Sanjay K. Sofat, Chief
Bureau of Water
Illinois Environmental Protection Agency
P.O. Box 19276
Springfield, IL 62794-9276

RECEIVED
JUL 16 2018
SW/WS/IFAS

Dear Mr. Sofat:

The U.S. Environmental Protection Agency has reviewed the final Total Maximum Daily Loads (TMDLs) and supporting documentation for the Middle Sangamon River. The River is located in central Illinois and flows in a westerly direction in Macon, Christian and Sangamon Counties, and a small portion in Logan County (IDs E-05, E-06, E-09 and E-16 in the Sangamon River). The TMDLs address four fecal coliform impairments in the Middle Sangamon River.

These TMDLs meet the requirements of Section 303(d) of the Clean Water Act and EPA's implementing regulations at 40 C.F.R. Part 130. Therefore, EPA hereby approves Illinois' TMDLs. The statutory and regulatory requirements, and EPA's review of Illinois' compliance with each requirement, are described in the enclosed decision document.

We wish to acknowledge Illinois' effort in submitting these TMDLs, and look forward to future TMDL submission by the State of Illinois. If you have any questions, please contact Mr. Peter Swenson, Chief of the Watersheds and Wetlands Branch at 312-886-0236.

Sincerely yours,

A handwritten signature in cursive script that reads "Linda Holst".

Linda Holst
Acting Director
Water Division

Enclosure

cc: Abel Haile, IEPA

DECISION DOCUMENT FOR THE APPROVAL OF THE MIDDLE SANGAMON RIVER, ILLINOIS WATERSHED TMDL

Section 303(d) of the Clean Water Act (CWA) and EPA's implementing regulations at 40 C.F.R. Part 130 describe the statutory and regulatory requirements for approvable TMDLs. Additional information is generally necessary for EPA to determine if a submitted TMDL fulfills the legal requirements for approval under Section 303(d) and EPA regulations, and should be included in the submittal package. Use of the verb "must" below denotes information that is required to be submitted because it relates to elements of the TMDL required by the CWA and by regulation. Use of the term "should" below denotes information that is generally necessary for EPA to determine if a submitted TMDL is approvable. These TMDL review guidelines are not themselves regulations. They are an attempt to summarize and provide guidance regarding currently effective statutory and regulatory requirements relating to TMDLs. Any differences between these guidelines and EPA's TMDL regulations should be resolved in favor of the regulations themselves.

1. Identification of Waterbody, Pollutant of Concern, Pollutant Sources, and Priority Ranking

The TMDL submittal should identify the waterbody as it appears on the State's/Tribe's 303(d) list. The waterbody should be identified/georeferenced using the National Hydrography Dataset (NHD), and the TMDL should clearly identify the pollutant for which the TMDL is being established. In addition, the TMDL should identify the priority ranking of the waterbody and specify the link between the pollutant of concern and the water quality standard (see section 2 below).

The TMDL submittal should include an identification of the point and nonpoint sources of the pollutant of concern, including location of the source(s) and the quantity of the loading, e.g., lbs/per day. The TMDL should provide the identification numbers of the NPDES permits within the waterbody. Where it is possible to separate natural background from nonpoint sources, the TMDL should include a description of the natural background. This information is necessary for EPA's review of the load and wasteload allocations, which are required by regulation.

The TMDL submittal should also contain a description of any important assumptions made in developing the TMDL, such as:

- (1) the spatial extent of the watershed in which the impaired waterbody is located;
- (2) the assumed distribution of land use in the watershed (e.g., urban, forested, agriculture);
- (3) Population characteristics, wildlife resources, and other relevant information affecting the characterization of the pollutant of concern and its allocation to sources;
- (4) present and future growth trends, if taken into consideration in preparing the TMDL

(e.g., the TMDL could include the design capacity of a wastewater treatment facility); and (5) an explanation and analytical basis for expressing the TMDL through *surrogate measures*, if applicable. *Surrogate measures* are parameters such as percent fines and turbidity for sediment impairments; chlorophyll *a* and phosphorus loadings for excess algae; length of riparian buffer; or number of acres of best management practices.

Comment:

Location Description: Section 1.2 of the TMDL states that the Illinois Environmental Protection Agency (IEPA) has submitted the Middle Sangamon River Watershed TMDL to address impaired waters in the watershed. The River is located in central Illinois and flows in a westerly direction in Macon, Christian and Sangamon Counties, and a small portion in Logan County, draining a total of 328,000 acres (IEPA Segment IDs E-05, E-06, E-09 and E-16 in the Sangamon River). This TMDL submittal includes four TMDLs for fecal coliform in four impaired segments of the Sangamon River, and addresses the Primary Contact Recreational Use impairments.

Though Section 1.2 of the TMDL states that Long Point Slough (ERA-01) and Buckhart Creek (EZM-02) are impaired for Aquatic Life Use by sediment/siltation, IEPA did not establish TMDLs for those segments but instead developed two Load Reduction Strategies (LRS) for Non-Volatile Suspended Solids (NVSS); the waterbodies are tributaries to the Sangamon River. An LRS was completed in lieu of a TMDL for those segments, because IEPA defers development of TMDLs when there are no numeric water quality standards for certain pollutants. The portion of the TMDL document that includes the NVSS approach and methodology was not reviewed for this decision document. In addition, a TMDL for Dissolved Oxygen (DO) was not developed for Buckhart Creek, as IEPA will pursue delisting Buckhart Creek for DO based upon recent sampling results indicating that the waterbody is no longer impaired for low DO (Section 5.1.3 of the TMDL).

The two most common soil types in the watershed are Ipava silt loam (17.1%) and Sable silty clay loam (17.2%), with other soil types accounting for less than 8% each. The soil groups are classified by IEPA based on their characteristics for runoff potential and water transmission through soil. The soils in the watershed are primarily (Section 2.4.1 of the TMDL):

- B/D, drained condition (38.4%) – moderately low runoff potential when thoroughly wet, unimpeded water transmission through soil; undrained condition - high runoff potential when thoroughly wet (i.e., changing runoff potential depending on drained/undrained condition of the soil);
- B (35.1%) - moderately low runoff potential when thoroughly wet, unimpeded water transmission through soil;
- C/D, drained condition (20.8%) – moderately high runoff potential when thoroughly wet, unimpeded water transmission through soil; undrained condition - high runoff potential when thoroughly wet.

Land use: The area is cropland planted predominantly in corn (43.2%) and soybeans (31.5%), followed by grass/pasture at 6.6%, developed medium/low intensity and developed/open space

totaling 11.5%, deciduous forest 4.8%, and the remaining land covers all less than 1% (Section 2.3 of the TMDL). The K-factor describes the erodibility of the soil and the higher the value, the greater the erodibility; factors include percentage of silt, sand, organic matter, soil structure and permeability. The range of the K-factor in the Middle Sangamon River watershed is 0.02 – 0.69, and in the watershed the K-factor ranges from 0.02 – 0.49 (Section 2.4.1 of the TMDL).

Problem Identification: Section 1.2 of the TMDL states that the Sangamon River segments are impaired for Primary Contact Recreation Use by fecal coliform. Figures 5-2 to 5-5 of the TMDL summarize data which demonstrate that the fecal coliform standards have been exceeded in the four segments.

Pollutant of Concern and Sources: Fecal coliform is the pollutant of concern (Section 1.2 of the TMDL).

Nonpoint Sources - primarily agricultural runoff, animal operations, and failing septic systems (Section 5.3.1, 5.3.2, and 5.3.3 in the TMDL).

- *Tillage practices* are directly related to either runoff of sediment or instream problems with sedimentation/siltation, as well as transport of pollutants such as fecal coliform. The counties' tillage practices are predominantly conventional: 84% (corn) and 69% (soybean) in Macon County; 92% (corn) and 18% (soybean) in Christian County, and; 52% (corn) and 51% (soybean) in Sangamon County which may add to agricultural runoff. Reduced till, mulch till or no till practices are much less prevalent in each county and crop, except reduced till is used in 70% soybeans in Christian County use reduced till 70% of the time.
- *Tiling and drainage systems* are estimated to be located in nearly all fields due to the nature of the soils, which lack good drainage characteristics. Up to 30% of farms have fully tilled fields. Runoff from fields (especially with spread manure) can be exacerbated by tile drainage lines, which channelize the stormwater flows and reduce the time available for bacteria to die-off.
- *Animal operations* are generally believed to be decreasing in the watershed based on comparison of animal count data from 2007 and 2013 from the Census of Agriculture (Section 5.3.2 of the TMDL). The exceptions are: hogs and pigs increasing in Christian County 33%, cattle/calves increasing 78% and poultry increasing 8% in Macon County. Beef, dairy, sheep/lambs, and horses/ponies are otherwise decreasing in the watershed.
- *Septic systems* that are failing or leaking can contribute to fecal coliform. About 20% of Macon County are on private septic systems. The town of Mount Auburn does not have a municipal sewer system, nor do the outlying residential areas in Christian County.

Point Sources - NPDES permits in the watershed include Sewage Treatment Plants (STPs), Water Treatment Plants (WTPs), and industrial facilities as shown in the following Table 5-4 (from the TMDL).

Table 5-4 Permitted Facilities Discharging to or Upgradient of Impaired Segments in the Middle Sangamon River Watershed

Stormwater from Municipal Separate Storm Sewer System (MS4s) can transport bacteria to surface waterbodies during or shortly after storm events. The MS4 for the Illinois Department of Transportation (IDOT) has a general statewide permit, but is not considered to have a measureable impact on the point source loading. As a result, IEPA did not calculate a WLA for that MS4 in the watersheds. The MS4s in the watershed are listed in Table 5-5 below (from Section 5.2 of the TMDL).

Table 5-5 MS4 Permits in the Middle Sangamon River Watershed

Municipality	MS4 Permit Number	Permit Name	Drainage Area (Sq. Miles)
Decatur	ILR400181	Decatur, City of	44.7
Forsyth	ILR400193	Forsyth, Village of	2.1
Macon County	ILR400262	Macon County, IL	n/a
IDOT	ILR400493	Illinois Dept. of Trans.	n/a

Future growth: There is no reserve capacity set aside because the watershed is not expected to have significant future growth in the near future. IEPA believes any future TMDL modifications would be easily calculated (Section 8.3.1.5 of the TMDL).

Priority ranking: The waters have been identified on the 2016 303(d) list as low priority for TMDL development in the segments above (E-05, -06, -09, -16) for fecal coliform.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this first element.

2. Description of the Applicable Water Quality Standards and Numeric Water Quality Target

The TMDL submittal must include a description of the applicable State/Tribal water quality standard, including the designated use(s) of the waterbody, the applicable numeric or narrative water quality criterion, and the antidegradation policy. (40 C.F.R. §130.7(c)(1)). EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

The TMDL submittal must identify a numeric water quality target(s) – a quantitative value used to measure whether or not the applicable water quality standard is attained. Generally, the pollutant of concern and the numeric water quality target are, respectively, the chemical causing the impairment and the numeric criteria for that chemical (e.g., chromium) contained in the water quality standard. The TMDL expresses the relationship between any necessary reduction of the pollutant of concern and the attainment of the numeric water quality target. Occasionally, the pollutant of concern is different from the pollutant that is the subject of the numeric water quality target (e.g., when the pollutant of concern is phosphorus and the numeric water quality target is expressed as Dissolved Oxygen (DO) criteria). In such cases, the TMDL submittal should explain the linkage between the pollutant of concern and the chosen numeric water quality target.

Comment:

Designated Uses: Section 4.2 of the TMDL states that the designated use for the impaired segments is General Use. General Use is defined by the Illinois Pollution Control Board (IPCB) as a standard that “will protect the state’s water for aquatic life, wildlife, agricultural use, secondary contact use and most industrial uses, and ensure the aesthetic quality of the state’s aquatic environment.” The four segments of the Middle Sangamon River are not supporting their Primary Contact Recreation (PCR) Use (Section 1.2 of the TMDL) and are impaired by fecal coliform. The target used in the TMDL development is the PCR standard which uses the fecal coliform geomean as described below.

Standards: The TMDL submittal states in Section 4.3 that the fecal coliform standard is **200 cfu/100mL geometric mean**, based on a minimum of five samples taken over not more than a 30-day period, and **400 cfu/100mL** shall not be exceeded by more than 10 percent of the samples collected during any 30-day period (collected in the recreational season May through October). (Established in 35 Illinois Administrative Code 302.209(b)). EPA notes that while the TMDL will focus on the geometric mean portion of the water quality standard, both parts of the water quality standards must be met.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this second element.

3. Loading Capacity - Linking Water Quality and Pollutant Sources

A TMDL must identify the loading capacity of a waterbody for the applicable pollutant. EPA regulations define loading capacity as the greatest amount of a pollutant that a water can receive without violating water quality standards (40 C.F.R. §130.2(f)).

The pollutant loadings may be expressed as either mass-per-time, toxicity or other appropriate measure (40 C.F.R. §130.2(i)). If the TMDL is expressed in terms other than a daily load, e.g., an annual load, the submittal should explain why it is appropriate to express the TMDL in the unit of measurement chosen. The TMDL submittal should describe the method used to establish the cause-and-effect relationship between the numeric target and the identified pollutant sources. In many instances, this method will be a water quality model.

The TMDL submittal should contain documentation supporting the TMDL analysis, including the basis for any assumptions; a discussion of strengths and weaknesses in the analytical process; and results from any water quality modeling. EPA needs this information to review the loading capacity determination, and load and wasteload allocations, which are required by regulation.

TMDLs must take into account *critical conditions* for stream flow, loading, and water quality parameters as part of the analysis of loading capacity. (40 C.F.R. §130.7(c)(1)). TMDLs should define applicable *critical conditions* and describe their approach to estimating both point and nonpoint source loadings under such *critical conditions*. In particular, the TMDL should discuss the approach used to compute and allocate nonpoint source loadings, e.g., meteorological conditions and land use distribution.

Comment:

Methodology - Load duration curves (LDCs) were developed to determine the TMDLs for each of the four segments, using the full range of hydrological conditions at each monitoring site to ensure all flow conditions were considered, including critical conditions. This method includes ranking daily flow values from highest to lowest, computing the percentage of days in the period of record with flows that exceed each daily value, and then plotting daily flow versus the exceedance percentage (x-axis). The curve represents the target value or allowable load, with points above the curve showing actual measured values exceeding the target. Each plot was divided into five flow duration intervals (low flows, dry conditions, mid-range, moist conditions, and high flows). The flow regimes are defined at the 0-10, 10-40, 40-60, 60-90, and 90-100th percentiles.

High flow exceedences more often occur from precipitation-related sources and spring conditions (run-off from upland pastures, cropland with surface manure application) on the left portion of the plot. Non-precipitation related events occur more often in the fall when there are large amounts of cattle access from pastures near streams, or from point sources. Exceedences occur under low flow conditions on the right portion of the plot. The TMDL for each flow regime was established by using the midpoint flow condition multiplied by the concentration target. In the example below for segment E-05, there are exceedences in all flow regimes.

Smith

Loading Capacity: The loading capacities are found in Section 8.3.1.6 of the TMDL in Tables 8.6 – 8.9 as shown below. The flow regimes (flow exceedance range) are shown in 10th percentile increments in the tables, whereas the plots in the methodology section are divided into high, moist, midrange, dry and low flow regimes. Significant reductions are needed in both high and low flow conditions. In some locations and flow regimes the calculated pollutant loads were less than the TMDL calculation (0% reduction needed).

¹ All non-point source contributions (LA) attributed to MS4 permitted areas and assigned as WLA

² Actual load was calculated using the 90th percentile of observed concentration in a given flow range (EPA 2007)

Note that in the final TMDL Table 8-8, some load capacities (TMDLs) were changed from the values in the draft TMDL which were based on an error in the calculations for segment E-09. EPA conferred up with IEPA and a new calculation was forwarded by IEPA, based on a changed GIS value for the MS4 that was not incorporated into the original TMDL calculation (personal communication with Abel Haile at IEPA 6/18/18 and 6/26/18). See corrections in Table 8-8 below.¹ High and moist conditions for LA and WLA changed from original values; other values remained the same for the other flow regimes and columns.

Table 8-8 Fecal Coliform TMDL for Sangamon River Segment E-09

Zone	Flow Exceedance Range (%)	LC (mil col/day)	LA (mil col/day)	WLA (mil col/day)	MOS (mil col/day)	RC (mil col/day)	Actual Load ¹ (mil col/day)	Percent Reduction Needed (%)

¹ Actual Load was calculated using the 90th percentile of observed concentrations in a given flow range (EPA 2007)

Critical Conditions - Sections 8.3.1.2 and 8.3.1.4 of the TMDL state that the critical condition is the recreational period from May through October when most primary contact recreation occurs. The exceedences of standards occur across all flow regimes, and are accounted for by using the LDC methodology. Illinois recognizes that the critical flow may be under not only high flow, but also low flow conditions.

EPA finds IEPA's approach for calculating the loading capacity to be reasonable and consistent with EPA guidance. EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this third element.

4. Load Allocations (LAs)

EPA regulations require that a TMDL include LAs, which identify the portion of the loading capacity attributed to existing and future nonpoint sources and to natural background. Load allocations may range from reasonably accurate estimates to gross allotments (40 C.F.R. §130.2(g)). Where possible, load allocations should be described separately for natural background and nonpoint sources.

Comment:

The Load Allocations are shown above in Tables 8-6 through 8-9 from Section 8.3.1.6 of the TMDL. There is a wide range of percentage reductions required based on the various flow regimes.

EPA finds IEPA's approach for calculating the LA to be reasonable and consistent with EPA guidance. EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this fourth element.

5. Wasteload Allocations (WLAs)

EPA regulations require that a TMDL include WLAs, which identify the portion of the loading capacity allocated to individual existing and future point source(s) (40 C.F.R. §130.2(h), 40 C.F.R. §130.2(i)). In some cases, WLAs may cover more than one discharger, e.g., if the source is contained within a general permit.

The individual WLAs may take the form of uniform percentage reductions or individual mass based limitations for dischargers where it can be shown that this solution meets WQSs and does not result in localized impairments. These individual WLAs may be adjusted during the NPDES permitting process. If the WLAs are adjusted, the individual effluent limits for each permit issued to a discharger on the impaired water must be consistent with the assumptions and requirements of the adjusted WLAs in the TMDL. If the WLAs are not adjusted, effluent limits contained in the permit must be consistent with the individual WLAs specified in the TMDL. If a draft permit provides for a higher load for a discharger than the corresponding individual WLA in the TMDL, the State/Tribe must demonstrate that the total WLA in the TMDL will be achieved through reductions in the remaining individual WLAs and that localized impairments will not result. All permittees should be notified of any deviations from the initial individual WLAs contained in the TMDL. EPA does not require the establishment of a new TMDL to reflect these revised allocations as long as the total WLA, as expressed in the TMDL, remains the same or decreases, and there is no reallocation between the total WLA and the total LA.

Comment:

The Wasteload Allocations for fecal coliform for the Middle Sangamon River are shown for facility and MS4 point sources in Tables 8-4 and 8-5 below. The WLAs are based upon the Design Average Flow under Low, Dry, and Mid-Range flow regimes, and Design Maximum Flow for the Moist and High flow regimes, multiplied by the fecal coliform geometric mean criteria of 200 org/100 mL (Section 8.3.1.4 of the TMDL). Several WWTPs identified in Table 8-4 below have disinfection exemptions, under which the facility must meet the WQS at a point downstream of the discharge point where recreation may occur. The WLAs are calculated to attain WQSs at the compliance point specified under the exemption (Section 8.3.1.4 of the TMDL). The flows used to calculate the TMDL under moist and high flow conditions also help to ensure there is capacity for growth.

Table 8-4: WLAs for Fecal Coliform from Permitted Discharges in the Middle Sangamon River Watershed

Facility	NPDES Permit Number	Design Average Flow (MGD)	Design Maximum Flow (MGD)	WLA at DAF (mil col/day)	WLA at DMF (mil col/day)	Applicable Stream Segments
SANITARY DISTRICT OF DECATUR	IL0028321	41	125	310,433	946,458	E-05, E-06, E-09, E-16

¹ Facilities with disinfection exemptions

Note that in the final TMDL Table 8-5, the MS4 values were changed from the draft TMDL values which were based on an error in the calculations for segment E-09. EPA conferred with IEPA and a new calculation was forwarded by IEPA, based on to a changed GIS value for the MS4 that was not incorporated into the original TMDL calculation (personal communication with Abel Haile at IEPA 6/18/18 and 6/26/18). See corrections in Table 8-5 below.²

Table 8-5 Fecal Coliform WLA for MS4s in the Middle Sangamon River Watershed

Impaired Segment	MS4 Permit	MS4 Area in Subbasin	Percent of Subbasin Area	WLA by Flow Condition Category and Flow Exceedance Range (mil. col/day)			
				High	Moist		
				0 - 10	10-20	20-30	30-40
E-05	Decatur	12,048	12%	1,784,447	753,530	369,337	168,917
	Forsyth	1,981	2%	293,420	123,905	60,731	27,775
	Macon County	1,786	2%	264,498	111,691	54,745	25,038
	Total	15,815	16%	2,342,366	989,126	484,813	221,730
E-06	Decatur	1,044	100%	13,180,479	5,774,360	3,014,315	1,574,492
	Total	1,044	100%	13,180,479	5,774,360	3,014,315	1,574,492
E-09	Decatur	2,860	30%	4,026,280	1,648,000	761,684	299,323
	Total	2,860	30%	4,026,280	1,648,000	761,684	299,323
E-16	Decatur	1,867	0.6%	103,139	44,049	22,028	10,540
	Total	1,867	0.6%	103,139	44,049	22,028	10,540

Estimates of current loading from MS4s were calculated by subtracting the WLA for NPDES point source dischargers and the margin of safety from the loading capacity of the waterbody to derive the load attributable to stormwater discharges and nonpoint sources. The proportion of developed land within the Middle Sangamon River subbasin and in each impaired segment's watershed

² Row E-09 High flow 0-10 is changed to 4,026,280 from 6,551,481 for WLA
Moist flow 10-20 is changed to 1,648,000 from 2,681,591 for WLA
Moist flow 20-30 is changed to 761,684 from 1,239,397 for WLA
Moist flow 30-40 is changed to 299,323 from 487,052 for WLA

potentially covered under one of the MS4 permit was then calculated using GIS layers for urbanized MS4 areas and multiplied by the segment's interim LA for non-point sources. Note that a separate WLA for the IDOT MS4 was not included as the contributing area from this MS4 in the watershed is very small and not likely to contribute loads of fecal coliform. The resulting value for the remaining MS4s represents an estimate of the proportion of overland runoff load attributable to these systems for each impaired segment. As the MS4 loads are from permitted sources, the MS4 load was then subtracted from the overall LA and added to the WLA calculated for POTWs. MS4 discharges are only operable during periods of active runoff and WLA for MS4s were only applied to the "moist" and "high" flow condition categories.

IEPA did not identify any combined Sewer Overflows (CSOs) or Concentrated Animal Feeding Operations (CAFOs) in the watershed. Therefore, the WLA = 0.

EPA finds IEPA's approach for calculating the WLA to be reasonable and consistent with EPA guidance. EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this fifth element.

6. Margin of Safety (MOS)

The statute and regulations require that a TMDL include a margin of safety (MOS) to account for any lack of knowledge concerning the relationship between load and wasteload allocations and water quality (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)). EPA's 1991 TMDL Guidance explains that the MOS may be implicit, i.e., incorporated into the TMDL through conservative assumptions in the analysis, or explicit, i.e., expressed in the TMDL as loadings set aside for the MOS. If the MOS is implicit, the conservative assumptions in the analysis that account for the MOS must be described. If the MOS is explicit, the loading set aside for the MOS must be identified.

Comment:

Section 8.3.1.3 of the TMDL states that IEPA used an implicit MOS in the methodology by utilizing a more restrictive and conservative portion of the standard where fecal coliform may not exceed the chronic standard of 200 cfu/100ml, rather than the acute single sample maximum of 400 cfu/100 ml.

The MOS also incorporated certain conservative assumptions in the calculation of the TMDLs. No rate of decay, or die-off rate of pathogen species, was used in the TMDL calculations or in the creation of load duration curves for *E. coli*. Bacteria have a limited capability of surviving outside their hosts, which would justify the use of a rate of decay. IEPA determined that it was more conservative to use the geometric mean portion of the WQS (200 cfu/100 mL) and not to apply a rate of decay.

As stated in *EPA's Protocol for Developing Pathogen TMDLs* (EPA 841-R-00-002), many different factors affect the survival of pathogens, including the physical condition of the water. These factors include, but are not limited to sunlight, temperature, salinity, and nutrient deficiencies. These factors vary depending on the environmental condition/circumstances of the water, and therefore it would be difficult to assert that the rate of decay caused by any given combination of these environmental variables was sufficient to meet the WQS of 200 cfu/100 mL. Thus, it is more conservative to apply the State's WQS as the MOS, because this standard must be met at all times under all environmental conditions.

EPA finds IEPA's approach for incorporating the MOS to be reasonable and consistent with EPA guidance. EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this sixth element.

7. Seasonal Variation

The statute and regulations require that a TMDL be established with consideration of seasonal variations. The TMDL must describe the method chosen for including seasonal variations. (CWA §303(d)(1)(C), 40 C.F.R. §130.7(c)(1)).

Comment:

Section 8.3.1.2 states that the seasonal variation was implicitly considered for fecal coliform by using the LDC under all expected flow conditions. The seasonal variation is an important consideration to be protective during the primary contact recreational season, so the target must be met from May through October, as shown above in the TMDL methodology and allocation tables.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this seventh element.

8. Reasonable Assurances

When a TMDL is developed for waters impaired by point sources only, the issuance of a National Pollutant Discharge Elimination System (NPDES) permit(s) provides the reasonable assurance that the wasteload allocations contained in the TMDL will be achieved. This is because 40 C.F.R. 122.44(d)(1)(vii)(B) requires that effluent limits in permits be consistent with "the assumptions and requirements of any available wasteload allocation" in an approved TMDL.

When a TMDL is developed for waters impaired by both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur, EPA's 1991 TMDL Guidance states that the TMDL should provide reasonable assurances that nonpoint source control measures will achieve expected load reductions in order for the TMDL to be approvable. This

information is necessary for EPA to determine that the TMDL, including the load and wasteload allocations, has been established at a level necessary to implement water quality standards.

EPA's August 1997 TMDL Guidance also directs Regions to work with States to achieve TMDL load allocations in waters impaired only by nonpoint sources. However, EPA cannot disapprove a TMDL for nonpoint source-only impaired waters, which do not have a demonstration of reasonable assurance that LAs will be achieved, because such a showing is not required by current regulations.

Comment:

There are overview and implementation activities in Section 9.1 of the TMDL that include the Nine Minimum Elements (NME); these elements of watershed planning will assist in providing reasonable assurance that impairments are addressed. The NME include many aspects of implementation that would improve the watershed: identifying causes and sources of pollution, estimating reductions, describing the NPS management measures, estimating the technical assistance and costs, including public information, developing a schedule, developing the interim and measureable milestones, identifying indicators to determining the achievement of reductions, and developing a monitoring component for the project. Beyond using those elements, the adaptive management approach will be used in implementation, including both structural (BMPs such as fencing and filter strips) and managerial (tillage or crop rotation) practices, further described below in the implementation section. Monitoring of key response indicators is performed to incorporate the results of implementation actions into future decisions.

For example, in Section 9.3 of the TMDL, IEPA described the benefits that buffer strips could provide in reducing bacteria loads in the watershed. Buffer strips are vegetative strips that are planted along a streambank which can filter out or slow the migration of pollutants into the waterbody. In Figures 9-1 to 9-4 of the TMDL, IEPA identified potential locations where buffer strips could be installed. In Table 9-9, IEPA provided cost estimates of numerous best management practices (BMPs) that could be used in the watershed. This information, along with the location information, will allow stakeholder to determine where various BMPs can be installed and what these BMPs could cost.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this eighth element.

9. Monitoring Plan to Track TMDL Effectiveness

EPA's 1991 document, *Guidance for Water Quality-Based Decisions: The TMDL Process* (EPA 440/4-91-001), recommends a monitoring plan to track the effectiveness of a TMDL, particularly when a TMDL involves both point and nonpoint sources, and the WLA is based on an assumption that nonpoint source load reductions will occur. Such a TMDL should provide assurances that nonpoint source controls will achieve expected load reductions and, such TMDL should include a monitoring plan that describes the additional data to be collected to determine if the load

reductions provided for in the TMDL are occurring and leading to attainment of water quality standards.

Comment:

Section 9.2 of the TMDL describes the importance of monitoring the effectiveness of BMPs and other actions in the watershed. Monitoring plans include both short-term and long-term monitoring activities, and are part of the Adaptive Management strategies. The monitoring provides assessment and guides future decisions to continually improve management policies. Defining characteristics of adaptive management include: acknowledging uncertainty, thoughtful assessment and design, implementation of a plan of action, monitoring of key response indicators, and analysis to consider the impact of management on the original objectives.

Monitoring of discharges, stream segments and storm events, storm sewer surveys, and intensive basin surveys (every five years) will occur. Contributors of data used by the IEPA to assess the streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program. The majority of data used for this TMDL is from the Ambient Water Quality and Intensive Basin Surveys. The Ambient Water Quality Network includes 213 fixed stream stations statewide that are sampled every 6 weeks. Additional data are collected during Intensive Basin Surveys, which typically include approximately 100 basin-specific stations per year and are conducted on a 5-year cycle.

The IEPA has described several milestones in monitoring and implementation, including: funding, implementing short-term projects, monitoring, holding annual stakeholder meetings, implementing larger projects, and education and outreach. The tracking will determine the extent of implementation, establish a baseline, measure voluntary efforts, support workload and cost analysis for regulatory management, and determine proper maintenance and operation (Section 9.10.1 and 9.10.2 of the TMDL).

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this ninth element.

10. Implementation

EPA policy encourages Regions to work in partnership with States/Tribes to achieve nonpoint source load allocations established for 303(d)-listed waters impaired by nonpoint sources. Regions may assist States/Tribes in developing implementation plans that include reasonable assurances that nonpoint source LAs established in TMDLs for waters impaired solely or primarily by nonpoint sources will in fact be achieved. In addition, EPA policy recognizes that other relevant watershed management processes may be used in the TMDL process. EPA is not required to and does not approve TMDL implementation plans.

Comment:

The TMDL provides many suggestions for implementation activities to reduce fecal coliform, including point source controls such as disinfection. A number of point source discharges in the watershed have exemptions from disinfection. STPs with exemptions are Harristown, Niantic, Buffalo/Dawson/Mechanicsburg, and Stonington. Disinfection exemptions are granted where the permittee has shown that the receiving water has average depths of two feet or less and no pronounced deep pools during the summer season; contains physical obstacles that prevent access for primary contact activities; or has adjacent land uses that discourage primary contact activities. However, the facility must still comply with standards at locations downstream in receiving waters where persons may have access, as well as continue monitoring during the recreational months from May to October.

Section 9.6 of the TMDL includes detailed information regarding BMPs to control nonpoint sources, including the pricing of filter strips, the type of riparian buffer cover, types of fencing, water tanks, water and sediment control basins, terracing, bank and grade stabilization, grassed waterways, various tilling practices, and septic system maintenance. GIS has been utilized to assist in quantifying the location and width of filter strips. A private sewage disposal system inspection and maintenance program, and the restriction of livestock access to streams, should be utilized to achieve standards.

Education and funding mechanisms are discussed in Sections 9.7 and 9.8 of the TMDL, respectively. The funding mechanisms include Illinois Section 319(h) of the Clean Water Act funding, whereby Illinois EPA receives federal funds, contributing to as much as 60% of the total cost. The Conservation Reserve Program gets funding from the Food & Security Act of 1985 to remove environmentally sensitive land from agricultural production if the owner meets certain requirements for eligible land. The Conservation Stewardship Program is used to improve soil quality, water quality and quantity, air quality, habitat quality and energy. Funds are available for eligible lands include agricultural lands, cropland, grassland, pastureland, rangeland and non-industrial private forest land. The Grassland Reserve Program prevents grazing and pasture from being converted into cropland or for urban development. The Agricultural Conservation Easement Program is used to conserve agricultural lands and wetlands. Lands protected by the easements provide environmental quality, historic preservation, wildlife habitat, and protection of open space. For wetlands, these easements protect fish and wildlife habitat, filter sediments and chemicals, reduce flooding, recharge of groundwater, and protect biological diversity. The Environmental Quality Incentive Program provides funding for conservation practices, and may provide up to 75% funding for the practices to be put into place. Illinois has provided timelines for acquiring funds, implementing short- and long-term projects, monitoring, holding stakeholder meetings, and providing education and outreach. IEPA provides local contact information for many of these entities in Section 9.8.3 of the TMDL. Citizens have provided IEPA with locations where severe erosion has occurred (Section 9.4 of the TMDL).

EPA reviews, but does not approve, implementation plans.

11. Public Participation

EPA policy is that there should be full and meaningful public participation in the TMDL development process. The TMDL regulations require that each State/Tribe must subject calculations to establish TMDLs to public review consistent with its own continuing planning process (40 C.F.R. §130.7(c)(1)(ii)). In guidance, EPA has explained that final TMDLs submitted to EPA for review and approval should describe the State's/Tribe's public participation process, including a summary of significant comments and the State's/Tribe's responses to those comments. When EPA establishes a TMDL, EPA regulations require EPA to publish a notice seeking public comment (40 C.F.R. §130.7(d)(2)). Provision of inadequate public participation may be a basis for disapproving a TMDL. If EPA determines that a State/Tribe has not provided adequate public participation, EPA may defer its approval action until adequate public participation has been provided for, either by the State/Tribe or by EPA.

Comment:

The TMDL was public noticed from September 27, 2017, to October 27, 2017. Copies of the draft TMDL were made available upon request, at the Illinois EPA and on IEPA's Internet web site at <http://www.epa.state.il.us/public-notices>. IEPA held a public meeting on September 27, 2017, at the Richland Community College, the National Sequestration Education Center in Decatur, Illinois. The public was informed that the TMDL could be accessed in hard copy at the Decatur Public Library or Harristown Village Hall. Comments received via e-mail, and IEPA's responses, are included in Appendix E. Once commenter informed IEPA that there were riparian habitat stressors at certain locations and commented on the importance of preserving habitat. Another comment was from a point source operator specifically requesting clarification of details of its permit and obligations related to the TMDL, Load Reduction Strategy, and BMPs. There were also verbal comments at the public notice meeting and some of those were addressed and incorporated into the final TMDL. EPA determined that the IEPA adequately responded to the comments.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this eleventh element.

12. Submittal Letter

A submittal letter should be included with the TMDL submittal, and should specify whether the TMDL is being submitted for a technical review or final review and approval. Each final TMDL submitted to EPA should be accompanied by a submittal letter that explicitly states that the submittal is a final TMDL submitted under Section 303(d) of the Clean Water Act for EPA review and approval. This clearly establishes the State's/Tribe's intent to submit, and EPA's duty to review, the TMDL under the statute. The submittal letter, whether for technical review or final review and approval, should contain such identifying information as the name and location of the waterbody, and the pollutant(s) of concern.

Comment:

EPA received the Middle Sangamon River Watershed TMDL on June 12, 2018, accompanied by a submittal letter dated June 12, 2018. In the submittal letter, IEPA stated “Illinois is submitting the Middle Sangamon River Watershed TMDL for USEPA’s final approval.” The letter states that the Middle Sangamon River is impaired on Illinois’ 2016 303(d) list. Primary Contact Use is impaired due to fecal coliform.

EPA finds that the TMDL document submitted by IEPA satisfies all requirements concerning this twelfth element.

13. Conclusion

After a full and complete review, EPA finds that the four TMDLs for the Middle Sangamon River Watershed (segments E-05, E-06, E-09 and E-16) for fecal coliform satisfy all of the elements of an approvable TMDL.

The EPA’s approval of these TMDLs extends to the waterbodies which are identified in Table 1 of this Decision Document.

ERRATA SHEET

Corrections for the IEPA's Middle Sangamon River Watershed Final Draft TMDL Report dated May 2018

Note that in the final TMDL Tables 8-5 and 8-8 (Refer to Section 8.3.1.4 – Waste Load Allocation and Section 8.3.1.6 - Load Allocation and TMDL Summary in the Report), the MS4 values were changed from the draft TMDL values which were based on an error in the calculations for segment E-09. EPA followed up with IEPA and a new calculation was forwarded by IEPA, due to a changed GIS value for the MS4 that was not incorporated into the initial TMDL calculation (personal communication with Abel Haile at IEPA 6/18/18 and 6/26/18).

Correct values are highlighted in yellow.

Table 8-5 Seg E-09	WLA correction	WLA initial values
Row 0-10	WLA 4,026,280	WLA 6,551,481
Row 10-20	WLA 1,648,000	WLA 2,681,591

Section 1

Goals and Objectives for the Middle Sangamon River Watershed

1.1 Total Maximum Daily Load Overview

A total maximum daily load, or TMDL, is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify waterbodies not meeting water quality standards following the state's 305(b) monitoring and assessment methodology and then establish TMDLs for restoration of water quality. Illinois EPA develops a list known as the "303(d) list" of waterbodies not meeting water quality standards every 2 years, and it is included in the Integrated Water Quality Report. The Integrated Water Quality Report includes both the 305(b) monitoring and assessment methodology as well as the 303(d) list of impaired waters. Waterbodies on the 303(d) list are then targeted for TMDL development. The Illinois EPA's most recent Draft 2016 Integrated Water Quality Report was submitted to the United States Environmental Protection Agency (USEPA) in July 2016. In accordance with USEPA's guidance, the report assigns all waters of the state to one of five categories. 303(d) listed waterbodies make up category five in the integrated report (Appendix A of the Integrated Report).

In general, a TMDL is a quantitative assessment of water quality impairments, contributing sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a waterbody.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters; and
- Where attainable, to achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water.

Water quality standards consist of three elements:

- The designated beneficial use or uses of a waterbody or segment of a waterbody
- The water quality criteria necessary to protect the use or uses of that particular waterbody

- An antidegradation policy

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 TMDL Goals and Objectives for the Middle Sangamon River Watershed

The Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

This report presents all stages of TMDL development for the Middle Sangamon River watershed. Stage 1 was completed in 2014. Data collection under Stage 2 was performed by Illinois EPA in 2015. Stage 3 documentation was completed in 2016.

Following are the impaired waterbody segments in the Middle Sangamon River watershed:

- Sangamon River (E-05, E-06, E-09, and E-16)
- Long Point Slough (ERA-01)
- Buckhart Creek (EZM-02)

These impaired waterbody segments are shown on **Figure 1-1**. There are six impaired waterbody segments within the Middle Sangamon River watershed that have TMDLs and/or a load reduction strategy (LRS) addressed in this report. **Table 1-1** lists the waterbody segment, waterbody size, and potential causes and sources of impairment for the waterbody.

Table 1-1 Impaired Waterbodies in Middle Sangamon River Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2016 303(d) list)
E-05	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
E-06	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
E-09	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
E-16	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
ERA-01	Long Point Slough	<i>Sedimentation/Siltation</i>	Aquatic Life	Channelization
EZM-02	Buckhart Creek	Dissolved Oxygen¹	Aquatic Life	Channelization
		<i>Sedimentation/Siltation</i>	Aquatic Life	Channelization and Crop Production

Bold Causes of Impairment have numeric water quality standards and TMDL development was pursued. 1A TMDL for Dissolved Oxygen was not developed after Stage 2 data collection showed that impairment no longer exists (see further discussion in Sections 5-8). Italicized Causes of Impairment do not have numeric water quality standards and an LRS was developed.

Illinois EPA has previously only developed TMDLs for parameters that have numeric water quality standards. For potential causes that do not have numeric water quality standards as noted in **Table 1-1**, TMDLs were not developed. However, LRSs (similar to TMDLs) were developed for these impairments based on target values established by Illinois EPA.

The TMDLs for the segments listed above specify the following elements:

- Loading Capacity (LC) or the maximum amount of pollutant loading a waterbody can receive without violating water quality standards
- Waste Load Allocation (WLA) or the portion of the TMDL allocated to existing or future point sources
- Load Allocation (LA) or the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- Margin of Safety (MOS) or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- Reserve Capacity (RC) or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\text{TMDL} = \text{LC} = \Sigma\text{WLA} + \Sigma\text{LA} + \text{MOS} + \text{RC}$$

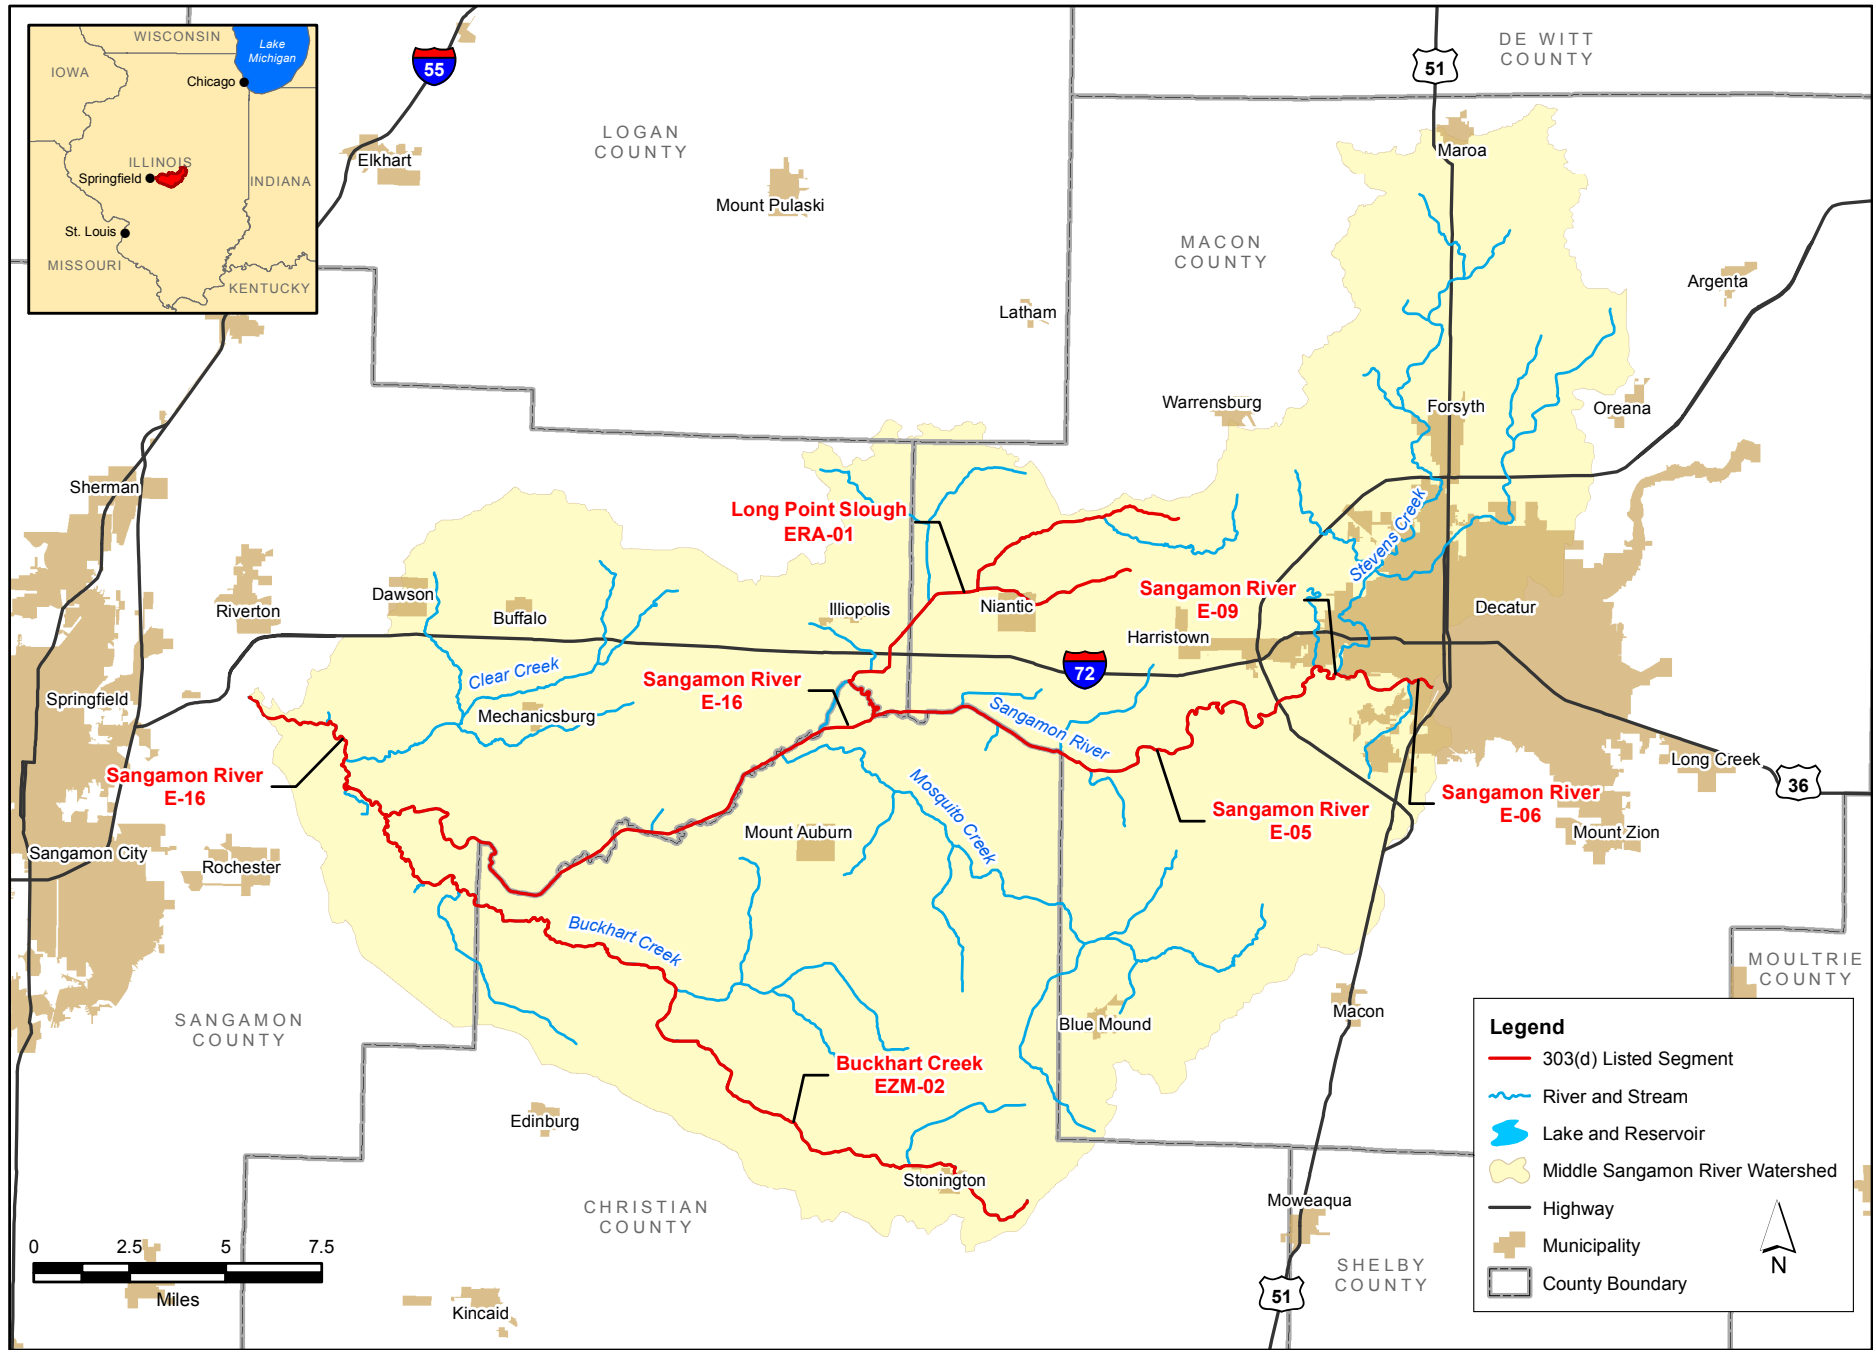

As part of the TMDL development process, Illinois EPA started to include LRSs in TMDL watershed projects in 2012 for those pollutants that do not currently have numeric water quality standards. Developing an LRS involves determining the LC and load reduction that is needed in order for the waterbody to meet “Full Use Support” for its designated uses. In an LRS, the LC is

not divided into WLA, LA, or MOS. These TMDL components are represented by one number as a target concentration for load reduction within each unique watershed. The LRS provides guidance (with no regulatory requirements) for voluntary nonpoint source reduction efforts by implementing agricultural and urban stormwater best management practices (BMPs). TMDL and LRS development also takes into account the seasonal variability of pollutant loads so that water quality standards are met during all seasons of the year. Also, reasonable assurance that the TMDL and LRS targets will be achieved is described in the implementation plan. The implementation plan for the Middle Sangamon Rivers watershed describes how water quality standards and targets will be met and attained. This implementation plan includes recommendations for implementing BMPs, cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completion of implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Middle Sangamon River Watershed Characteristics** provides a description of the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Public Participation and Involvement** discusses public participation activities that occur throughout TMDL development.
- **Section 4 Middle Sangamon River Watershed Water Quality Standards** defines the water quality standards for the impaired waterbodies.
- **Section 5 Middle Sangamon River Watershed Characterization** presents the available water quality data needed to develop TMDLs, discusses the characteristics of the impaired stream segments in the watershed, and also describes the point and nonpoint sources with potential to contribute to the watershed load.
- **Section 6 Approach to Developing TMDL and Identification of Data Needs** makes recommendations for the models and analysis that are needed for TMDL development and also suggests segments for Stage 2 data collection.
- **Section 7 Methodology Development for the Middle Sangamon River Watershed** details the development of the TMDLs and LRSs for each impaired stream segment.
- **Section 8 Total Maximum Daily Load for the Middle Sangamon River Watershed** provides the results of the TMDL and LRS analyses for each impaired stream segment.
- **Section 9 Implementation Plan for the Middle Sangamon River Watershed** makes recommendations for implementation actions, point source controls, management measures, and BMPs that can be used to address water quality issues in the watershed.

**Middle Sangamon River
TMDL Watershed**

FIGURE 1-1

This page intentionally left blank.

Section 2

Middle Sangamon River Watershed Description

2.1 Middle Sangamon River Watershed Location

The Middle Sangamon River watershed (**Figure 1-1**) is located in central Illinois, flows in a westerly direction, and drains approximately 328,000 acres. A total of 150,085 acres (46 percent of the total watershed) lie in Macon County, 95,405 CDL loading cap acres (29 percent of the total watershed) lie in northern Christian County, 82,111 acres (25 percent of the total watershed) lie in eastern Sangamon County, and 709 acres (0.2 percent of the total watershed) lie in southern Logan County.

2.2 Topography

Topography is an important factor in watershed management because stream types, precipitation, and soil types can vary dramatically by elevation. National Elevation Dataset (NED) coverages containing 30-meter grid resolution elevation data are available from the U.S. Geological Survey (USGS) for each 1:24,000-topographic quadrangle in the United States. Elevation data for the Middle Sangamon River watershed were obtained by overlaying the NED grid onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed.

Elevation in the Middle Sangamon River watershed ranges from 750 feet above sea level in the eastern portion of the watershed to 509 feet along the Sangamon River at the downstream (eastern) end of the watershed.

2.3 Land Use

Land use data for the Middle Sangamon River watershed were extracted from the U.S. Department of Agriculture's (USDA) National Agriculture Statistics Service (NASS) 2013 Cropland Data Layer (CDL). The CDL is a raster based, geo-referenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities and to produce digital, crop-specific, categorized geo-referenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2013 and includes 30 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters. The 2013 CDL and extensive metadata are available at <http://www.nass.usda.gov/research/Cropland/SARS1a.htm>.

Land use characteristics of the watershed were determined by overlaying the statewide 2013 CDL data layer onto the GIS-delineated watershed. **Table 2-1** contains the land uses contributing to the Middle Sangamon River watershed, based on the 2013 CDL land cover categories and also includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed.

Table 2-1 Land Cover and Land Use in Middle Sangamon River Watershed

Land Cover Category	Area (Acres)	Percentage
Corn	141,946	43.2%
Soybeans	103,514	31.5%
Grass/Pasture	21,726	6.6%
Developed/Low Intensity	16,872	5.1%
Developed/Open Space	16,267	5.0%
Deciduous Forest	15,847	4.8%
Developed/Med Intensity	4,566	1.4%
Open Water	2,022	0.6%
Woody Wetlands	1,959	0.6%
Developed/High Intensity	1,849	0.6%
Winter Wheat	1,085	0.3%
Alfalfa	221	0.1%
Barren	173	0.1%
Winter Wheat/Soybeans	101	<0.1%
Other Hay/Non Alfalfa	58	<0.1%
Herbaceous Wetlands	21	<0.1%
Clover/Wildflowers	16	<0.1%
Sweet Corn	13	<0.1%
Fallow/Idle Cropland	9.3	<0.1%
Corn/Soybeans	6.7	<0.1%
Dry Beans	2.2	<0.1%
Winter Wheat/Sorghum	1.8	<0.1%
Pop or Orn Corn	1.6	<0.1%
Sod/Grass Seed	0.89	<0.1%
Walnuts	0.67	<0.1%
Sunflower	0.44	<0.1%
Spring Wheat	0.44	<0.1%
Switchgrass	0.44	<0.1%
Oats	0.22	<0.1%
Rye	0.22	<0.1%
Grand Total	328,282	100

The land cover data reveal that over 247,137 acres, representing 75.3 percent of the total watershed area, are devoted to agricultural activities. Corn and soybean farming account for 43.2 percent and 31.5 percent of the watershed area, respectively. Rural grassland, floodplain forest, and upland areas represent a total of 11.5 percent of the watershed area (37,588 acres). Approximately 12 percent of the watershed area (39,554 acres) is developed, urbanized land.

2.4 Soils

Soils data are available through the Soil Survey Geographic (SSURGO) database. For SSURGO data, field mapping methods using national standards are used to construct the soil maps. Mapping

scales generally range from 1:12,000 to 1:63,360 making SSURGO the most detailed level of soil mapping done by the Natural Resources Conservation Service (NRCS).

Attributes of the spatial coverage can be linked to the SSURGO databases, which provide information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups as well as the K-factor of the Universal Soil Loss Equation (USLE). The following sections describe and summarize the specified soil characteristics for the Middle Sangamon River watershed.

2.4.1 Middle Sangamon River Watershed Soil Characteristics

Appendix B contains a table of the SSURGO soil series for the Middle Sangamon River watershed. A total of 133 soil types exist in the watershed. The two most common types—Ipava silt loam (0 to 2 percent slopes), and Sable silty clay loam (0 to 2 percent slopes)—each cover a small percentage of the overall watershed (17.7 and 17.2 percent, respectively). All other soil types each represent less than 8 percent of the total watershed area. The table in Appendix B also contains the area, dominant hydrologic soil group, and k-factor range.

Hydrologic soil groups can be used to estimate runoff volumes based on precipitation data. A number of different hydrologic soil groups are found within the Middle Sangamon River watershed **Figure 2-3**. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

While hydrologic soil groups A, B, C, D, B/D, and C/D are all found within the Middle Sangamon River watershed, groups B/D, B, and C/D are the most common types and represent 38.4, 35.1, and 20.8 percent of the watershed, respectively. Group C soils cover approximately 4 percent of the watershed with the remaining soil groups each covering less than 1 percent of the land area. Group B is defined as having "moderately low runoff potential when thoroughly wet." Water transmission through these soils is unimpeded. Group B/D and C/D soils are dual hydrologic soil groups because these soils can be adequately drained. The first letter applies to the drained condition and the second to the undrained condition. For the purpose of hydrologic soil group, adequately drained means that the seasonal high water table is kept 24 inches below the surface in a soil where it would be higher in a natural state (NRCS 2009).

A commonly used soil attribute is the soil erodibility factor (K-factor). The K-factor indicates the susceptibility of a soil to sheet and rill erosion by water. The K-factor is one of the factors used in the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss

by sheet and rill erosion. Losses are expressed in tons per acre per year. These estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of K range from 0.02 to 0.69. The higher the value, the more susceptible the soil is to sheet and rill erosion by water (Web Soil Survey 2013).

The distribution of K-factor values in the Middle Sangamon River watershed range from 0.02 to 0.49.

2.5 Population

The Census 2010 TIGER/Line data from the U.S. Census Bureau were retrieved. Geographic shapefiles of census blocks were downloaded for the entire state of Illinois. All census blocks that have geographic center points (centroids) within the watershed were selected and tallied in order to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Approximately 70,800 people reside in the Middle Sangamon River watershed. The major municipalities in the watershed are shown in **Figure 1-1**. The largest urban development in the watershed is the city of Decatur. The estimated population of the portion of Decatur that lies within the watershed boundary is approximately 47,100 people.

2.6 Climate, Pan Evaporation, and Streamflow

2.6.1 Climate

Central Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly precipitation and temperature data from Decatur, Illinois (station id. 112193) in Macon County were extracted from the National Climatic Data Center (NCDC) database for the years 1893 through 2013. The data station in Decatur, Illinois is near the eastern edge of the Middle Sangamon River watershed and is expected to be representative of precipitation throughout the watershed.

Table 2-2 contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is 38.3 inches. May and June are historically the wettest months while January and February are the driest.

Table 2-2 Average Monthly Climate Data in Decatur, Illinois

Month	Total Precipitation (inches)	Maximum Temperature (degrees F)	Minimum Temperature (degrees F)
January	2.2	57.2	-4.8
February	2.0	61.5	-0.3
March	3.2	74.6	12.2
April	3.9	83.6	25.3
May	4.3	89.9	35.4
June	4.1	95.4	46.2
July	3.6	97.6	52.2
August	3.4	96.4	50.3
September	3.5	93.5	38.0
October	3.0	85.7	27.1
November	2.8	73.0	15.1
December	2.5	60.5	1.4
Total	38.3		

2.6.2 Pan Evaporation

Through the Illinois State Water Survey (ISWS) website, pan evaporation data are available from nine locations across Illinois (ISWS 2007). The Springfield, Illinois station was chosen to be representative of pan evaporation conditions for the Middle Sangamon River watershed. The Springfield station is located approximately 25 miles west of the Middle Sangamon River watershed. This station was chosen for its proximity to the Middle Sangamon River watershed. The average annual pan evaporation at the Springfield station for the years 1980 to 1990 is 49.2 inches. Actual evaporation is typically less than pan evaporation, so the average annual pan evaporation was multiplied by 0.75 to calculate an average annual evaporation of 36.9 inches (ISWS 2007).

2.6.3 Streamflow

Analysis of the Middle Sangamon River watershed requires an understanding of flow throughout the drainage area. One active USGS gage (USGS 5573540 Sangamon River at Rt 48 at Decatur, Illinois) exists within the watershed **Figure 2-4**. An additional active USGS gage (USGS 5576500 at Riverton, Illinois) is located on the Sangamon River approximately 2 miles downstream of the Middle Sangamon River watershed boundary. USGS gage 5592050 Robinson Creek near Shelbyville, Illinois is located on a smaller tributary approximately 15 miles south of the Middle Sangamon River watershed and serves as a surrogate for estimating stream flows in smaller tributaries within the Middle Sangamon River watershed **Figure 2-4**. **Table 2-3** summarizes the stations along with their respective data availability information.

Table 2-3 Streamflow Gages used for Middle Sangamon River Watershed TMDL Assessment

Gage Number	Name	Available Data Type	POR
5573540	Sangamon River at Rt. 48 at Decatur, IL	Gage Height, Discharge	1982-2016
5576500	Sangamon River at Riverton, IL	Gage Height, Discharge	1908-2016
5592050	Robinson Creek near Shelbyville, IL	Gage Height, Discharge	1979-2016

USGS gage 5573540 (Sangamon River at Rt 48) is located at the upper end of the Middle Sangamon River watershed just above impaired segment E-05. The Sangamon River at this gage has a drainage area of approximately 938 square miles. The average monthly flows in the Sangamon River at this location (gage 5573540) range from 111 cubic feet per second (cfs) in August to 1,360 cfs in May **Figure 2-5**.

USGS gage 5576500 (Sangamon River at Riverton, Illinois) is located approximately 2 miles downstream of the Middle Sangamon River Watershed and has a drainage area of approximately 2,618 square miles. The average monthly flows in the Sangamon River at this location (gage 5576500) are considerably greater, ranging from 498 cfs in August to 3,310 cfs in May.

USGS gage 5592050 (Robinson Creek near Shelbyville) is located approximately 15 miles south of the Middle Sangamon River Watershed and has a drainage area of approximately 93.1 square miles. The average monthly flows in the Robinson Creek range from 13 cfs in August to 151 cfs in May.

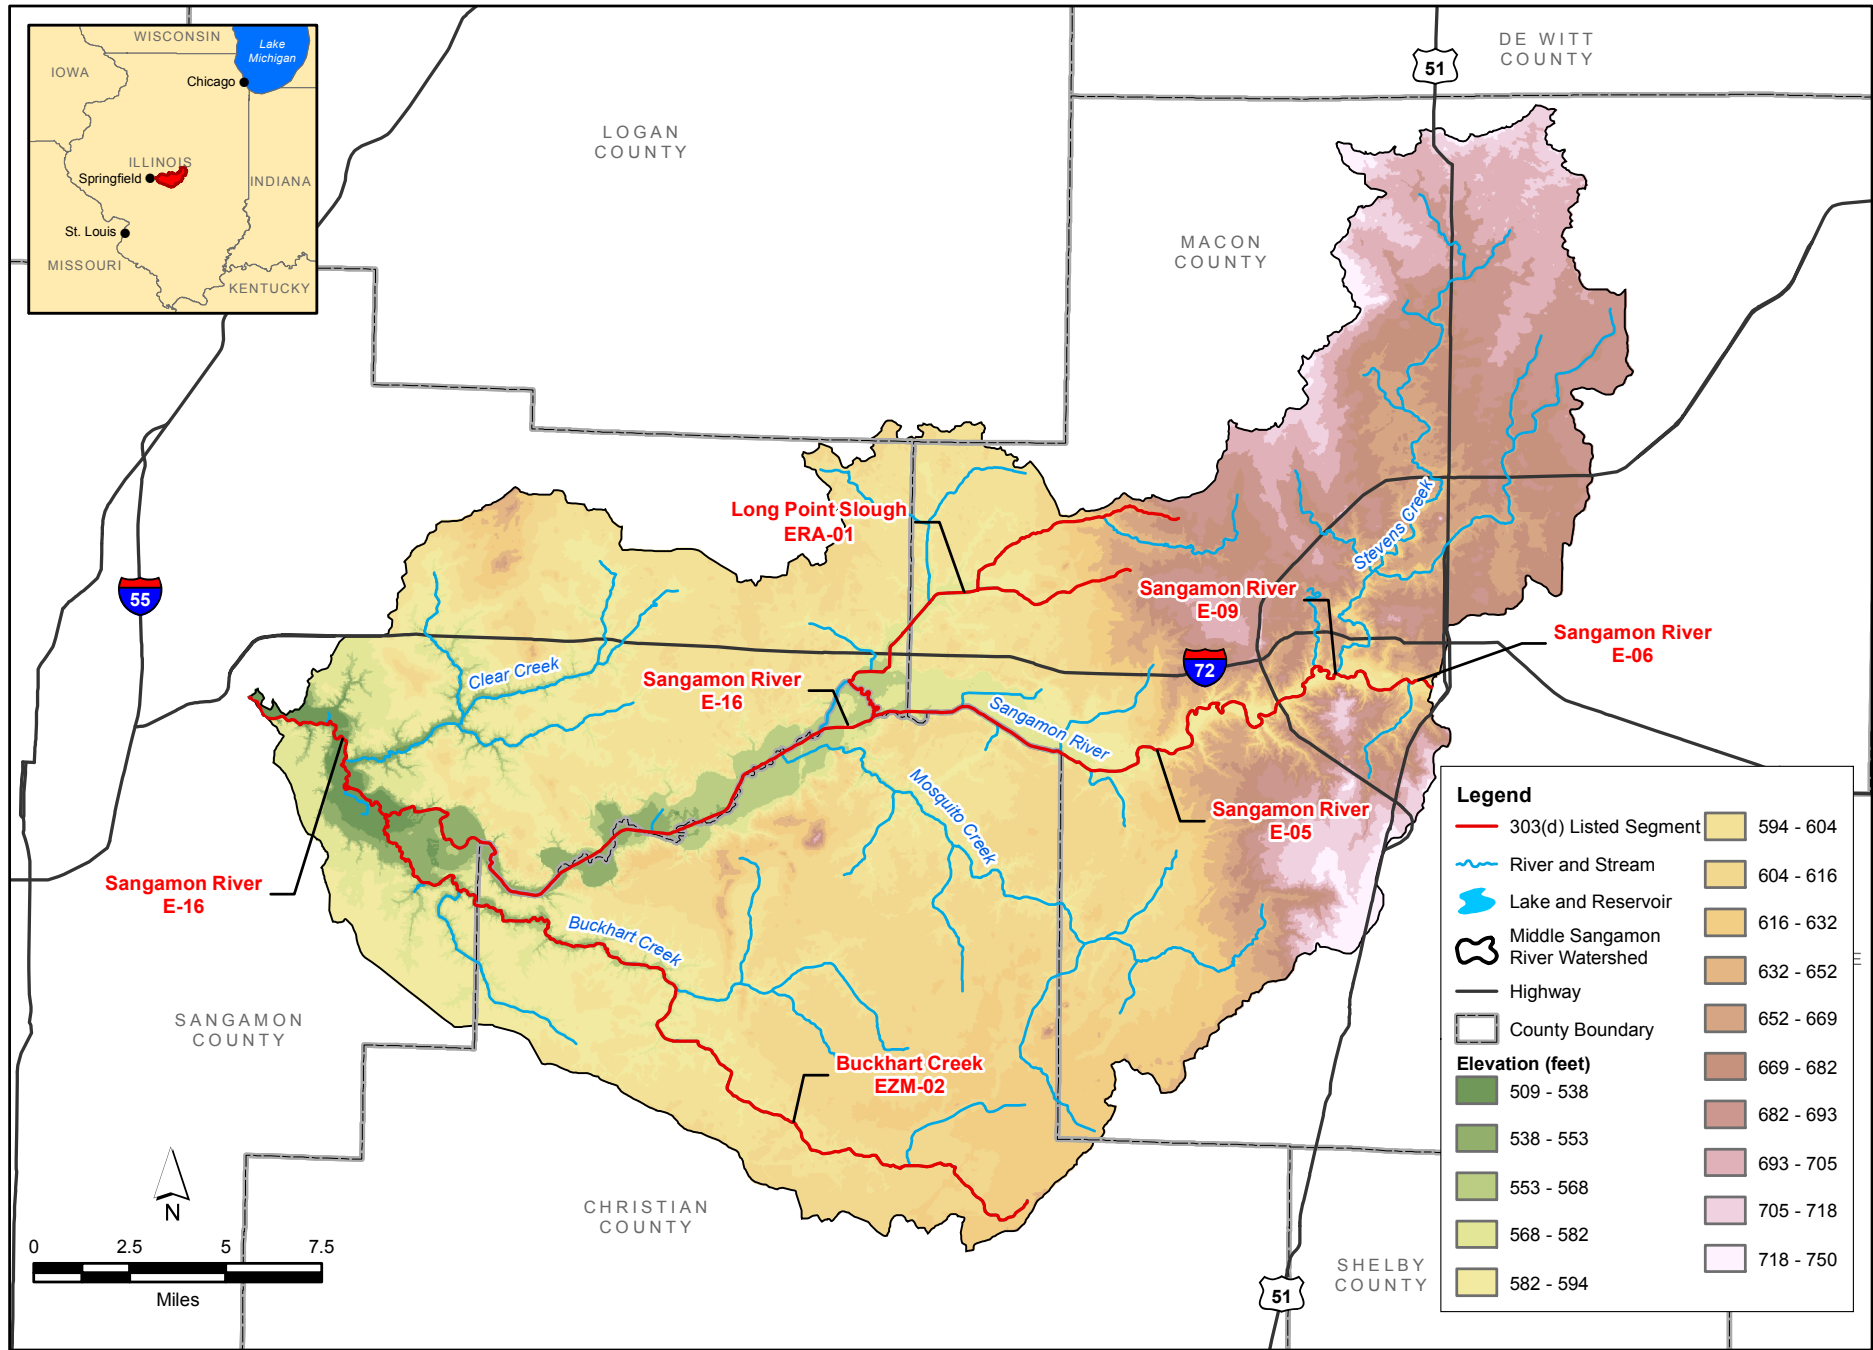

Data from these gages were used to estimate flow values for the impaired segments within the Middle Sangamon River watershed. The closest available gage on the same waterbody or the gage with the most similar land use and watershed area was selected for each segment. Estimates of flow values for impaired segments is corrected for each segment's watershed size using the drainage area ratio method, represented by the following equation:

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where Q_{gaged} = Streamflow of the gaged basin
 Q_{ungaged} = Streamflow of the ungaged basin
 $\text{Area}_{\text{gaged}}$ = Area of the gaged basin
 $\text{Area}_{\text{ungaged}}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

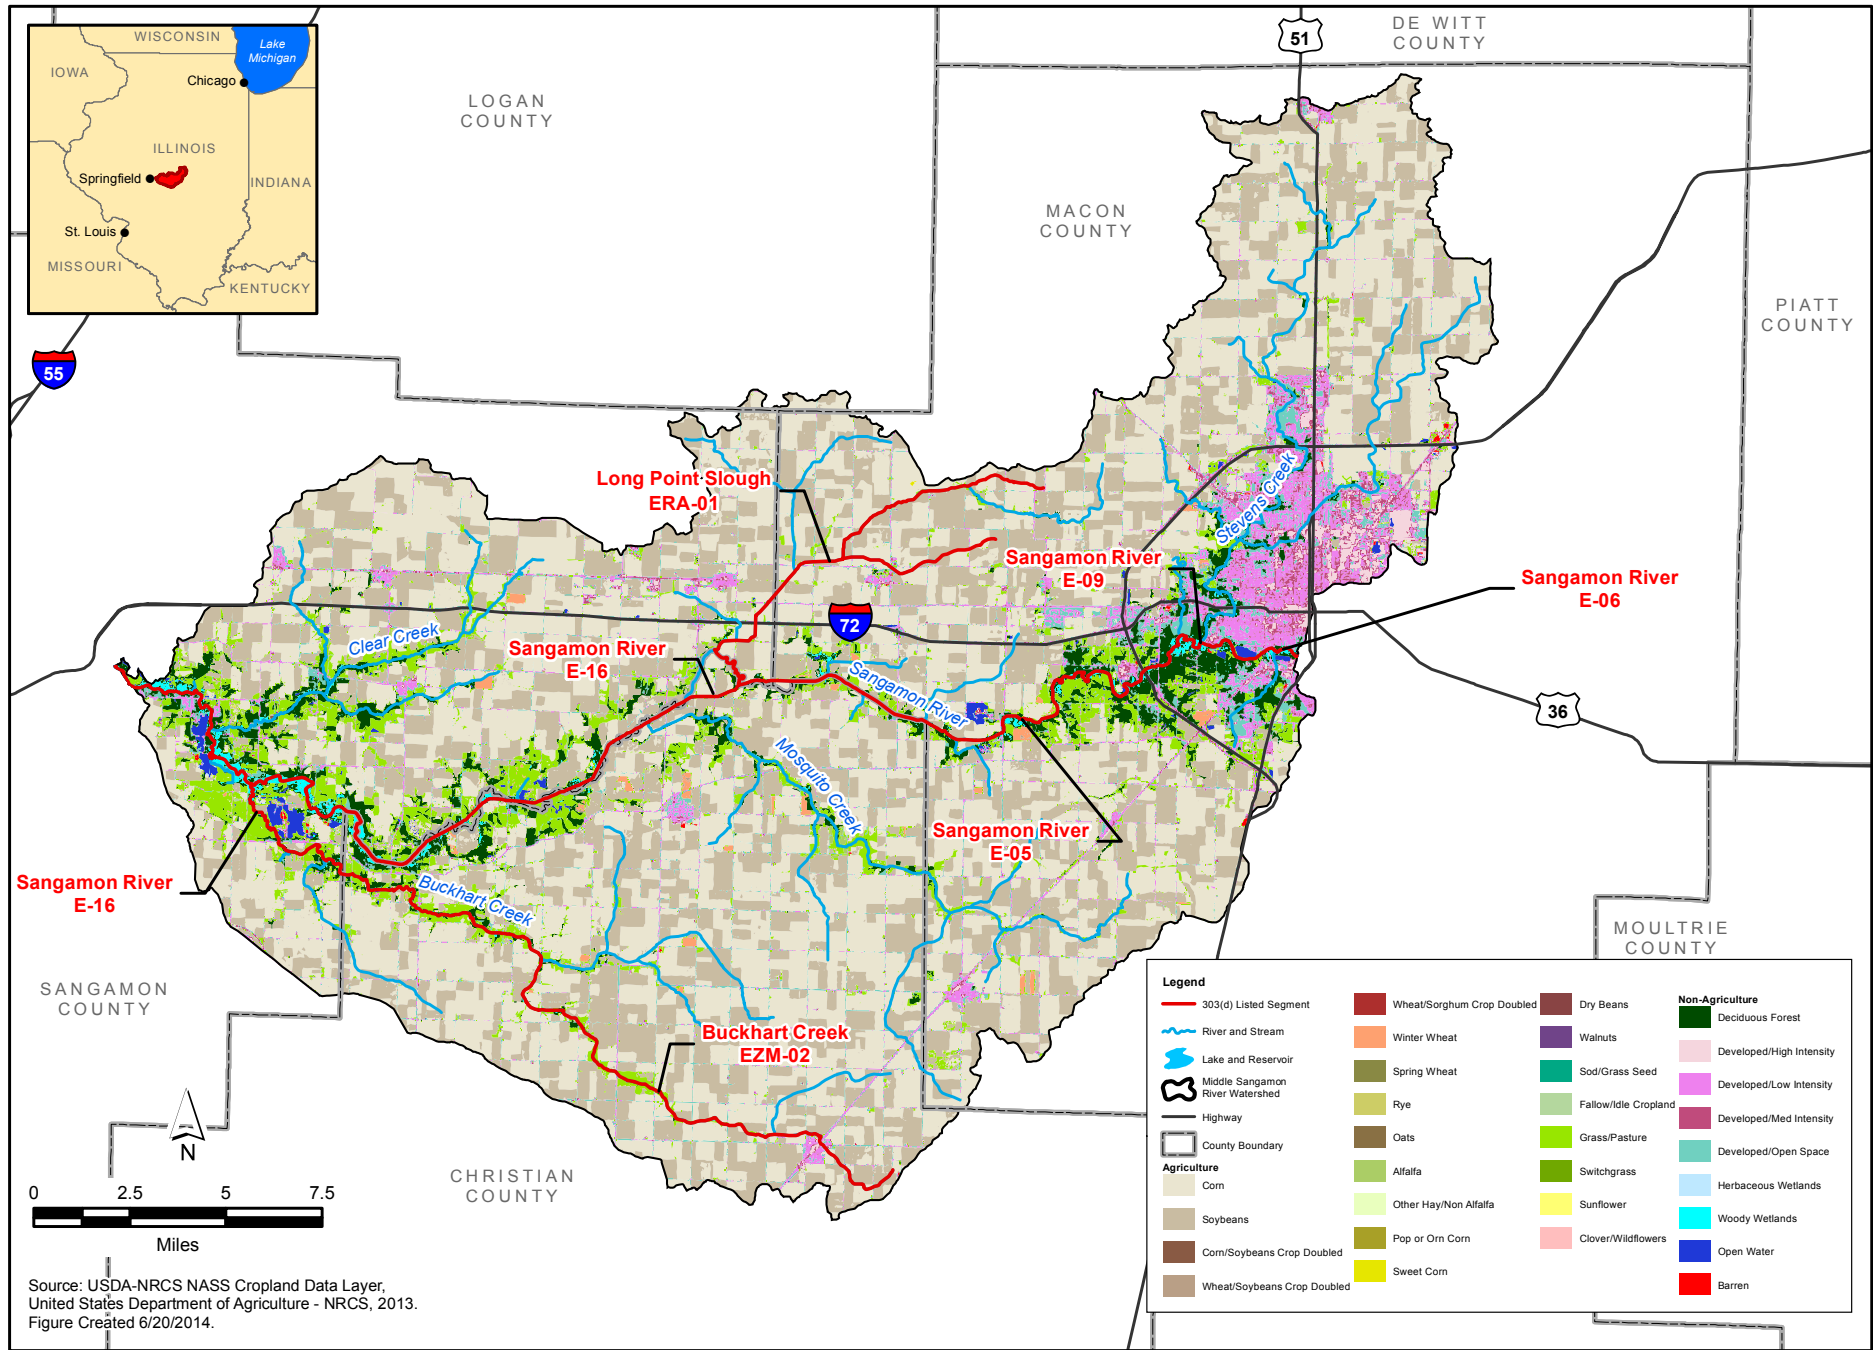

Data downloaded through the USGS for the surrogate gage on Robinson Creek were adjusted to account for point source influence in the watershed upstream of the gaging station. Average daily flows from all National Pollutant Discharge Elimination System (NPDES) permitted facilities upstream of the surrogate USGS gages were subtracted from the gaged flow prior to flow-per-unit-area calculations. The resulting estimates account for flows associated with precipitation and overland runoff only. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the target watershed were then added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment.

Section 3

Middle Sangamon River Watershed Public Participation

3.1 Middle Sangamon River Watershed Public Participation and Involvement

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet recommended TMDLs. It is important to involve the public as early in the process as possible to achieve maximum cooperation and counter concerns as to the purpose of the process and the regulatory authority to implement any recommendations.

The Stage 1 public meeting was held in Decatur, Illinois on September 11, 2014. An additional public meeting was held at Richland Community College on September 27, 2017. Comments received at the meetings, or following the meetings during the 30-day comment period, have been incorporated into this document.

This page intentionally left blank.

Section 4

Middle Sangamon River Watershed Water Quality Standards

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the "designated uses" of the state's waterways. In the state of Illinois, setting the water quality standards is the responsibility of the Illinois Pollution Control Board (IPCB). Illinois is required to update water quality standards every 3 years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA, in conjunction with USEPA. New standards are then developed or revised during the 3-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to the IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards.

4.2 Designated Uses

The waters of Illinois are classified by designated uses, which include: General Use, Public and Food Processing Water Supplies, Lake Michigan, and Secondary Contact and Indigenous Aquatic Life Use (Illinois EPA 2013). The designated use applicable to the Middle Sangamon River Watershed is the General Use.

4.2.1 General Use

The General Use classification is defined by IPCB as standards that "will protect the state's water for aquatic life, wildlife, agricultural use, secondary contact use and most industrial uses, and ensure the aesthetic quality of the state's aquatic environment." Primary contact uses, defined as "any recreational or other water use in which there is prolonged and intimate contact with the water (where the physical configuration of the waterbody permits it) involving considerable risk of ingesting water in quantities sufficient to pose a significant health hazard, such as swimming and water skiing" (35 Ill. Adm. Code 301.355), are protected for all General Use waters.

4.3 Illinois Water Quality Standards for Impaired Waterbodies in the Middle Sangamon River Watershed

Table 4-1 presents the numeric water quality standards of the potential causes of impairment for streams in the Middle Sangamon River Watershed. According to the Illinois EPA Integrated Report, aquatic life use assessments in streams are typically based on the interpretation of biological information, physicochemical water data, and physical-habitat. The primary biological measures used are the fish Index of Biotic Integrity (fIBI), the macroinvertebrate Index of Biotic

Integrity (mIBI) and the Macroinvertebrate Biotic Index (MBI). Physical-habitat information used in assessments includes quantitative or qualitative measures of stream-bottom composition and qualitative descriptors of channel and riparian conditions. Physicochemical water data used include measures of “conventional” parameters (e.g., dissolved oxygen [DO], pH, and temperature), priority pollutants, non-priority pollutants, and other pollutants. To assess primary contact use, Illinois EPA uses all fecal coliform bacteria from water samples collected in May through October, over the most recent five-year period (i.e., 2009 through 2013 for the 2014 Integrated Report). Based on these water samples, geometric means and individual measurements of fecal coliform bacteria are compared to the concentration thresholds.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of Impairments in the Middle Sangamon River Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Dissolved Oxygen	mg/L	March through July ≥5.0 minimum & ≥6.0 7-day daily mean averaged over 7 days;	302.206(b)
		August through February ≥3.5 minimum, ≥4.0 7-day minimum averaged over 7 days & ≥5.5 30-day daily mean	
Total Fecal Coliform	Count/100 mL	<i>May through October</i> 200 ⁽¹⁾ , 400 ⁽²⁾	302.209

mg/L = milligrams per liter

(1) Geometric mean based on a minimum of five samples taken over not more than a 30-day period.

(2) Standard shall not be exceeded by more than 10 percent of the samples collected during any 30-day period.

4.4 Water Quality Targets

As mentioned in Section 1.2, Illinois EPA began including LRSs in TMDL watershed projects in 2012 for pollutants that do not currently have numeric water quality standard. Developing an LRS involves determining the loading capacity and load reduction necessary that is needed in order for the waterbody to meet “Full Use Support” for its designated uses. The load capacity is not divided into WLA, LA, or MOS, these are represented by one number as a target concentration for load reduction within each unique watershed. The LRS provides guidance (with no regulatory requirements) for voluntary nonpoint source reduction efforts by implementing agricultural and urban stormwater BMPs.

The current LRS targets are based on data from all stream segments within the HUC-10 basins of the watershed, as well as stream segments or lakes which closely border the watershed in neighboring HUC-10 basins, in order to best represent the land use, hydrologic, and geologic conditions unique to the watershed. Load reduction targets were calculated by Illinois EPA using data from stream segments whose most current assessment shows full support for aquatic life and data that have passed quality assurance and quality checks within Illinois EPA and are in accordance with state and federal laws. An LRS target value was developed by Illinois EPA for the Middle Sangamon River watershed to address impairments caused by sedimentation and siltation using non-volatile suspended solids (NVSS) concentrations as a surrogate target parameter. The watershed-specific target value for NVSS is 23.1 mg/L.

4.5 Potential Pollutant Sources

In order to properly address the conditions within the Middle Sangamon River watershed, potential pollutant sources must be investigated for the pollutants where TMDLs have been developed. The following is a summary of the potential sources associated with the listed potential causes for the 303(d) listed segments in this watershed. The sources provided below were identified in the 2016 303(d) list by the state. Additional investigation and documentation of sources is provided in Sections 5, 7 and 8.

Table 4-2 Potential Pollutant Sources for Impaired Waterbodies in the Middle Sangamon River Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2016 303(d) list)
E-05	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
E-06	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
E-09	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
E-16	Sangamon River	Fecal Coliform	Primary Contact Recreation	Sources Unknown
ERA-01	Long Point Slough	<i>Sedimentation/Siltation</i>	Aquatic Life	Channelization
EZM-02	Buckhart Creek	Dissolved Oxygen	Aquatic Life	Channelization
		<i>Sedimentation/Siltation</i>	Aquatic Life	Channelization and Crop Production

Bold Causes of Impairment have numeric water quality standards and TMDLs were developed. Italicized Causes of Impairment do not have numeric water quality standards and were addressed through LRS development.

Section 5

Middle Sangamon River Watershed Characterization

In order to further characterize the Middle Sangamon River watershed, a wide range of data were collected and reviewed. Water quality data for impaired stream segments, as well as information on potential point and nonpoint sources within the watershed were compiled from a variety of data sources. This information is presented and discussed in further detail in the remainder of this section.

5.1 Water Quality Data

Illinois EPA monitoring programs that contribute data to the assessment of streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program. The majority of data used for this report came from the Ambient Water Quality and Intensive Basin Surveys. The Ambient Water Quality Network includes 213 fixed stream stations statewide that are sampled every 6 weeks. Additional data are collected during Intensive Basin Surveys, which typically include approximately 100 basin-specific stations per year and are conducted on a 5-year cycle. Additional information on Illinois EPA's monitoring programs can be found in the "Illinois Water Monitoring Strategy" (<http://www.epa.state.il.us/water/water-quality/monitoring-strategy/>).

Data from a total of eight historical water quality monitoring stations within the Middle Sangamon River watershed were reviewed for this report. These water quality data were primarily provided by the Illinois EPA; however, some additional water quality data were queried from the USEPA's Storage and Retrieval (STORET) database. **Figure 5-1** shows the water quality data stations within the watershed that contain data relevant to the impaired segments.

The impaired waterbody segments in the Middle Sangamon River watershed were presented in Section 1. Refer to **Table 1-1** for impairment information specific to each segment. Data are summarized by impairment and discussed in relation to the relevant Illinois numeric water quality standard or LRS target value. Data summaries provided in this section include all available date ranges of collected data, in some cases dating back to the 1970s.

5.1.1 Stream Water Quality Data

There are six impaired stream segments within the Middle Sangamon River watershed (Sangamon River segments E-05, E-06, E-09, and E-16; Long Point Slough segment ERA-01; and Buckhart Creek segment EZM-02). Impaired segments on the Sangamon River and Buckhart Creek have causes of impairment based on constituents with numeric water quality standards (fecal coliform and dissolved oxygen [DO]). Buckhart Creek and Long Point Slough are impaired due to excess sedimentation and siltation which was assessed by review of NVSS concentrations

(refer to discussion in Section 4). The available NVSS data for these segments are presented below.

There is one active water quality station on Long Point Slough (ERA-01) and in each of the impaired segments of the Sangamon River: E-05, E-06, E-09, and E-16. Data from three water quality stations are available for the impaired segment of Buckhart Creek: EZM-01, EZM-02, and EZM-07. The periods of record for the Long Point Slough and Buckhart Creek data, however, is extremely limited. The data summarized in this section include water quality data for impaired constituents as well as parameters that may be useful for future modeling and analysis efforts. All historical water quality data for the impaired segments of the Middle Sangamon River watershed are available in Appendix C.

5.1.2 Fecal Coliform

Sangamon River segments E-05, E-06, E-09, and E-16 are listed for impairment of the primary contact recreation use caused by total fecal coliform. **Table 5-1** summarizes available historical fecal coliform data on these segments. The general use water quality standard for fecal coliform states that the standard of 200 colony forming units (cfu) per 100 milliliters (mL) shall not be exceeded by the geometric mean of at least five samples, nor can 10 percent of the samples collected exceed 400 cfu per 100 mL in protected waters, except as provided in 35 Ill. Adm. Code 302.209(b). Samples must be collected over a 30-day period or less during the months of May through October. Due to the frequency of historical sampling, the required minimum of five samples collected in a 30-day period was not available for comparison to the standard prior to Stage 2 data collection.

In 2015, Illinois EPA collected samples for fecal coliform bacteria analysis on a number of occasions and the 5-samples in 30-days requirement was met at stations E-05, E-06, and E-09 during a period covering parts of May and June. Exceedances of the 200 cfu/100 ml 30-day average (geomean) standard were noted during this time period at stations E-05 (338 cfu/100ml) and E-06 (209 cfu/100ml). The 30-day average at station E-09 during this time period was 118 cfu/100ml and did not exceed the standard. A total of four viable samples were collected at E-16 during this time period and resulted in a geomean of 547 cfu/100ml, however; the minimum sample size criteria was not achieved.

In order to utilize a broader scope of the available data and as a conservative measure, single samples are compared to both standards for the purposes of this report. Potential exceedances of the 200 cfu/100 mL geometric mean (based on single sample comparisons to the geometric mean standard due to data limitations) and 400 cfu/100 mL daily maximum standards occur regularly throughout all impaired stream segments (**Table 5-1**), with potential exceedances recorded most frequently in Segment E-09 (96 of 119 samples). **Figure 5-2** through **Figure 5-5** show the total fecal coliform samples collected over time on the impaired segments of the Sangamon River. The data do not show any discernable seasonal or long-term temporal trends.

Table 5-1 Existing Fecal Coliform Data for Sangamon River Watershed Impaired Stream Segments

Sample Location and Parameter	Period of Record and Number of Data Points	Geometric Mean of all Samples	Maximum	Minimum	Number of Samples > 200 (1)	Number of Samples > 400 (1)
Sangamon River Segment E-05; Sample Location E-05						
Total Fecal Coliform (cfu/100 mL)	2000 - 2015; 56	443	11,800	30	40	27
Sangamon River Segment E-06; Sample Location E-06						
Total Fecal Coliform (cfu/100 mL)	1999 - 2015; 70	53	20,000	1	16	6
Sangamon River Segment E-09; Sample Location E-09						
Total Fecal Coliform (cfu/100 mL)	1978 - 2015; 134	1,208	920,000	10	103	89
Sangamon River Segment E-16; Sample Location E-16						
Total Fecal Coliform (cfu/100 mL)	2000 - 2015; 40	302	6,050	1	28	18

¹⁾ Samples collected during the months of May through October

5.1.3 Dissolved Oxygen

Buckhart Creek segment EZM-02 is listed for impairment of the aquatic life use caused by low DO concentrations. **Table 5-2** summarizes available historical DO data on this segment. Two active water quality stations were located on this segment; however, prior to TMDL Stage 2 activities, the available data included only three records for DO. All prior measurements of DO reported for segment EZM-02 occurred in 2003. Additional data were collected from Buckhart Creek in 2015 and are included in this report.

The general use water quality standard for DO provides seasonal instantaneous minimum and minimum weekly (7-day) average concentrations for DO in streams. Due to limited data availability, only the instantaneous minimum standards (5.0 mg/L for March through July and 3.5 mg/L for August through February) were used to assess compliance.

The summary data presented in **Table 5-2** reflect single measurements compared to the applicable seasonal standard at the time of the field measurement. One exceedance was reported in the available dataset. The exceedance was reported on October 15, 2003, for a DO measurement of 3.2 mg/L that was below the applicable water quality standard of 3.5 mg/L. **Figure 5-6** shows the DO measurements collected over time on Buckhart Creek. Recent data show that DO concentrations have been in compliance with the water quality standard and further TMDL development is not warranted. The segment has been recommended for delisting from the 2018 303(d) list.

Table 5-2 Existing Dissolved Oxygen Data for Buckhart Creek Segment EZM-02; Monitoring Locations EZM-01, EZM-02, and EZM-07

Parameter	Illinois WQ Standard (mg/L)	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Number of Exceedances
Dissolved Oxygen	5.0 ⁽¹⁾ , 3.5 ⁽²⁾	2003; 4	7.4	10.3	3.2	1
		2015; 9	7.7	9.2	5.9	0

⁽¹⁾ Instantaneous Minimum *March-July*

⁽²⁾ Instantaneous Minimum *August-February*

5.1.4 Siltation/Sedimentation

Long Point Slough (ERA-01) and Buckhart Creek segment EZM-02 are both listed for impairment of the aquatic life use by sedimentation and siltation. Illinois EPA is currently addressing sedimentation and siltation impairments through assessment of NVSS concentrations. Illinois EPA provided a watershed-specific LRS target value for NVSS concentrations in streams of the Middle Sangamon River watershed of 23.1 mg/L of NVSS.

NVSS concentrations are calculated as the difference of total suspended solids (TSS) and total volatile solids (TVS) in a single sample. Only paired TSS and TVS results from the same sampling event and location were used to calculate NVSS concentrations. The available NVSS data for these segments are presented in **Table 5-3** below. Graphical comparison of the data to the LRS target value is also provided **Figure 5-7**.

Table 5-3 Existing NVSS Data for Stream Segments Impaired by Excess Sedimentation/Siltation

Sample Location and Parameter	Period of Record and Number of Data Points	Mean	Maximum	Minimum	Exceedances of the LRS Target Value
Long Point Slough Segment ERA-01; Sample Location ERA-01					
NVSS (mg/L)	2003; 3	37	55	20	2
Buckhart Creek Segment EZM-02; Sample Locations EZM-01, EZM-07					
NVSS (mg/L)	2003, 2013; 7	22	47	6	3

5.2 Point Sources

There are 14 individual NPDES permitted point sources located within the Middle Sangamon River watershed. Wastewater treatment plants, combined sewer overflows (CSOs), and additional overflow outfalls in the Upper Sangamon River watershed were assigned WLAs as part of the TMDL process completed in that watershed in 2007. WLAs for fecal coliform were assigned to the permitted discharges based on the TMDL endpoint of 200 cfu/100 mL and permitted flows or historical overflow event flow data. This earlier TMDL is being implemented to restore all waters upstream of the dam to comply with applicable water quality standards. **Table 5-4** contains permit information for all of the point sources in the Middle Sangamon River basin while **Figure 5-8** shows the locations of outfalls for each facility. Permit limits and discharge monitoring reports were analyzed and further detailed in Sections 7 and 8, where appropriate.

Municipal separate storm sewer system (MS4) permits within the watershed exist for Macon County, the City of Decatur and the Village of Forsyth (**Table 5-5**). Illinois Department of

Transportation (IDOT) roadways are also covered by a MS4 permit. MS4 discharges have the potential to impact all four segments of the mainstem Sangamon River within the watershed. Each segment is impaired for fecal coliform, which can be a potential concern for stormwater discharges.

Facilities discharging treated domestic wastewater have the potential to affect fecal coliform counts in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain sediments, but industry is typically less likely to impact fecal coliform counts. Permitted urban stormwater has the potential to affect sediment loading and fecal coliform loading to area waterbodies.

Table 5-4 Permitted Facilities Discharging to or Upgradient of Impaired Segments in the Middle Sangamon River Watershed

Facility ID	Facility Name	Impaired Segments	Facility Type

5.3 Nonpoint Sources

There are many potential nonpoint sources of fecal coliform and sediment loading to the impaired segments in the Middle Sangamon River watershed. Data presented below include site-specific cropping practices, animal operations, and information on area septic systems. Data were collected where available through communications with the local NRCS, Illinois Soil and Water Conservation Districts, and public health departments.

5.3.1 Crop Information

Approximately 75 percent of the land within the Middle Sangamon River watershed is devoted to agriculture. Corn and soybean farming account for 43.2 and 31.5 percent of the agricultural land in the watershed area, respectively. Agricultural practices are important nonpoint sources to consider in TMDL development because of their potential to contribute sediments through soil loss and erosion. Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. Each tillage practice leaves varying levels of crop residue after planting (see detailed discussion in Section 9). Tillage practices directly relate to water quality through their effects on soil loss. Soil can be an instream pollutant (sedimentation/siltation) and can also carry pollutants (fecal coliform) to receiving waters.

The percentage of each tillage practice for corn, soybeans, and small grains by county are available in the Illinois Soil Conservation Transect Surveys conducted by the Illinois Department of Agriculture. Data specific to the Middle Sangamon River watershed were not available; however, data from the 2013 survey are presented in the following tables for the full extent of Macon **Table 5-6**, Christian **Table 5-7**, and Sangamon **Table 5-8** Counties.

Table 5-6 Tillage Practices in Macon County

Tillage System	Corn	Soybean
Conventional	84%	69%
Reduced - Till	13%	18%
Mulch - Till	1%	2%
No - Till	1%	11%

Table 5-7 Tillage Practices in Christian County

Tillage System	Corn	Soybean
Conventional	92%	18%
Reduced - Till	7%	70%
Mulch - Till	0%	8%
No - Till	0%	4%

Table 5-8 Tillage Practices in Sangamon County

Tillage System	Corn	Soybean
Conventional	52%	51%
Reduced - Till	20%	10%
Mulch - Till	8%	13%
No - Till	20%	26%

According to local NRCS officials, the use of tile drainage is widespread throughout the watershed. Tile drainage can potentially be a path for increased sediment and nutrient loss from fields. Tile drains help move water from soils and provide a quick route for pollutants on fields and bound in soils to receiving waters, particularly following precipitation events. Extensive tiling can also intensify the volume and timing of runoff events. Increasing the frequency of high intensity runoff events can increase streambank erosion which increases the sediment loading to the watershed. In Christian County, NRCS officials estimate that nearly all fields have some tiling, with up to 30 percent of farms having fully tilled fields. The situation is similar in Sangamon County, where tiling began soon after the area was settled. However, Sangamon County NRCS officials noted that many farms have recently upgraded their drainage systems to replace failing equipment. Macon County NRCS officials said drain tile is very common throughout the county due to the nature of the local soils. Without more precise local information, soils data may be reviewed in the future to provide information on hydrologic soil groups in order to estimate tiling to inform implementation of management measures.

5.3.2 Animal Operations

Information on commercial animal operations is available from the *National Agricultural Statistics Service* (NASS). Data for Christian, Macon, and Sangamon Counties are presented in **Tables 5-9, 5-10, and 5-11**. Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals and wildlife have the potential to increase erosion and contribute fecal coliform through manure. Data from 2013 have been published on the USDA website, and are presented here along with the 2007 dataset for comparison. Watershed-specific information regarding animal operations located near impaired waters in the Middle Sangamon River watershed was not available during report development. The data show that in general, livestock numbers have been decreasing in the watershed counties with the exception of hogs and pigs in Christian County and cattle and calves and poultry in Macon County.

Table 5-9 Christian County Animal Population (2007 & 2013 Census of Agriculture)

Animal	2007	2013	Percent Change
Cattle and calves	8,610	7,164	-17%
Beef	4,771	1,974	-59%
Dairy	NA	10	NA
Hogs and Pigs	35,096	46,581	33%
Poultry	896	509	-43%
Sheep and Lambs	537	388	-28%
Horses and Ponies	517	337	-35%

Table 5-10 Macon County Animal Population (2007 & 2013 Census of Agriculture)

Animal	2007	2013	Percent Change
Cattle and calves	1,978	3,528	78%
Beef	NA	1,576	NA
Dairy	NA	NA	NA
Hogs and Pigs	14,368	10,259	-29%

Sheep and Lambs	549	434	-21%
Horses and Ponies	2,214	1,682	-24%

5.3.3 Septic Systems

Approximately 6 percent of the Middle Sangamon River watershed consists of developed or urbanized land, primarily in the Decatur metropolitan area. A majority of businesses, residences, and other structures in the developed areas are served by a municipal sewer district and septic systems are uncommon in these areas. The remainder of the watershed is rural and primarily devoted to agricultural purposes.

Many households in rural areas of Illinois that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. There are many types of septic systems, but the most common septic system is composed of a septic tank draining to a septic field, where pollutant removal occurs. However, the degree of removal is limited by soils and system upkeep and maintenance.

Throughout the U.S., septic systems have been found to be a significant source of nutrient and bacteria pollution. Failing or leaking septic systems contribute to fecal coliform pollution, although animal waste, urban runoff, and permitted point sources can also contribute.

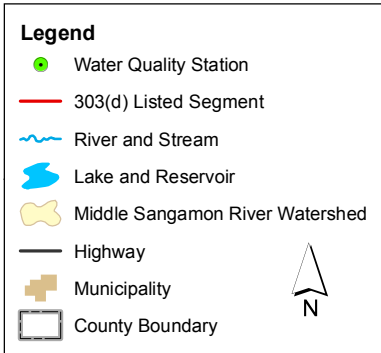

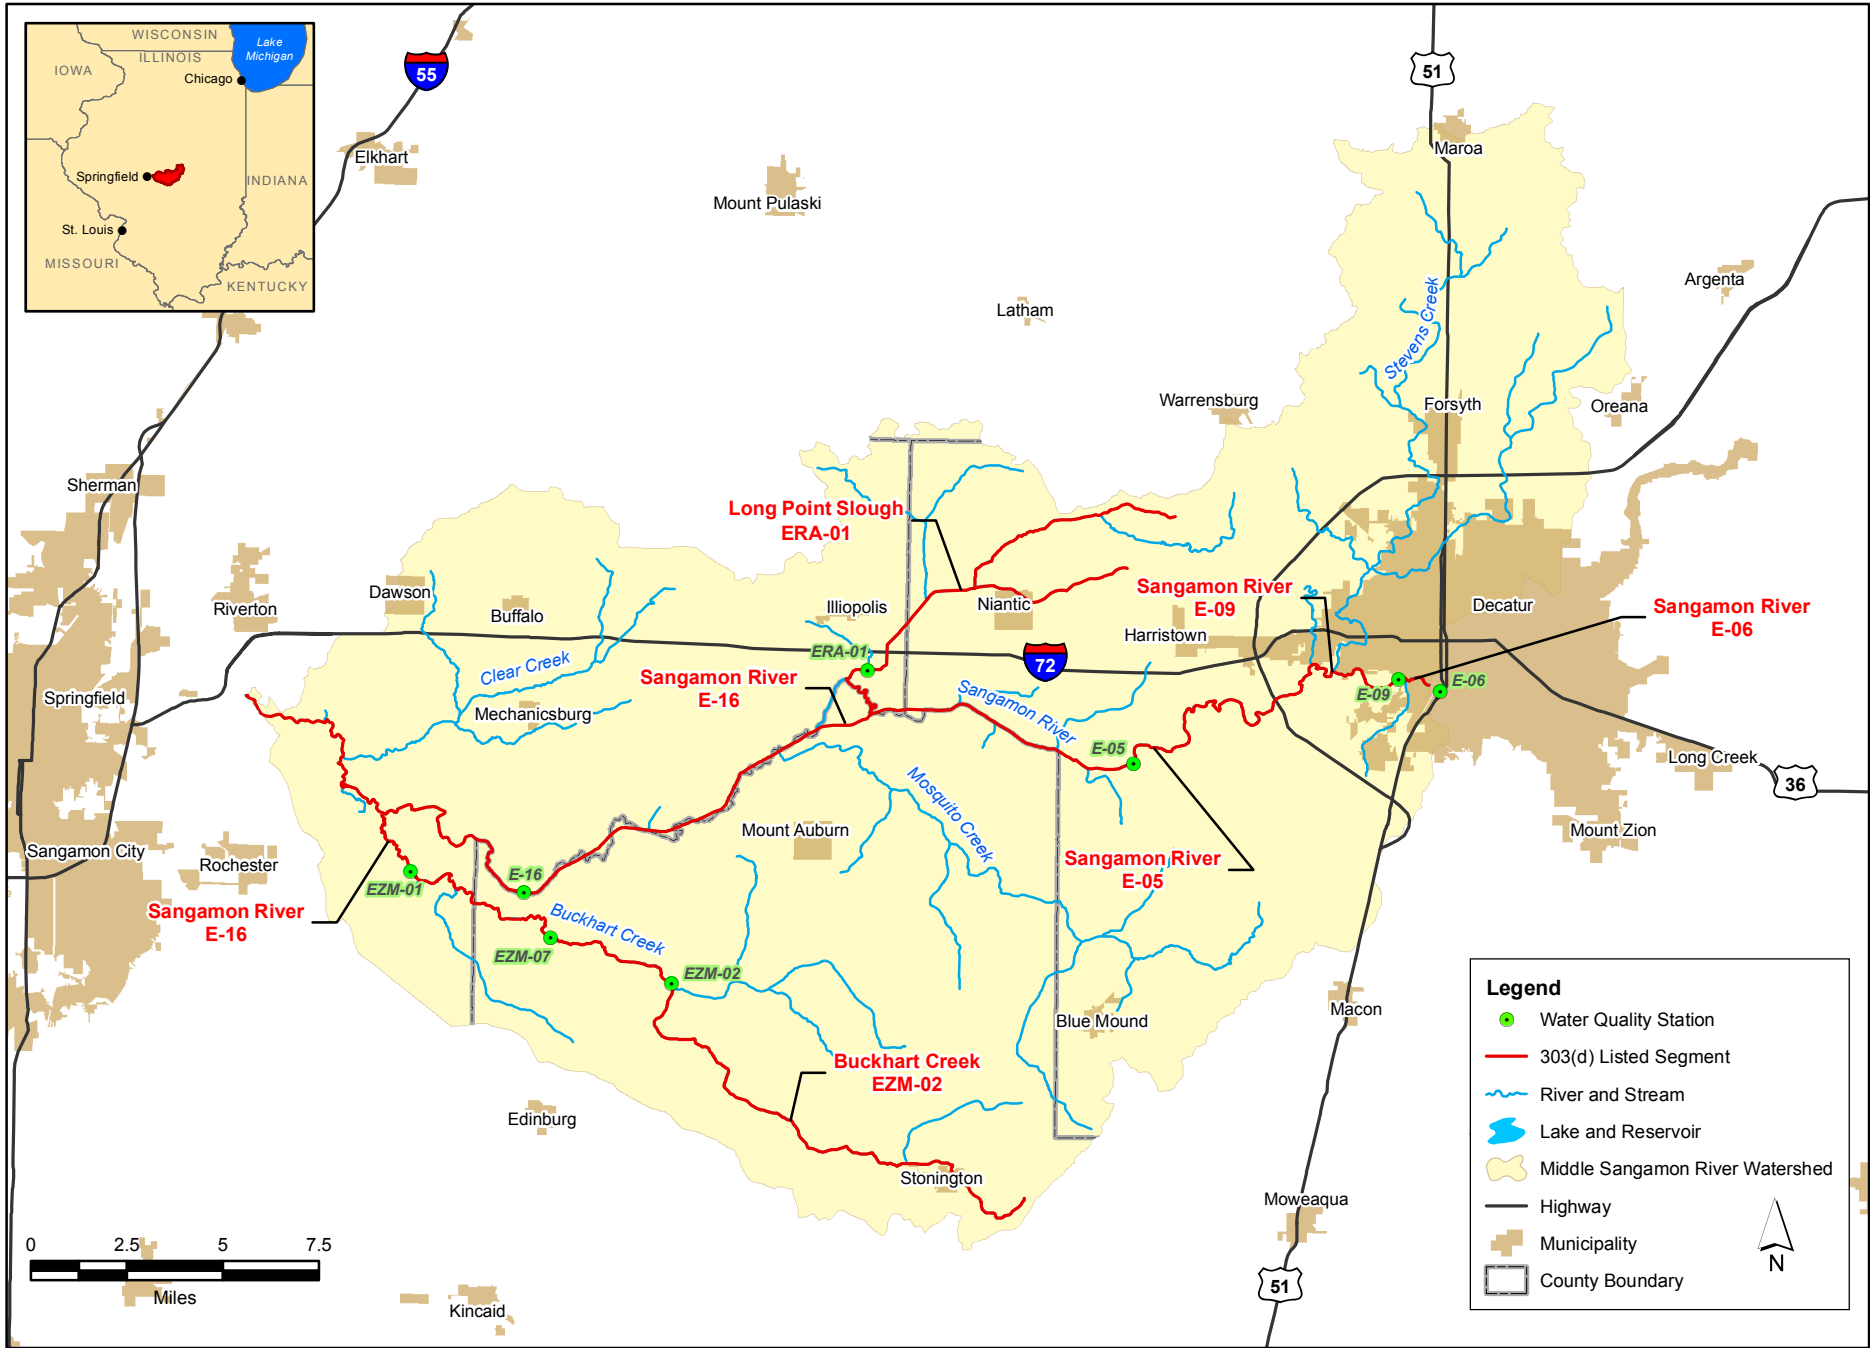

Information on the extent of sewerred and non-sewerred municipalities in the Middle Sangamon River watershed was obtained from the respective county health departments. Sangamon County health officials said most municipalities have public sewer systems but households outside of the city limits use private septic systems. The City of Decatur is the largest population center within the watershed, and Macon County health officials said that Decatur, and most towns in the county, have municipal sewer systems but estimated that perhaps 20 percent of county residents are on

private septic systems. Christian County health officials said that the Town of Stonington has a municipal sewer system but the Town of Mount Auburn does not. Residents in outlying areas of Christian County rely on private septic systems.

5.4 Watershed Studies and Other Watershed Information

Beyond the data sources described in previous sections of this report, a number of water quality and aquatic biology research projects focused on streams and lakes within the Middle Sangamon River watershed have been provided to Illinois EPA by staff and students from the Department of Biology and Chemistry at Milliken University in Decatur, Illinois. These data have been incorporated where possible, but may primarily benefit future watershed planning efforts beyond the scope of the TMDL process.

Section 6

Approach to Developing TMDL and Identification of Data Needs

Illinois EPA is currently developing TMDLs for pollutants that have numeric water quality standards. Pollutants without numeric water quality standards are addressed through the development of an LRS. Of the pollutants causing impairment to streams in the Middle Sangamon River watershed, fecal coliform and DO are the parameters with numeric water quality standards. Impairments caused by sedimentation/siltation in streams are based on narrative standards. Refer to **Table 1-1** for a full list of potential causes of impairment. Illinois EPA believes that addressing the parameters with numeric standards should lead to an overall improvement in water quality due to the interrelated nature of the other listed pollutants. Recommended technical approaches for developing TMDLs and LRSs are presented in this section. Additional data needs are also discussed.

6.1 Simple and Detailed Approaches for Developing TMDLs

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass-balance, load-duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches. Therefore, simple analyses are recommended for the Middle Sangamon River watershed. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL. As discussed above, this link can be established through a variety of techniques. The objective of the remainder of this section is to recommend approaches for establishing these links for the constituents of concern in the Middle Sangamon River watershed.

6.2 Additional Data Needs for TMDL Development in the Middle Sangamon River Watershed

Table 6-1 contains summary information regarding data availability for impairments in the Middle Sangamon River watershed. This table also includes recommendations for additional data collection to support TMDL and LRS development.

Table 6-1 Data Availability and Data Needs for TMDL Development in the Middle Sangamon River Watershed

Impairment Parameter	Segment ID	Data Count	Period of Record	Additional Data Needs ⁽¹⁾
Fecal Coliform	Sangamon River E-05	56	2000-2015	Additional fecal coliform data collection was recommended to assess current condition
	Sangamon River E-06	70	2000-2015	None
	Sangamon River E-09	134	1978-2015	Additional fecal coliform data collection was recommended to assess current condition
	Sangamon River E-16	40	2000-2015	Additional fecal coliform data collection was recommended to assess current condition
Dissolved Oxygen	Buckhart Creek EZM-02	13	2003, 2015	Additional data collection was recommended to assess current condition. Synoptic data collection for flow, hydraulics, DO, temperature, nutrients, CBOD, and SOD also recommended.
Sedimentation & Siltation (as NVSS)	Long Point Slough ERA-01	3	2003	Additional data collection recommended to assess current condition.
	Buckhart Creek EZM-02	7	2003, 2013	Additional data collection recommended to assess impairment across multiple flow conditions

⁽¹⁾ Additional site-specific data were collected by Illinois EPA in 2013-2015 from impaired waterbodies in the Middle Sangamon River watershed. At the time of Stage 1 report publication, the results of the additional sampling were listed as provisional and were not incorporated into this document. All applicable data were incorporated in Stage 3 of the TMDL process (2016).

Although there are relatively high numbers of fecal coliform sample data points throughout the Sangamon River at the time of Stage 1 report development in 2014, three of the four impaired segments in the watershed were last sampled in 2004. In order to confirm impairment and better assess the current fecal coliform concentrations in these segments (E-05, E-09, and E-16), additional sample collection was recommended and subsequently performed prior to development of this report. Sample collection at various times of the recreation season and over a range of flow conditions is most beneficial for assessing the entire range of conditions that may occur within each segment and provides a more accurate depiction of potential factors influencing the fecal coliform impairments in these segments. Illinois EPA collected multiple fecal coliform samples from impaired waterbodies in this watershed in 2013-2015. Once the necessary quality control measures were performed, these data were incorporated into this report.

The available DO dataset for Buckhart Creek at the time of the Stage 1 report publication consisted of four measurements collected in 2003. Further data collection was recommended for verification of impairment and, if needed, for development of a water quality model to calculate a DO TMDL for Buckhart Creek. It was recommended that future data collection would ideally include a synoptic (snapshot in time) water quality survey of the entire reach and potentially its major tributaries. Specific data requirements for a robust model development include measurements of flow, hydraulics, DO, temperature, major nutrients (nitrogen and phosphorus), sediment oxygen demand (SOD), and carbonaceous biochemical oxygen demand (CBOD). Illinois EPA collected additional DO data and habitat information at Buckhart Creek in 2013-2015, which have been incorporated into this report following completion of the necessary quality control measures. The additional sample results did not include any exceedances of the applicable DO

standards and this segment has subsequently been recommended for de-listing for impairment caused by low DO.

The available NVSS dataset for Buckhart Creek and Long Point Slough is limited in sample size and period of record. Recommendations for additional data collection to assess these impairments were not included in the Stage 1 report due to lack of LRS target values to address sedimentation and siltation impairments at the time of Stage 1 report publication. Although these impairments are addressed in this Stage 3 report, additional data collection in the future would allow for more reliable estimates of load reductions necessary to meet the applicable target.

6.3 Approaches for Developing TMDLs and LRSs for Stream Segments in Middle Sangamon River Watershed

6.3.1 Recommended Approach for Fecal Coliform TMDLs in the Sangamon River

The recommended approach for developing TMDLs for fecal coliform on the impaired segments is the load-duration curve method. The load-duration curve methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a waterbody.

6.3.2 Recommended Approach for DO TMDLs in Buckhart Creek

The recommended approach to TMDL development for DO impairments in streams typically consists of the development and parameterization of a series of QUAL2K models. QUAL2K is an updated spreadsheet-based version of the well-known and USEPA-supported QUAL2E model. The model simulates DO dynamics as a function of nitrogenous and CBOD, atmospheric re-aeration, SOD, and phytoplankton photosynthesis and respiration. The model also simulates the fate and transport of nutrients and BOD and the presence and abundance of phytoplankton (as chlorophyll-a). Stream hydrodynamics and temperature are important controlling parameters in the model. The model is suited to steady-state simulations.

As discussed in Section 6.2, more recent sampling performed in Buckhart Creek by Illinois EPA showed that DO levels in the waterbody meet the applicable standards. As a result, this segment is recommended for removal from the 2018 303(d) list for impairment caused by low DO.

6.3.3 Recommended Approach for Siltation/Sedimentation Evaluation

Illinois EPA developed a watershed-specific target to address impairment caused by excess siltation/sedimentation in the Long Point Slough and Buckhart Creek prior to Stage 3 of TMDL development. Illinois EPA provided a target value for NVSS concentrations as a means of addressing these impairments. Potential sources of siltation and sedimentation and NVSS have been identified as agriculture, livestock, and urban runoff in the watershed. The recommended approach for developing LRSs for sedimentation and siltation is the development of load-duration curves to assess NVSS concentrations. The load-duration curve methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a waterbody.

Section 7

Methodology Development for the Middle Sangamon River Watershed

7.1 Methodology Overview

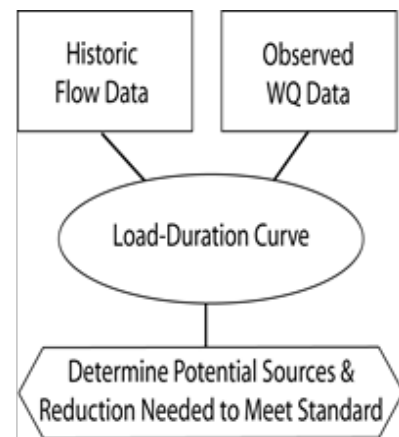

Table 7-1 contains information on the methodologies selected and used to develop TMDLs and LRSs for impaired waterbodies within the Middle Sangamon River Watershed. As discussed in Sections 5 and 6, the review of historical data and additional data collected in 2015 as part of Stage 2 of the TMDL process show that segment EZM-02 of the Buckhart Creek is no longer impaired by low DO. As a result, this segment is recommended for removal from the 2018 303(d) list for impairment caused by low DO. The development of load duration curves is the recommended methodology for the remaining impaired segments.

Table 7-1 Impaired Waterbodies in Middle Sangamon River Watershed and Assessment Methodologies

Segment ID	Segment Name	Potential Causes of Impairment	Assessment Type	Methodology
E-05	Sangamon River	Fecal Coliform	TMDL	Load Duration Curve
E-06	Sangamon River	Fecal Coliform	TMDL	Load Duration Curve
E-09	Sangamon River	Fecal Coliform	TMDL	Load Duration Curve
E-16	Sangamon River	Fecal Coliform	TMDL	Load Duration Curve
ERA-01	Long Point Slough	<i>Sedimentation/Siltation</i>	LRS	Load Duration Curve
EZM-02	Buckhart Creek	Dissolved Oxygen	No TMDL Developed	No Impairment – Recommended for 2018 delisting
		<i>Sedimentation/Siltation</i>	LRS	Load Duration Curve

7.1.1 Load-Duration Curve Overview

Loading capacity analyses were performed for stream impairments caused by fecal coliform and sedimentation/siltation through the development of a series of load-duration curves. A load-duration curve is a graphical representation of the maximum load of a pollutant that a stream segment can assimilate over a range of flow scenarios while still meeting the instream water quality standard. The load-duration curve approach utilizes historical flow data and observed water quality data to assess the magnitude and frequency of exceedences as well as to determine the flow scenarios when exceedences occur most often. This information is then used to

calculate load allocations and reductions needed to meet instream standards under all flow scenarios.

7.2 Methodology Development

The following sections further discuss and describe the methodologies utilized to examine impairments in the stream segments of the Middle Sangamon River Watershed.

7.2.1 Load Duration Curve Development

Load duration curves are used for assessment and comparison of the range of loads allowable throughout the flow regime of a stream. This approach was used to characterize the current loading of fecal coliform in impaired segments of the Sangamon River (E-05, E-06, E-09, and E-16) and NVSS concentrations in Long Point Slough (ERA-01) and Buckhart Creek (EZM-02).

7.2.1.1 Watershed Delineation and Flow Estimation

Watersheds for the areas contributing directly to each of the impaired stream segments were delineated using GIS analyses of data layers provided in the National Elevation Dataset (NED). **Figure 7-1** shows the location of the water quality stations on each segment as well as the boundary of the GIS-delineated watersheds.

Flow data corresponding to each water quality sample is required for development of a load duration curve. No active USGS stream gages currently exist in the Middle Sangamon River Watershed; therefore, as discussed in Section 2.6.3 of this report, two surrogate gages were selected for use in estimating flows: USGS gage 5573540 Sangamon River at Rt. 48 in Decatur, Illinois and USGS gage 5592050 Robinson Creek near Shelbyville, Illinois. USGS gage 5573540 (Sangamon River at Rt 48) is located at the upper end of the Middle Sangamon River watershed just above impaired segment E-05 and has a watershed area of approximately 938 square miles. USGS gage 5592050 (Robinson Creek near Shelbyville) is located approximately 15 miles south of the Middle Sangamon River Watershed and has a drainage area of approximately 93.1 square miles.

Data from these gages were used to estimate flow values at locations in the Middle Sangamon River Watershed using the drainage area ratio method represented by the following equation:

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where

Q_{gaged}	=	Streamflow of the gaged basin
Q_{ungaged}	=	Streamflow of the ungaged basin
$\text{Area}_{\text{gaged}}$	=	Area of the gaged basin
$\text{Area}_{\text{ungaged}}$	=	Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Data downloaded through the USGS for the surrogate gage for the available period of record were adjusted to account for point source influence in the watershed upstream of the gaging station. The watershed area of each impaired segment, the surrogate gage used, the gage watershed, and the approximate gage watershed to impaired segment watershed area ratios used in load duration curve development are provided in **Table 7-2**.

Table 7-2 Watershed Areas, Surrogate Gages, and Watershed Area Ratios for load Duration Curve Assessments in the Middle Sangamon River Watershed

Impaired Segment	Watershed Area (square miles)	Surrogate Stream Gage Used	Watershed Area Ratio
Sangamon River E-06	878	USGS 5573540	0.94
Sangamon River E-09	938	USGS 5573540	1.00
Sangamon River E-05	1,004	USGS 5573540	1.07
Sangamon River E-16	1,237	USGS 5573540	1.32
Long Point Slough ERA-01	61	USGS 5592050	0.65
Buckhart Creek EZM-02	97	USGS 5592050	1.04

7.2.1.2 Fecal Coliform in Sangamon River Segments E-05, E-06, E-09, and E-16

Load duration curves for fecal coliform in the impaired segments of the Sangamon River were generated by ranking the estimated daily flow data generated through the area ratio method discussed above, determining the percent of days these flows were exceeded, and then graphically plotting the results. Because the fecal coliform standard is seasonal and is applicable between the months of May and October, only flows recorded during this time period were used in the analysis. The flows in the duration curve were then multiplied by the chronic water quality standard of 200 cfu/100mL to generate a load duration curve. Fecal coliform data collected between May and October were compiled from historical data amassed during Stage 1 of TMDL development and additional data collected by Illinois EPA in 2015. These data were then paired with the corresponding flows for the sampling dates and plotted against the load duration curves for each impaired segment **Figures 7-2** through **7-5**. It should be noted that there is a significant NPDES discharger (Sanitary District of Decatur, IL0028321) located downstream of the USGS gage. The addition of the facility's average flows into the load duration curves significantly flattens the curves during low flow and dry conditions.

A total of 56 data points were available to calculate actual fecal coliform loads in segment E-05 during the May-October recreational use season. The load duration curve constructed for E-05 shows that, based on the lowest chronic standard of 200 cfu/100ml, potential exceedances for fecal coliform occur with regularity under all flow conditions. Based on the available data, a somewhat lower proportion of samples exceed the load limits under lower flows than during periods of high flow **Figure 7-2**.

Sixteen of the 70 fecal coliform samples collected on segment E-06 during the May-October recreation season represents loads in excess of the calculated allowable load based on the 200

cfu/100ml criteria. Exceedances along this segment of the Sangamon River occurred under all but the lowest flow condition. Exceedances again appear to be more common at higher flows than under low flow conditions **Figure 7-3**.

Twenty of the 41 fecal coliform samples available for segment E-09 that were collected during the May-October recreation season represent loads in excess of the calculated allowable load. Exceedances along this segment of the Sangamon River occurred under all flow conditions. Exceedances in this segment appear to occur with greatest frequency at the lowest flow condition, however; the sample size in the lowest flow categories is relatively small **Figure 7-4**.

Of the 44 fecal coliform samples collected from segment E-16 during the May-October recreation season, 31 samples represent loads in excess of the calculated allowable load. Exceedances along this segment of the Sangamon River occurred under all flow conditions and occur with greatest frequency under the highest flow categories **Figure 7-5**.

Spreadsheets used for the calculation of the load duration curves are provided in Appendix D.

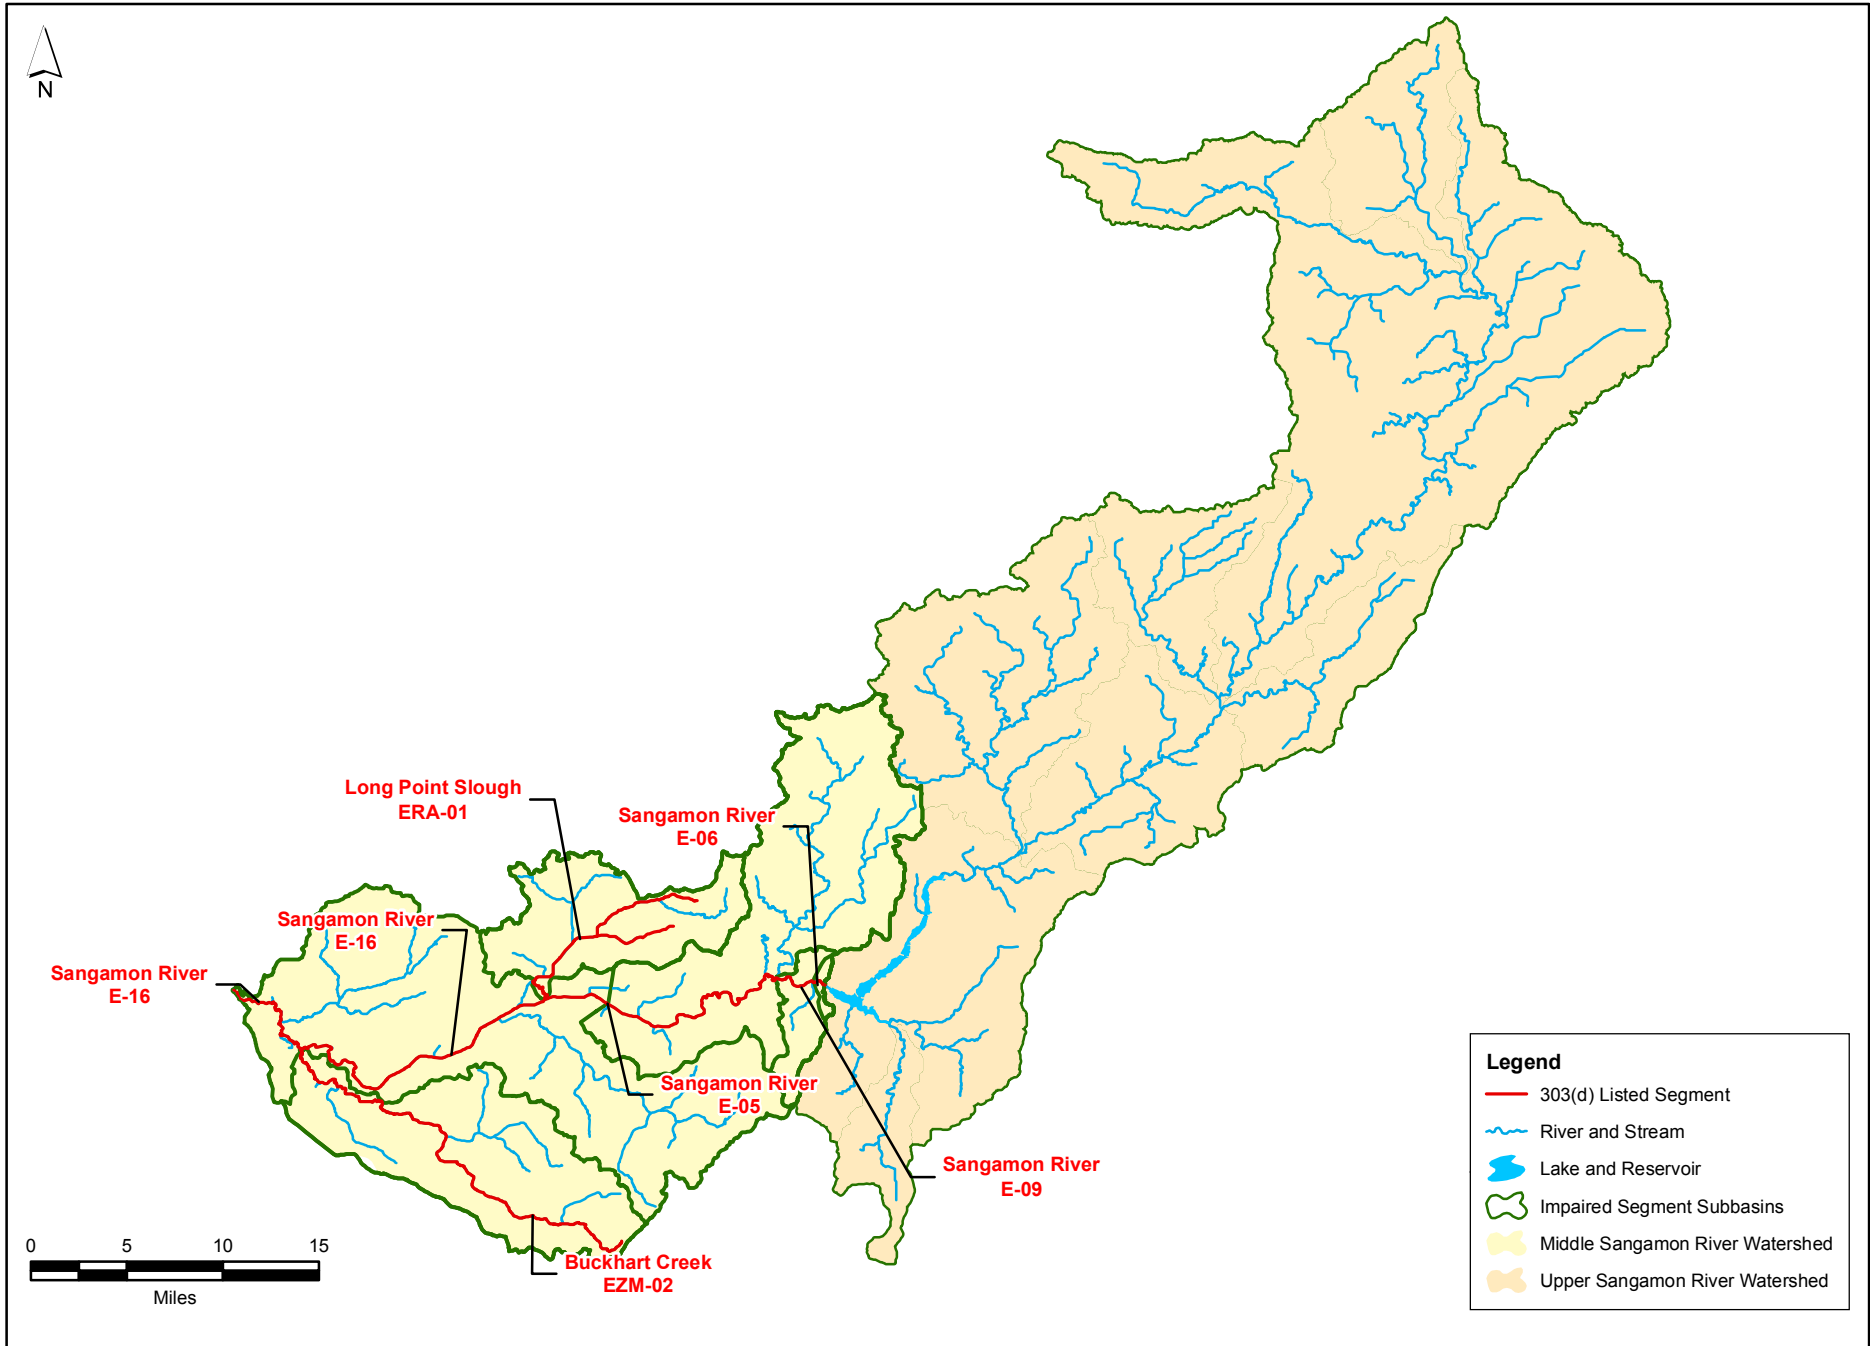

7.2.1.3 Sedimentation and Siltation in Long Point Slough (ERA-01) and Buckhart Creek (EZM-02)

Load duration curves were developed for NVSS to address sedimentation/siltation impairments in Long Point Slough (ERA-01) and segment EZM-02 of Buckhart Creek (**Figures 7-6 and 7-7**). Curves were generated by determining the percent of days each estimated flow was exceeded, and then multiplying the estimated flows by the watershed-specific LRS target value of 23.1mg/L of NVSS. NVSS is calculated as the difference between paired TSS and TVS data. NVSS concentration data compiled during TMDL development were then paired with the corresponding flows for the sampling dates to calculate approximate loads. These loads were then plotted against the flow duration curve developed for each segment.

The available dataset for NVSS at Long Point Slough is limited to three samples collected in 2003. Two of the three samples exceed the water quality target value for NVSS. All samples were collected under dry conditions, significantly limiting the efficacy of the load duration curve methodology for assessing reduction needs at various flow rates. Additional data collection is needed to fully evaluate the sedimentation/siltation impairment on this segment.

Seven paired TSS and TVS data points were available for calculating NVSS concentrations from Segment EZM-02 of Buckhart Creek. Samples were collected under moist, dry, and low flow conditions. Three of the seven data points exceed the LRS target value of 23.1 mg/L. All exceedances were collected during low flow and dry conditions; however, the available dataset is not sufficient for assessing the potential for exceedances at higher flows.

Appendix D contains spreadsheets used for the calculation of the load duration curves for NVSS.

Section 8

Total Maximum Daily Loads for the Middle Sangamon River Watershed

8.1 TMDL Endpoints for the Middle Sangamon River Watershed

The TMDL endpoints and LRS target values for impairments in the Middle Sangamon River watershed are summarized in **Table 8-1**. The fecal coliform endpoints listed are based on protection of the primary contact recreation use. A numeric water quality standard exists for fecal coliform and it is assessed via the TMDL process and the TMDL endpoints directly correlate to the lowest applicable water quality standard established for a given parameter. The sedimentation and siltation endpoint is a watershed-specific LRS target value for NVSS developed by Illinois EPA to protect the aquatic life use. The LRS target values are voluntary measures and are intended to serve as planning tools for overall water quality improvement strategies in the watershed.

Table 8-1 TMDL Endpoints and Average Observed Concentrations for Impaired Constituents in the Middle Sangamon River Watershed

Segment Name	Segment ID	Potential Causes of Impairment	Assessment Type	TMDL Endpoint or Target Value
Sangamon River	E-05	Fecal Coliform	TMDL	200 cfu/100 ml
	E-06	Fecal Coliform	TMDL	200 cfu/100 ml
	E-09	Fecal Coliform	TMDL	200 cfu/100 ml
	E-16	Fecal Coliform	TMDL	200 cfu/100 ml
Long Point Slough	ERA-01	<i>Sedimentation/Siltation</i>	LRS	23.1 mg/L of NVSS
Buckhart Creek	EZM-02	Dissolved Oxygen	No TMDL Developed ¹	
		<i>Sedimentation/Siltation</i>	LRS	23.1 mg/L of NVSS

¹ Additional sample collection as part of Stage 2 efforts confirmed that the stream segment is no longer impaired by low DO

8.2 Pollutant Sources and Linkages

Potential pollutant sources for impaired streams in the Middle Sangamon River Watershed include both point and nonpoint sources as described in Section 5 of this report. Fecal coliform impairment in the watershed is likely caused by a combination of urban/rural stormwater and point sources while sediment loading likely originates in urban/rural stormwater, area agricultural practices, and stream modifications (streambank erosion, channelization, etc).

Load duration curves developed for the fecal coliform TMDLs and the sedimentation/siltation LRS assessments are discussed in this section. Load duration curves are useful in that they provide a link between historical sampling values and hydrologic condition. **Table 8-2** provides an example of source area relationship to hydrologic condition developed by USEPA.

Table 8-2 Example Source Area/Hydrologic Condition Considerations (USEPA, 2007)

Contributing Source Area	Duration Curve Zone				
	High Flow	Moist	Mid-Range	Dry	Low Flow
Point Source				M	H
Onsite Wastewater System			H	M	
Riparian Areas		H	H	H	
Stormwater: Impervious Areas		H	H	H	
Combined sewer overflows	H	H	H		
Stormwater: Upland	H	H	M		
Bank Erosion	H	M			

Note: potential relative importance of source area to contribute loads under given hydrologic conditions (H: High, M: Medium)

Further discussion regarding pollutant sources is provided throughout this section. Implementation activities designed to reduce loading from the potential sources are outlined in Section 9.

8.3 TMDL Allocation

As explained in the Section 1 of this report, the TMDLs for impaired segments in the Middle Sangamon River Watershed address the following equation:

$$\text{TMDL} = \text{LC} = \Sigma \text{WLA} + \Sigma \text{LA} + \text{MOS} + \text{RC}$$

- where:
- LC = Loading capacity - the maximum amount of pollutant loading a waterbody can receive without violating water quality standards
 - WLA = Waste load allocation - the portion of the TMDL allocated to existing or future point sources
 - LA = Load allocation - the portion of the TMDL allocated to existing or future nonpoint sources and natural background
 - MOS = Margin of safety - an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
 - RC = Reserve capacity - the portion of the load explicitly set aside for future population growth and additional development in the watershed

Each of these elements is discussed in this section as well as consideration of seasonal variation in the TMDL calculation.

8.3.1 TMDL for Fecal Coliform in Sangamon River Segments E-05, E-06, E-09, and E-16

Sangamon River segments E-05, E-06, E-09, and E-16 are listed for impairment of the primary contact recreation use caused by elevated fecal coliform concentrations. Load duration curves were developed for each segment (see Section 7) to determine load reductions needed to meet the instream water quality standard at varying flow scenarios.

8.3.1.1 Target Loading Capacity

The LC is the maximum amount of fecal coliform bacteria the impaired waterbody can receive and still meet the water quality standard. The allowable fecal coliform loads that can be generated in the watershed and still maintain the geometric mean chronic standard of 200 cfu/100mL were determined with the methodology discussed in Section 7. The fecal coliform loading capacity according to flow is presented in **Table 8-3**.

Table 8-3 Estimated Fecal Coliform Loading Capacities under Various Flow Conditions in the Middle Sangamon River

Estimated Mean Daily Flow (cfs)	Allowable Load (million colonies/day)
1	4,894
10	48,932
100	489,332
500	2,446,689
1,000	4,893,696
10,000	48,936,960
25,000	122,342,400

8.3.1.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the TMDLs have been calculated to meet the standard during all flow conditions.

The critical period for fecal coliform is the primary contact recreation season which is May through October. There is no one critical flow condition during the recreation season. The fecal coliform standard must be met under all flow scenarios and standard exceedances have occurred during the majority of flow scenarios. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.1.3 Margin of Safety

The MOS can be implicit (incorporated into the TMDL analysis through conservative assumptions) or explicit (expressed in the TMDL as a portion of the loadings) or a combination of both. The MOS for each of these fecal coliform TMDLs is implicit as the analysis used the more conservative 200 cfu/100mL chronic standard for developing the loading capacity as opposed to the single-sample, acute maximum standard of 400 cfu/100mL. In addition, the TMDL does not account for die-off of bacteria which occurs at an unquantified rate as bacteria move downstream in the system.

8.3.1.4 Waste Load Allocation

There are 18 NPDES permitted discharges (14 facilities and 4 MS4 permits) within the modeled portion of the Middle Sangamon River watershed (see Section 5.2). Additional discharges exist in the Upper Sangamon River watershed upstream; however, these facilities are included in upstream TMDLs and applicable WLAs have previously been assigned. Seven of the discharges within the Middle Sangamon River watershed are associated with private or municipal sewage treatment facilities for which fecal coliform WLAs are appropriate. Four of these municipal

treatment facilities have applied for and received a year-round disinfection exemption, which allows a facility to discharge wastewater without disinfection. However, all of these exempted treatment facilities are required to comply with the geometric mean fecal coliform water quality standard of 200 cfu/100 mL at the end of the exempted reach as determined by Illinois EPA. Exempted facilities in the Middle Sangamon River watershed and their exempted reaches are shown in **Figure 8-1**. As a result of this requirement, the fecal coliform standard (200 cfu/100ml) and each of the exempted facilities' design average flow (DAF) values were used to set the WLA for low and moderate flow levels. Each of the facilities with disinfection exemptions will be required to reapply for their disinfection exemption prior to permit renewals. Expansion of treatment operations as a result of increased development in the area will require further review of disinfection exemptions and provide the opportunity to implement disinfection requirements should they be necessary to meet instream TMDL targets. The likely reduction in fecal coliform waste loads effectively provides a conservative estimate should population growth increase in the watershed.

The Sanitary District of Decatur (IL0028321) is the only publicly owner treatment works (POTW) in the watershed currently assigned a permit effluent limit for fecal coliform (400 cfu/100ml daily maximum). However, the 200 cfu/100ml (based on the geometric mean) is the most restrictive applicable standard and was therefore the target used to assign WLAs for all POTWs in the watershed. Each facility's design average flow (DAF) was used for calculating loads during periods of low and moderate instream flow conditions. To provide a more conservative TMDL calculation, each facility's design maximum flows (DMF) were used to calculate the WLA at higher stream flow conditions. A summary of DAF and DMF WLAs for each sewage treatment facility in the watershed, along with the individual segments impacted by the facility, are provided in **Table 8-4**.

Under certain stream flow conditions, the effluent discharge from the treatment facilities may represent the primary source of flow in the receiving stream. Under these low flow conditions, large proportions of the discharge will be lost to evaporation and infiltration into the stream bed, limiting the potential for conveyance of discharged materials into downstream reaches. Because WLA calculations are based on the permitted flow for each facility, under low to mid-level flow conditions the WLA can be overestimated and the resulting calculations will show WLA exceeding the LC for the receiving stream. In this case, the point source discharges represent all the instream flow during dry and low flows and WLAs were set equal to the calculated loading capacity at that flow level and the resulting non-point source load percent reduction needed is calculated at 100%.

Four NPDES permits for MS4 systems exist in the Middle Sangamon River watershed: City of Decatur (ILR400181), Village of Forsyth (ILR400193), IDOT (ILR400493); and the County of Macon (ILR400262). WLAs for NPDES-permitted stormwater discharges such as MS4s that do not have numerical effluent limitations are typically expressed as a percent reduction. In this case, estimates of MS4 contributions to fecal coliform loads were included in WLA calculations at the current load estimate for each impaired segment. Estimates of current loading from MS4s were calculated by subtracting the WLA for NPDES point source dischargers and the margin of safety from the loading capacity of the waterbody to derive the load attributable to all non-point sources including stormwater discharges. The proportion of developed land within the Middle Sangamon

River subbasin and in each impaired segment’s watershed potentially covered under one of the MS4 permit was then calculated using GIS layers for urbanized MS4 areas and multiplied by the segment’s interim LA for non-point sources. Note that a WLA for the IDOT MS4 was not included as the contributing area from this MS4 in the watershed is very small and not likely to contribute loads of fecal coliform. The resulting value for the remaining MS4s represents an estimate of the proportion of overland runoff load attributable to these systems for each impaired segment. As the MS4 loads are from permitted sources, the MS4 load was then subtracted from the overall LA and added to the WLA calculated for POTWs. MS4 discharges are only operable during periods of active runoff and WLA for MS4s were only applied to the “moist” and “high” flow condition categories. The results of the WLA calculations for MS4 areas are shown in **Table 8-5**.

	Total	1,867	0.6%	103,139	44,049	22,028	10,540

8.3.1.5 Reserve Capacity

No Reserve Capacity was included in the TMDL. Large future growth is not anticipated in the area, however, because the WLA is set at the water quality standard, a future TMDL modification would be easily calculated.

8.3.1.6 Load Allocation and TMDL Summary

Summaries of the fecal coliform TMDLs for impaired segments E-05, E-06, E-09, and E-16 of the Sangamon River are provided in **Tables 8-6, 8-7, 8-8 and 8-9**; respectively. The WLAs were calculated using the appropriate design flow for each facility and the geometric mean 200cfu/100ml water quality standard. Under low and mid-level flow conditions, the calculated WLA is greater than the calculated LC, which is a product of the disproportionately high discharge flows associated with using design flows under such low flow conditions. In order to reconcile this and provide more accurate load allocation numbers, the WLA was set equal to the LC for these lower flow categories.

Significant reductions in fecal coliform loading are required to meet the water quality standard under both high and low flow conditions in each segment. The percent reductions presented below are calculated as an overall percent reduction from all potential sources within each segment's contributing watershed.

Table 8-6 Fecal Coliform TMDL for Sangamon River Segment E-05

8.3.2 LRS for Sedimentation and Siltation in Streams

Long Point Slough (ERA-01) and Buckhart Creek (EZM-02) are listed for impairment of the aquatic life use caused by excessive sedimentation and siltation. As no numeric water quality standard exists for sedimentation/siltation in Illinois, a numeric target value of 23.1 mg/L of NVSS was provided by Illinois EPA for incorporation into the LRS calculations. A load duration curve was developed for each segment to determine load reductions needed to meet the instream water quality target during varying flow scenarios.

Table 8-10 NVSS Target Loading Capacities in the Streams under Various Flow Conditions in the Middle Sangamon River Watershed

Estimated Mean Daily Flow (cfs)	Target Load Capacity (lbs/day of NVSS)
1	125
5	623
10	1,245
100	12,452
500	62,261
1,000	124,522
5,000	622,611

8.3.2.1 Target Loading Capacity

The LC is the maximum amount of NVSS the impaired water can receive and still meet the LRS target value for sedimentation/siltation impairments in this watershed. The allowable NVSS loads that may be generated in the watershed were determined using estimated flow conditions and the numeric LRS target, as discussed in Section 7. The NVSS loading capacities as a function of flow are presented in **Table 8-10**.

8.3.2.2 Seasonal Variation

Consideration of seasonality is inherent in the load duration analysis. Because the load duration analysis represents the range of expected stream flows, the LRS has been calculated to meet the target during all flow conditions.

There is not one critical flow condition during the year for sedimentation and siltation impairments. The target value is intended to be met under all flow scenarios. By using the load duration curve method, all of these "critical conditions" are accounted for in the loading allocations.

8.3.2.3 Percent Reduction and LRS Summary

Tables 8-11 and 8-12 provide summaries of the percent reductions in NVSS from current conditions needed to meet the LRS target under various flow conditions for Long Point Slough and Buckhart Creek, respectively. Analysis for both impaired streams was limited by the datasets available for calculating NVSS concentrations. Instream NVSS loads in Long Point Slough exceed the target during both flow condition categories for which instream data are available and required load reductions range from 39-46%. NVSS loads exceed the LRS target value during two of the three flow condition categories for which there was available instream data in Buckhart Creek. Load reductions necessary to meet the LRS target value in Buckhart Creek range from 0-49%.

Table 8-11 LRS Targets for NVSS in Long Point Slough (ERA-01)

Section 9

Implementation Plan for the Middle Sangamon River Watershed

9.1 Implementation Overview

The goal of this watershed plan is to identify BMPs to be implemented in the Middle Sangamon River watershed that will provide reasonable assurance that impaired waters in the watershed will meet water quality criteria developed to ensure waterbodies are able to support their designated uses.

The USEPA has identified nine minimum elements that a watershed plan for impaired waters is expected to include. These components are:

1. Identify causes and sources of pollution that will need to be controlled to achieve the pollutant load reduction requirements estimated within the watershed plan.
2. Estimate pollutant load reductions expected as a result of implementing the management measures described in #3 below.
3. Describe the nonpoint source management measures that will need to be implemented to achieve load reduction estimates and identify the critical areas where measures need to be implemented.
4. Estimate the level of technical assistance, associated costs, potential funding sources, and parties that will be relied upon to implement the prescribed measures.
5. Include a public information/education component designed to change social behavior.
6. Develop an implementation schedule for the plan.
7. Develop a description of interim, measureable milestones.
8. Identify indicators that can be used to determine whether pollutant loading reductions are being achieved over time.
9. Develop a monitoring component to evaluate the effectiveness of the implementation efforts over time.

For Element 1, the causes and sources of pollution are described in Section 5 of this report.

9.2 Adaptive Management

An adaptive management or phased approach is recommended for the implementation of management practices designed to meet the TMDLs and LRSs developed for the Middle Sangamon River watershed. Adaptive management conforms to the USEPA guidelines outlined

above because it is a systematic process for continually improving management policies and practices through learning from the outcomes of operational programs. Some of the defining characteristics of adaptive management include:

- Acknowledgement of uncertainty about what policy or practice is "best" for the particular management issue
- Thoughtful selection of the policies or practices to be applied (the assessment and design stages of the cycle)
- Careful implementation of a plan of action designed to reveal the critical knowledge that is currently lacking
- Monitoring of key response indicators
- Analysis of the management outcomes in consideration of the original objectives and incorporation of the results into future decisions (British Columbia Ministry of Forests 2000)

Implementation actions, point source controls, management measures, and/or BMPs are used to control the generation or distribution of pollutants within a watershed. BMPs are either structural, such as wetlands, sediment basins, fencing, or filter strips; or managerial, such as conservation tillage practices, nutrient management plans, or crop rotation. Both structural and managerial BMPs require effective management to be successful in reducing pollutant loading to water resources (Osmond et al. 1995).

It is typically most effective to install a combination of point source controls and BMPs or a BMP system. A BMP system is a combination of two or more individual BMPs that are used to control pollutants from a single critical source. If the watershed has more than one identified pollutant, but the transport mechanism is the same, a BMP system that establishes controls for the transport mechanism can be employed (Osmond et al. 1995).

To assist in development of an adaptive management program, implementation actions, management measures, available assistance programs, and recommended continued monitoring are all discussed throughout the remainder of this section. The point source BMPs described below are generally required and typically already being implemented although some modifications may be appropriate. The nonpoint source BMPs are entirely voluntary based on the landowner's preference.

9.3 BMP Recommendations for Reducing Fecal Coliform in Streams in the Middle Sangamon River Watershed

Results for nearly 80% of the fecal coliform single samples exceeded the 200 cfu per 100 mL geometric mean water quality standard, and approximately 57% of the samples exceeded 400 cfu per 100 mL maximum standard (refer to **Table 5-1**). Loading calculations discussed in Section 7.2.1.2 indicate that exceedances were reported under all flow conditions with most impaired segments having more exceedances under higher flow conditions (E-05, E-06, and E-16) and one segment under lower flow conditions (E-09). Potential sources of fecal coliform include

wastewater treatment plant and/or failed septic system discharges/leaks, MS4 discharges, general nonpoint source runoff and animal-related runoff (as discussed in Section 5 of this report). Animal impacts often consist of livestock, where present, but may also include other animals such as resident and migratory waterfowl and other wildlife such as deer.

9.3.1 NPDES Permitted Point Sources of Fecal Coliform

Table 5-4 of this report listed 14 NPDES permitted point sources present within the Middle Sangamon River watershed. Seven of the 14 permitted facilities have reasonable potential to contribute fecal coliform to receiving waters. **Table 9-1** lists the permitted facilities that have been assigned WLAs (refer to Section 8.1.3.4 for additional discussion). Sewage from plants treating domestic and/or municipal waste without disinfection processes contains fecal coliform. In Illinois, many municipal treatment plants have applied for and received a disinfection exemption allowing the facility to discharge wastewater without disinfection. Disinfection exemptions are granted where the permittee has shown that the receiving water has average depths of two feet or less and no pronounced deep pools during the summer season; contains physical obstacles sufficient to prevent access or primary contact activities; or has adjacent land uses sufficient to discourage primary contact activities. These treatment facilities are required to comply with the geometric mean fecal coliform water quality standard of 200 cfu/100 mL at the closest point downstream where recreational use could occur in the receiving water, or where the water flows into a fecal coliform impaired segment.

Facilities with year-round disinfection exemptions are now required to monitor and report fecal coliform counts from May to October to Illinois EPA. In addition, facilities directly discharging into a segment whose recreational use is impaired by fecal coliform may have their year-round disinfection exemption revoked through future NPDES permitting actions.

Table 9-1 WLAs for NPDES Permitted Municipal Treatment Facility Discharges in the Middle Sangamon Watersheds

Facility	NPDES Permit Number	Design Average Flow (MGD)	Design Maximum Flow (MGD)	WLA at DAF (mil col/day)	WLA at DMF (mil col/day)	Applicable Stream Segments

¹ Facilities with disinfection exemptions

Additionally, as noted in Section 2.3, a portion of the watershed is urban in nature and some of the municipalities within the watershed have MS4s, including the City of Decatur (ILR400181) and the Village of Forsyth (ILR400193). Macon County (ILR400262) and IDOT (ILR400493) are

also covered by MS4 permits. Unfortunately, information on the amount of fecal coliform that may be contributed to stream segments via urban stormwater sources is not currently available. WLAs were assigned based on contributing land area (refer to **Table 8-5**). A storm sewer survey may be warranted to determine urban stormwater runoff impacts to fecal coliform counts in area receiving waters.

9.3.2 Nonpoint Sources of Fecal Coliform

Several BMPs have been identified to help reduce fecal coliform counts in the impaired segments of the Middle Sangamon River watershed. These management options focus on the most likely nonpoint sources of fecal coliform within the basin, such as agricultural runoff, septic systems, and livestock.

Filter Strips: Filter strips can be used as a control to reduce both pollutant loads from runoff and sedimentation to impaired stream segments. Filter strips implemented along stream segments slow and filter runoff and provide bank stabilization, decreasing erosion and re-deposition. Grass filter strips have been shown to remove as much as 65 percent of sediment and 75 percent of total phosphorus from runoff, so it is assumed that the removal of other contaminants such as fecal coliform from runoff may fall within this range (USEPA 2003). Riparian vegetation also provides bank stability that further reduces sediment loading to the stream. The installation of filter strips adjacent to the impaired stream segments, as well as any contributing tributaries, can result in considerable reduction of overland contributions of sediments and suspended solids to an impaired waterbody.

The Illinois NRCS Conservation Practice Standard 393 (June 2003) describes filter strip requirements based on land slope; the requirements are designed to achieve a minimum flow through time of 15 to 30 minutes at a one-half inch depth. **Table 9-2** provides a summary of the guidance for filter strip width, or flow length, as a function of slope (NRCS 2003).

Table 9-2 Filter Strip Flow Lengths Based on Land Slope

Percent Slope	0.5%	1.0%	2.0%	3.0%	4.0%	5.0% or greater
Minimum (feet)	36	54	72	90	108	117
Maximum (feet)	72	108	144	180	216	234

GIS land use and topographic data, described in Section 2 of this report, were used in conjunction with soil slope data to provide an estimate of acreage where filter strips could be installed. As discussed in Section 2.4.1, a total of 133 soil types exist in the watershed. The two most common types—Ipava silt loam (0 to 2 percent slopes), and Sable silty clay loam (0 to 2 percent slopes)—each cover a small percentage of the overall watershed (17.7 and 17.2 percent, respectively). All other soil types each represent less than 8 percent of the total watershed area. Although the two primary soil types and corresponding slope values suggest that the maximum values associated with 2 percent or less slopes could be used for this analysis, there does still remain some considerable variability in soil type and corresponding slope values across the watershed.

In conjunction with the available land use, topography, and soil information discussed in Section 2, mapping software was used to buffer impaired stream segments, and their major tributaries, to

determine the total area found within the appropriate footages of the stream segments. Due to the wide range of soil types and slopes found in the watershed, the appropriate buffer widths were estimated in GIS based on the average slope of land within the maximum buffer areas of each impaired segment's major tributaries. These average slopes were then used to calculate approximate buffer distances based on the NRCS guidance using a best-fit equation to interpolate between the slope percentages to buffer width relationships provided in the NRCS guidance.

Not all land use types within the buffer areas are candidates for conversion to buffer strips. Existing forests and undisturbed grasslands already function as filter strips and conversion of developed residential or commercial lands is often infeasible. In general, agricultural lands are the land use type most conducive to conversion to buffer strips and will likely provide the greatest benefit to water quality once converted. Therefore, GIS software was used to extract the approximate acreage of agricultural lands within the appropriate buffer area for each impaired stream segment and its tributaries. The calculated overall buffer areas and acreage of agricultural land within the buffer distances for each impaired stream segment and its tributaries are provided in **Table 9-3**. These data represent an approximation of the maximum acreage of land potentially available for conversion to filter strips. More detailed assessment of a given property is necessary to determine the exact size and extent of convertible lands likely to provide the greatest benefit to in-stream water quality following conversion to filter strips.

There are approximately 30,180 total acres within the various buffer distances for the four segments impaired by fecal coliform and their tributaries in the Middle Sangamon River watershed (not including tributaries in the Upper Sangamon River Watershed addressed by alternate TMDLs). Of this total area, approximately 20,776 acres are classified as agricultural land where filter strips could potentially be installed. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table 9-2**. Figures depicting the buffered areas and agricultural lands suitable for conversion to filter strips in each segment are provided as **Figures 9-1** through **9-4**.

Table 9-3 Average Slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land Buffers Potentially Suitable for Conversion for Filter Strips for Mitigation of Fecal Coliform, by Impaired Stream Segment

Stream Name	Segment ID	Average Slope Adjacent to Streams (%)	Filter Strip Flow Length (feet)	Total Area in Buffer (Acres)	Agricultural Land Buffer (Acres)
Sangamon River	E-05	9.6	234*	8,137	4,426
	E-06	4.6	226	44	0
	E-09	11.5	234*	1,003	295
	E-16	7.4	234*	30,180	20,776

*Maximum recommended minimum filter strip flow length (slope >5.0%)

Private Septic System Inspection and Maintenance Program: As indicated in Section 2.3, approximately 12 percent of the Middle Sangamon River watershed consists of developed or urbanized land, primarily in the Decatur metropolitan area. A majority of businesses, residences, and other structures in the developed areas are served by a municipal sewer district and septic

systems are uncommon in these areas. The remainder of the watershed is rural and primarily devoted to agricultural purposes. Many households in rural areas of Illinois that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. The degree of nutrient removal in these systems is limited by soils and system upkeep and maintenance.

Failing or leaking septic systems can be a significant source of fecal coliform pollution. A program that actively manages functioning systems and addresses non-functioning systems could be implemented to reduce the potential bacteria loads from septic systems in the watershed. The USEPA has developed guidance for managing septic systems, which includes assessing the functionality of systems, public health, and environmental risks (USEPA 2005). It also introduces procedures for selecting and implementing a management plan.

To reduce the discharge of excessive amounts of contaminants from a faulty septic system, a scheduled maintenance plan that includes regular pumping and maintenance of the septic system should be followed. The majority of failures originate from excessive suspended solids, nutrients, and biochemical oxygen demand (BOD) loading to the septic system. Reduction of solids entering the tank can be achieved via limiting the use of garbage disposals.

Septic system management practices can extend the life and maintain the efficiency of a septic system. Water conservation practices, such as limiting daily water use or using low flow toilets and faucets, are the most effective methods to maintain a properly functioning septic system. Additionally, septic systems should not be used for the disposal of solids, such as cigarette butts, cat litter, cotton swabs, coffee grounds, disposable diapers, etc. Physical damage to the drain field can be prevented by:

- Maintaining a vegetative cover over the drain field to prevent erosion
- Avoiding construction over the system
- Protecting the area down slope of the system from excavation
- Landscaping the area to divert surface flow away from the drain field (Johnson 1998)

The cost of each management measure is highly variable, and site-specific data on septic systems and management practices do not exist for the watershed; therefore, homeowners with septic systems should contact their county health department for septic system management costs.

Current protocols for addressing failing septic systems in the rural areas are to be performed in accordance with the Illinois Private Sewage Disposal Licensing Act and Code "to prevent the transmission of disease organisms, environmental contamination and nuisances resulting from improper handling, storage, transportation and disposal from private sewage disposal systems." Any new, replaced, or renovated system must be installed by a licensed contractor or the homeowner and permitted through the county health department. The department must receive both an application for permit and the appropriate fee from the contractor/homeowner. Once reviewed and approved, a permit is issued and an inspection of the system is conducted during and after construction. The county health department also investigates private sewage disposal system complaints.

A long-range solution to failing septic systems is connection to a municipal sanitary sewer system. Connection to a sanitary sewer line would reduce existing fecal coliform sources by replacing failing septic systems with municipal treatment and will allow communities to develop without further contribution of pathogens to the Sangamon River. Costs for the installation are generally paid over a period of several years (average of 20 years) and help to avoid forcing homeowners to shoulder the entire initial cost of installing a new septic system. In addition, costs are sometimes shared between the community and the utility responsible for treating the wastewater generated from replacing the septic tanks. The planning process is involved and requires participation from townships, cities, counties, businesses, and citizens.

It is unknown at this time how many septic systems are present within the watershed. However, as discussed in Section 2.5, approximately 70,800 people reside in the Middle Sangamon River watershed, and the largest urban development is the city of Decatur with an estimated population of approximately 47,100 for the portion of Decatur that lies within the watershed boundary. Homes and businesses within city limits are expected to be on a municipal sewer system. Additional townships within the watershed include Blue Mound, Dawson, Buffalo, Forsyth, Harristown, Illiopolis, Mechanicsburg, Mount Auburn, Niantic, and Stonington (as shown in **Figure 1-1**). The communities have permitted sewage treatment plants and residents/businesses are therefore assumed to be on a municipal sewer system. Based on the areas shown in **Figure 1-1**, the combined areas of Blue Mound, Dawson, Forsyth, Harristown, Niantic, and Stonington might comprise approximately one third to one-half of the portion of Decatur that lies within the watershed boundary and may therefore account for approximately 19,000 people. Information on the townships of Buffalo, Illiopolis, Mechanicsburg, and Mount Auburn is not available. For the purposes of this evaluation, homes and businesses in these four communities are presumed to use private septic systems.

Based on these assumptions, up to 4,700 people remain and which may be served by private septic systems. If a typical household is assumed to consist of four people, there may be around 1,200 households which have septic systems.

Restrict Livestock Access to the Middle Sangamon River: As discussed in Section 5.3 of this report, significant quantities of livestock are present within the Middle Sangamon River watershed. Data from NASS indicates there were approximately 22,000 head of cattle within Christian, Macon, and Sangamon Counties in 2013, but these animals are primarily pastured and no high concentration feed operations exist in the watershed.

It is unknown to what extent livestock have access to the Middle Sangamon River or its tributaries. Reduction of livestock access to streams, however, is recommended to reduce bacteria loads and limit damage to streambanks. Access of livestock and other animals to streams can increase bank erosion, trample filter strips and riparian buffers causing short circuiting of pollutant treatment, and provide direct input of manure to the waterbody. Exclusion or restricting pet, livestock, and wildlife access to streams with fencing helps reduce pollutant loads. The USEPA found that livestock exclusion from waterways and other grazing management measures were successful in reducing fecal coliform counts by 29 to 46 percent (2003).

Fencing and alternate watering systems are effective ways to restrict livestock from streams; however, fencing emplacement is not always feasible from either a cost or animal management

viewpoint. If used, fencing should be placed outside of the filter strip/riparian area to prevent manure from being entrained during flooding. Another option is to limit access of people to areas of the waterbody; this indirectly keeps a large percentage of pet waste at a distance from the waterbody. Waterfowl are an issue for phosphorus and fecal coliform loading at lakes and slow moving streams. Acoustic devices and other repellants can be used to stress nuisance waterfowl so they avoid congregating in select areas.

9.4 BMP Recommendations for Sedimentation/Siltation in the Middle Sangamon River Watershed

Long Point Slough (ERA-01) and Buckhart Creek segment EZM-02 are both listed for impairment of the aquatic life use by sedimentation and siltation. Streams have historically been listed for impairment caused by sedimentation/siltation when over 34 percent siltation was observed (prior to 2006), or over 75 percent siltation was observed (2008 to 2010). Illinois EPA now addresses sedimentation and siltation impairments through assessment of NVSS concentrations. Illinois EPA provided a watershed-specific LRS target value for NVSS concentrations in streams of the Middle Sangamon River watershed of 23.1 mg/L of NVSS. NVSS data were limited for both segments but load reductions were calculated for flow scenarios where possible (**Tables 8-11** and **8-12**).

The local SWCD submitted public comments during the TMDL process indicating that sedimentation/siltation was also an issue along the Middle Sangamon River, particularly between segments E-06 and E-05 (including E-09). They have witnessed severe streambank in recent years. The erosion is likely due from heavy releases from Lake Decatur Dam upstream after heavy rainfall. The high volume releases are loading large amounts of sediment in the water and trees that normally hold the soil in the river bank have been undercut and have fallen in the river, leaving the bank even more exposed to erode.

Sedimentation/siltation within the Long Point Slough and Buckhart Creek impaired segments is most likely from nonpoint sources. As indicated in **Figure 2-2**, the areas surrounding the Long Point Slough and Buckhart Creek impaired segments primarily consist of croplands. However, municipalities covered by MS4s (city of Decatur and village of Forsyth, as noted in Section 9.3.1) should be encouraged to review their stormwater BMPs to ensure that effective BMPs are being used within their systems. Additional nonpoint source BMPs are provided below.

Filter Strips: As mentioned in Section 9.3.2, filter strips can be used as a control to reduce sedimentation to impaired stream segments. Grass filter strips have been shown to remove as much as 65 percent of sediment. Riparian vegetation also provides bank stability that further reduces sediment loading to the stream. Filter strip buffer areas are calculated as described in Section 9.3.2. There are approximately 3,286 total acres within the calculated minimum buffer distance of 227 feet of Long Point Slough and its tributaries, an estimated 2,918 acres of which are classified as agricultural land **Table 9-4**. A total of 5,051 acres of land exists in the calculated 234-foot minimum buffer width for Buckhart Creek and its tributaries, 4,107 of which are classified as agricultural lands. Landowners should be encouraged to evaluate their land adjacent to impaired streams and their tributaries to determine the practicality of installing or extending filter strips to achieve effective flow lengths as described in the NRCS guidance provided in **Table**

9-2. Figures depicting the buffered areas and agricultural lands suitable for conversion to filter strips in each segment are provided as **Figures 9-5** and **9-6**.

Table 9-4 Average Slopes, Filter Strip Flow Length, Total Buffer Area, and Area of Agricultural Land Buffers Potentially Suitable for Conversion for Filter Strips to Mitigate Sedimentation/Siltation Impairments, by Impaired Stream Segment

Stream Name	Segment ID	Average Slope Adjacent to Streams (%)	Filter Strip Flow Length (feet)	Total Area in Buffer (Acres)	Agricultural Land Buffer (Acres)
Long Point Slough	ERA-01	4.6	227	3,286	2,918
Buckhart Creek	EZM-02	6.0	234*	5,051	4,107

*Maximum recommended minimum filter strip flow length (slope >5.0%)

Riparian Buffers: Riparian corridors, including both the stream channel and adjacent land areas, are important components of watershed ecology. Riparian vegetation, specifically the shade-producing variety, plays a significant role in controlling stream temperature change. The shade provided will reduce both solar radiation loading to the stream and peak temperatures during the growing season which can in turn increase the water body DO saturation level. Furthermore, preserving natural vegetation along stream corridors can effectively reduce water quality degradation associated with development. The root structure of the vegetation in a buffer enhances infiltration of runoff and subsequent trapping of nonpoint source pollutants, such as phosphorus. The buffers are only effective in this manner, however, when the runoff enters the buffer as a slow moving, shallow sheet. Concentrated flow in a ditch or gully will quickly pass through the buffer offering minimal opportunity for retention and uptake of pollutants.

Even more important than the filtering capacity of the buffers is the protection they provide to streambanks. The rooting systems of the vegetation serve as reinforcements in streambank soils, which help to hold streambank materials in place and minimize erosion. Due to the increase in stormwater runoff volume and peak rates of runoff associated with agriculture and other land development, stream channels are subject to greater erosional forces during stormflow events. Thus, preserving natural vegetation along stream channels minimizes the potential for water quality and habitat degradation due to streambank erosion, as well as that additional sediment load entering the stream.

Converting land adjacent to streams for the creation of riparian buffers will provide stream bank stabilization, stream shading, and nutrient uptake and trapping from adjacent areas. Minimum buffer widths of 25 feet are required for water quality benefits. Higher removal rates are provided with greater buffer widths. The USEPA (2003) reports phosphorus removal rates of approximately 25 to 30 percent for 30-foot-wide buffers and 70 to 80 percent for 60 to 90-foot-wide buffers. Riparian corridors can typically treat a maximum of 300 feet of adjacent land before runoff forms small channels that short circuit treatment. In addition to the treated area, the land converted from agricultural land to buffer strip will generate up to a 90 percent lower nutrient load based on data presented in Haith et al. (1992).

Land use data for Long Point Slough (ERA-01) and Buckhart Creek (EZM-02) were clipped to 25 foot buffer zones created around the impaired stream segments. Grassland, forest, and agricultural areas within the 25-foot buffer zones are shown in **Table 9-5** by segment. There are

363 within 25 feet of ERA-01 and its tributaries; approximately 63 of these acres are existing grassland or forest while 276 acres are currently classified as agricultural. Approximately 545 acres of land exists within 25 feet of EZM-02 and its tributaries; approximately 199 of these acres are existing grassland or forest while 305 acres are currently classified as agricultural and may be candidates for riparian buffer improvements. Landowners should be encouraged to assess parcels adjacent to the stream channels and maintain or improve existing riparian areas or potentially convert cultivated lands.

Table 9-5 Total Area and Area of Grassland, Forest, and Agricultural Land Within 25-Foot Buffer, by Stream Segment, Long Point Slough and Buckhart Creek

Stream Name	Segment ID	Total Area in 25 ft Buffer (Acres)	Grassland in 25 ft Buffer (Acres)	Forest in 25 ft Buffer (Acres)	Agricultural Land In 25 ft Buffer (Acres)
Long Point Slough	ERA-01	363	37	27	276
Buckhart Creek	EZM-02	545	117	83	305

Conservation Tillage Practices: Conservation tillage practices could help reduce sediment loads into the impaired stream segments by reducing erosion of soils. **Table 9-6** shows the areas (acres) in each impaired segment that are under cultivation, along with the percent of the corresponding watershed area which is cultivated. In conservation tillage, at least 30 percent of the soil surface retains cover by residue after planting. Crop residuals or living vegetation cover on the soil surface protects against soil detachment from water and wind erosion.

Table 9-6 Cultivated Areas for the ERA-01 and EZM-02 Impaired Stream Segments

Waterbody Name	Segment ID	Land Cover Area (Acres)	Cultivated Area (Acres)	Percent Cultivated
Long Point Slough	ERA-01	39,425	35,323	89.6%
Buckhart Creek	EZM-01	63,892	55,403	86.7%

Conservation tillage practices are grouped into three types: no-till, ridge-till, and mulch-till. No one method is best for all fields; instead, the decision on the type of conservation tilling to be used should be based on factors such as the severity of the erosion problem, the soil type, crop rotation, and available equipment. No-till leaves the soil undisturbed from harvest to planting thus leaving a high percentage of surface covered by crop residues. No-till planting can be done successfully in chemically-killed sod, in crop residues from the previous year, or when double-cropping after a small grain. The planting is done in a narrow (usually 6 inches or less) seedbed or slot created by coulters, row cleaners, disk openers, in-row chisels, or roto-tillers. A press-wheel follows to provide firm soil-seed contact. Herbicides are the primary method of weed control, although cultivation may be used for emergency weed control.

Ridge-till involves planting into a seedbed prepared on ridges with sweeps, disk openers, coulters, or row cleaners. The ridges are rebuilt during cultivation and, except for nutrient injection, the soil is left undisturbed from harvest to planting. Ridge-till systems therefore leave residue on the surface between ridges so the degree of soil conservation depends on the amount

of residue and the row direction. Planting on the contour and increased surface coverage greatly reduce soil loss. Ridge-till works best on nearly level, poorly drained soils. The ridges speed up drainage and soil warm-up. Cultivation controls weeds along with some herbicides.

Mulch-till uses chisel plows, field cultivators, disks, sweeps, or blades to till the soil before planting. The tillage does not invert the soil but leaves it rough and cloddy. Various chisel points or sweeps attached to the shanks affect the amount of residue cover left on the soil surface. The effectiveness of mulch-till systems in reducing erosion depends on surface roughness, amount of residue, and tillage direction. Fall chiseling should be done to a depth of 8-10 inches, and spring chiseling should be no deeper than 6 inches. Disking or other shallow tillage operations can be used in seed bed preparation. A standard, or tandem, disk does not till as deep and leaves more residue on the surface compared to heavy (offset) disks. Herbicides and/or cultivation controls weeds in a mulch-till system.

Conservation tillage practices can remove up to 45 percent of the dissolved and total phosphorus from runoff and approximately 75 percent of the sediment. Additionally, studies have found around 93 percent less erosion occurred from no-till acreage compared to acreage subject to moldboard plowing (USEPA 2003). Tillage practices in the Long Point Slough and Buckhart Creek impaired segment areas should be assessed and possibly improved upon to reduce sediment loads.

Terracing: Terracing is a soil conservation practice that can prevent runoff of precipitation falling on high gradient lands from causing serious erosion. Terraces may consist of an earthen embankment, a channel, or a combination of ridges and channels constructed across the slope. Terraces reduce both the volume and velocity of water moving across the soil surface, which greatly reduces soil erosion. Terracing reduces peak discharge rates by temporarily storing runoff and allowing the associated sediment and other contaminants to settle out behind the terrace ridge rather than directly entering a receiving stream. Terrace systems have been shown to remove as much as 85 percent of sediment and 70 percent of total phosphorus from runoff (USEPA 2003).

Water and Sediment Control Basins (WASCOBs): These basins are designed to trap sediments (and the pollutants bound to the sediment) prior to reaching a receiving water. Sediment control basins are typically earthen embankments installed along drainages that act similarly to a terrace. The basin traps water and sediment running off cropland upgradient from the structure, and reduces gully erosion by controlling flow within the drainage area. The basin then releases water slowly, which also helps to decrease streambank erosion in the receiving water.

Sediment control basins are usually designed to capture drainage from an area of 30 acres or less and should be large enough to control runoff from at least a 10-year, 24-hour storm. Locations are determined based on slopes, tillage, and crop management, and the local NRCS can often provide information and advice for design and installation. Maintenance includes reseeding or planting the basins in order to maintain vegetation and periodically checking them, especially after large storms, to determine the need for embankment repairs or mechanical removal of excess sediment.

Grassed Waterways: Grassed waterways are natural or constructed broad, shallow, and heavily vegetated channels designed to move surface water across farmland without causing soil erosion. The vegetative cover within the waterway reduces peak discharge and protects the channel surface from rill and gully erosion. Waterways are often constructed in natural depressions where the water collects and flows to an outlet. In addition to reducing erosion, grassed waterways can positively affect water quality through uptake of other pollutants attached to soils such as nutrients. The NRCS recommends these maintenance measures for grassed waterways:

- If possible, bring row crop patterns into the waterway nearly on the contour, or use it as the turn area. Don't plant end rows along the side of the waterway.
- Plant good quality NRCS-approved seed and fertilize periodically.
- Inspect the area frequently for eroding areas and places needing reseeding. Repair minor rills or gullies by reshaping and reseeding.
- Maintain the width of the grass area when tilling and planting adjacent fields.
- Avoid spraying herbicides in the waterway.
- Avoid driving up and down grassed waterways, especially during wet conditions. The ruts caused by tire tracks can lead to gullies.
- Maintain outlets to prevent gullies from forming. This may include reshaping and reseeding the outlet, or repairing components of structural outlets.

Streambank Stabilization/Erosion Control: Soil erosion is the process of moving soil particles or sediment by flowing water or wind. Additionally, eroding soil transports pollutants that can potentially degrade water quality. Four available approaches to potentially decrease nonpoint TSS, sedimentation/siltation, and/or pollutant source loads, as well as helping to stabilize eroding banks include the following:

- **Stone Toe Protection:** Non-erodible materials are used to protect the eroding banks of a stream. Meandering bends found in the watershed could potentially be stabilized by placing the hard armor only on the toe of the bank. Stone toe protection is most commonly implemented "using stone quarry stone that is sized to resist movement and is placed on the lower one third of the bank in a windrow fashion" (STREAMS 2005).
- **Rock Riffle Grade Control:** Naturally stable stream systems typically have an alternating riffle-pool sequence that helps to dissipate stream energy. Riffle rock grade control places loose rock grade control structures at locations where natural riffles would occur to create and enhance the riffle-pool flow sequence of stable streams. By installing riffle rock in an incised channel, the riffles will raise the water surface elevation resulting in lower effective bank heights, which increases the bank stability by reducing the tractive force on the banks (STREAMS 2005).
- **Floodplain Excavation:** Rather than raising the water level, Floodplain Excavation lowers the floodplain to create a more stable stream. Floodplain Excavation uses mechanical

means to restore the floodplain by excavating and utilizing the soil that would eventually be eroded away and deposited in the stream (STREAMS 2005).

- **Rock chutes:** Rock chutes are riprap lined water conveyance structures used to move water down a slope in a non-erosive manner. The main purpose of a rock chute is to reduce channel flow velocity by dissipating energy and to provide a stable grade at the outlet to prevent erosion.

The extent of streambank erosion within and upstream of the Long Point Slough and Buckhart Creek impaired segments is unknown but local stakeholders have indicated that streambank erosion is also occurring along the Middle Sangamon River. Further investigation is recommended to determine the extent that targeted erosion control measures could help manage sedimentation/siltation in the reaches.

9.5 BMP Recommendations for Improving DO in Buckhart Creek

The Buckhart Creek (Segment EZM-02) area of the Middle Sangamon River watershed was listed during Stage 1 for impairment of aquatic life use due to a single low DO concentration that occurred in 2003. As discussed in Section 5 of this report, this exceedance occurred at one of the two water quality stations located in this segment; however, additional Stage 2 sampling conducted by the Illinois EPA in 2015 did not confirm the DO impairment or show a current impairment. The DO impairment in Burkhart Creek is therefore recommended for delisting and no TMDLs or BMPs for improving DO were included.

9.6 Cost Estimates of BMPs

Cost/payment rate estimates for a number of suggested BMPs are provided in the following subsections. This information was obtained from the 2016 Illinois EQIP “Payment Scenario Descriptions” document located at:

(<http://www.nrcs.usda.gov/wps/portal/nrcs/main/il/programs/financial/eqip/>).

9.6.1 Filter Strips and Riparian Buffers

Several types of filter strip practices are available, including areas for native herbaceous vegetation with or without fertility measures required and areas of introduced species, also with or without fertility measures required. Filter strip implementation that includes seedbed preparation and native seed application ranges from \$520/acre to \$639/acre depending on the type used, with an average of approximately \$594/acre.

Riparian buffers consisting of bare-root shrubs cost approximately \$1.10 to \$1.65 each while direct seeding of trees and/or shrubs costs approximately \$741/acre. The direct seeding scenario includes a planting rate of approximately 3,000 to 4,800 seeds per acre as well as the foregone income for the land taken out of crop production. Land preparation, including removing undesirable vegetation and improving site conditions, is estimated at \$38/acre. For cases where an herbaceous cover is preferable, such a native grass or certain species of forbs and/or shrubs, costs average \$642/acre.

9.6.2 Livestock and Wildlife Exclusion

Costs for livestock and/or wildlife exclusion depend on the type of fencing used. For example, permanent high tensile electric fencing is approximately \$0.79/foot for a single strand, \$1.16/foot for 2 to 3 strands, \$1.42/foot for 4 to 6 strands (with fence post centers no more than 30 feet apart), and \$1.78/foot for 7 or more strands (with double H bracing and fence post centers no more than 30 feet apart). A permanent, multi-strand barbed wire fence averages \$1.62/foot, and a permanent woven wire fence averages \$1.96/foot.

The cost for providing an alternate water supply will vary depending on the supply system used. For example, in areas frequently used by livestock for limited access to drinking water from a pond or stream, an access ramp may be constructed to provide a stable, non-eroding surface and is approximately \$1.44/square foot. This includes earthwork, geotextile, gravel, and other surfacing materials that might be part of the design, as well as a small diversion berm to protect the ramp from concentrated overland flow. If vegetation should be established near the access ramp, costs for a dozer for grading and shaping of small gullies, seedbed preparation with typical tillage implements, grass/legume seed, companion crop, and fertilizer and lime with application are \$716.03/acre. Straw mulch or other approved natural material may be applied where needed to facilitate establishment of vegetative cover. The cost for mulching averages \$238/acre.

Several tank types may be used in areas where lower capacity water supplies are needed and only a backup supply is required for peak demand periods. Above ground tanks vary from \$2,220 for a 1,000 to 3,000 gallon tank and \$3,717 for a tank greater than 3,000 gallons. A large, permanent water tank (500 to 1,000 gallons) or fountain averages \$975, a small permanent tank (less than 500 gallons) is approximately \$400, a frost-free waterer is approximately \$1,011, and a portable tank is \$153. Heavy use protection should be established around these tanks and costs range from \$0.86 to \$4.91/square foot for gravel beds up to a 12 foot width. An underground storage tank may also be used, \$3,600 each, with a livestock pipeline for overflow. A plastic, buried pipeline, less than 2 inches diameter, averages \$1.94/foot. If a bedded pipeline is needed due to special considerations, such as rocky soil, the cost is \$3.38/foot. A non-electric livestock pump is approximately \$961.

9.6.3 Water and Sediment Control Basins

The average cost for a water and sediment basin is approximately \$2.70/cubic yard depending on height (greater than or less than 5 ft) and if topsoil stockpiling is necessary. Installation of an underground outlet, plastic conduit, averages \$2.27/foot.

If vegetation should be established, costs for a dozer for grading and shaping of small gullies, seedbed preparation with typical tillage implements, grass/legume seed, companion crop, and fertilizer and lime with application are \$716.03/acre. Straw mulch or other approved natural material may be applied where needed to facilitate establishment of vegetative cover. The cost for mulching is \$238/acre.

9.6.4 Terraces

Costs for terraces range from \$1.66 to \$5.39/foot depending on the width (broadbase or narrowbase), slope width (less than or greater than 9 percent), whether topsoil stockpiling is needed, and timing of construction (if crop season).

9.6.5 Bank Stabilization/Erosion Controls

Streambank and shoreline protection features include weirs/rock riffles, stream barbs, and bank armor. Weirs/rock riffles range from \$2,448 to \$6,305 each depending on the size. A stream barb or bendway weir along with a longitudinal peaked stone toe ranges from \$27.27 to \$52.50/foot. Full bank armor (rip rap) may be use where typical techniques such as stone toe protection or stream barbs are not feasible. The armor is \$37.55/cubic yard.

Several types of grade stabilization structures may be used depending on the site-specific conditions and include the following: concrete block chutes, \$7.81/square foot, and riprap-lined (rock) chutes, \$48.73/cubic yard. A pipe structure, \$5.20/cubic yard, may be used to stabilize a classic gully with very erodible soils in a wooded area where vegetative establishment is not possible on most of the backslope. A straight overfall grade stabilization structure may be used to control erosion. The overfall structure may be implemented as a toewall, or any other type of straight overfall including concrete, sheet pile, or gabions. Where the height from the inlet to outlet is less than 5 feet, the cost is \$119.11/square foot, and where the height is equal to or greater than 5 feet, the cost is \$194.01/square foot. A pipe drop grade stabilization structure, \$10.24/square foot, includes earthwork and a principal spillway outlet structure.

9.6.6 Grassed Waterways

Costs for grassed waterways range from \$2,568 to \$4,916/acre depending on the width, timing of construction (if crop season), and whether checks (fabric or rock) are used.

9.6.7 Conservation Tillage

Conservation tillage is assumed to include tillage practices that preserve at least 30 percent residual cover of the soil after crops are planted. Costs associated with converting to conservation tillage will depend on the extent and degree of conservation tillage practices implemented. A no-till/strip-till system, organic or non-organic, involves managing the amount, orientation, and distribution of crop and other plant residue on the soil surface year-round while limiting soil-disturbing activities used to grow and harvest crops. These systems average approximately \$16/acre. Incorporating mulch till in place of conventional till costs \$4.21/acre, and applies to both organic and conventional fields. A full-width ridge-till system costs approximately \$30/acre. Contour farming is a practice in which row orientation is changed from up and down hill orientation to nearly perpendicular to the flow of runoff. Costs for this practice are \$6.06/acre.

9.6.8 Septic System Maintenance

Septic tanks are designed to accumulate sludge in the bottom portion of the tank while allowing water to pass into the drain field. If the tank is not pumped out regularly, the sludge can accumulate and eventually become deep enough to allow for flow into the drain field. Pumping the tank every three to five years prolongs the life of the system by protecting the drain field from solid material that may cause clogs and system back-ups. In addition, septic systems should not be connected to field tile lines.

The cost to pump a typical septic tank ranges from \$250 to \$350 depending on how many gallons are pumped out and the disposal fee for the area. If a system is pumped once every three to five years, this expense averages out to less than \$100 per year.

The cost of developing and maintaining a watershed-wide database of the onsite wastewater treatment systems in the Middle Sangamon River watershed depends on the number of systems that need to be inspected and the means by which the systems are inventoried. Education of home and business owners that use onsite wastewater treatment systems should occur periodically. Public meetings; mass mailings; and radio, newspaper, and TV announcements can all be used to remind and inform owners of their responsibility to maintain their systems. The costs associated with education and inspection programs will vary depending on the level of effort required to communicate the importance of proper maintenance and the number of systems in the area. Grand scale estimates of watershed septic systems were included in Section 9.3.2.

9.7 Information and Education

As discussed in Section 3, public education and participation is a key factor for TMDL and watershed plan implementation. Increased public awareness can increase implementation of BMPs. Small incremental improvements and individual adoption of BMPs can be achieved at a much lower cost compared to the large-scale BMPs identified above. Outreach and education efforts should focus on activities that support the watershed plan goals, including:

- Biological and water quality monitoring
- Encouraging native landscaping including buffers along streambanks
- Buffer (filter) strips
- Water conservation
- Green infrastructure
- Field visit days with demonstrations of agricultural conservation practices

An additional public meeting was held within the watershed to present the final TMDL results and the implementation plan. Additional recommended activities to support public outreach and education include:

- Websites and social media to publicize meetings, upcoming events, and links to resources
- E-mail updates
- Brochures with information on septic tanks
- Educational signs to educate viewers on water quality issues, purpose of BMPs, and environmental stewardship
- Public service announcements
- Informational meetings on State and Federal cost share programs

9.8 Project Funding

Cost-share programs at the state and federal level are available to landowners, homeowners, and farmers in the watershed to help offset costs of implementing many of the BMPs recommended in this report. Some of these programs are discussed below.

9.8.1 Available State-Level Programs for Nonpoint Sources

State-level programs to encourage landowners to implement resource-conserving practices for water quality and erosion control purposes are discussed in the following paragraphs.

9.8.1.1 Conservation Practices Cost-Share Program

The Conservation Practices Cost-Share Program (CPP) is a 10-year program. The practices consist of waterways, water and sediment control basins, pasture/hayland establishment, critical area, terrace system, no-till systems, diversions, and grade stabilization structures. The CPP is state-funded through the Illinois Department of Agriculture (IDA). There is a project cap of \$5,000 per landowner and costs per acre vary significantly from project to project.

9.8.1.2 Streambank Stabilization and Restoration Program

The Streambank Stabilization and Restoration Program (SSRP) was established to address problems associated with streambank erosion, such as loss or damage to valuable farmland, wildlife habitat, and roads; stream capacity reduction through sediment deposition; and degraded water quality, fish, and wildlife habitat. The primary goals of the SSRP are to develop and demonstrate vegetative, stone structure, and other low cost bio-engineering techniques for stabilizing streambanks and to encourage the adoption of low-cost streambank stabilization practices by making available financial incentives, technical assistance, and educational information to landowners with critically eroding streambanks. A cost share of 75 percent is available for approved project components such as willow post installation, bendway weirs, rock riffles, stream barbs/rock, vanes, lunger structures, gabion baskets, and stone toe protection techniques. There is no limit on the total program payment for cost-share projects that a landowner can receive in a fiscal year. However, maximum cost per foot of bank treated is used to cap the payment assistance on a per foot basis and maintain the program's objectives of funding low-cost techniques (Illinois Institute for Rural Affairs 2015). All project proposals must be sponsored and submitted by the local Soil and Water Conservation District (SWCD).

9.8.2 Available Federal-Level Programs for Nonpoint Sources

There are several voluntary conservation programs established by various federal agencies that encourage landowners to implement resource-conserving practices for water quality and erosion control purposes. These programs apply to crop fields as well as rural grasslands that are presently used for livestock grazing. Federal-level programs are discussed in the following paragraphs. The USEPA manages the Clean Water Act Section 319 Grants. The Farm Service Agency (FSA) oversees the Conservation Reserve Program (CRP) and the Grasslands Reserve Program (GRP). Voluntary conservation programs established through the 2014 U.S. Farm Bill, and managed by the NRCS, include the Agricultural Conservation Easement Program (ACEP), the Conservation Stewardship Program (CSP), and the Environmental Quality Incentives Program (EQIP).

9.8.2.1 Clean Water Act Section 319 Grants

Section 319 was added to the CWA to establish a national program to address nonpoint sources of water pollution. Through this program, each state is allocated Section 319 funds on an annual basis according to a national allocation formula based on the total annual appropriation for the section 319 grant program. The total award consists of two categories of funding: incremental funds and base funds. A state is eligible to receive USEPA 319(b) grants upon the USEPA's approval of the state's Nonpoint Source Assessment Report and Nonpoint Source Management Program. States may reallocate funds through sub-awards (e.g., contracts, sub-grants) to both public and private entities, including local governments, tribal authorities, cities, counties, regional development centers, local school systems, colleges and universities, local nonprofit organizations, state agencies, federal agencies, watershed groups, for-profit groups, and individuals.

USEPA designates incremental funds, a \$163-million award in 2016, for the restoration of impaired water through the development and implementation of watershed-based plans and TMDLs for impaired waters. Base funds, funds other than incremental funds, are used to provide staffing and support to manage and implement the state Nonpoint Source Management Program. Section 319 funding can be used to implement activities which improve water quality, such as filter strips, streambank stabilization, etc. (USEPA 2003).

Illinois EPA receives federal funds through Section 319(h) of the CWA to help implement Illinois' Nonpoint Source Pollution Management Program. The purpose of the program is to work cooperatively with local units of government and other organizations toward the mutual goal of protecting the quality of water in Illinois by controlling nonpoint source pollution. The program emphasizes funding for implementing cost-effective corrective and preventative BMPs on a watershed scale; funding is also available for BMPs on a non-watershed scale and the development of information/education nonpoint source pollution control programs.

The maximum Federal funding available is 60 percent of the total cost, with the remaining 40 percent coming from local match. The program period is two years unless otherwise approved. This is a reimbursement program.

Section 319(h) funds are awarded for the purpose of implementing approved nonpoint source management projects. The funding will be directed toward activities that result in the implementation of appropriate BMPs for the control of nonpoint source pollution or to enhance the public's awareness of nonpoint source pollution. Applications are accepted June 1 through August 1.

9.8.2.2 Conservation Reserve Program

The CRP is voluntary program, administered through the FSA, which encourages landowners to agree to remove environmentally sensitive land from agricultural production and plant long-term resource-conserving cover to improve water quality, prevent soil erosion, and reduce loss of wildlife habitat. The program was initially established in the Food & Security Act of 1985 and is the largest private-lands conservation program in the United States.

Participants can enroll in CRP in two ways and the duration of the contracts under CRP range from 10 to 15 years. The first enrollment method is through a competitive process known as the

CRP General Sign-up. These are announced on a periodic basis by the Secretary of Agriculture but do not occur on any fixed schedule. The second enrollment method is through CRP Continuous Sign-up, which is offered on a continuous basis. Continuous sign-up provides management flexibility to farmers and ranchers to implement certain high-priority conservation practices on eligible land. All enrollment offers are processed through the local FSA office.

Certain conditions must be met in order for land to be eligible for CRP enrollment. These conditions include the following:

1. The farmer applying for enrollment must have owned or operated the land for at least 12 months prior to the previous CRP sign-up period (except in cases of a change in ownership due to the previous owner's death, foreclosure, or land purchase by the new owner without the sole intention of placing it in the CRP).
2. Cropland that is planted or considered planted to an agricultural commodity for four of the six most recent crop years (including field margins) and must be physically and legally capable of being planted in a normal manner to an agricultural commodity.
3. Certain marginal pastureland suitable for use as any of the following conservation practices: buffer for wildlife habitat, wetlands buffer or restoration, filter strips, riparian buffer, grass waterway, shelter belt, living snow fence, contour grass strip, salt tolerant vegetation, or shallow water area for wildlife.

In addition to the eligible land requirements, cropland must meet one of the following criteria:

- Have a weighted average erosion index of 8 or higher
- Be expiring CRP acreage
- Be located in a national or state CRP conservation priority area.

The FSA bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or cash-rent equivalent. The maximum rental rate for each offer is calculated in advance of enrollment. Producers may offer land at the maximum rate or at a lower rental rate to increase likelihood of offer acceptance. In addition, the FSA provides cost-share assistance for up to 50 percent of the participant's costs in establishing approved conservation practices (USDA 2016: <https://www.fsa.usda.gov/programs-and-services/conservation-programs/prospective-participants/index>). CRP annual rental payments may include an additional amount up to \$2 per acre per year as an incentive to perform certain maintenance obligations (up to \$7 for certain continuous sign-up practice).

Finally, the FSA offers additional financial incentives for certain continuous sign-up practices. Signing Incentive Payment is a one-time incentive payment of \$10/acre for each acre enrolled for each full year of the contract. Eligible practices include field windbreaks; grassed waterways; shelter belts; living snow fences; filter strips; riparian buffers; marginal pastureland wildlife and wetland buffers; bottom timber establishment; field borders; longleaf pine establishment; duck nesting habitat; SAFE buffers, wetlands, trees, longleaf pine, and grass; pollinator habitat; and several wetlands practices. The Performance Incentive Payment is a one-time incentive payment

made to participants who enroll land in CRP to be devoted to all continuous sign up practices except establishment of permanent vegetative cover on terraces, wetland restoration (including non-floodplain), bottomland timber establishment, and duck nesting habitat.

The maximum annual non-cost share payment that an eligible “person” can receive under the CRP is \$50,000 per fiscal year. This is a separate payment limitation applying only to CRP non-cost share payment.

The current extent of land enrolled in CRP within the Middle Sangamon River watershed is unknown.

9.8.2.3 Conservation Stewardship Program

The CSP helps agricultural producers maintain and improve their existing conservation systems and adopt additional conservation activities to address priority resources concerns. Participants earn CSP payments for conservation performance—the higher the performance, the higher the payment.

Through CSP, participants take additional steps to improve resource conditions including soil quality, water quality and quantity, air quality, habitat quality, and energy. CSP provides two types of payments through 5-year contracts: annual payments for installing new conservation activities and maintaining existing practices; and supplemental payments for adopting a resource-conserving crop rotation. Producers may be able to renew a contract if they have successfully fulfilled the initial contract and agree to achieve additional conservation objectives. Payments are made soon as practical after October 1 of each fiscal year for contract activities installed and maintained in the previous year. In fiscal year 2016, NRCS made \$150 million available for producers through the CSP.

Eligible lands include private and Tribal agricultural lands, cropland, grassland, pastureland, rangeland and non-industrial private forest land. CSP is available to all producers, regardless of operation size or type of crops produced, in all 50 states, the District of Columbia, and the Caribbean and Pacific Island areas. Applicants may include individuals, legal entities, joint operations, or Indian tribes that meet the stewardship threshold for at least two priority resource concerns when they apply. They must also agree to meet or exceed the stewardship threshold for at least one additional priority resource concern by the end of the contract. Producers must have effective control of the land for the term of the proposed contract, which include all eligible land in the agricultural operation. Some additional restrictions and program requirements may apply and interested applicants should contact the local NRCS office for more information.

9.8.2.4 Grassland Reserve Program

The purpose of the GRP, administered by the FSA, is to prevent grazing and pasture land from being converted into cropland, used for urban development, or developed for other non-grazing uses. Participants in the program voluntarily limit future development of the land while still being able to use the land for livestock grazing and activities related to forage and seed production. Some restrictions on activities may apply during the nesting season of certain bird species that are in decline or protected under federal or state law.

The GRP has several enrollment options, including a rental contract for 10, 15, or 20 years, or enrollment of the land in a conservation easement for an indefinite period of time. Applications are accepted any time and are processed through the local FSA office.

To be eligible for a rental agreement, the applicant must own or have control of the land for the length of the contract. To enroll in a conservation easement, the applicant must own and be willing to restrict use of the land either in perpetuity or under the maximum length of time under state law. Persons enrolled in GRP receive an annual rental payment for their enrolled acres. Rental payments were not available on the USDA website as of June 2016 (<https://www.fsa.usda.gov/programs-and-services/conservation-programs/grassland-reserve/index>); however, further information about the program, including payment amounts, eligibility and maintenance criteria, and land requirements may be obtained from the local FSA office.

9.8.2.5 Agricultural Conservation Easement Program

ACEP provides financial and technical assistance to help conserve agricultural lands and wetlands and their related benefits. Under the Agricultural Land Easements component, NRCS helps American Indian tribes, state and local governments, and non-governmental organizations protect working agricultural lands and limit non-agricultural uses of the land. Land protected by agricultural land easements provides additional public benefits, including environmental quality, historic preservation, wildlife habitat, and protection of open space. Under the Wetlands Reserve Easements component, NRCS helps to restore, protect, and enhance enrolled wetlands. Wetland Reserve Easements provide habitat for fish and wildlife, including threatened and endangered species, improve water quality by filtering sediments and chemicals, reduce flooding, recharge groundwater, protect biological diversity and provide opportunities for educational, scientific and limited recreational activities.

Agricultural Land Easements: NRCS provides financial assistance to eligible partners purchase Agricultural Land Easements that protect the agricultural use and conservation values of eligible land. In the case of working farms, the program helps farmers and ranchers keep their land in agriculture. The program also protects grazing uses and related conservation values by conserving grassland, including rangeland, pastureland and shrubland. Land eligible for agricultural easements includes cropland, rangeland, grassland, pastureland and non-industrial private forest land. NRCS will prioritize applications that protect agricultural uses and related conservation values of the land and those that maximize the protection of contiguous acres devoted to agricultural use.

To enroll land through agricultural land easements, NRCS enters into cooperative agreements with eligible partners. Each easement is required to have an agricultural land easement plan that promotes the long-term viability of the land. Under the Agricultural Land component, NRCS may contribute up to 50 percent of the fair market value of the agricultural land easement. Where NRCS determines that grasslands of special environmental significance will be protected, NRCS may contribute up to 75 percent of the fair market value of the agricultural land easement.

Wetland Reserve Easements: NRCS also provides technical and financial assistance to restore, protect, and enhance wetlands through the purchase of a wetland reserve easement. These agreements include the right for NRCS to develop and implement a wetland reserve restoration

easement plan to restore, protect, and enhance the wetland's functions and values. Land eligible for wetland reserve easements includes farmed or converted wetland that can be successfully and cost-effectively restored. NRCS will prioritize applications based on the easement's potential for protecting and enhancing habitat for migratory birds and other wildlife. For acreage owned by an Indian tribe, there is an additional enrollment option of a 30-year contract. Through the wetland reserve enrollment options, NRCS may enroll eligible land through one of the following:

- **Permanent Easements** – These are conservation easements in perpetuity. NRCS pays 100 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 75 to 100 percent of the restoration costs.
- **30-year Easements** – These expire after 30 years. Under 30-year easements, NRCS pays 50 to 75 percent of the easement value for the purchase of the easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- **Term Easements** – Term easements are easements made for the maximum duration allowed under applicable State laws. NRCS pays 50 to 75 percent of the easement value for the purchase of the term easement. Additionally, NRCS pays between 50 to 75 percent of the restoration costs.
- **30-year Contracts** – 30-year contracts are only available to enroll acreage owned by Indian tribes, and program payment rates are commensurate with 30-year easements.

For wetland reserve easements, NRCS pays all costs associated with recording the easement in the local land records office, including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Wetland Reserve Enhancement Partnership – The 2014 Farm Bill replaced the Wetland Reserve Enhancement Program with the Wetland Reserve Enhancement Partnership (WREP) as an enrollment option under ACEP. WREP continues to be a voluntary program through which NRCS signs agreements with eligible partners to leverage resources to carry out high priority wetland protection, restoration, and enhancement and to improve wildlife habitat.

- Partner benefits through WREP agreements include:
 - Wetland restoration and protection in critical areas
 - Ability to cost-share restoration or enhancement beyond NRCS requirements through leveraging
 - Able to participate in the management or monitoring of selected project locations
 - Ability to use innovative restoration methods and practices

In 2016, NRCS made \$15 million in financial and technical assistance available to help eligible conservation partners leverage local resources to voluntarily protect, restore, and enhance critical wetlands on private and tribal agricultural land nationwide. The funding is provided through the WREP, a special enrollment option under the Agricultural Conservation Easement Program. Proposals were due to the local NRCS offices by May 16, 2016; however, landowners

should check with the NRCS to see about applying in future years. To enroll land eligible partners may submit proposals to the local NRCS office.

9.8.2.6 Environmental Quality Incentive Program

EQIP is a voluntary program that provides financial and technical assistance to agricultural producers to plan and implement conservation practices that improve soil, water, plant, animal, air, and related natural resources on agricultural land and non-industrial private forestland. Through EQIP, the NRCS develops contracts with agricultural producers to implement conservation practices to address environmental natural resource problems. Persons engaged in livestock or agricultural production and owners of non-industrial private forestland are eligible for the program. Eligible land includes cropland, rangeland, pastureland, private non-industrial forestland, and other farm or ranch lands. Eligible applicants must, at a minimum, meet the following criteria; additional program requirements may apply:

- Be agricultural producer (person, legal entity, or joint operation who has an interest in the agricultural operation, or who is engaged in agricultural production or forestry management).
- Control or own eligible land.
- Comply with adjusted gross income for less than \$900,000. Note: Federally recognized Native American Indian Tribes or Alaska Native corporations are exempt from the adjusted gross income payment limitations.
- Be in compliance with the highly erodible land and wetland conservation requirements.
- Develop an NRCS EQIP plan of operations that addresses at least one natural resource concern

Persons interested in entering into a cost-share agreement with the NRCS for EQIP assistance may file an application at any time; however, each state may establish deadlines for one or more application periods in which to consider eligible applications for funding. Applications submitted after the deadlines will be evaluated and considered for funding during later funding opportunities.

As part of the program, a Conservation Activity Plan (can be developed for producers to address a specific natural resource concern on their agricultural operation. Each plan is developed by a certified Technical Service Provider, who is selected by the EQIP participant. Technical assistance payments for Technical Service Providers do not count against the financial assistance aggregate payment limitation or the contract financial assistance payment limitation. The plan becomes the basis of the EQIP contract between NRCS and the participant, and the contracts can be up to 10 years in duration. Financial assistance payments are made to eligible producers once conservation practices are completed according to NRCS requirements. Payment rates are set for each fiscal year and are attached to the EQIP contract when it is approved.

Historically underserved producers (limited resource farmers/ranchers, beginning farmers/ranchers, socially disadvantaged producers, Indian Tribes, and veteran farmer or ranchers) who self-certify on Form NRCS-CPA-1200, Conservation Program Application are

eligible for a higher practice payment rate to support implementation of contracted conservation practices and activities. Historically underserved producers may also be issued advance payments up to 50 percent of the established payment rate to go toward purchasing materials or contracting services to begin installation of approved conservation practices. Self-certified socially disadvantaged farmer/rancher, beginning farmer/rancher, and veteran farmer/rancher producers may elect to be evaluated in special EQIP funding pools. More information can be obtained from the local NRCS office.

EQIP provides payments up to 75 percent of the incurred costs and 100 percent estimated income foregone of certain conservation practices and activities. Payments received by producers through EQIP contracts after February 7, 2014 may not exceed \$450,000 for all EQIP contracts entered into during the period from 2014 to 2018. Payment limitations for organic production may not exceed an aggregate \$20,000 per fiscal year or \$80,000 during any 6-year period for installing conservation practices.

Conservation practices eligible for EQIP funding which are recommended BMPs for this watershed TMDL include filter strips, conservation tillage, grade stabilization structures, grass waterways, riparian buffers, streambank/shoreline protection, terraces, and wetland restoration. More information regarding state and local EQIP implementation can be found at <http://www.nrcs.usda.gov/wps/portal/nrcs/main/il/programs/financial/eqip/>.

9.8.3 Local Program Contact Information

The FSA administers the CRP and GRP. NRCS administers the ACEP, CSP, and EQIP. Local contact information for counties containing some portion of the Middle Sangamon River watershed are listed in the **Table 9-7** below.

Table 9-7 Local SWCD, NRCS, FSA, and IDA Contact Information

County	Address	Phone
State FSA Office		
	Illinois State FSA Office 3500 Wabash Avenue Springfield, IL 62711	(217) 241-6600
Local NRCS/Soil and Water Conservation District Office		
Christian County	620 N. Webster Street Taylorville, IL 62568	(217) 287-1315
Macon County	4004 College Park Road Decatur, IL 62521	(217) 877-5670
Sangamon County	2623 Sunrise Drive, Suite 1 Springfield, IL 62703-8302	(217) 241-6635
Local IDA Office for SSRP		
	P.O. Box 19281, State Fairgrounds Springfield, IL 62794-9281	(217) 782-6297

9.9 Planning Level Cost Estimates for Implementation Measures

Cost estimates for different implementation measures are presented in **Table 9-8**. The column labeled "Program" or "Sponsor" lists the financial assistance program or sponsor available for various BMPs (as discussed in Section 9.9). IEPA 319 Grants are applicable to all of the practices.

Table 9-8 Cost Estimates of Various BMP Measures

BMP	Units	Installation Cost	Program	Sponsor(s)
Filter strip (seeded)	per ac	\$520 - \$639, avg \$594	CRP	NRCS, IDA
Riparian buffer – bare-root shrubs	each	\$1.10 - \$1.65	CRP	NRCS, IDA
– forested	per ac	\$741		
– herbaceous cover	per ac	\$642		
– land preparation	per ac	\$38		
Livestock exclusion	per ac		EQIP	NRCS
Fencing – permanent high-tensile, 1 strand	per ft	\$0.79		
– permanent high-tensile, 2-3 strands	per ft	\$1.16		
– permanent high-tensile, 4-6 strands	per ft	\$1.42		
– permanent high-tensile, 7 or more strands	per ft	\$1.78		
– barbed wire, multi-strand	per ft	\$1.62		
– woven wire	per ft	\$1.96		
Alternate water			EQIP	NRCS
– access ramp	per SF	\$1.44		
– tanks, at or above ground	each	\$153 - \$3,717;		
– tanks, at or above ground, heavy use protection	per SF	\$0.86 - \$4.91		
– tanks, frost-free waterer	each	\$1,011		
– tank, below ground	each	\$3,600		
– tank, below ground, pipeline and pump	per ft each	\$1.94 - \$3.38/ft for pipeline, \$961/pump		
Water and sediment control basin	per CY	avg \$2.70	CPP	IDA
– underground outlet, plastic	per ft	\$2.27		
Terraces	per ft	\$1.66 - \$5.39	CPP	IDA
Bank stabilization	per ac	\$27 - \$52/ft	SSRP	IDA
– weirs/rock riffles	each	\$2,448 - \$6,305		
– stream barb/bendway weir with longitudinal peaked stone toe	per ft	\$27.27 - \$52.50		
– bank armor	per CY	\$37.55		

BMP	Units	Installation Cost	Program	Sponsor(s)
Grade stabilization			CPP, SSRP	IDA
– concrete block chutes	per SF	\$7.81		
– rip rap-lined (rock) chute	per CY	\$48.73		
– gully pipe structure	per CY	\$5.20		
– overfall structure	per SF	\$119.11 - \$194.01		
– pipe drop grade structure	per SF	\$10.24		
Grassed waterway	per ac	\$2,568 - \$4,916	CPP CRP	IDA NRCS
Conservation tillage			EQIP	NRCS, IDA
– no-till/strip-till	per ac	\$16		
– mulch-till	per ac	\$4.21		
– ridge-till	per ac	\$30		
Contour farming	per ac	\$6.06	EQIP	NRCS
Vegetation and mulch as needed for various BMPs, such as alternate water access ramp and WASCOBs	per ac	\$716 for vegetation, \$238 for mulch	See corresponding program and sponsor listed above	
Septic system maintenance	per event	\$250 - \$350	Private system owner	

ac = acre CY = cubic yard
ft = foot SF = square foot

9.10 Milestones and Monitoring

9.10.1 Interim Measurable Milestones and Schedule

Successful plan implementation relies on establishing and tracking milestones to measure progress. **Table 9-9** identifies these milestones and a schedule for meeting each milestone. Stakeholders should evaluate milestone progress on an annual basis and implement adaptive management to modify the management measures, milestones, and schedules as necessary.

Implementation of the management actions outlined in this section should occur in phases, often over the course of several years, with effectiveness assessments made as improvements are completed. The process of obtaining funding, and developing and implementing projects designed to improve water quality, can take months or years to complete and once in place, improvements in water quality as a result of BMPs may not be detectable for several years. Continued monitoring and reevaluation of the implementation measures during this time will allow for more expedient adjustment to BMP implementation measures that may result in earlier attainment of water quality targets.

Table 9-9 Implementation Milestones

Milestones	Description	Estimated Schedule
Funding	Develop grant application(s)	Short term: 2-5 years
Implement Short-term Projects	Identify and implement short-term pilot projects that can be completed (i.e., willing landowners and available funding)	Mid-term: 2-5 years
Monitoring	Implement monitoring plan	Continuous: 1-20 years
Annual Stakeholder meetings	Stakeholders will convene once a year to gauge progress and discuss evolving needs and planned activities	Annually
Implement Larger Projects	Identify and implement larger projects. These projects are more likely to have multiple funding sources and stakeholders.	Mid- Term: 5-10 years
Education and outreach	Prepare and implement and education and outreach plan. Conduct at least two public meetings annually.	Immediate: 1-2 years

9.10.2 Monitoring Plan

The purpose of the monitoring plan for the Middle Sangamon River watershed is to assess the overall implementation of the management actions outlined in this section. This can be accomplished by conducting the monitoring programs designed to:

- Track implementation of BMPs in the watershed
- Estimate effectiveness of BMPs
- Further monitor point source discharges in the watershed
- Continue monitoring of impaired stream segments and tributaries, including low-flow monitoring of fecal coliform and periodic visual assessments of sedimentation/siltation
- Conduct an urban storm sewer survey to assess contributions to pollutant loading in receiving waters
- Monitor storm-based high flow events

Tracking the implementation of the management measures can be used to:

- Determine the extent to which the management measures and practices have been implemented compared to the actions needed to meet the TMDL endpoints
- Establish a baseline from which decisions can be made regarding the need for additional incentives for implementation efforts
- Measure the extent of voluntary implementation efforts
- Support the work-load and costing analyses for assistance or regulatory programs
- Determine the extent to which management measures are properly maintained and operated

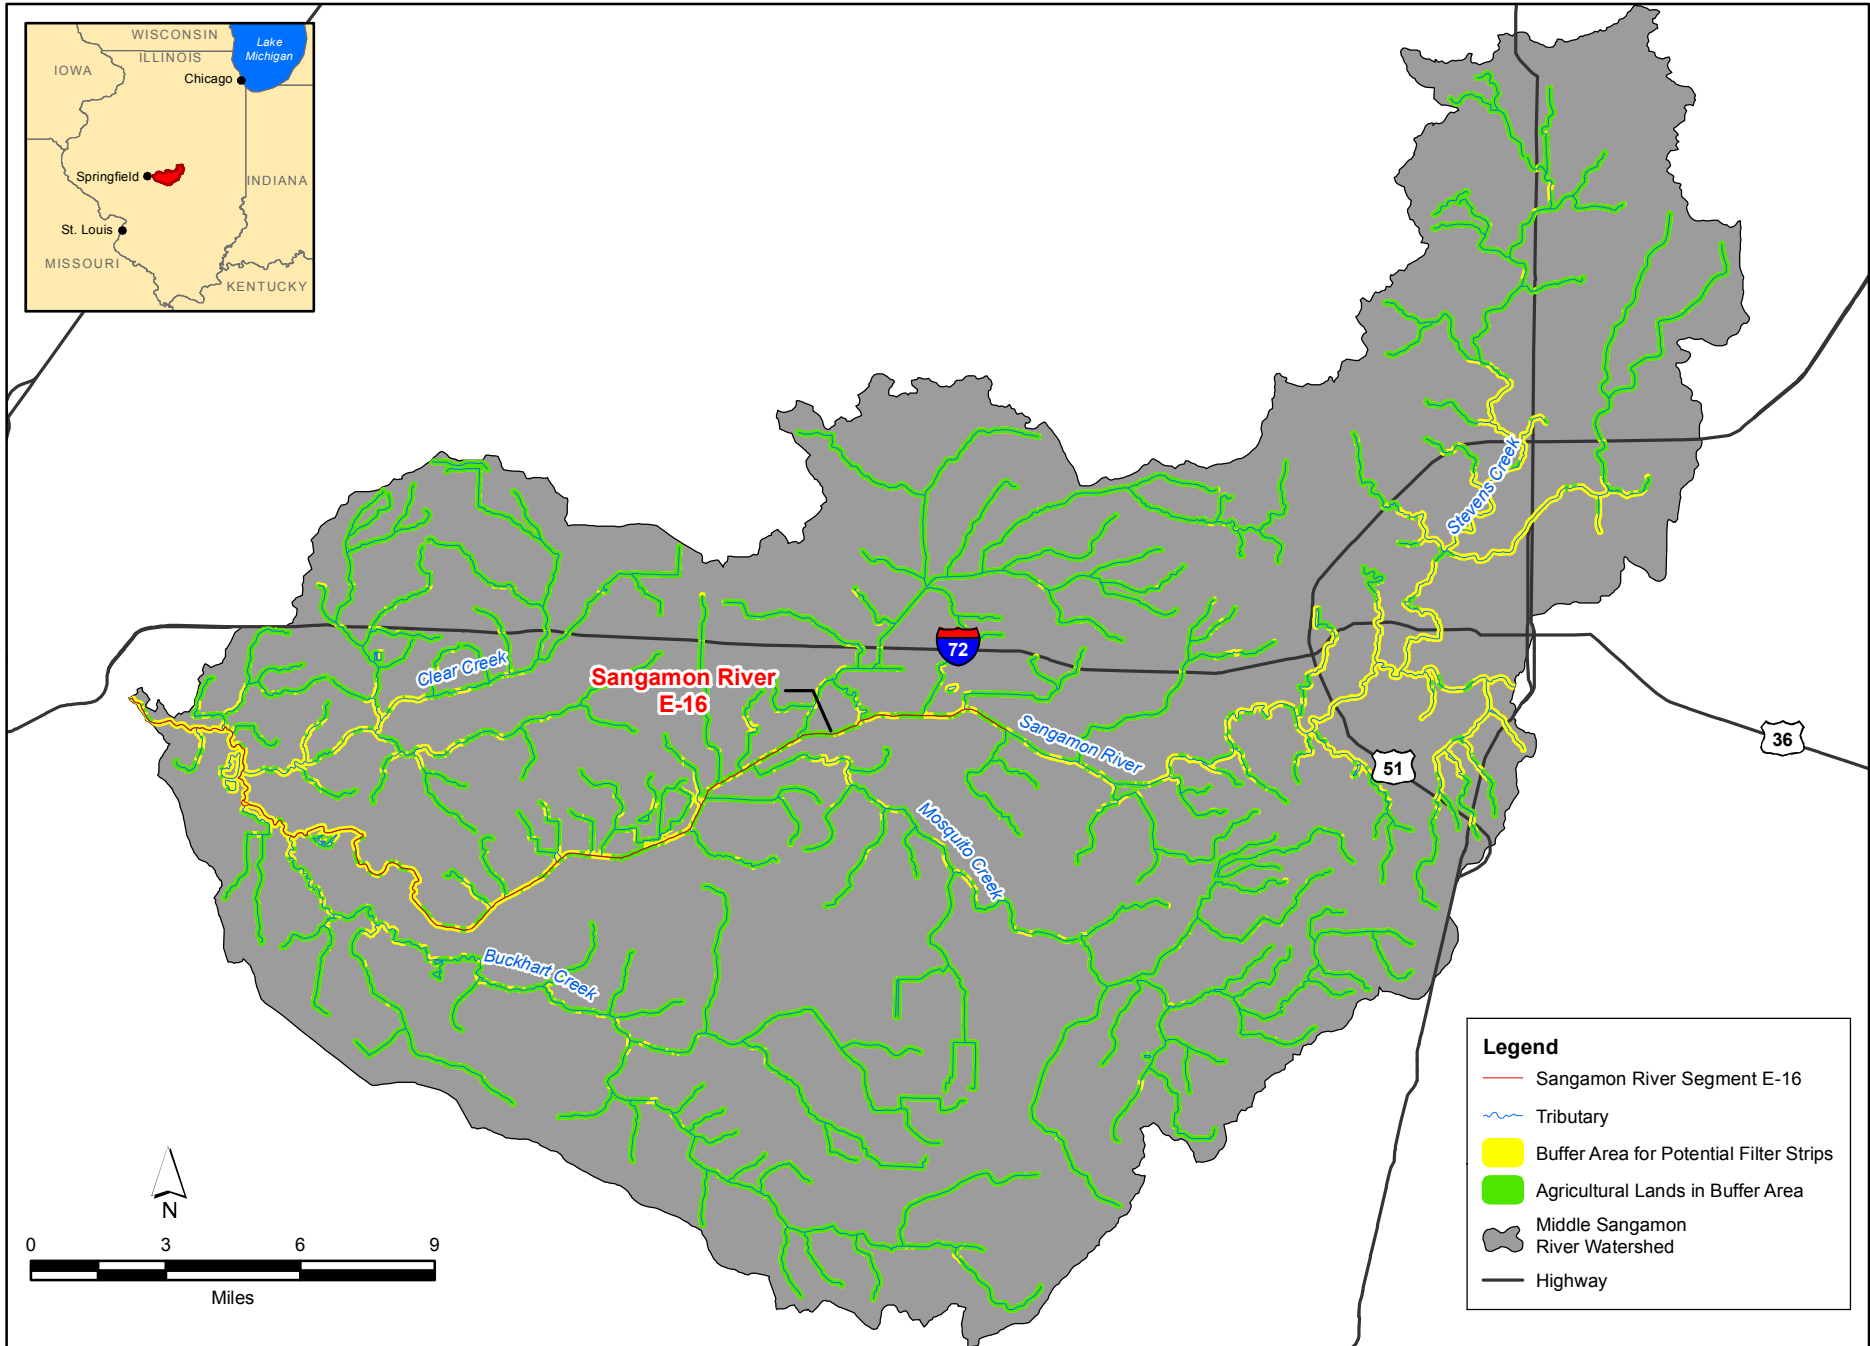

Estimating the effectiveness of the BMPs implemented in the watershed could be completed by monitoring before and after the BMP is incorporated into the watershed. Additional monitoring could be conducted on specific structural systems such as a sediment control basin. Inflow and outflow measurements could be conducted to determine site-specific removal efficiency.

Illinois EPA conducts Intensive Basin Surveys every 5 years. Additionally, select ambient sites are monitored nine times a year. Continuation of this state monitoring program will assess stream water quality as improvements in the watershed are completed. This data will also be used to assess whether water quality standards in the impaired segments are being attained.

9.10.3 Success Criteria

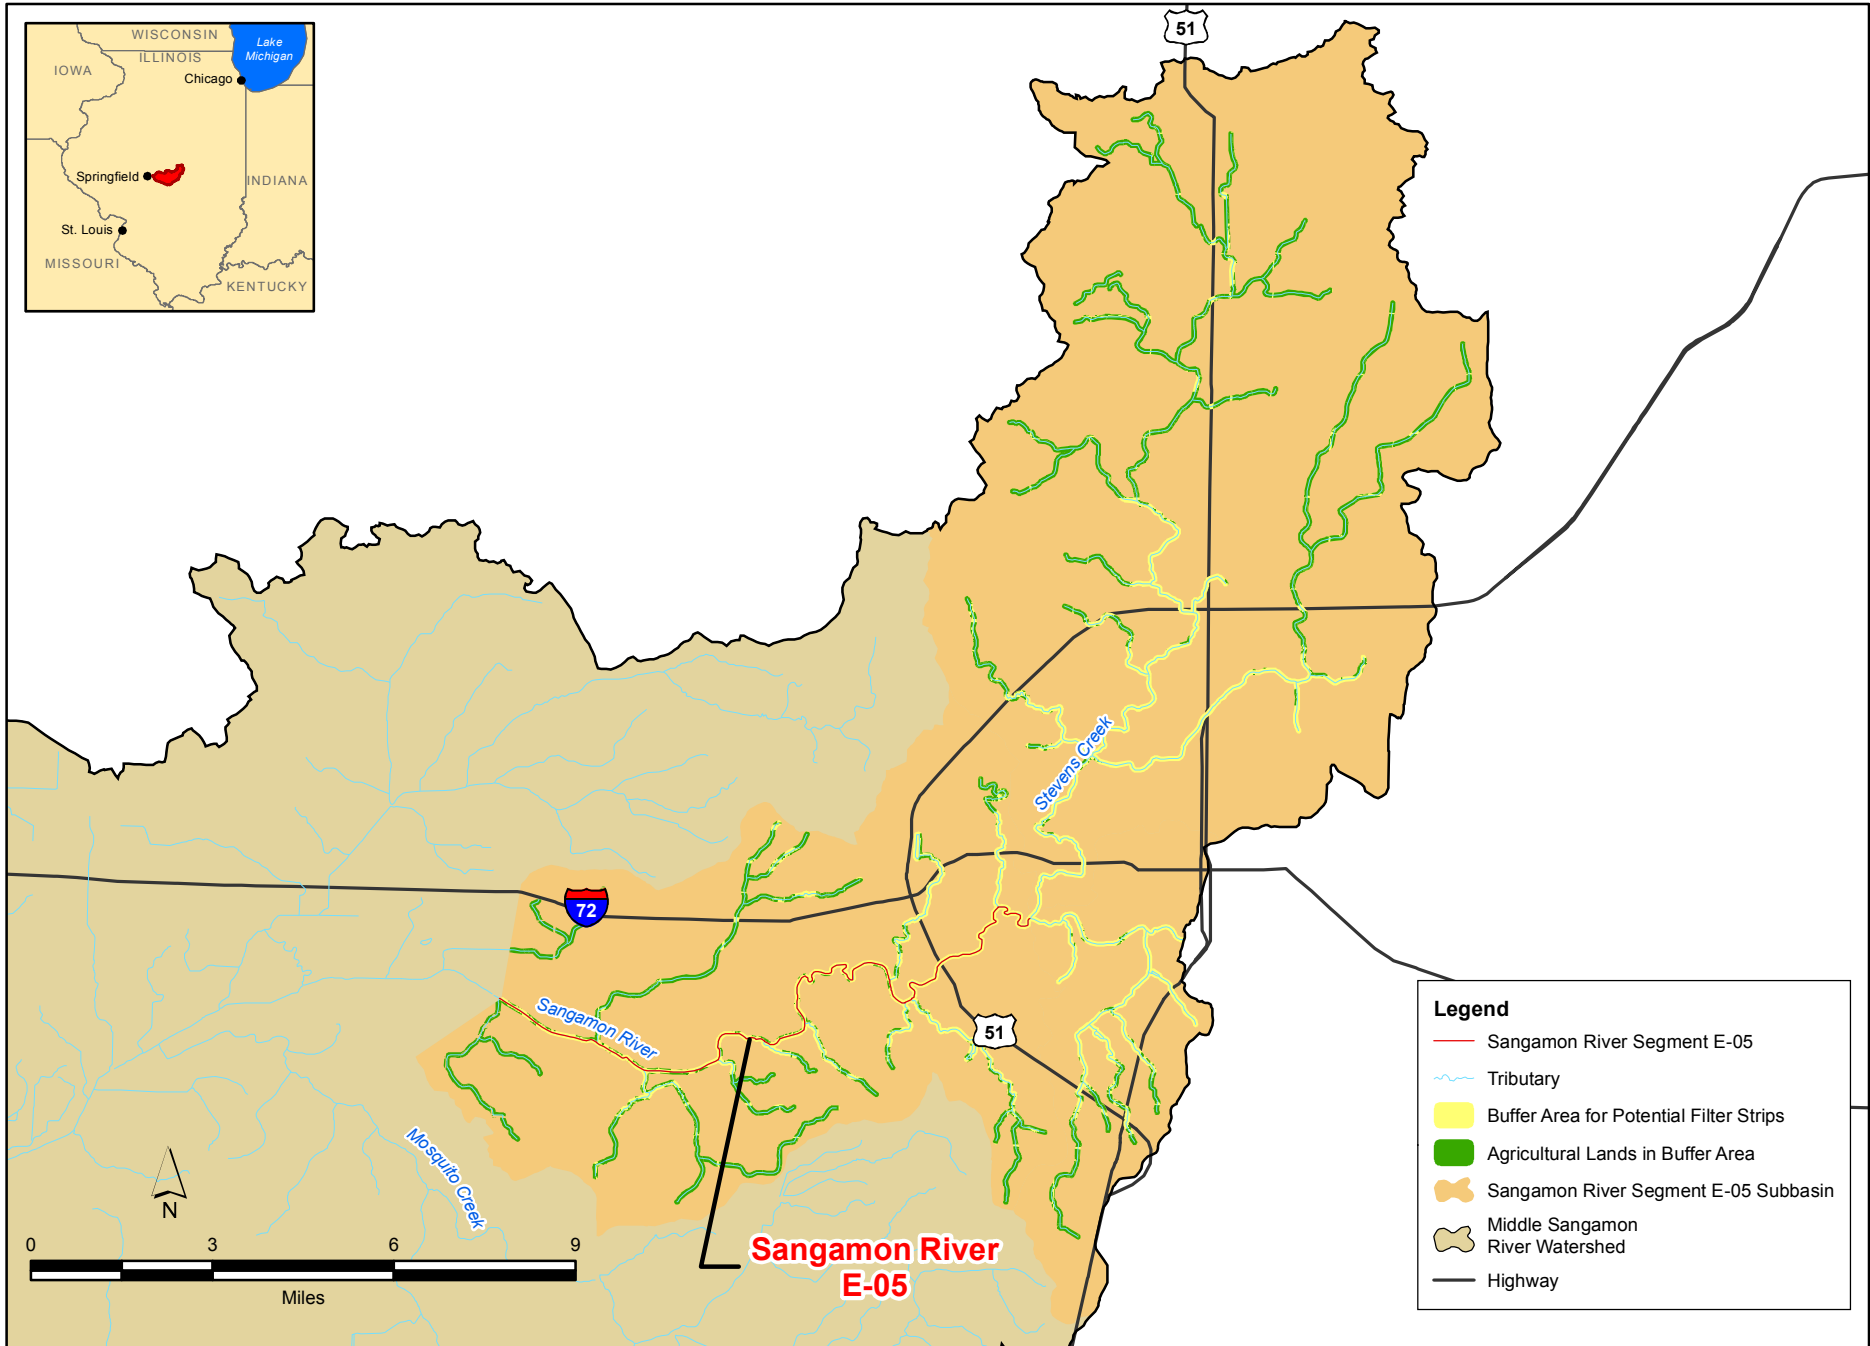

Measuring the plan's success depends largely on tracking the milestones outlined above. Implementing BMPs should equate to improved water quality and attainment of designated uses and water quality standards. Monitoring pollutant-load reductions will be the primary success criteria. Key components include:

- Securing funding for priority projects within 5 years
- Meeting the identified milestones
- Meeting 25-50% of target reductions within 10 years
- Meeting 100% of target reductions within 20 years
- Utilizing adaptive management to ensure best practices
- Delisting of the impaired waterbodies
