_RCG

- **Big Four Ditch Watershed WPP**
    - Included a WPP to address Dissolved Oxygen in the following segments:
        - IL_BPKP-01
        - IL_BPKP-02

- **Kickapoo Creek Watershed WPP**
    - Included a WPP to address Dissolved Oxygen in the following segment:
        - IL_BENA-01

- **Salt Creek Watershed WPP**
    - Included a WPP to address Manganese in the following segment:
        - IL_CPD-01
    - Included a WPP to address Total Phosphorus in the following segments:
        - IL_CPD-01
        - IL_CPD-03
        - IL_CPD-04
        - IL_CPC-TU-C1
        - IL_CP-04
        - IL_CP-EF-C2
        - IL_CP-EF-C4
        - IL_CP-TU-C3

- **Big Creek Watershed WPP**
    - Included a WPP to address Manganese, DO and Total Phosphorus in the following segment:
        - IL_BEDB-01

Initial TMDL development for the targeted watersheds began in 2019. During the development process, the 2020/2022 Illinois Integrated Water Quality Report and 303(d) List was approved by EPA on June 30, 2022. TMDLs were completed based on the updated 2020/2022 303(d) List. Illinois EPA develops TMDLs for parameters that have numeric water quality standards. TMDLs for parameters that do not have water

quality standards have been deferred until criteria are adopted. Load reduction goals and watershed protection plans have also been included in the reports where appropriate. Illinois EPA contracted with CDM Smith to complete the Stage 1 and Stage 3 TMDL reports.

Public Meetings

The Stage 1 public meeting was held virtually on June 30, 2021, and comments and questions received from the first public meeting have been addressed and incorporated into the Stage 3 TMDL/WPP reports.

The Stage-3 public meeting was conducted virtually using WebEx on January 17, 2024. The meeting started at 10:00 am and concluded at 12:00 pm, central time. Approximately 30 people attended the meeting, with the public notice period remaining open for 30 days until midnight of February 16, 2024. The draft Stage-3 TMDL report was available for review and comment on the Illinois EPA's webpage: https://epa.illinois.gov/public-notices/general-notices.html

In addition, a direct mailing was sent to NPDES permittees and stakeholders in the watersheds prior to the Stage 3 meeting. The notice gave the date, time, and purpose of the Stage-3 TMDL meeting.

The notice also provided references on how to obtain additional information about these TMDLs/WPPs, Illinois EPA's Total Maximum Daily Load Program, and other related information.

Questions and Comments Received During Public Notice

1. After reading through the WPP, the City of Paxton would be interested in learning more about potential wetland and/or WASCOB construction. The City of Paxton is currently considering several stormwater retention options as part of a comprehensive drainage plan.

   Response – Information on wetlands and WASCOBs is presented in the WPP (Section 7 of the Big Four Ditch Watershed report) in Section 7.3.1.2. Additional detail on WASCOBs and constructed wetlands can be found in the NRCS Conservation Practice Standards:

   WASCOBS:
   https://efotg.sc.egov.usda.gov/api/CPSFile/5838/638_IL_CPS_Water_and_Sediment_(Con)trol_Basin_2018

   Constructed Wetlands:
   https://www.nrcs.usda.gov/sites/default/files/2022-09/656_NHCP_CPS_Constructed_Wetland_2020_0.pdf

Stakeholders interested in pursuing water quality improvement projects are encouraged to contact their local NRCS/SWCD offices and the Illinois EPA Nonpoint Source Management Program.

Ford County SWCD: https://fordcountyswcd.tripod.com/

Illinois EPA Nonpoint Source Management: https://epa.illinois.gov/topics/water-quality/watershed-management/nonpoint-sources.html

Contact: Jeff Edstrom, IEPA/BOW-Watershed Management Section, Nonpoint Source Unit, email: Jeffrey.Edstrom@Illinois.gov, phone: (217)782-3362

2. The 2002 watershed report for North Fork Kent Creek and a 2008 draft modeling report for Kinnikinnick Creek and North Fork Kent Creek have been completed.

Response – Thank you for the information. Both reports have been listed with summary information in Section 5.5.

3. Upon reviewing the Stage 1 Draft report for the Rock River and Pierce Lake watershed, Winnebago County has identified the need for updated local water quality sample collection to reflect and monitor changes since the last recorded collection in 2013. The County will continue to engage with the IEPA throughout TMDL report stages (2 and 3), and collaborate with the agency to locally monitor, address and mitigate potential sources of impairment to preserve water quality, public health and mitigate subsequent issues through long term planning and environmental regulation. The continued collaboration and communication with the IEPA will inform future local planning efforts related to the criteria stated above.

Response – Thank you for the comment. Text has been incorporated into Section 9 (watershed protection plan) to reflect Winnebago County's engagement. Additional comments and information were provided by Winnebago County following the Stage 3 public meeting. Please refer to responses to comment #5 below.

4. I was glancing through the presentation on TMDLs that are underway and noticed a Keith Creek is listed for arsenic. Anything easy you can send me on the

cause of that impairment. To my knowledge, that is the only arsenic impairment listed for a creek in Illinois. (my knowledge may be limited)

Response – Additional investigation into the 2018 stream listing of Keith Creek for arsenic found that the listing was initially based on 2008 sediment data. Instream water quality data presented in Section 5 did not show impairment of the aquatic life use and TMDL development for water column arsenic did not continue beyond the Stage 1 report (Sections 1-6). Text has been included throughout the report to clarify the delisting.

5. After reviewing the Draft TMDL Phase 3 report bein completed for the Rock River/Pierce Lake watershed, I thought I would provide a few comments:

- There was a watershed study for an unnamed creek that was identified as Buckbee Creek, which was completed in 2013. This is a smaller drainageway/watershed just south of the Keith Creek watershed (that may be included in the overall Spring Creek watershed). That was identified more of flooding issue, as the stream itself is more intermittent in flow and much of it is channelized. There were a few priority areas identified in that study to address water quality.

Response – This information has been added to Section 5.5.

- The Region 1 Planning Council recently received an IEPA 319 grant for 2 site projects (bioswales) in the Buckbee Creek and the South Fork Kent Creek watersheds. Part of the grant includes a “watershed Education and Outreach” component, to look at BMP’s in the Agricultural, Suburban and Urban areas to address soil loss, stormwater runoff and nutrient management. The District is working with them on some of education and outreach.

Response – This information has been added to Section 9.4.2.2 and 9.6.

- The Region 1 Planning Council also has a “Climate Resiliency Forum” that is developing a “Climate Action Plan” to be completed by next winter. This also looks at vulnerabilities regarding increased stormwater runoff, and potential impacts across all sectors. The District is on that committee as well.

Response – This information has been added to Section 9.6.

- The Region 1 Planning Council and Winnebago County Health Department also did a “Small Community Water Assessment and Report.” While this mainly looks at groundwater, with the highly sensitive aquifers in the Region, it is addressing surface water management concerns. We sat on that committee as well.

Response – This information has been added to Section 9.6.

- Like you mention in Section 9.4.2. the District and NRCS have various state and federal programs. While those programs are popular and very much in use in the rural areas on the western side of this watershed, it is limited in much of the eastern side of the watershed, due to ownership, development pressures, etc. which typically limit investment in agricultural BMP’s. Also, cost is typically a factor, especially with streambank stabilization, as the actual costs often far exceed what a landowner can bare, even with cost share assistance (a streambank stabilization grant was funded for a project upstream of Pierce Lake several years ago, but was cancelled due to excessive cost/burden to the landowner.

Response – This information has been added to Section 9.4.2. and 9.4.3.

- The District also is hosting an Erosion & Sediment Control workshop (for construction sites) and a Producer workshop (crop ground) in March; and have tree, fish, seed and rain barrel sales this spring.

Response – This information has been added to Section 9.5.

- I realize many of these comments above don’t necessarily address fecal coliform directly, but they do provide overall watershed improvements.

Response – Thank you for all the local information provided for this report. The information has been incorporated throughout the watershed-based plan (Section 9).

6. Looking over the data for the copper issue and it seems like the data is mostly from 2006 (with one being from 2001) and there aren’t a lot of data points

overall. One of the points also seems like it could be an outlier, which the paragraph below the chart does point toward but it didn't help us understand why that was included or not re-sampled since it was significantly different.

Is there concern over the data being 18+ years old?

Or is there concern over one of the data points sampled at the same location as the others is quite different from the others? The time window is only a few months for all samples taken in 2006 so it seems like the October one is too different to not be either ruled out or have triggered a re-sample. October also showed a major spike in TP concentrations in the Boneyard. Is there any connection between the two measurements?

Or are there any concerns that only one section was sampled for copper as opposed to a wider selection of locations through the Boneyard Creek area?

Response – Copper was first listed as impacting Aquatic Life in the segment back in 2010 based on the available data from 2006. The listing was given a low priority ranking for TMDL development but has remained listed as a pollutant indicator. The HUC-10 watershed containing Boneyard Creek was slated for TMDL development in 2018 and the TMDL was calculated using available data as there has not been additional data collected since the time of the original listing to confirm or refute that copper continues to impact the aquatic life use. There is not enough data/information available at this time to conclusively determine if the high copper, high phosphorus, and low hardness values were outliers, sampling error, or a legitimate spike from an urban watershed source. The text throughout the report has been expanded to emphasize the limited amount of data and to strongly recommend monitoring as a starting place for TMDL implementation.

7. In the presentation you had suggested cities could send in some updates they have done in the recent past (i.e. since the 2006 sampling that was done for copper and phosphorous). Attached is a word doc that has a short timeline of what we've done since 2006, what we have in the works/hope to get done soon, and our ongoing activities. Let me know if you have any questions or need more information.

<u>City of Champaign Boneyard Creek Improvements Timeline since 2006</u>

2010: Scott Park Drainage Improvements implemented

2010: Second Street Detention Basin constructed

2012: Dredging of Healey Street Basin

2012-2020: Boneyard Creek Reporting to ACOE as part of permitting process for Boneyard Creek Projects

2018 – 2020: Bristol Park Basin constructed

2018 – 2020: Boneyard Creek Improvements (Bradley Avenue to Hickory Street, part of Phase D)

2020-2023: Boneyard Creek Improvements (Hickory Street to Neil Street, part of Phase D)

2023-2024: Boneyard Creek Improvement at Skelton Park (part of future Phase B/C, added onto a Champaign Park District improvement project in the same area to cause less overall disruption)

<u>City of Champaign Future Boneyard Creek Projects</u>

Boneyard Creek Improvements Phase B/C (Hill Street to Bradley Avenue): This project will include underground storage for storm water, a new wet detention basin and a new dry bottom detention basin (also doubles as a park area when dry) just north of Washington Street to alleviate localized flooding, provide for suspended particle settlement (basin), and trash removal (trash separator installed with the underground detention). In addition to the above, there will be an increase of open channel with native plantings of the Boneyard created with the moving of the Boneyard from piping underneath businesses on the northern end of the project to City property east of those businesses. Further, this phase of the project will also include wetland creation and repairs to the existing wetlands throughout the project length (all locations suggested by the EPA draft report on wetland construction as a mitigation option).

Boneyard Creek Improvements Phase A (University Avenue to Hill Street): This is the smallest section of the overall Boneyard Creek Improvement plan and will connect the Second Street Basin to the work already performed in advance for Phase B/C at Skelton Park (between Hill Street and Washington Street). This section will also move part of the Boneyard Creek out from pipes under a business and create open channel with native plantings. The overall stretch of the Boneyard Creek through this project phase will have the entire channel upgraded with improved bank stabilization and native plantings.

*Dredging of the Second Street Basin***:** The Second Street Basin has proven to be quite effective at retaining particulate matter from the storm water run off and keeping it from being released downstream. This project is still in the early

planning stages and care is being taken to make sure any plans are made to limit the impact on water quality downstream and limit the impact on native plant and animal life in the basin area.

*MS4 Group Planning***:** This activity is still in the preliminary phase of organizing either the entire MS4 group or a task force with a representative from each organization to come up with further ongoing plans to have more water test samples taken, more locations of sampling, and further implementation of BMPs (existing or new).

City of Champaign Continuous Boneyard Creek Management Projects

Boneyard Creek Community Day: Started in 2006 and typically run in April, this is a community event that is run by City staff and utilizes volunteers to pick up trash along Boneyard Creek. The usual locations for trash pick-up on this day run through the Second Street Basin, through Scott Park, and down south along the Boneyard Creek area in Campustown. More information can be found here: https://champaignil.gov/2023/05/05/2023-boneyard-creek-community-day/

America Recycles Day: An additional clean up day was added to the regular BCCD to align with the EPA's America Recycles Day in the Fall. The usual locations for this are focused more on the norther sections of the Boneyard Creek and go from University Avenue to as far north as volunteers wish to walk. More information can be found here: https://champaignil.gov/public-works/recycling/america-recycles-day/

National Flood Insurance Program: Participant since May 2016 and the region's only Class 5 city

MS4 Requirements: All minimum measures required to maintain the MS4 permitting requirements

Ongoing Maintenance projects: There are several ongoing maintenance projects for the Boneyard Creek areas that utilize city staff and third-party contractors to perform the work time, weather and budget permitting. Tasks include, but are not limited to, the following:

- Grass mowing
- Native plant management and maintenance
- Removal of invasive plant species
- Canada goose management in compliance with IDNR
- Trash removal from stream and surrounding native plantings
- Pump and equipment maintenance at/in the basins and water features
- Community outreach

- Channel repairs from human, animal, or natural damages

Response – Summary information of previous work has been included in Sections 5.4 and the timeline of improvements and future plans have been included throughout Section 9.

8. The City of Urbana would like to submit the following comments on the Draft Stage 3 TMDL Report and Watershed Protection Plan for the Saline Branch Watershed (HUC 0512010902):

- High levels of Cu may not actually be an issue for Boneyard Creek. The data used to determine that a TMDL was needed was from 2001-2006 (and included only 4 data points, where only 1 data point exceeded the water quality standard), so as the watershed-based plan points out, due to improvements in recent years in brake pads other materials that were large contributors of Cu in the past, this issue may no longer exist.
- A spike TP occurred in the October 2006 sampling, which is rationalized by it being the end of the agricultural growing season and during low stream flows. However, a spike also occurred in the Cu sampling during October 2006 and no further data was collected to see if these points were outliers tied to one specific event.

Response – Refer to the responses to similar comment addressed in comment/response #6.

The data used for the draft TMDL Report and Watershed Protection Plan for Saline Branch is over 17 years old. Numerous BMPs have been put in place along with other activities performed which would improve water quality within the watershed in the City of Urbana since the data was collected, including, but not limited to:

2007 – Urbana adopted a new Erosion & Sediment Control Ordinance to control water pollution from construction sites that disturb over 2,000 sq. ft.

2012 – Urbana adopted a Stormwater Utility Ordinance to provide dedicated funds for stormwater management & comply with the NPDES Phase II Stormwater Permit requirements.

2012-2014 – Urbana constructed the Boneyard Creek Crossing project along Boneyard Creek from Griggs to Broadway Avenue which included a new public

park and gathering space, channel naturalization and widening, gabion toe protection, stone landscaping, earth retaining walls, structural walls, storm sewers, and new landscaping.

2023 – Urbana repaired erosive bank conditions along Boneyard Creek with installation of riprap to stabilize the banks and J-Hooks in -stream to slow erosive flows.

2023 – Urbana passed an ordinance updating the Stormwater Utility with a revised fee structure and increased rate to more equitably bill property owners and more sustainably fund the stormwater management program.

Response – Summary information has been included in Sections 5.4 and the timeline of improvements has been included throughout Section 9.

9. I am attaching a watershed plan for the Salt Creek Watershed (HUC 0512011402) that was developed in 2020-2021 by Regina Cassidy as her capstone project for the Master of Urban and Regional Planning from University of Illinois. I hope this can be useful to you as you continue developing the TMDL for the Salt Creek.

Response – Thank you for the information. Ms Cassidy's watershed plan has been referenced and cited in Sections 5 and 9 of the Salt Creek Watershed Protection Plan report. Implementation information relevant to this study has also been referenced/included as Appendix F.
