Section 1

Goals and Objectives for the Salt Creek Watershed

1.1 Total Maximum Daily Load Overview

A total maximum daily load, or TMDL, is a calculation of the maximum amount of a pollutant that a water body can receive and still meet water quality standards. TMDLs are a requirement of Section 303(d) of the Clean Water Act (CWA). To meet this requirement, the Illinois Environmental Protection Agency (Illinois EPA) must identify water bodies not meeting water quality standards and then establish TMDLs for restoration of water quality. Illinois EPA develops a list known as the 303(d) list of water bodies not meeting water quality standards every two years, and it is included in the Integrated Water Quality Report. Water bodies on the 303(d) list are then targeted for TMDL development. Water bodies listed as impaired in this TMDL report are from the most recent final 2018 Integrated Water Quality Report and 303(d) list that was approved by USEPA on March 19, 2021¹. In accordance with USEPA's guidance, the report assigns all waters of the state to one of five categories. 303(d) listed water bodies make up category five in the integrated report (Appendix A of the final 2018 Integrated Water Quality Report).

In general, a TMDL is a quantitative assessment of water quality impairments, contributing potential sources, and pollutant reductions needed to attain water quality standards. The TMDL specifies the amount of pollutant or other stressor that needs to be reduced to meet water quality standards, allocates pollutant control or management responsibilities among sources in a watershed, and provides a scientific and policy basis for taking actions needed to restore a water body.

Water quality standards are laws or regulations that states authorize to enhance water quality and protect public health and welfare. Water quality standards provide the foundation for accomplishing two of the principal goals of the CWA. These goals are:

- Restore and maintain the chemical, physical, and biological integrity of the nation's waters; and
- Where attainable, achieve water quality that promotes protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water.

Water quality standards consist of three elements:

- The designated beneficial use or uses of a water body or segment of a water body;
- The water quality criteria necessary to protect the use or uses of that particular water body; and

¹ <https://www2.illinois.gov/epa/topics/water-quality/watershed-management/tmdls/Pages/303d-list.aspx>

- An antidegradation policy.

Examples of designated uses are primary contact (swimming), protection of aquatic life, and public and food processing water supply. Water quality criteria describe the quality of water that will support a designated use. Water quality criteria can be expressed as numeric limits or as a narrative statement. Antidegradation policies are adopted so that water quality improvements are conserved, maintained, and protected.

1.2 TMDL Goals and Objectives for the Salt Creek Watershed

The Illinois EPA has a three-stage approach to TMDL development. The stages are:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (optional)

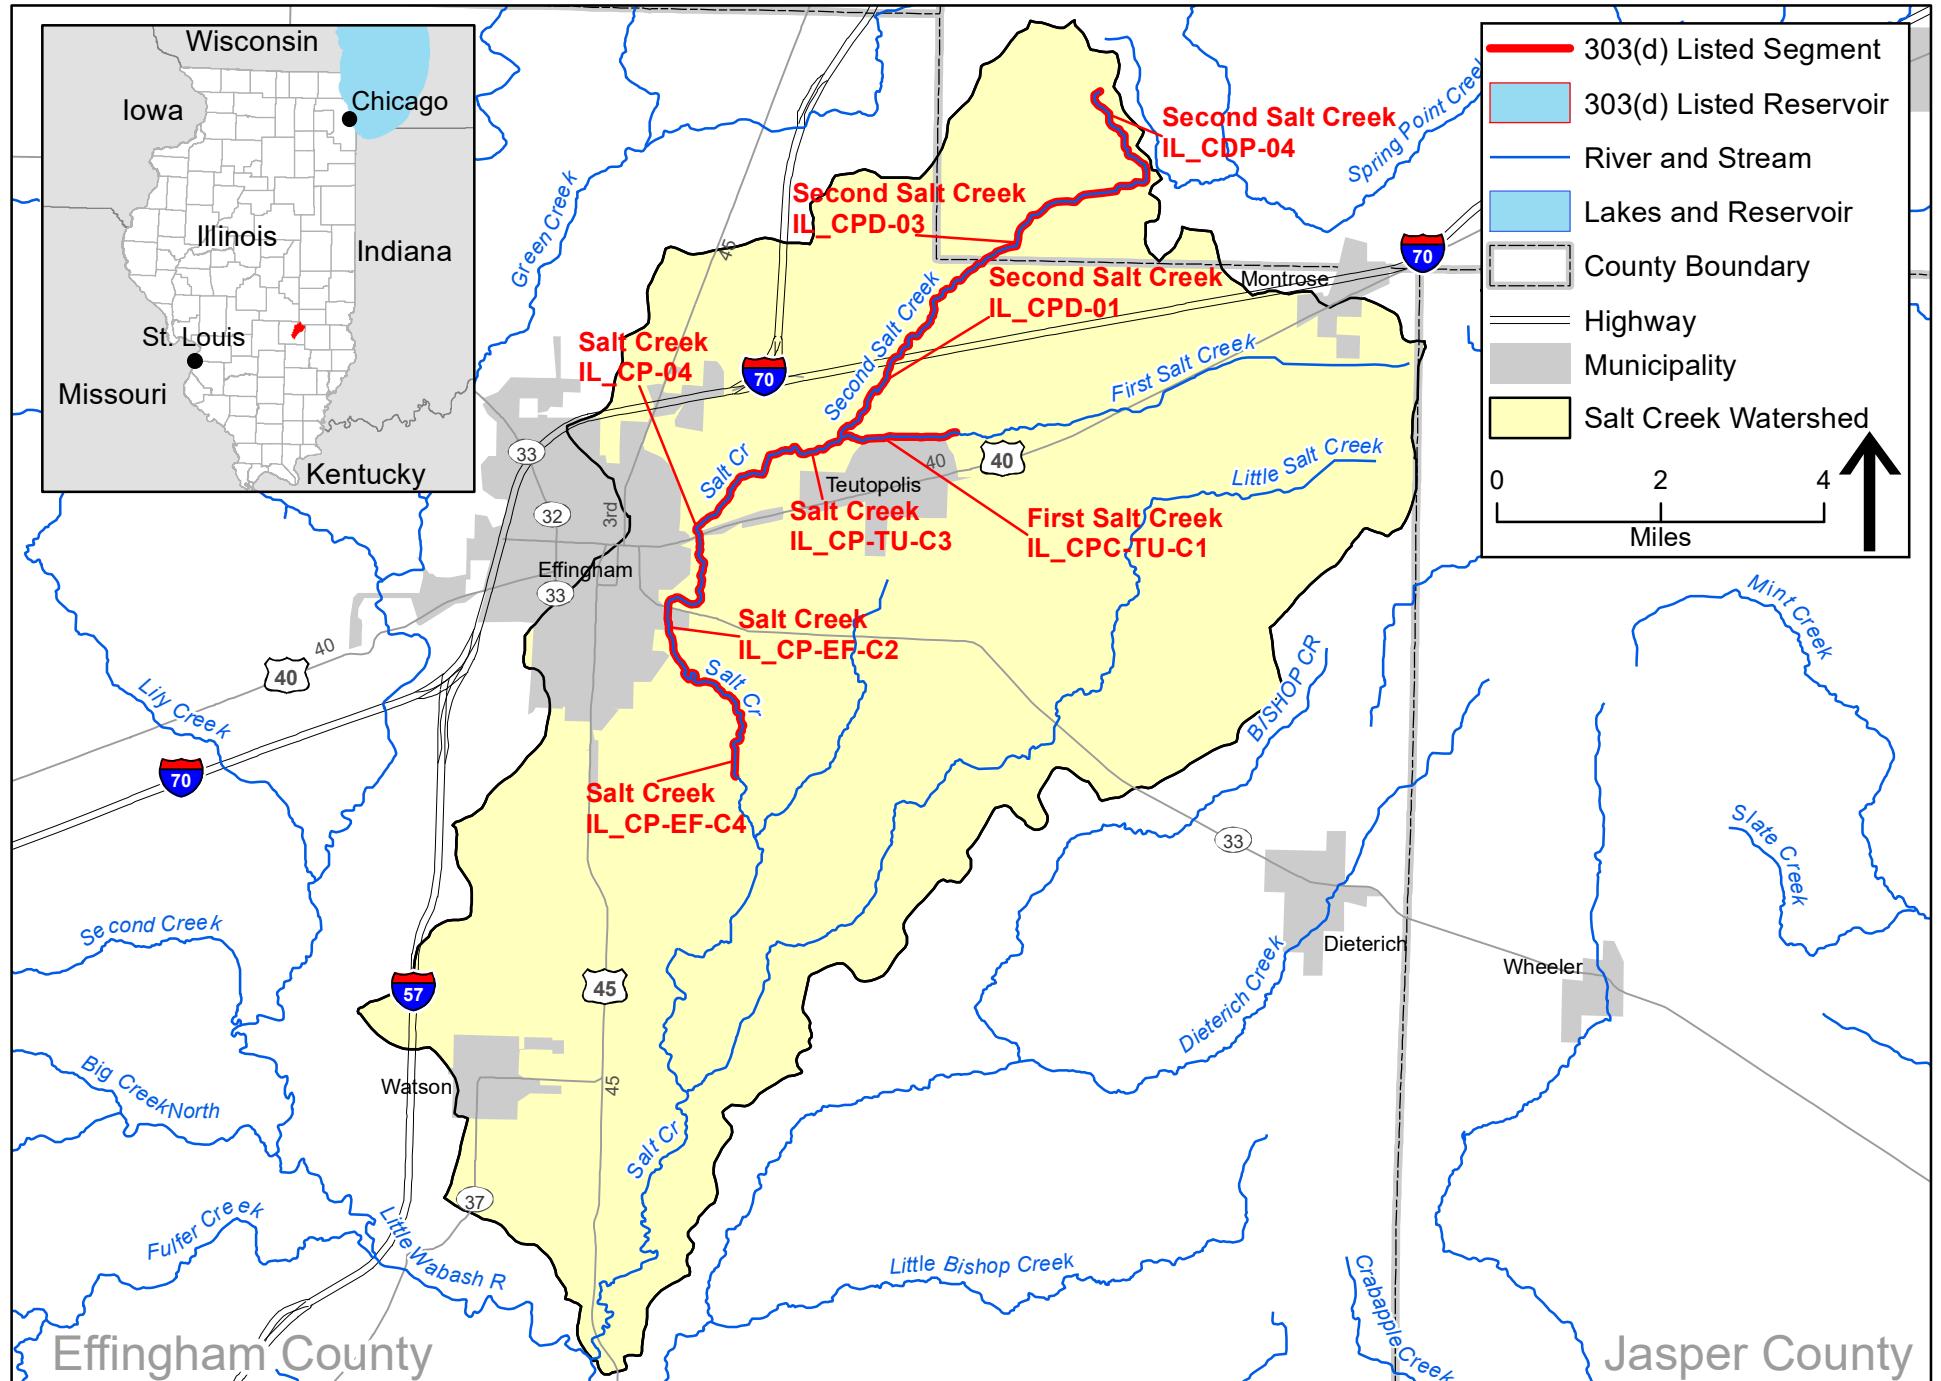

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

Illinois EPA uses the US Geologic Survey (USGS) 10-digit hydrologic unit code (HUC) to group subbasins into TMDL watersheds. This report addresses Stage 1 TMDL development for the Salt Creek watershed (HUC 0512011402). Stages 2 and 3 will be conducted upon completion of Stage 1. Stage 2 is optional as data collection may not be necessary if additional data are not required to establish the TMDL.

Following this process, the TMDL goals and objectives for the Salt Creek watershed will include developing TMDLs for all impaired water bodies within the watershed, describing all of the necessary elements of the TMDL, developing a watershed-based plan (WBP) for each TMDL, and gaining public acceptance of the process. The following impaired water body segments in the Salt Creek watershed are addressed in this report:

- Second Salt Creek (CPD-01)
- Second Salt Creek (CPD-03)
- Second Salt Creek (CPD-04)
- First Salt Creek (CPC-TU-C1)
- Salt Creek (CP-04)
- Salt Creek (CP-EF-C2)
- Salt Creek (CP-EF-C4)
- Salt Creek (CP-TU-C3)

The eight impaired water body segments are shown on **Figure 1-1** and TMDLs and/or percent reduction goals will be developed for each segment and parameter. **Table 1-1** lists the water body segment and potential causes and sources of impairment.

DRAFT

Smith**

Figure 1-1: Salt Creek Watershed
HUC 0512011402

This page intentionally left blank

Table 1-1 Impaired Water Bodies in the Salt Creek Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2018 303(d) list)
CPD-01	Second Salt Creek	Manganese	Aquatic Life	Source Unknown, Natural Sources
		<i>Phosphorus (Total)</i>	Aquatic Life	Animal Feeding Operations, Livestock
CPD-03	Second Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Animal Feeding Operations, Crop Production
CPD-04	Second Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Animal Feeding Operations, Crop Production
CPC-TU-C1	First Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production
CP-04	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Crop Production, Agriculture
CP-EF-C2	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
CP-EF-C4	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
CP-TU-C3	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production

Bold Causes of Impairment have numeric water quality standards and TMDLs will be developed.

Italicized Causes of Impairment do not have numeric water quality standards and reduction goals will be applied as directed by Illinois EPA. WBPAs will be developed where appropriate.

Illinois EPA is currently only developing TMDLs for parameters that have numeric water quality standards. For potential causes that do not have numeric water quality standards, as noted in Table 1-1, TMDLs will be deferred until those criteria are developed. However, until numeric criteria are adopted, watershed-based plans (WBPs) will be developed using parameter-specific reduction goals that have been established by Illinois EPA. In addition, some of these potential causes may be addressed by implementation of controls for the pollutants with numeric water quality standards.

The TMDL for the segments listed above will specify the following elements:

- Loading Capacity (LC) or the maximum amount of pollutant loading a water body can receive without violating water quality standards
- Waste Load Allocation (WLA) or the portion of the TMDL allocated to existing or future point sources
- Load Allocation (LA) or the portion of the TMDL allocated to existing or future nonpoint sources and natural background
- Margin of Safety (MOS) or an accounting of uncertainty about the relationship between pollutant loads and receiving water quality
- Reserve Capacity (RC) or a portion of the load explicitly set aside to account for growth in the watershed

These elements are combined into the following equation:

$$\text{TMDL} = \text{LC} = \Sigma \text{WLA} + \Sigma \text{LA} + \text{MOS} + \text{RC}$$

TMDLs will be developed that include an LC, reductions needed to meet the LC, a MOS and, where applicable, an RC. TMDL development will also take into account the seasonal variability of pollutant loads so that water quality standards are met during all seasons of the year. Also, reasonable assurance that the TMDLs and load reduction goals will be achieved and will be described in the WBP. The WBP for the Salt Creek watershed will describe how water quality standards and goals will be met and attained. This WBP will include recommendations for implementing best management practices (BMPs), cost estimates, institutional needs to implement BMPs and controls throughout the watershed, and a timeframe for completion of implementation activities.

1.3 Report Overview

The remaining sections of this report contain:

- **Section 2 Salt Creek Watershed Characteristics** provides a description of the watershed's location, topography, geology, land use, soils, population, and hydrology.
- **Section 3 Public Participation and Involvement** discusses public participation activities that will occur throughout TMDL development.
- **Section 4 Salt Creek Watershed Water Quality Standards** defines the water quality standards and water quality guidelines for the impaired water bodies.
- **Section 5 Salt Creek Watershed Data and Potential Pollutant Sources** presents the available water quality data needed to develop TMDLs and water quality goals, discusses the characteristics of the impaired stream segments in the watershed, and describes the point and nonpoint sources with potential to contribute to the watershed load.
- **Section 6 Approach to Developing TMDL and Identification of Data Needs** makes recommendations for the models and analysis that are needed for TMDL and WBP development and suggests segments for Stage 2 data collection.
- **Section 7 References**

Section 2

Salt Creek Watershed Description

2.1 Salt Creek Watershed Location

The Salt Creek watershed (HUC 0512011402 shown on Figure 1-1) is located in central Illinois and drains approximately 60,300 acres (94.2 square miles). Roughly 56,200 acres (93.2 percent of the total watershed) lie in Effingham County and 4,100 acres lie in Cumberland County (6.8 percent of the total watershed).

2.2 Topography

Topography is an important factor in watershed management as stream types, precipitation, and soil types can vary significantly with elevation. National Elevation Dataset¹ (NED) coverages containing 30-meter grid resolution elevation data are available from the U.S. Geological Survey (USGS) for each 1:24,000-topographic quadrangle in the United States. Elevation data for the Salt Creek watershed were obtained by overlaying the NED grid onto the geographic information system (GIS)-delineated watershed. **Figure 2-1** shows the elevations found within the watershed.

Elevation in the Salt Creek watershed ranges from approximately 650 feet above sea level in the north-central portion of the watershed to 465 feet above sea level where Salt Creek feeds into the Little Wabash River.

2.3 Land Use

Land use data for the Salt Creek watershed was extracted from the U.S. Department of Agriculture's (USDA) National Agriculture Statistics Service (NASS) 2018 Cropland Data Layer (CDL)². The CDL is a raster based, geo-referenced, crop-specific land cover data layer created to provide acreage estimates to the Agricultural Statistics Board for the state's major commodities and to produce digital, crop-specific, categorized geo-referenced output products. This information is made available to all agencies and to the public free of charge and represents the most accurate and up-to-date land cover datasets available at a national scale. The most recent available CDL dataset was produced in 2018 and includes 26 separate land use classes applicable to the watershed. The available resolution of the land cover dataset is 30 square meters.

Land use characteristics of the Salt Creek watershed were determined by overlaying the Illinois Statewide 2018 CDL onto the GIS-delineated watershed. **Table 2-1** contains the main categories of land uses contributing to the Salt Creek watershed, based on the 2018 CDL land cover categories, and includes the area of each land cover category and percentage of the watershed area. **Figure 2-2** illustrates the land uses of the watershed. **Appendix A** contains a table of all land uses in the watershed.

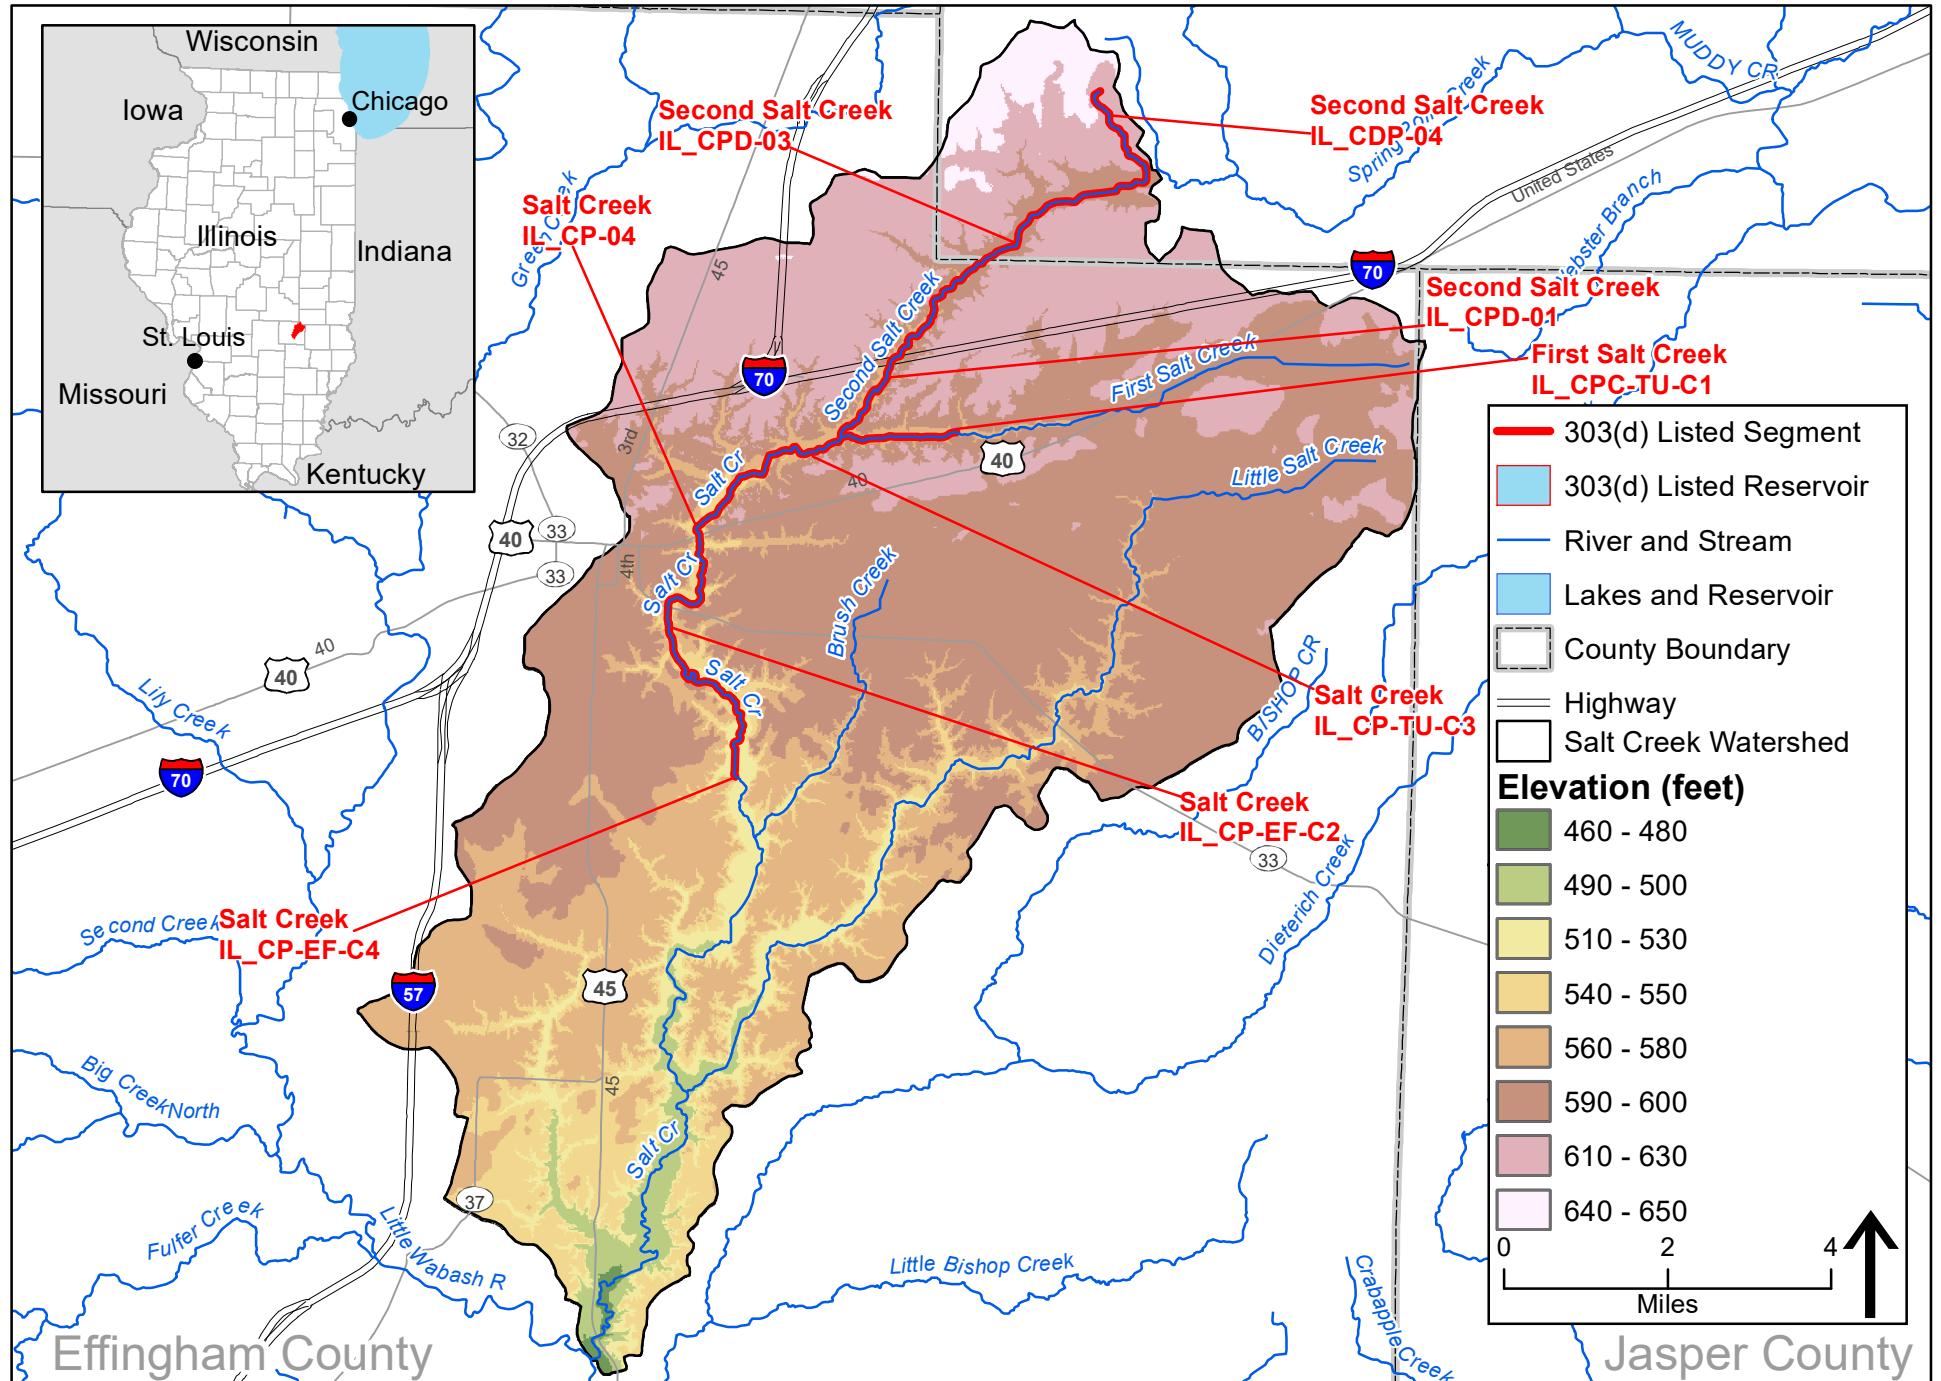

¹ <https://catalog.data.gov/dataset/usgs-national-elevation-dataset-ned>

² https://www.nass.usda.gov/Research_and_Science/Cropland/Release/index.php

Table 2-1 Land Cover and Land Use in the Salt Creek Watershed

USDA/NASS Land Use Cropland Category	Acres	Percentage
Soybeans	17,173	28.2%
Corn	15,149	24.9%
Deciduous Forest	12,082	19.8%
Grass/Pasture	5,598	9.2%
Developed/Open Space	5,303	8.7%
Developed/Low Intensity	2,531	4.2%
Developed/Medium Intensity	894	1.5%
Double Crop Winter Wheat/Soybeans	868	1.4%
Developed/High Intensity	408	0.7%
Winter Wheat	317	0.5%
Alfalfa	244	0.4%
All Others	346	0.6%
Total	60,913	100%

The land cover data reveal that 33,751 acres, representing 55.4 percent of the total watershed area, are devoted to agricultural activities. Corn and soybean make up 96% of the agricultural land use within the watershed. Forests and woodlands cover 19.8 percent of the watershed (12,082 acres). Approximately 15 percent of the watershed area (9,136 acres) is developed, urbanized land. Grasslands and pasture make up 9.2 percent of the area (5,598 acres) and the remainder (0.6 percent) of the watershed is wetland or open water.

2.3.1 Subbasin Land Use

The subbasin area draining to the impaired segments were further delineated through GIS (see Figure 2-2). Land cover data was then intersected with the subbasin boundaries to determine the land uses contributing runoff to the impaired waterbodies, as shown in **Tables 2-2** through **2-9**. These tables include all land areas upgradient of the impaired segment, including areas draining more directly to upstream impaired segments within the watershed.

Table 2-2 Land Cover and Land Use in the Second Salt Creek (CPD-01) Subbasin

Land Cover Category	Area (Acres)	Percentage
Corn	2,274	33.2%
Soybeans	2,122	31.0%

2.4 Soils

Soils data are available through the Soil Survey Geographic (SSURGO) database³. For SSURGO data, field mapping methods using national standards are used to construct the soil maps.

Mapping scales generally range from 1:12,000 to 1:63,360 making SSURGO the most detailed level of soil mapping done by the Natural Resources Conservation Service (NRCS).

Attributes of the spatial coverage can be linked to the SSURGO databases, which provide information on various chemical and physical soil characteristics for each map unit and soil series. Of particular interest for TMDL development are the hydrologic soil groups as well as the K-factor of the Universal Soil Loss Equation (USLE). The following sections describe and summarize the specified soil characteristics for the Salt Creek watershed.

³ <https://www.nrcs.usda.gov/wps/portal/nrcs/surveylevel/soils/survey/state/?stateId=IL>

2.4.1 Salt Creek Watershed Soil Characteristics

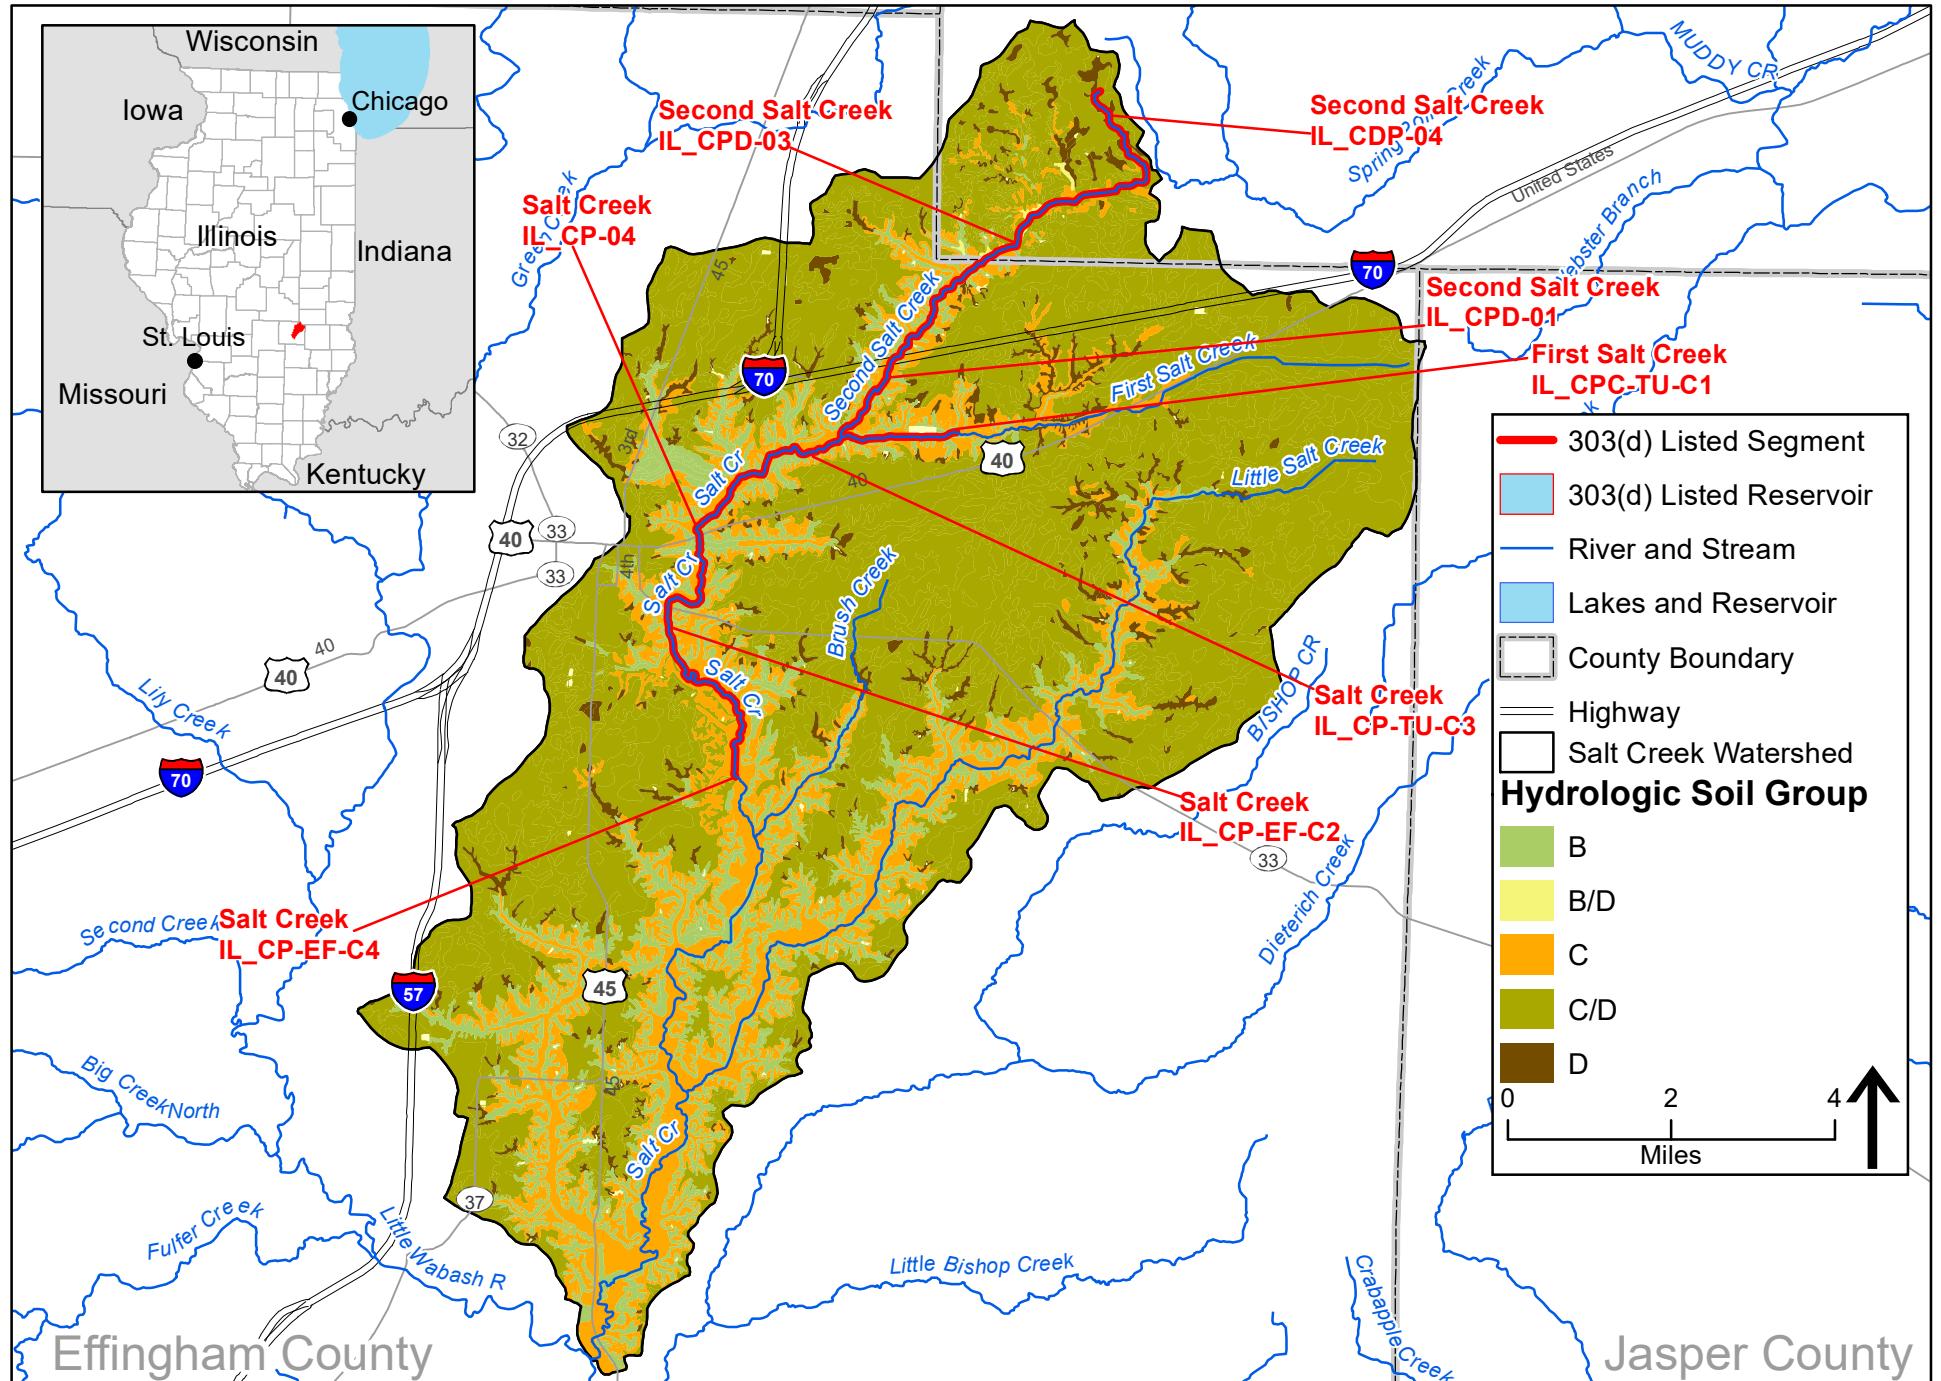

Appendix B contains a table of the SSURGO soil series for the Salt Creek watershed. A total of 49 soil types exist in the watershed. The most common type, Cisne silt loam (0 to 2 percent slopes), covers 24 percent of the watershed. The next most common types, Bluford silt loam (0 to 2 percent slopes), Ava silt loam (2 to 5 percent slopes), and Newberry silt loam (0 to 2 percent slopes) cover 10.7, 10.5, and 9.1 percent of the watershed, respectively. All other individual soil types each represent less than 8 percent of the total watershed area. The table in Appendix B also contains the area, dominant hydrologic soil group, and K-factor range. Each of these characteristics is described in more detail in the following paragraphs.

Figure 2-3 shows the hydrologic soils groups found within the Salt Creek watershed (NRCS 2007). Hydrologic soil groups are used to estimate runoff from precipitation. Soils are assigned to one of four groups according to the infiltration of water when the soils are thoroughly wet and receive precipitation from long-duration storms:

- Group A: Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.
- Group B: Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.
- Group C: Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
- Group D: Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

While hydrologic soil groups B, C, D, B/D, and C/D are all found within the Salt Creek watershed, group C/D soils are the most common type representing 62.5 percent of the watershed. Group C/D is a dual hydrologic soil group. Dual hydrologic soil groups can be adequately drained. The first letter applies to the drained condition and the second letter to the undrained condition. For the purpose of hydrologic soil group, adequately drained means that the seasonal high-water table is kept at 24 inches below the surface (NRCS 2007).

A commonly used soil attribute is the K-factor, which is a measure of soil erodibility and quantifies the relative susceptibility of soil to sheet and rill erosion. Values of K range from 0.02 to 0.64, from least erodible to most erodible, respectively, and are influenced by elements including texture, organic matter content, structure, and saturated hydraulic conductivity (NRCS 2011). The distribution of K-factor values in the Salt Creek watershed range from 0.28 to 0.55, as shown in **Figure 2-4**.

2.5 Population

The Census TIGER/Line data⁴ from the U.S. Census Bureau were retrieved (Census 2015). Geographic shapefiles of census block groups⁵ were downloaded for the entire state of Illinois. All census block groups that have geographic center points (centroids) within the watershed were selected and tallied in order to provide an estimate of populations in all census blocks both completely and partially contained by the watershed boundary. Given that the optimal size of a census block group is 1,500 people, and 8 block group centroids are located within the watershed, it is estimated that approximately 12,000 people reside in the Salt Creek watershed. The major municipality in the watershed is shown in Figure 1-1. The largest urban development in the watershed is the city of Effingham, approximately half of which lies outside of the watershed, with a population of approximately 12,600.

2.6 Climate and Streamflow

2.6.1 Climate

Central Illinois has a temperate climate with hot summers and cold, moderately snowy winters. Monthly temperature and precipitation data from Effingham, Illinois (Station ID USC00112687) were extracted from the National Centers for Environmental Information (NCEI) database⁶ for the years 1893 through 2019. Although there are no climate stations located within the Salt Creek watershed, this station is located less than 4 miles to the west and was selected due to its proximity to the watershed and completeness of its dataset. **Table 2-10** contains the average monthly precipitation along with average high and low temperatures for the period of record. The average annual precipitation is approximately 40 inches. May and June are historically the wettest months while January and February are the driest. July is historically the warmest month, with an average maximum temperature of 89 °F, while January is typically the coldest month, with an average minimum temperature of 20 °F.

Table 2-10 Average Monthly Climate Data for Effingham, Illinois

Month	Average Total Precipitation (inches)	Average Daily Maximum Temperature (°F)	Average Daily Minimum Temperature (°F)
January	2.4	37.5	20.0
February	2.2	41.1	22.5
March	3.5	52.4	32.0
April	3.8	65.5	42.6
May	4.5	75.4	52.2
June	4.6	84.8	61.5
July	3.6	88.8	65.1
August	3.3	87.1	63.0
September	3.2	80.8	55.6
October	3.0	68.7	44.3
November	3.3	53.5	33.6
December	2.9	41.1	24.3
Average	40.3*	64.7	43.1

⁵ <https://www.census.gov/geographies/reference-maps/2010/geo/2010-census-block-maps.html>

⁶ <https://www.ncdc.noaa.gov/cdo-web/datatools/findstation>

2.6.2 Streamflow

Analysis of the Salt Creek watershed requires an understanding of flow throughout the drainage area. There are no USGS stream gages⁷ within the watershed; however, one gage is located nearby in an adjacent watershed with similar characteristics to that of the Salt Creek watershed, as shown in **Figure 2-5** (USGS 2019). **Table 2-11** summarizes the information from this station.

Table 2-11 Streamflow Gages in the Salt Creek Watershed

Gage Number	Name	Drainage Area (mi ²)	Approximate Distance from Salt Watershed (mi)	POR	Minimum Monthly Mean Flow (cfs)	Maximum Monthly Mean Flow (cfs)
03378635	Little Wabash River near Effingham	240	1.5	1966-2020	52	421

The gage shown in Table 2-11, given its location adjacent to the Salt Creek watershed, may be used to estimate flow values for TMDL development for the impaired waterbodies in the Salt Creek watershed using the drainage area ratio method, represented by the following equation:

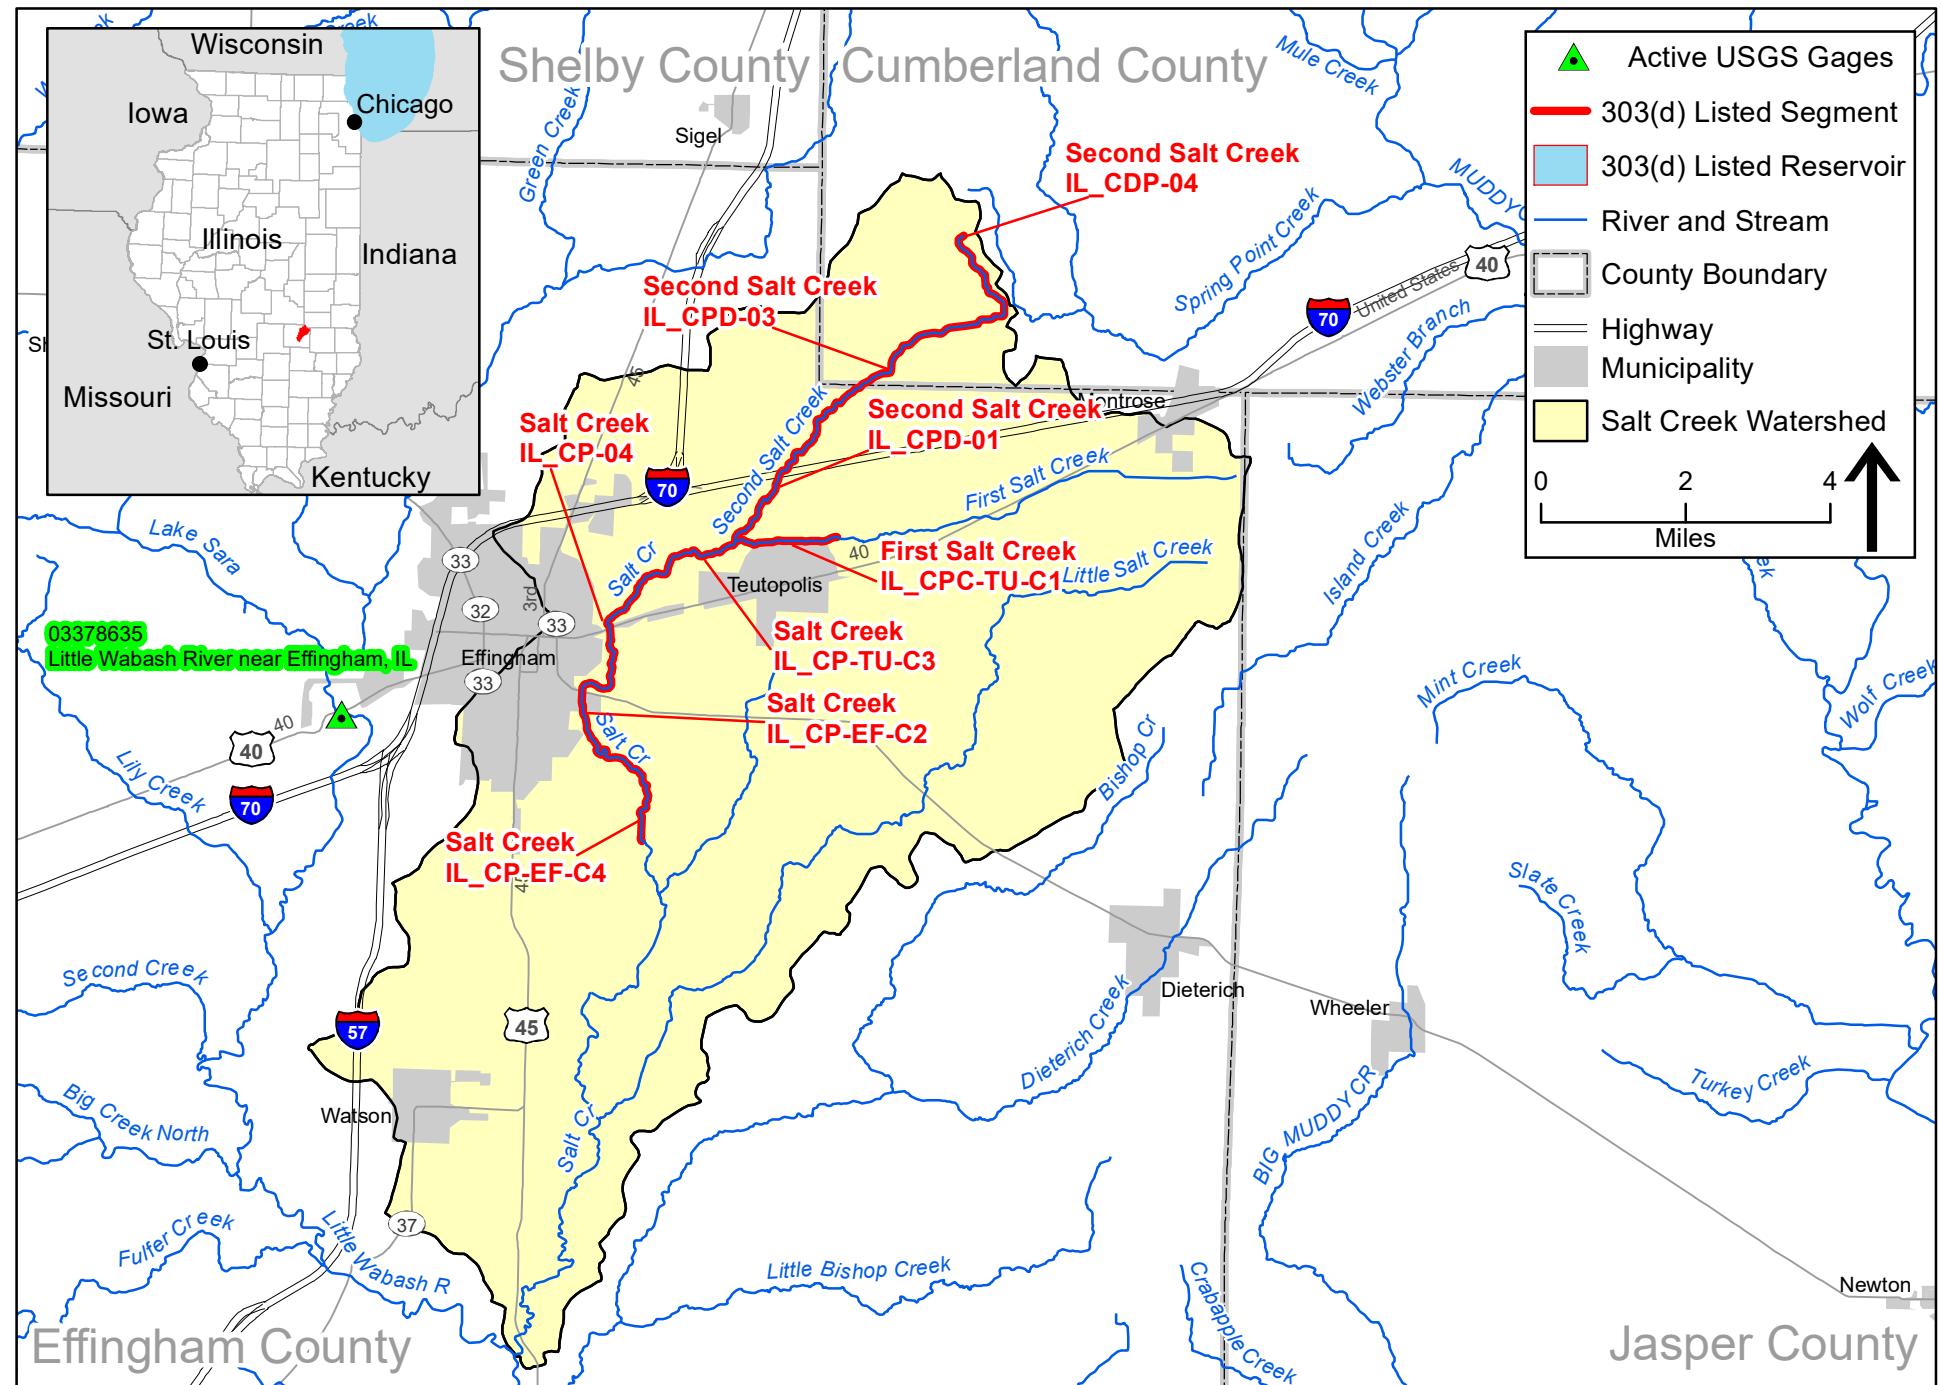

$$Q_{\text{gaged}} \left(\frac{\text{Area}_{\text{ungaged}}}{\text{Area}_{\text{gaged}}} \right) = Q_{\text{ungaged}}$$

where Q_{gaged} = Streamflow of the gaged basin
 Q_{ungaged} = Streamflow of the ungaged basin
 $\text{Area}_{\text{gaged}}$ = Area of the gaged basin
 $\text{Area}_{\text{ungaged}}$ = Area of the ungaged basin

The assumption behind the equation is that the flow per unit area is equivalent in watersheds with similar characteristics. Therefore, the flow per unit area in the gaged watershed multiplied by the area of the ungaged watershed estimates the flow for the ungaged watershed.

Data downloaded through the USGS for the surrogate gage for the available period of record will be adjusted to account for point source influence in the watershed upstream of the gaging station. Average daily flows from all National Pollutant Discharge Elimination System (NPDES) permitted facilities upstream of the surrogate USGS gages are subtracted from the gaged flow prior to flow-per-unit-area calculations. The resulting estimates account for flows associated with precipitation and overland runoff only. Average daily flows from permitted NPDES discharges upstream of the impaired segments in the Salt Creek watershed can then be added back into the equation to more accurately reflect estimated daily streamflow conditions in a given segment.

Section 3

Salt Creek Watershed Public Participation

3.1 Salt Creek Watershed Public Participation and Involvement

Public knowledge, acceptance, and follow-through are necessary to implement a plan to meet recommended TMDLs and WBPAs. It is important to involve the public as early in the process as possible to achieve maximum cooperation and counter concerns as to the purpose of the process and the regulatory authority to implement any recommendations.

Illinois EPA, along with CDM Smith, will hold a public meeting for the Salt Creek watershed at the completion of Stages 1 and 3. Comments received through the public meeting process will be included in an appendix. This section will be updated following each public meeting.

This page intentionally left blank.

Section 4

Salt Creek Water Quality Standards and Guidelines

4.1 Illinois Water Quality Standards

Water quality standards are developed and enforced by the state to protect the "designated uses" of the state's waterways. In the state of Illinois, setting the water quality standards is the responsibility of the Illinois Pollution Control Board (IPCB). Illinois is required to update water quality standards every three years in accordance with the CWA. The standards requiring modifications are identified and prioritized by Illinois EPA, in conjunction with USEPA. New standards are then developed or revised during the three-year period.

Illinois EPA is also responsible for developing scientifically based water quality criteria and proposing them to the IPCB for adoption into state rules and regulations. The Illinois water quality standards are established in the Illinois Administrative Rules Title 35, Environmental Protection; Subtitle C, Water Pollution; Chapter I, Pollution Control Board; Part 302, Water Quality Standards¹.

4.2 Designated Uses

The waters of Illinois are classified into four primary categories of narrative and numeric water quality standards for surface waters, which include: General Use Standards, Public and Food Processing Water Supplies Standards, Secondary Contact and Indigenous Aquatic Life Standards, and Lake Michigan Basin Water Quality Standards². Segments CPD-01, CPD-03, and CPD-04 of Second Salt Creek; CPC-TU-C1 of First Salt Creek; and CP-04, CP-EF-C2, CP-EF-C4, and CP-TU-C3 of Salt Creek are impaired for total phosphorus for the aquatic life designated use under the General Use Standard. Segment CPD-01 of Second Salt Creek is also impaired for manganese for the aquatic life designated use under the General Use Standard.

4.2.1 General Use

The General Use classification is defined by IPCB as standards that "are intended to protect aquatic life, wildlife, agricultural, primary contact, secondary contact, and most industrial uses." They are also intended to "ensure the aesthetic quality of the state's aquatic environment and to protect human health from disease or other harmful effects that could occur from ingesting aquatic organisms taken from surface waters of the state."

4.3 Water Quality Criteria

According to the Illinois EPA Integrated Report², aquatic life use assessments in streams are typically based on the interpretation of biological information, physiochemical water data, and physical habitat. The primary biological measures used are the fish Index of Biotic Integrity (fIBI), the macroinvertebrate Index of Biotic Integrity (mIBI), and the

¹ <http://www.ilga.gov/commission/jcar/admincode/035/03500302sections.html>

² <https://www2.illinois.gov/epa/topics/water-quality/watershed-management/tmdl/Pages/303d-list.aspx>

Macroinvertebrate Biotic Index (MBI). Physical habitat information used in assessments includes quantitative and qualitative measures of stream bottom composition and qualitative descriptors of channel and riparian conditions. Physiochemical water data used include measures of “conventional” parameters (e.g. dissolved oxygen [DO], pH, and temperature), priority pollutants, non-priority pollutants, and other pollutants.

Table 4-1 presents the numeric water quality standards of the potential causes of impairment for Second Salt Creek, First Salt Creek, and Salt Creek in the Salt Creek watershed. Only constituents with numeric water quality standards will have TMDLs developed at this time.

Table 4-1 Summary of Numeric Water Quality Standards for Potential Causes of Stream Impairments in the Salt Creek Watershed

Parameter	Units	General Use Water Quality Standard	Regulatory Reference
Manganese (dissolved)	µg/L	Acute = $e^{A+B\ln(H)}$ X 0.9812* where A = 4.9187 and B = 0.7467 Chronic = $e^{A+B\ln(H)}$ X 0.9812* where A = 4.0635 and B = 0.7467	302.208(e)

µg/L = micrograms per liter

H = hardness

* = Conversion factor multiplier for dissolved metals

4.4 Illinois Nutrient Loss Reduction Strategy

In addition to the water quality standards provided above, the Illinois EPA has also established water quality guidelines for nutrients in accordance with the Illinois Nutrient Loss Reduction Strategy (NLRS)³. The NLRS was developed in response to hypoxia in the Gulf of Mexico and all 12 states within the Mississippi River Basin were called upon by the USEPA to reduce nutrient loads flowing into the Mississippi River. Water quality goals will be incorporated into the WBPs based on the NLRS, which calls for an overall 45% load reduction of total phosphorus leaving the state of Illinois, and an interim target of 25% load reduction by 2025. A WBP will be developed for all stream segments listed as impaired by total phosphorus using the interim total phosphorus load reduction goal of 25%. The WBP for the Salt Creek watershed will include a comprehensive suite of best management practices (BMPs) for reducing loads from identified watershed sources.

4.5 Potential Pollutant Sources

In order to properly address the conditions within the Salt Creek watershed, potential pollutant sources must be investigated for the pollutants where TMDLs will be developed.

Table 4-2 summarizes the potential sources associated with the listed impairments in the 2018 303(d) list for each of the impaired segments in this watershed.

³ <https://www2.illinois.gov/sites/agr/Resources/NutrientLoss/Pages/default.aspx>

Table 4-2 Impaired Water Bodies in the Salt Creek Watershed

Segment ID	Segment Name	Potential Causes of Impairment	Designated Use	Potential Sources (as identified by the 2018 303(d) list)
CPD-01	Second Salt Creek	Manganese	Aquatic Life	Source Unknown, Natural Sources
		<i>Phosphorus (Total)</i>	Aquatic Life	Animal Feeding Operations, Livestock
CPD-03	Second Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Animal Feeding Operations, Crop Production
CPD-04	Second Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Animal Feeding Operations, Crop Production
CPC-TU-C1	First Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production
CP-04	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Crop Production, Agriculture
CP-EF-C2	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
CP-EF-C4	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production, Urban Runoff/Storm Sewers
CP-TU-C3	Salt Creek	<i>Phosphorus (Total)</i>	Aquatic Life	Municipal Point Source Discharges, Crop Production

Bold Causes of Impairment have numeric water quality standards and TMDLs will be developed.

Italicized Causes of Impairment do not have numeric water quality standards and a WBP will be developed where water quality targets have been developed.

This page intentionally left blank

Section 5

Salt Creek Watershed Data and Potential Pollution Sources

In order to further characterize the Salt Creek watershed, a wide range of pertinent data were collected and reviewed. Water quality data for streams, and information on potential point and nonpoint sources within the watershed, were compiled from a variety of data sources. This information is presented and discussed in further detail in the remainder of this section.

5.1 Water Quality Data

Illinois EPA monitoring programs that contribute data to the assessment of streams include the Ambient Water Quality Monitoring Network, the Pesticide Monitoring Subnetwork, Facility-Related Stream Surveys, Intensive Basin Surveys, and the Fish Contaminant Monitoring Program¹. Much of the data used for this report came from Intensive Basin Surveys, which are typically conducted on a 5-year cycle and focus on basins where intensive data are currently lacking or where historical data need updating. Additional information on Illinois EPA's monitoring programs can be found in the "Illinois Water Monitoring Strategy²."

Data from a total of 19 historic water quality stations on, or upgradient of, the impaired stream segments within the Salt Creek watershed were located and reviewed for this report. These water quality data were provided by the Illinois EPA. **Figure 5-1** shows all the known water quality data stations within the watershed that may contain data relevant to the impaired segment. **Figures 5-2 through 5-9** show the subbasins draining to each impaired segment. These figures include land use/land cover data that were presented in Section 2.3.1 and show the locations of permitted discharges (further discussed in Section 5.3).

The impaired water body segments in the Salt Creek watershed were presented in Section 1. The data summaries provided in this section includes all available date ranges of collected data.

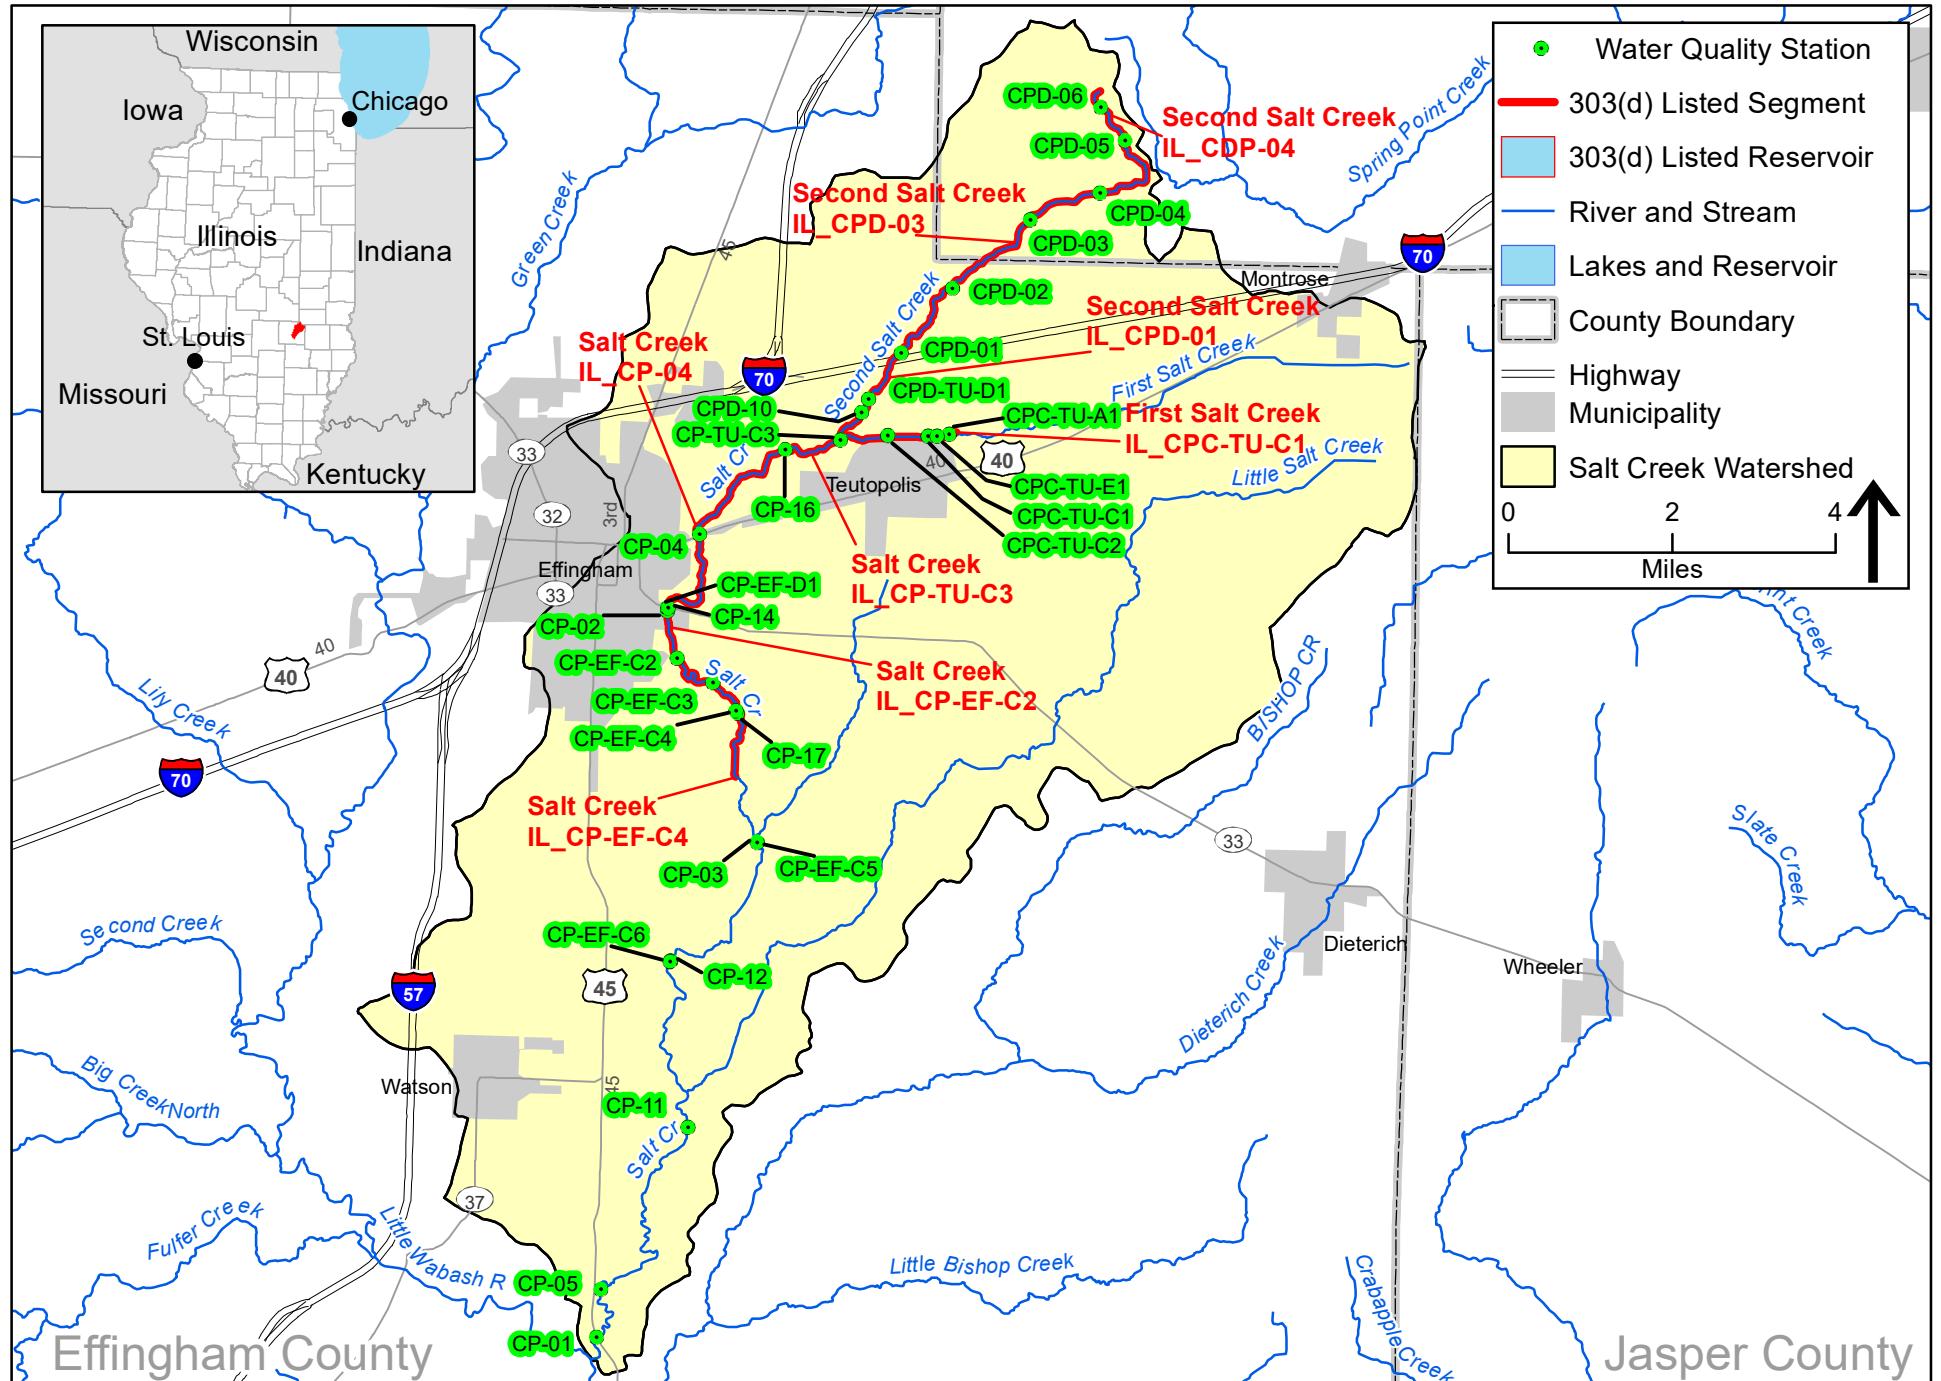

5.1.1 Stream Water Quality Data

Eight impaired stream segments exist within the Salt Creek watershed. The data summarized in this section include water quality data for the impaired constituents (manganese and TP). All historical water quality data for the impaired segments in the Salt Creek watershed are available in Appendix C and additional water quality data for other parameters may be used during Stage 3 TMDL development to support modeling efforts.

5.1.1.1 Dissolved Manganese

Second Salt Creek segment CPD-01 is listed for impairment of aquatic life use caused by elevated dissolved manganese concentrations. **Table 5-1**, along with **Figure 5-10**, summarizes the available historical dissolved manganese data for this segment. Both the acute and chronic general use water quality standards for dissolved manganese are calculated standards that vary with the total hardness of the sampled water.

Table 5-1 Existing Dissolved Manganese Data for Second Salt Creek segment CPD-01

Illinois WQ Standard ($\mu\text{g/L}$)	Period of Record and Number of Data Points	Mean ($\mu\text{g/L}$)	Maximum ($\mu\text{g/L}$)	Minimum ($\mu\text{g/L}$)	Number of Exceedances	Sample Locations
varies ⁽¹⁾	2007-2017;6	791	1500	128	0	CPD-01

⁽¹⁾ Hardness-dependent

The summary of data presented in Table 5-1 reflects single samples from the impaired segment compared to the hardness-dependent standard. No exceedances were noted in the available dataset for Second Salt Creek, representing zero percent of available dissolved manganese measurements. **Figure 5-10** shows the dissolved manganese measurements collected over time at the impaired segment.

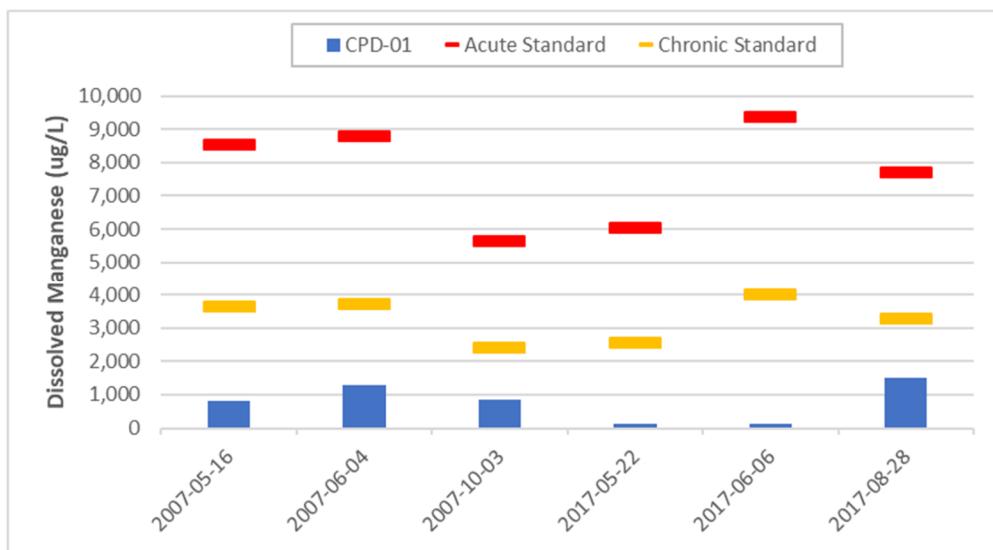

Figure 5-10 Dissolved Manganese concentrations in Second Salt Creek Segment CPD-01

The lack of reported exceedances where data exists suggests that this segment was assessed as impaired due to elevated manganese concentrations based on a previous water quality standard for manganese. Prior to 2012, the applicable water quality standard for manganese to protect aquatic life uses in Illinois was 1.0 mg/L of total manganese. This standard has since been replaced by the current hardness-dependent standards developed for the dissolved fraction of manganese in water. The lack of reported exceedances for segment CPD-01 suggests that removal of this impairment from the Illinois 303(d) list may be warranted.

5.1.1.2 Total Phosphorus

The following segments are listed for aquatic life use impairments caused by total phosphorus:

- Second Salt Creek segment CPD-01
- Second Salt Creek segment CPD-03
- Second Salt Creek segment CPD-04
- First Salt Creek segment CPC-TU-C1
- Salt Creek segment CP-04
- Salt Creek segment CP-EF-C2
- Salt Creek segment CP-EF-C4
- Salt Creek segment CP-TU-C3

Table 5-2, along with **Figures 5-11 through 5-18**, summarize historical phosphorus data collected on the impaired segments. Note that no data are available for two of the impaired segments (CPD-03 and CPD-04). Data show that total phosphorus concentrations have generally decreased over time starting around the year 2001 for most segments with sufficient data and periods of record. Total phosphorus concentrations have also historically been highest during late summer/early fall. This is typically at the end of the agricultural growing season and during low stream flows. Currently, there are not numeric stream standards for total phosphorus in Illinois, however, as discussed in Section 4.4, the NLRS calls for an overall 45% load reduction of total phosphorus leaving the state of Illinois, and an interim target of 25% load reduction by 2025.

Table 5-2 Existing Total Phosphorus Data for Impaired Segments within the Salt Creek Watershed

Impaired Segment	Period of Record and Number of Data Points	Mean (mg/L)	Maximum (mg/L)	Minimum (mg/L)	Sample Locations
CPD-01	2007-2017; 12	0.51	0.74	0.21	CPD-01

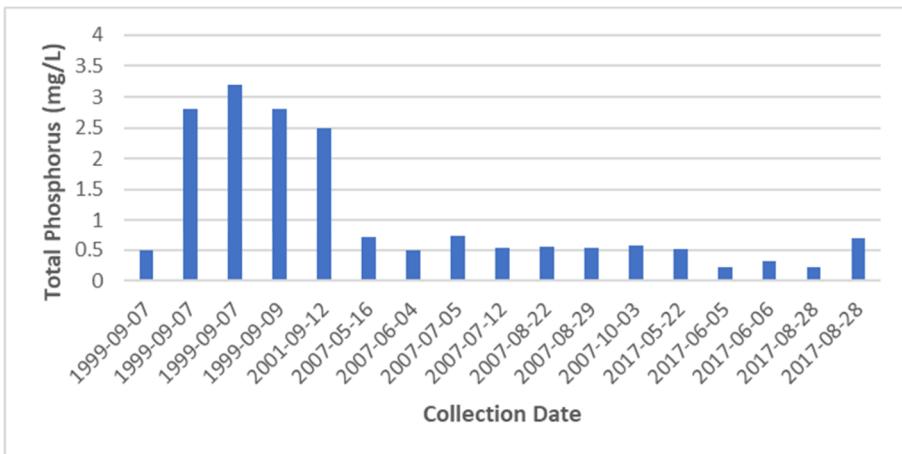

Figure 5-18 Total Phosphorus concentrations in Salt Creek Segment CP-TU-C3

5.2 Point Sources

There are three active point sources located within the Salt Creek watershed that discharge to or upstream of the impaired segment. **Table 5-3** contains permit information for these point sources while **Figure 5-19** shows the locations of outfalls for each facility. Note that not all facilities within the watershed discharge upstream of impaired segments. In general, facilities discharging treated domestic wastewater have the potential to affect nutrient levels in their receiving waters. Potential pollutants discharged from industrial facilities vary by industry and may or may not contain metals and/or nutrients. National Pollutant Discharge Elimination System (NPDES) facilities with permit limits are required to submit discharge monitoring reports (DMRs) to Illinois EPA. The Stage 3 documentation will include a summary of relevant DMR data from discharges with the potential to impact impaired streams.

Table 5-3 Permitted Facilities Discharging to or Upstream of the Impaired Segments in the Salt Creek Watershed

Facility ID	Facility Name	Design Average/Maximum Flow (mgd)	Receiving Water
IL0028622	Effingham STP	3.75/9.0*	Unnamed tributary of Salt Creek
IL0075680	Landfill 33	Intermittent Discharge of Stormwater	Unnamed tributary of Salt Creek and Salt Creek
ILG582024	Village of Teutopolis STP	0.263 (avg)	First Salt Creek (IL-CPC-TU-C1)
ILG580056	Watson WTP	0.109 (avg)	Unnamed tributary of Salt Creek

*Flows are for the main outfall only. This facility also has a second outfall for treated combined sewer overflows (CSOs). No flow data are available for this outfall. It is likely that discharge only occurs during extreme high flow events.

5.3 Nonpoint Sources

There are many potential nonpoint sources of pollutant loading to the impaired segments in the Salt Creek watershed. This section will discuss site-specific cropping practices, animal operations, and area septic systems. Data were collected through communications with the local NRCS, Illinois Soil and Water Conservation Districts (SWCDs), and county health departments.

5.3.1 Crop Information

Approximately 56 percent of the land within the Salt Creek watershed is devoted to agriculture. Because much of the watershed is under cultivation, soil loss from fields is likely the primary source of sediment and any pollutant attached to the sediment (nutrients and potentially naturally occurring metals such as manganese). Tillage practices for crops such as corn, soybeans, and grains can be categorized as conventional till, reduced till, mulch till, and no till. The percentage of each tillage practice for corn, soybeans, and small grains by county are generated from County Transect Surveys by the Illinois Department of Agriculture (IDA)³. Data are presented in **Tables 5-4** and **5-5** for Effingham and Cumberland counties, respectively.

Table 5-4 Tillage Practices in Effingham County, Illinois

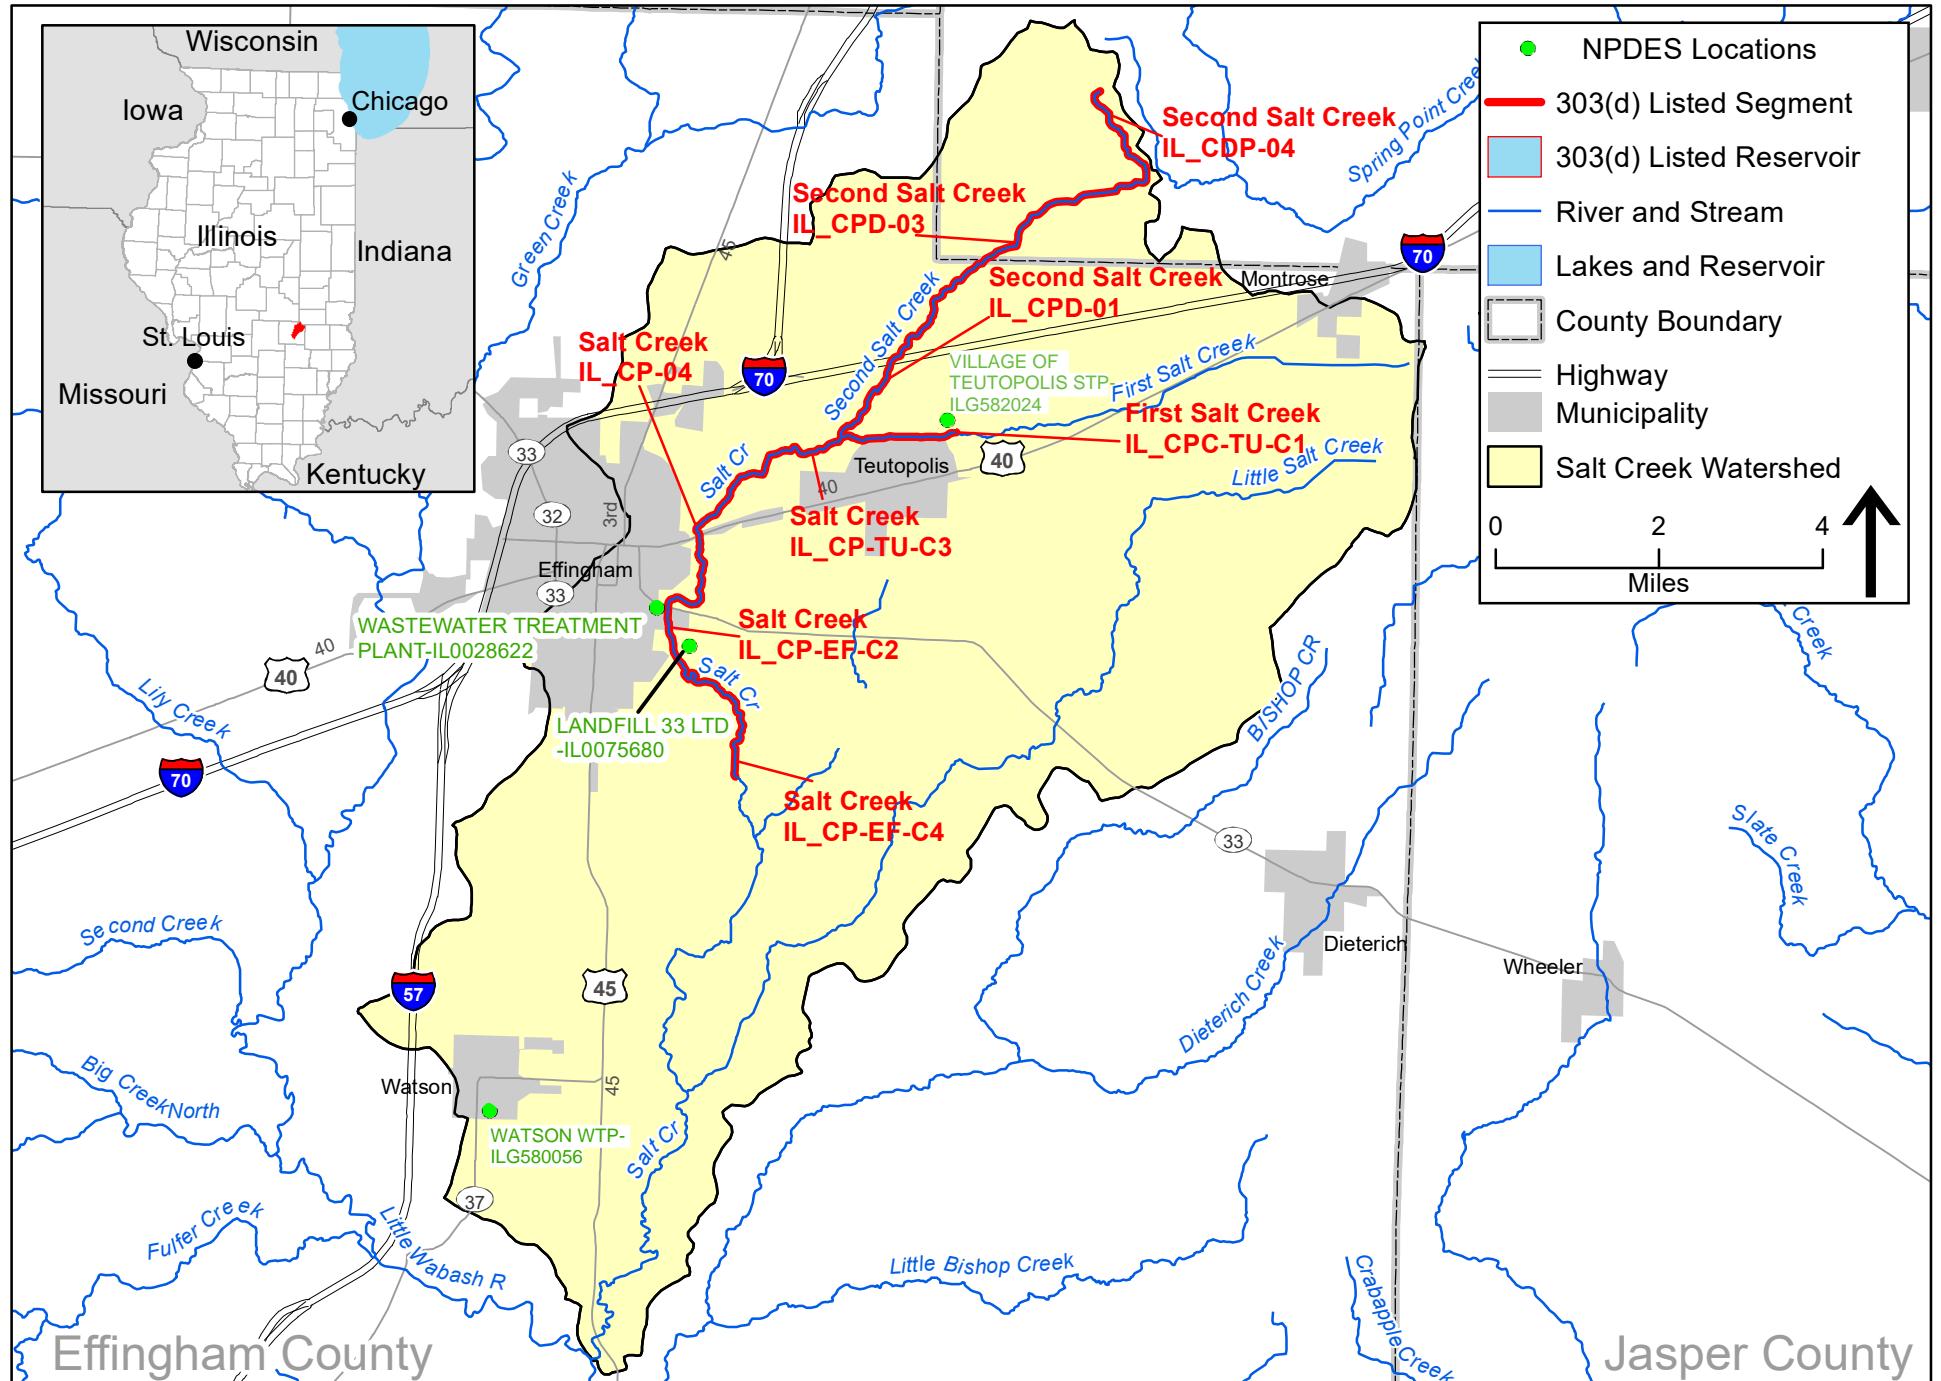

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	94.0%	94.6%	29.5%	29.4%	0.0%	33.3%
Reduced - Till	2.8%	3.1%	27.5%	31.6%	0.0%	0.0%
Mulch - Till	3.2%	1.3%	27.5%	20.6%	27.3%	26.7%
No - Till	0.0%	0.9%	15.6%	18.4%	72.7%	40.0%

Table 5-5 Tillage Practices in Cumberland County, Illinois

Tillage System	Corn		Soybean		Small Grain	
	2015	2018	2015	2018	2015	2018
Conventional	91.0%	89.1%	17.4%	28.8%	0.0%	28.6%
Reduced - Till	4.0%	3.9%	38.3%	30.4%	75.0%	57.1%
Mulch - Till	2.0%	1.2%	35.4%	24.8%	25.0%	0.0%
No - Till	3.0%	5.8%	9.0%	16.0%	0.0%	14.3%

According to the County Transect Survey summary report, fields planted conventionally leave less than 15% of the soil surfaced covered with crop residue after planting, while mulch-till leaves at least 30% of the residue from the previous crop remaining on the soil surface after being tilled and planted. Reduced-till falls between conventional and mulch (greater than 15%

³ <https://www.agr.state.il.us/illinois-soil-conservation-transect-survey-reports>

DRAFT

**CDM
Smith**

Figure 5-19: Salt Creek Watershed
NPDES Locations

This page intentionally left blank

but less than 30%) and no-till practices leave the soil virtually undisturbed from harvest through planting. Residue is important because it shields the ground from the eroding effects of rain and helps retain moisture for crops. Information on field tiling practices was also sought as field drains can influence the timing and amount of water delivered to area streams and reservoirs as well as deliver dissolved nutrients from fields to receiving waters. Local NRCS offices reported, however, that tile drainage is very rare within the watershed⁴.

5.3.2 Animal Operations

Information on commercial animal operations is available from the NASS. Knowing the number of animal units in a watershed is useful in TMDL development as grazing animals have the potential to increase erosion and contribute nutrients through manure. Although watershed-specific data are not available, countywide data for Effingham and Cumberland counties are presented in **Tables 5-6** and **5-7**, respectively^{5,6}.

Table 5-6 Effingham County Animal Population

Livestock Type	2012	2017	Percent Change
Cattle and Calves	35,491	26,737	-24.7%
Beef	4,395	4,836	10.0%
Dairy	4,363	3,925	-10.0%
Hogs and Pigs	159,036	177,645	11.7%
Poultry	83	79	-4.8%
Sheep and Lambs	1,205	977	-18.9%
Horses and Ponies	1,138	770	-32.3%

Table 5-7 Cumberland County Animal Population

Livestock Type	2012	2017	Percent Change
Cattle and Calves	13,268	9,344	-29.6%
Beef	1,533	1,462	-4.6%
Dairy	2,720	1,794	-34.0%
Hogs and Pigs	23,627	71,697	203.5%
Poultry	30	29	-3.3%
Sheep and Lambs	180	179	-0.6%
Horses and Ponies	286	222	-22.4%

The tables above show significant cattle, hog and pig populations within the watershed counties. There are no known concentrated animal feeding operations (CAFOs) within the watershed, but communications with local NRCS officials have indicated that livestock is generally prolific within the Salt Creek watershed⁷.

5.3.3 Septic Systems

Most households in rural areas of Illinois that are not connected to municipal sewers make use of onsite sewage disposal systems, or septic systems. There are several types of septic

⁴ Klingler, L. 2019, November 14. Natural Resource Conservation Service (NRCS) - Cumberland County, District Conservationist. Email correspondence

⁵https://www.nass.usda.gov/Publications/AgCensus/2017/Full_Report/Volume_1_Chapter_2_County_Level/Illinois/

⁶https://www.nass.usda.gov/Publications/AgCensus/2012/Full_Report/Volume_1_Chapter_2_County_Level/Illinois/

⁷ Klingler, L. 2019, November 14. Natural Resource Conservation Service (NRCS) - Cumberland County, District Conservationist. Email correspondence

systems, but the most common septic system is composed of a septic tank draining to a septic field, where nutrient removal occurs. However, the degree of nutrient removal is limited by local soils and the extent of system upkeep and maintenance. Across the U.S., septic systems have been found to be a significant source of phosphorus pollution.

Information on the extent of septic use in the Salt Creek watershed was obtained from the Effingham County Health Departments. Health department officials stated that there are approximately 3,300 permitted septic systems within the county⁸.

5.4 Watershed Studies and Other Watershed Information

Previous efforts completed within the watershed are discussed below, although it is assumed that more information will become available through public meetings within the watershed community. In the event that other watershed-specific information becomes available, it will be reviewed, and all applicable data will be incorporated during Stages 2 and 3 of TMDL development.

2008 – TMDLs were developed for the Little Wabash River 8-digit hydrologic unit watershed, which includes the 10-digit hydrologic unit Salt Creek watershed discussed in this report. TMDLs were developed for First Salt Creek (CPC-TU-C1), Second Salt Creek (CPD-01, CPD-03, and CPD-04), and Salt Creek (CP-EF-C2 and CP-TU-C3), all of which are also addressed in this report. First Salt Creek was listed for manganese, dissolved oxygen, and total phosphorus. Second Salt Creek was listed for dissolved oxygen, sedimentation/siltation, total suspended solids, and total phosphorus. Salt Creek was listed for manganese, total phosphorus, dissolved oxygen, and total nitrogen as N⁹.

Section 6

Approach to Developing TMDL and Identification of Data Needs

Illinois EPA is currently developing TMDLs for pollutants that have numeric water quality standards. Of the pollutants causing impairment in the Salt Creek watershed, manganese is the parameter for which numeric water quality standards currently exist. In addition, a water quality goal has been developed for total phosphorus loading based on the Illinois NLRS. Refer to Table 1-1 for a full list of potential causes of impairment.

6.1 Simple and Detailed Approaches for Developing TMDLs

The range of analyses used for developing TMDLs varies from simple to complex. Examples of a simple approach include mass-balance, load-duration, and simple watershed and receiving water models. Detailed approaches incorporate the use of complex watershed and receiving water models. Simplistic approaches typically require less data than detailed approaches. Establishing a link between pollutant loads and resulting water quality is one of the most important steps in developing a TMDL. As discussed above, this link can be established through a variety of techniques. The objective of the remainder of this section is to recommend approaches for establishing these links for the constituents of concern in the Salt Creek watershed.

6.2 Additional Data Needs for TMDL and Water Quality Goal Development in the Salt Creek Watershed

Table 6-1 contains summary information regarding data availability for all impairments to be addressed by TMDLs and water quality goals in the Salt Creek watershed. The available datasets for assessing total phosphorus impairments on Second Salt Creek, First Salt Creek, and Salt Creek are generally sufficient for basic water quality loads and reduction calculations and model development, with the exception of segments CPD-03 and CPD-04 on Second Salt Creek, neither of which have any available data. Additional data collection is recommended for these segments. In addition, segment CPC-TU-C1 of First Salt Creek has only five available data points dating back to 2001 and could also benefit from additional data collection for impairment verification and to allow for more accurate load estimation.

There are six available data points for dissolved manganese in impaired stream segment CPD-01, and although the available data show that this segment may once have been impaired based on a previous standard established for total manganese (1.0 mg/L), it is no longer impaired when compared to the currently applicable hardness-dependent water quality standard developed for dissolved manganese. It is recommended that this segment be removed from the current 303(d) list for aquatic life use impairment by dissolved manganese.

Table 6-1 Data Availability and Data Needs for TMDL and Water Quality Goal Development in the Salt Creek Watershed

Impaired Segment	Impairment	Period of Record	Data Points for Impairment Assessment	Additional Data Needs
Second Salt Creek (CPD-01)	Manganese	2007-2017	6	None – Recommend delisting
	Phosphorus (Total)	2007-2017	12	None
Second Salt Creek (CPD-03)	Phosphorus (Total)	NA	0	Additional data collection recommended
Second Salt Creek (CPD-04)	Phosphorus (Total)	NA	0	Additional data collection recommended
First Salt Creek (CPC-TU-C1)	Phosphorus (Total)	1999-2001	5	Additional data collection recommended
Salt Creek (CP-04)	Phosphorus (Total)	1999-2017	33	None
Salt Creek (CP-EF-C2)	Phosphorus (Total)	1999-2017	39	None
Salt Creek (CP-EF-C4)	Phosphorus (Total)	1999-2017	40	None
Salt Creek (CP-TU-C3)	Phosphorus (Total)	1999-2017	17	None

6.3 Approaches for Developing TMDLs and Water Quality Goals for Stream Segments in the Salt Creek Watershed

6.3.1 Recommended Approach for Manganese and Total Phosphorus in Impaired Stream Segments

The recommended approach for developing a TMDL and load reduction estimates in the total phosphorus impaired streams in the Salt Creek watershed is the load duration curve method. The load duration methodology uses the cumulative frequency distribution of stream flow and pollutant concentration data to estimate the allowable loads for a waterbody. CDM Smith will work with Illinois EPA to determine a concentration to use for the load duration curves in order to reduce loading by 25% to meet the interim goals of the NLRS.

The data review performed for Second Salt Creek segment CPD-01 show that dissolved manganese concentrations in this segment support the general use and it is recommended that it be removed from the current 303(d) list.
