Appendix F

Acute and Chronic Zinc Standards Calculations

Section 302.208 Numeric Standards for Chemical Constituents

e) Numeric Water Quality Standards for the Protection of Aquatic Organisms

Constituent	AS (µg/L)	CS (µg/L)
Zinc (dissolved)	$e^{A+B\ln(H)} \times 0.978^*$	$e^{A+B\ln(H)} \times 0.986^*$
	where A = 0.9035 and B = 0.8473	where A = -0.4456 and B = 0.8473

where:

- µg/L = microgram per liter
- e^x = base of natural logarithms raised to the x-power
- $\ln(H)$ = natural logarithm of Hardness
- * = conversion factor multiplier for dissolved metals
- ** = standard to be evaluated using either of the following USEPA approved methods,

Re: Sierra Club and Openlands Comments on Draft Thorn Creek Watershed Stage 3 TMDL Report

Dear Mr. Haile,

The Sierra Club, Illinois Chapter and Openlands hereby comment on the draft Thorn Creek Watershed TMDL. The Sierra Club and Openlands have members who live near and recreate in Thorn Creek and downstream water bodies who are affected by nutrient pollution, pathogens and other pollution in the Thorn Creek watershed. It is critical to restoring Thorn Creek that appropriate load reduction strategy (LRS) targets be chosen for phosphorus, sediment and other pollutants and that the total maximum daily loads be properly calculated, that load and waste load allocations be reasonable and that an effective implementation plan be developed.

Further, particularly here where the some of LRS targets are based on uncertain science and data, the final TMDL implementation plan as presented for approval to U.S. EPA should explicitly call for revisiting the water quality targets and recalculating the load and waste load allocations in five years. This milestone should be added to Section 3.15.3 Success Criteria.

Unless we are missing appendices, it is not clear from the TMDL document how the 0.226 mg/L LRS phosphorus target was derived by IEPA. What method was used?

It is stated that that waste load allocation (WLA) and load allocations (LA) are not being considered because LAs are “voluntary” (2-31) and non-point controls are “entirely voluntary.” (3-2) However, as is explained at the beginning of the report (1-5), a TMDL is supposed to include a WLA and a LA. Moreover, while non-point source pollution is not regulated under the Clean Water Act, that is no reason why such controls could not be imposed under state or local law as has been done in many areas. See, *Pronsolino v. Nastri*, 291 F.3d 1123 (9th Cir. 2002). The final TMDL should include a realistic appraisal of what could be done to better control non-point pollution, including through use of mandatory programs (such as the MS4 program), and should include a realistic allocation of reductions between point and non-point sources of phosphorus pollution.

The TMDL further states that phosphorus limits for point sources will be worked out by IEPA during the NPDES process. (3-31). This further precludes creation of an appropriate WLA and combined with the conclusion that non-point controls will be “entirely voluntary” implies that point sources will be responsible for all the reductions.

Assuming a criteria as loose as 0.226 mg/L is tolerable, end-of-the-pipe limits below that level should be imposed on the four major point sources as limits below 0.2 mg/L can be met and have been imposed as to other dischargers. See e.g. *Upper Blackstone Sanitary v. EPA*, 690 F.3d 9,18 (1st Cir. 2012); U.S. EPA, Montana Variance Approval letter, Oct. 31, 2017. See

<https://deq.mt.gov/Portals/112/Water/WQPB/Standards/NutrientWorkGroup/PDFs/Montana%20Nutrients%20Variance%20Final%20Letter%2010%2031%2017.pdf>. Lower limits than that will be necessary if it is insisted that the non-point share will only be approached with purely voluntary programs as the points sources must then be called upon to make up reductions that non-point sources are not being required to address.

Further, if, as we fear, phosphorus limits tighter than 0.226 mg/L prove to be needed, further wastewater treatment and additional point and non-point controls will be necessary in the future. That the IEPA will reconsider the 1) LRS targets, 2) the WLA-LA allocation, 3) the need for new or enhanced non-point controls and 4) reduced point source limits should be made an explicit requirement of the implementation plan.

In Section 1.5.2.6 Total Phosphorus LRSs for Streams, it is reported that the Innophos facility discharges phosphorus at an average monthly concentration of 60.6 mg/L with discharges as high as 116 mg/L. This is an extremely high level of phosphorus discharge. Certainly reducing this discharge should be an immediate priority for TMDL implementation and not put off as part of a generalized LRS. Likewise, priority should be placed on reducing any phosphorus discharges above the LRS target of 0.226 mg/L from the other point sources in the watershed.

ECHO also reports that the Innophos facility has exceeded its Total Suspended Solids limit ten times in the last twelve quarters. Resolving compliance problems at facilities that are not meeting their current permit limits should be a first step in meeting the TMDL.

We are pleased that the Army Corps is scheduled to remove the Sauk Trail Lake dam on Thorn Creek in 2021-2022. We recommend that continuous monitoring of dissolved oxygen levels in the dam pool reach be conducted prior to and after the dam is removed in order to document the impact of dam removal on oxygen levels in the creek.

Facilities such as the Park Forest Excess Flow Facility and Homewood Excess Flow Treatment Plant are a source of nutrients and oxygen demanding materials that may cause violations of the DO standard in the river when discharging at times outside of the critical condition model considered in the TMDL. Reductions in these discharges should be considered through the implementation of end of pipe controls and green infrastructure installation in order to address the release of oxygen-demanding materials to the waterways during high flows.

Questions

- In Section 1.5.1.4 Headwater Conditions, it is stated that data from July 6, 2005 was used in the modeling. Were DO and fecal coliform water quality standards met in these reaches during that period?
- It is stated in Section 1.5.1.7 that estimates were made when there was not facility data available for model inputs. Does Table 1-6 represent the reported point source information only? What are the estimated values for the data missing from the table? Where can they be found? Was a phosphorus input estimated for each point source? What are those values and where can they be found?
- Regarding Section 1.5.2.2 Fecal Coliform TMDLs for Streams, did IEPA or CDM Smith review the discharge monitoring reports for the facilities that discharge in the watershed? Were any problems identified where the facilities were not meeting their standards? For example, ECHO indicates that Thorn Creek Basin Sanitary District STP violated its fecal coliform limit in the first quarter of 2018. Resolving any problems in compliance at facilities that are not meeting their current permit limits should be a first step in meeting the TMDL.
- How soon will the 200 cfu/100 ml monthly geometric mean water quality standard for fecal coliform be incorporated into the facilities listed in Table 2-4? Couldn't the IEPA immediately impose a limit and monitoring requirement for this standard through a minor permit modification?
- How does IEPA plan to incorporate the WLAs for fecal coliform into the MS4 permits for the facilities listed in Tables 2-5 through 2-12? How soon can this be done?
- Thorn Creek Basin Sanitary District STP has a chloride monitoring requirement in its current NPDES permit. Based on that data, how often is the facility currently discharging chloride in excess of the calculated WLA-DMF of 167,949 lbs/day?
- If Illinois adopts a more science-based chloride standard, how and when will this be integrated into the TMDL and any implementation strategies?
- Has IEPA evaluated the ammonia reductions described as needed in Section 2.3.5.6 Load Allocations and TMDL Summary to reflect the known need to change Illinois' water quality standards for ammonia to better protect freshwater mussels? Would these load reductions serve that purpose too? Shouldn't the point sources in the watershed be required to contribute to this reduction too rather than only be set at their most stringent current permit levels as has been done in Table 2-29?

We note that having a local coalition of stakeholders is important to implementing the provisions of the TMDL and other projects that have been identified to improve the health of the Thorn Creek Watershed. From 2003 to 2005 a watershed-based plan was developed by the Northeastern Illinois Planning Commission with local stakeholders. That plan was updated by the Chicago Metropolitan Agency for Planning in December 2014. See <https://www2.illinois.gov/epa/Documents/iepa/water-quality/watershed-management/watershed-based-planning/2016/thornwbp.pdf>. Our organizations stand

ready and willing to mobilize our members to engage with other stakeholders to implement both the TMDL and the watershed-based plan.

Sincerely,

Cindy Skrukud

Subject: Thorn Creek Watershed Stage 3 TMDL Report

Mr Haile,

I am sending this email to provide comments regarding Thorn Creek Watershed Stage 3 TMDL Report on behalf of the Illinois Department of Transportation. Chloride is listed as a pollutant of concern. Road salt application was identified as a potential contributor to the impairment. IDOT requests to be included in the waste load allocations for chloride. Please inform Felecia Hurley, Felecia.hurley@illinois.gov, of any needed data in order for this to be accomplished.

Felecia Hurley

Comments to the draft Thorn Creek Watershed TMDL

Abel Haile, Manager, Planning (TMDL) Unit

Watershed Management Section, Bureau of Water

Illinois Environmental Protection Agency

Proposed Zinc TMDL:

Abel the proposed TMDL for zinc for Deer Creek segment HDBC is based on an outdated interim (monitoring Only) limit of 0.079 mg/l. This proposed limit will be dropped from the NPDES permit IL0024473 Aqua Illinois- University Park WWTP on the next permit renewal upon one year of discharge data in compliance with the limits. This is based on identifying the zinc and nickel discharger and reducing the discharge to acceptable levels. Attached is the spreadsheet with monthly levels below the interim limit of 0.079 mg/l for zinc and 0.0013 mg/l for nickel.

Aqua Illinois requests the proposed TMDL zinc limit be eliminated.

Reducing the Fecal Coliform limit from 400 to 200 col/100ml:

A reduced limit for fecal coliform bacteria is also proposed for Deer Creek.

Deer Creek is not a wadable stream and is not easily accessed from the steep stream banks. Utilizing more stringent than whole body contact limits for fecal coliform bacteria is not justified for a stream that is not utilized for recreation including wading or swimming, therefore reducing the limit for fecal coliform bacteria is unjustified.

Please accept the above as official comments to the TMDL draft report for the Thorn Creek Watershed.

Respectfully,

Kevin M. Culver

**RE: Thorn Creek Basin Sanitary District
Comments on Draft Thorn Creek Watershed Stage 3 TMDL Report**

Dear Mr. Haile:

The Thorn Creek Basin Sanitary District appreciates the opportunity to provide comments on the Draft Thorn Creek Watershed Stage 3 TMDL Report. The District is concerned that a number of issues need to be addressed before any TMDL is finalized for the Thorn Creek Watershed. In addition, the District requests that the Load Reduction Strategy (LRS) for total phosphorus be withdrawn in its entirety, because no narrative-based total phosphorus impairments exist in the Thorn Creek Watershed, the LRS allocation is not authorized for inclusion in a TMDL, and the LRS allocation target of 0.226 mg/L has no valid basis. Finally, a TMDL should not become effective until validly promulgated as a rule. Each of these issues is described in more detail below.

In addition, a technical review of the Draft TMDL Report is contained in Attachment 1. This review identifies a number of serious flaws in the technical basis underlying the Draft TMDL Report, which should be addressed through a revised draft that is reissued for comment.

The Total Phosphorus LRS Should Be Withdrawn

The Draft TMDL Report indicates that impairments based on narrative water quality standards are assessed through the development of LRSs, and then goes on to develop an LRS for total phosphorus, allegedly based on the narrative standard.¹

¹ Draft TMDL Report at 2-31.

However, that approach is not authorized by applicable Illinois regulations or the state's methodology for listing impaired waters. The narrative standard for "offensive conditions" is found at 35 Ill. Adm. Code 302.203, and prohibits "sludge or bottom deposits, floating debris, visible oil, odor, plant or algal growth, color or turbidity of other than natural origin" in all general use waters. The Illinois Integrated Water Quality Report and Section 303(d) List, 2016 indicates that since 1997, exclusively narrative standards such as the one for offensive conditions apply only to the protection of aesthetic quality in Illinois waters.² The same language is noted in the 2018 Draft Integrated Report.³

None of the Thorn Creek segments, however, is or has been listed as impaired for aesthetic quality. Indeed, in the 2008, 2010, and 2012 Integrated Reports, none of the Thorn Creek segments were evaluated for aesthetic quality.⁴ In the 2014, 2016, and 2018 Integrated Reports, Thorn Creek segments HBD-04 and HBD-05 were assessed as fully supporting aesthetic quality, while the remaining segments were not evaluated.⁵

Although the 2008 listing methodology indicated that total phosphorus could be listed as a cause of aquatic life impairment in streams, that approach is contrary to Illinois regulations and the more recent listing methodologies. The nontoxic parameters currently used for evaluation of aquatic life uses in streams are water temperature, pH, and dissolved oxygen, but not total phosphorus.⁶ In fact, Illinois EPA has separately determined that any dissolved oxygen impairments in Thorn Creek are not related to excess algal growth that might require reductions in total phosphorus:

The dissolved oxygen (DO) cause for impairment in the above waters was investigated for a link to excess algae or aquatic plant cause of impairment. Continuous monitoring data for Thorn Creek at several locations does not indicate that algae or plant growth in excess is present. The DO values that resulted in this cause being listed were at times of day that do not related to algal or plant respiration.⁷

Because there is no valid impairment listing for total phosphorus based on the narrative standards, the LRS allocation for total phosphorus should be withdrawn.

In addition, it is not clear that Illinois EPA has the authority to adopt LRS targets or allocations in the Draft TMDL Report. Nothing in federal or state regulations authorizes the development of LRSs either within or outside the TMDL process. Further, the Draft TMDL Report indicates that the LRSs are not intended to be translated into permit limits. If the LRSs are intended only as supplemental information, they should not be included in a TMDL, which is intended to have binding effect on NPDES permittees and other dischargers. The inclusion of LRSs in a binding TMDL could result in regulatory confusion, and components of the LRSs could be used for purposes that were neither intended nor authorized by law. If needed at all, LRSs should be removed from the Draft TMDL Report and addressed through some other mechanism.

² 2016 Integrated Report at 16.

³ 2018 Draft Integrated Report at 15.

⁴ 2008 Integrated Report, Appendix B-2 at 99; 2010 Integrated Report, Appendix B-2 at 84; 2012 Integrated Report, Appendix B-2 at 80.

⁵ 2014 Integrated Report, Appendix B-2 at 84-85; 2016 Integrated Report, Appendix B-2 at 88; 2018 Draft Integrated Report, Appendix B-2 at 39.

⁶ 2018 Draft Integrated Report at 25.

⁷ Draft Thorn Creek Basin Sanitary District NPDES Permit (Nov. 17, 2015).

Finally, there is no valid basis for the LRS target of 0.226 mg/L. The Draft Report simply indicates that:

As no numeric water quality standard exists for total phosphorus in streams in Illinois, a numeric target (0.226 mg/L) was developed by Illinois EPA for this watershed.⁸

There is nothing in the Draft TMDL Report to demonstrate why that target is appropriate for all segments of Thorn Creek, what designated use that target is necessary to support, or how that target was derived.

For the reasons discussed above, the LRS for total phosphorus should be withdrawn and removed from the Draft TMDL Report.

TMDLs Must Be Promulgated Through Rulemaking

A TMDL establishes binding conditions that will determine the effluent limitations included in National Pollutant Discharge Elimination System (NPDES) permits issued to regulated parties who discharge into the affected waters. As a result, other states such as Ohio have determined that a TMDL must be promulgated through the rulemaking process before it can become effective.⁹ Because TMDLs developed by Illinois EPA have the same binding effect as in other states, they should be promulgated pursuant to the Illinois Administrative Procedures Act, 5 ILCS 100/, and the Illinois Pollution Control Board procedural rules.

Conclusion

The District requests that Illinois EPA withdraw the LRS for total phosphorus and remove it from the Draft TMDL report, and that the agency promulgate the TMDL before implementation in permits. In addition, the District requests that the agency address the issues raised in the technical comments contained in Attachment 1 and reissue a revised Draft TMDL Report for public comment. The District appreciates your consideration of its comments, and would like to discuss these issues with Illinois EPA before the agency allows the Draft TMDL to be finalized. I will be in touch with you to schedule that discussion.

Sincerely,

Jennifer Hindel, Executive Director

cc Fred Andes, Barnes & Thornburg

⁸ Draft TMDL Report at 2-31.

Attachment 1

Review of Thorn Creek Watershed Stage 3 TMDL Report for Public Review (September 2018)

Geosyntec conducted a review of the Thorn Creek Stage 3 total maximum daily load (TMDL) public review document. The information included the September 2018 TMDL document provided on September 20, 2018; the appendices provided on October 3, 2018; and the modeling files provided on October 26, 2018. A separate review of the QUAL2k model is included in Attachment 2. Comments on the TMDL in this attachment are provided by section.

Geosyntec recommends that the TMDL not be finalized until the issues with the QUAL2k model are resolved and Illinois EPA has time to review stakeholder comments on the models used to establish the TMDL and the TMDL document.

1.2 TMDL Goals and Objectives for Thorn Creek Watershed

- As stated on page 1-4, the dam for Sauk Trail Lake is scheduled to be removed in less than four years. It is unclear why TMDLs were calculated for the lake. Dam removals typically improve water quality downstream of the dam – why did the TMDLs for Thorn Creek not consider the additional assimilative capacity that may be provided by the dam removal project?

1.3.1 Existing Water Quality Data

- As stated on page 1-6, Appendix A was intended to include a summary of all relevant data for the TMDL and load reduction strategies (LRSs). Given the importance of ammonia to the Thorn Creek TMDL, Appendix A should summarize the 21 parameters listed in Table 1-2 versus repeating Table 1-3.

1.5.1.4 Headwater Conditions

- Headwater water quality conditions were set based on data from July 6, 2005 which is more than 13 years old (page 1-14). No information was provided as to whether this is representative of current conditions. At a minimum, information on how this compares to the validation period of July 10, 2007 should be provided.

1.5.2.2 Fecal Coliform TMDLs for Streams

- The fecal coliform standard consists of two parts: (1) a geometric mean of 200 colony forming units (cfu)/100 mL, and (2) a statistical threshold value (STV) of 400 cfu/100 mL not to be exceeded in more than 10% of five samples taken over a 30-day period during the recreation season. Applying the 200 cfu/100 mL as a daily maximum (page 1-20) is inappropriate and overly conservative. USEPA's 2012 recreational criteria recommend use of the STV as an instantaneous

maximum for beach notification purposes (as opposed to compliance with the water quality standard since the STV can be exceeded at times). Illinois EPA should apply this same principle for the TMDL.

- Captions for Figures 1-6 through 1-13 should reflect that the flow duration curve (FDC) represents only flows from May through October.
- The statement on page 1-25 asserts that the primary sources of fecal coliform loads occur during higher flow conditions. However, the FDCs clearly show that exceedances occur under all flow conditions.
- The FDCs include data from multiple stations. Data from the stations should be plotted with different symbols so that any upstream to downstream trends can be ascertained. This comment applies to all FDCs (not just fecal coliform).

1.5.2.3 Chloride TMDLs for Streams

- The modeling files did not include a chloride FDC for HBD-06. This information needs to be provided.
- The statement on page 1-27 about typical sources of chlorides and winter months with less extreme high flow events is questionable. There was a chloride exceedance for HBD-04 in June 2006 and the data reflect high flows in the winter.

1.5.2.4 Zinc TMDLs for Streams

- The statement that primary sources of zinc loads are not runoff related (page 1-28) are not substantiated. Sources of zinc cited in Section 2.2 include sediment-bound zinc in runoff.

1.5.2.6 Total Phosphorus LRSs for Streams

- The TMDL should include justification for the 0.226 mg/L total phosphorus target and why it is applicable to all stream segments.
- The draft permit issued to the Thorn Creek Basin Sanitary District on November 17, 2015 indicates that total phosphorus LRSs are not needed for HBD-06, HBD-02, and HBD-04. The permit writer stated "The dissolved oxygen (DO) cause for impairment in the above waters was investigated for a link to excess algae or aquatic plant cause of impairment. Continuous monitoring data for Thorn Creek at several locations does not indicate that algae or plant growth in excess is present. The DO values that resulted in this cause being listed were at times of day that do not relate to algal or plant respiration."

1.5.2.7 TSS and Sedimentation/Siltation LRSs for Streams

- The TMDL should include justification for the 72.7 mg/L for TSS and 61.6 mg/L for NVSS targets.

1.5.3.4 BATHTUB Confirmatory Analysis

- Information on the selected kinetic parameters should be provided in the TMDL document. These parameters were adjusted iteratively to achieve an "excellent match". It is therefore unclear as to how this model has "predictive value."

2.2 Pollutant Sources and Linkages

- There is no discussion of illicit discharges to municipal separate storm sewer systems (MS4s) under the sources of fecal coliform (page 2-3).
- Chloride can build up in soils adjacent to roadways which could be a source of chloride in non-winter months.
- The statement on page 2-5 that low dissolved oxygen levels are driven by a combination of low reaeration and high sediment oxygen demand are unsubstantiated given the issues with the QUAL2k model.

2.3.1.4 Waste Load Allocation (fecal coliform)

- It is inappropriate to assign individual waste load allocations (WLAs) to the MS4s in the tables. WLAs should be assigned to the aggregate MS4s discharging to each segment. No information was provided on whether the MS4 areas in the watersheds are accurate. Further, the relative contribution of the fecal coliform from each MS4 may have nothing to do with relative area in the watershed. If this table remains in the TMDL, a footnote should be provided that the WLAs are not the allowable WLA for each individual MS4.

2.3.1.6 Load Allocation and TMDL Summary (fecal coliform)

- The fecal coliform TMDLs are largely unattainable and do not account for the variability in concentration that is reflected in the water quality standard. A dynamic model should be used to establish the TMDLs. At a minimum, a 400 cfu/100mL target should be used because of the permitted point sources in the watershed, including the two excess flow facilities (which are disinfected).
- Why was the permitted design maximum flow (DMF) not used for the Park Forest Excess Flow Facility? (page 2-14)

2.3.2.4 Waste Load Allocation (chloride)

- The TMDL states that HBD-06 (Thorn Creek) is no longer impaired for chloride and recommended for delisting and therefore a TMDL was not developed (page 2-2). If the segment that TCSD discharges into is no longer impaired for chloride, how can the exceedances in HBD-04 be attributed to the TCSD? (page 2-18)
- Table 2-24 shows that no reductions are needed for the chloride inputs to HBD-04. Why is a TMDL even required?

2.3.5.6 Load Allocations and TMDL Summary (dissolved oxygen)

- The QUAL2k model does not appear to be calibrated to anything other than dissolved oxygen. Therefore, there are numerous combinations of total ammonia, total phosphorus, carbonaceous biochemical oxygen demand and sediment oxygen demand that could all achieve the dissolved oxygen targets. Tables 2-31 through 2-36 are therefore questionable. Also, the calibration was conducted for extreme flow flows – it is unclear why WLAs would be provided for the MS4s.

Attachment 2

Review of Thorn Creek Watershed Stage 3 TMDL Report for Public Review (September 2018): Issues with the QUAL2k Model

Geosyntec conducted a review of the information provided on the QUAL2k model used for the Thorn Creek Stage 3 total maximum daily load (TMDL) public review document. The information included the September 2018 TMDL document provided on September 20, 2018; the appendices provided on October 3, 2018; and the modeling files provided on October 26, 2018. A complete review of the model was not possible as Appendix B did not include the calibration plots described in the TMDL document; data used to support the selection of upstream boundary conditions in the model was not provided in the document or appendices; and there was no information in the TMDL document regarding the model validation included with the modeling files.

Geosyntec recommends that the TMDL not be finalized. Illinois EPA should evaluate the limitations identified herein and stakeholders should be given adequate time to thoroughly review the model.

Model Segmentation

The QUAL2k model does not include the Sauk Trail Lake impoundment and dam even though it physically connects segments HBD-03 and HBD-05 of Thorn Creek. The Lake has a surface area of 28.8 acres, the volume of the lake is about 120 acre-feet, the maximum depth is 6.4 feet, and the average depth is 4.0 feet¹. The residence time of the water in the lake should therefore be included the QUAL2k model to accurately simulate water quality in the downstream segments of Thorn Creek. Table 1 shows the QUAL2k model segments and the prescribed ammonia sediment fluxes (discussed under Reach Characterization). There is no segment for Sauk Trail Lake.

Table 1: QUAL2k model reach segments

Reach	Length km	Prescribed ammonia flux mgN/m ² /day
Thorn Creek Mainstem		
HBD-03	7.53	1,000
HBD-05	4.25	1,000
HBD-06	3.19	1,000
HBD-02	0.85	1,000
HBD-02	3.70	1,000

¹ Thorn Creek Watershed Based Plan 2005. Northeastern Illinois Planning Commission. December 2005. See <https://www.cmap.illinois.gov/programs/water/water-quality-management/watershed-planning>

Reach	Length km	Prescribed ammonia flux mgN/m ² /day
HBD-04	7.93	1,000
Deer Creek		
HBDC	10.65	500
HBDC-02 (2 reaches)	7.40	1,000
Butterfield Creek		
HBDB-03 (3 reaches)	7.88	500
North Creek		
HBDA-01	4.30	250
HBDA-01	7.10	250

Reach Characterization

Each model segment in the QUAL2k model has been assigned a high ammonia sediment flux value ranging from 250 to 1,000 milligrams per square meter per day of nitrogen (mgN/m²/day) as shown in Table 1. These ammonia fluxes will result in elevated levels of ammonia in the QUAL2k model, as shown in Figure 1. Information was not provided as to how the model predictions compare with measured values in the creek.

Figure 1 : Ammonia concentrations predicted by the QUAL2k model

Headwater Inputs

The headwater inputs for Thorn Creek and its tributaries have very high values of ammonia and nitrate specified (Table 2). The headwaters of Thorn Creek and its tributaries do not include wastewater treatment plant inputs or other potential sources of ammonia, and hence the use of these values is not justified. The dissolved oxygen inputs for the headwaters of Thorn Creek and North Creek seem unrepresentatively low for shallow creeks.

Table 2: Headwater inputs for QUAL2k model

Headwater	Flow cms	Dissolved Oxygen mg/L	Ammonia mg/L	Nitrate mg/L
Thorn Creek	0.01	2	20	20
Deer Creek	0.01	7	5	5
Butterfield Creek	0.01	5	5	5
North Creek	0.005	3	5	20

Point Sources Inputs

The flow values for the two major publicly-owned treatment works (POTWs) reported in the Table 1-6 of the TMDL report and the QUAL2k model inputs do not match (see Table 3). This discrepancy between the model and TMDL report should be corrected.

Table 3 : Discrepancies in major POTW flows and model inputs

Facility	Flow reported in Table 1-6 (MGD)	Flow used in QUAL2k model (MGD)
Aqua Illinois University Park WWTF	2.4	1.8
Thorn Creek Basin Sanitary District STP	15.9	12.0

Diffuse Flow Inputs

The QUAL2k model includes the diffuse flow inputs for the flow that directly drains into mainstems of Thorn Creek and its major tributaries. The water quality concentration for the diffuse flow were varied for calibration since there is no available data. A summary of water quality concentrations associated with diffuse flow inputs is provided in Table 4. The use of high values of ammonia and nitrate is not justified since there are no major wastewater plants in the area draining directly to the mainstems of Thorn Creek and its tributaries.

Table 4. Concentrations assigned to diffuse flows in the QUAL2k model

Diffuse Flow inputs	Flow cms	Dissolved Oxygen mg/L	Ammonia mg/L	Nitrate mg/L
Thorn Creek	0.203	2	20	20
Deer Creek	0.025	7	10	10
Butterfield Creek	0.027	5	2.5	2.5
North Creek	0.006	3	2.5	2.5

Rates

There were certain issues in the kinetic rates used for the QUAL2k model:

1. Organic nitrogen hydrolysis is set to 4 per day which is at least an order of magnitude higher than the literature reported values of 0.001 to 0.4 per day².
2. Settling velocity of organic nitrogen is set to zero.
3. Subsistence quotas for nitrogen (q_{0Np}) and phosphorus (q_{0Pp}) are set to zero for phytoplankton. This results in no nutrient limitation for phytoplankton. Hence the QUAL2k model is missing the important process of nutrient limitation for phytoplankton which impacts dissolved oxygen predictions.

Nutrient Limitation. The nutrient limitation due to inorganic carbon is represented by a Michaelis-Menten. In contrast, for nitrogen and phosphorus, the photosynthesis rate depends on intracellular nutrient levels using a formulation originally developed by Droop (1974). The minimum value is then employed to compute the nutrient attenuation factor.

$$\phi_{Np} = \min \left[1 - \frac{q_{0Np}}{q_{Np}}, 1 - \frac{q_{0Pp}}{q_{Pp}}, \frac{[H_2CO_3^*] + [HCO_3^-]}{k_{sCp} + [H_2CO_3^*] + [HCO_3^-]} \right] \quad (80)$$

Model Calibration

Final calibration profiles are not included in Appendix B of the report. The plots provided here are generated with the modeling files supplied by Illinois EPA. Given the comments described above, calibration plots should be provided for various state variables as opposed to providing only the comparison to dissolved oxygen (which should be the final step in calibration).

Figure 2. Dissolved oxygen calibration for Thorn Creek

Figure 3. Dissolved oxygen calibration for Deer Creek

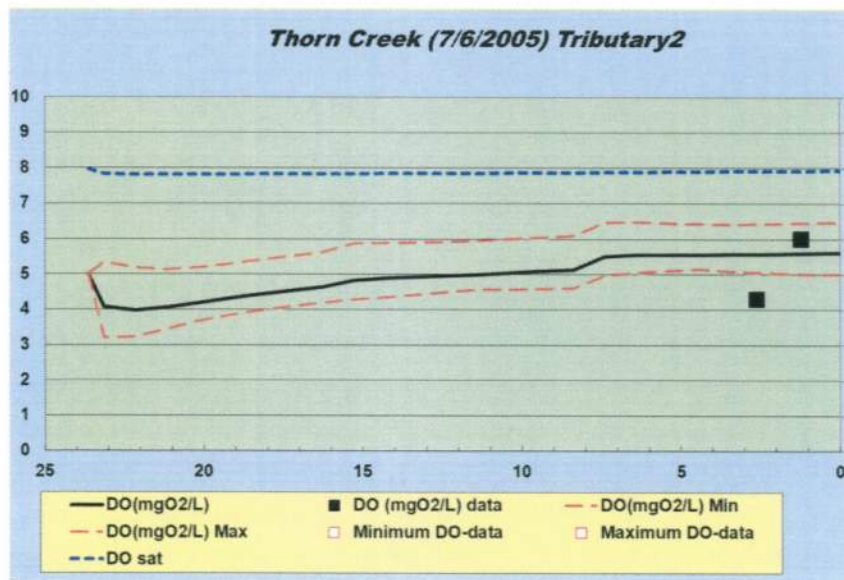

Figure 4. Dissolved oxygen calibration for Butterfield Creek

Sensitivity Analyses

An initial sensitivity analysis run was performed by removing the flow from the Thorn Creek Sanitary District (TCSD). Figure 5 shows that dissolved oxygen drops in absence of flow from the TCSD, even in the upstream segments of TCSD. This is because the inputs for the diffuse flow are tied to the point source discharges.

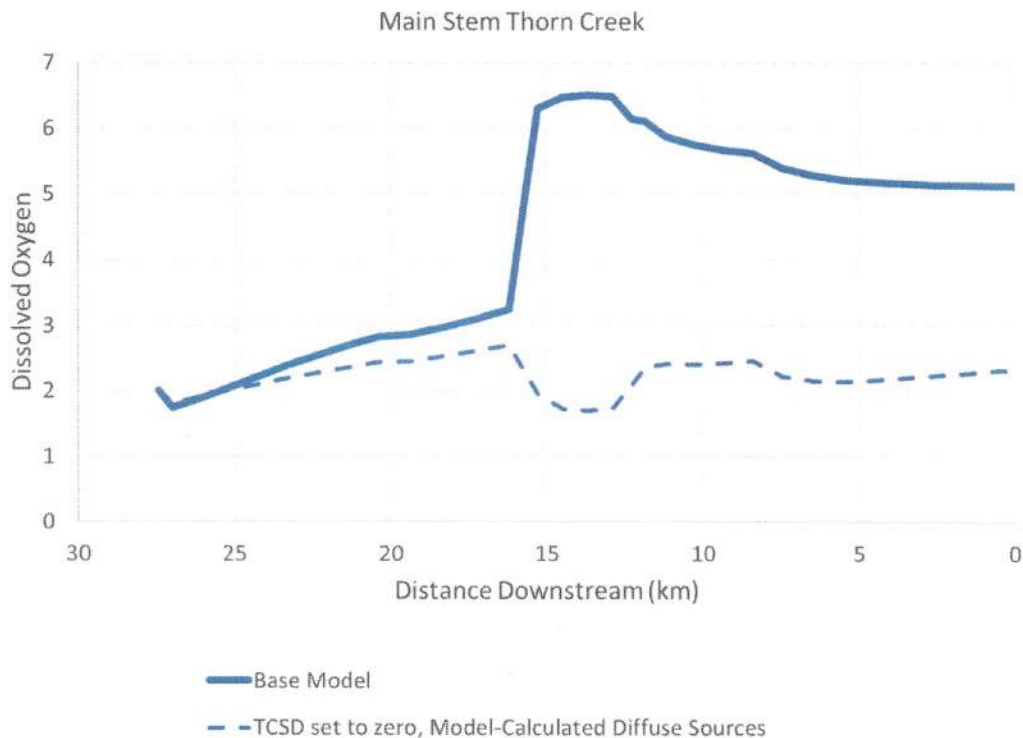

Figure 5: Sensitivity analysis for QUAL2k model – TCSD discharge set to zero

A second sensitivity run was conducted by zeroing out the TCSD discharge but forcing the diffuse flows to remain the same as in the model calibration. Figure 6 shows that the upstream decline in dissolved oxygen from the reduced diffuse flows is addressed and that dissolved oxygen declines downstream of the plant without the TCSD flow. A third sensitivity run (Figure 7) was conducted to evaluate the impact of increasing (doubling) the TCSD discharge. Dissolved oxygen levels improve.

Figure 6: Sensitivity analysis for QUAL2k model – TCSD discharge set to zero with forced diffuse flows

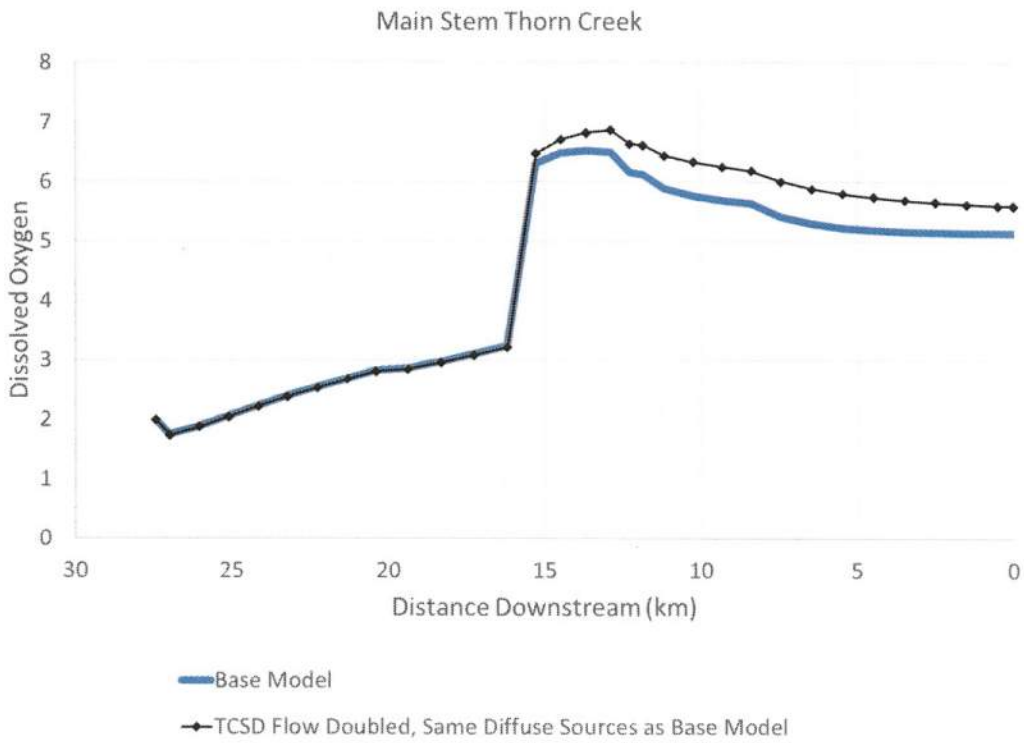

Figure 7: Sensitivity analysis for QUAL2k model – TCSD discharge doubled with forced diffuse flows

Figure 6: Sensitivity analysis for QUAL2k model – TCSD discharge set to zero with forced diffuse flows

Figure 7: Sensitivity analysis for QUAL2k model – TCSD discharge doubled with forced diffuse flows

Responsiveness Summary - Stage 3

Responsiveness Summary

Thorn Creek Watershed Total Maximum Daily Load

The responsiveness summary responds to questions and comments received during the public comment period from October 11, 2018, through December 11, 2018.

What is a TMDL?

A Total Maximum Daily Load (TMDL) is the sum of the allowable amount of a pollutant that a water body can receive from all contributing sources and still meet water quality standards or designated uses. The Thorn Creek Watershed TMDL report contains a plan detailing the actions necessary to reduce pollutant loads to the impaired water bodies and ensure compliance with applicable water quality standards. The Illinois EPA implements the TMDL program in accordance with Section 303(d) of the federal Clean Water Act and regulations thereunder.

Background

The watershed targeted for TMDL development is the Thorn Creek watershed (a sub-watershed of the larger Chicago watershed) located approximately 30 miles south of Chicago, and consists of Thorn Creek, its tributaries (Butterfield Creek, Deer Creek, Third Creek, and North Creek), engineered ditch systems (such as Lansing Ditch and State Street Ditch), and numerous small lakes and wetlands. In total, over 65 miles of streams wind throughout 104 square miles of northeastern Illinois and three-square miles of northwestern Indiana. Most streams of the Thorn Creek watershed flow from southwest to northeast from their origins in Eastern Will County to their confluence with Thorn Creek and continue to the Little Calumet River in southern Cook County. North Creek, however, flows west from its headwaters in northeastern Indiana, receiving additional drainage from the Lansing Ditch system and then meanders northwest to its junction with Thorn Creek.

The Thorn Creek watershed is further sub-divided into four sub-watersheds, each related to one of its major creeks (Butterfield Creek, Thorn Creek, Deer Creek and North Creek). The Thorn Creek watershed drains more than 66,000 acres from the area encompassing the western most point near Frankfort, IL to its easternmost point in northwestern Indiana and from the southernmost point outside of Monee, IL to the northern most point near South Holland, IL. For general characteristics of the major streams within the Thorn Creek watershed, refer to Table 2.1 & Figure 2-1 in the Stage 1 Report (Appendix A).

The Clean Water Act and USEPA regulations require that states develop TMDLs for waters on the Section 303(d) List. Illinois EPA has developed TMDLs for pollutants that have numeric water quality standards in Thorn Creek Watershed.

Therefore, fecal coliform TMDL was developed for Thorn Creek waterbody segments (IL_HBD-02, IL_HBD-03, IL_HBD-04, IL_HBD-05, and IL_HBD-06), Deer Creek waterbody segments (IL_HBDC and IL_HBDC-02), and Butterfield Creek waterbody segment (IL_HBDB-03).

A dissolved oxygen (DO) TMDL was developed for Thorn Creek waterbody segments (IL_HBD-02, IL_HBD-03, IL_HBD-04, and IL_HBD-06), North Creek waterbody segment (IL_HBDA-01), Deer Creek waterbody segment (IL_HBDC-02), and Sauk Trail Lake (IL_RHI).

A phosphorus TMDL was developed for Sauk Trail Lake (IL_RHI).

Silver and zinc TMDLs were developed for Thorn Creek waterbody segment (IL_HBD-02), and a chloride TMDL was developed for Thorn Creek waterbody segments (IL_HBD-04 and IL_HBD-06).

Load Reduction Strategy (LRS) has been developed for Total Suspended Solids (TSS) and sedimentation\ siltation for impaired waterbody segments in the watershed.

Illinois EPA contracted with CDM Smith (a TMDL Consultant) to prepare the TMDL report for the Thorn Creek Watershed project.

Public Meeting

The draft Stage 1 TMDL public meeting was held on June 23, 2009 (6:00 pm) at the Park Forest Village Hall in the Village of Park Forest, IL. Approximately 7 people attending the meeting. The comments received during the public comment period have been addressed and are incorporated in the draft Stage 3 TMDL report.

The draft Stage 3 TMDL public meeting was also held at the same location on October 11, 2018 (10:00 a.m.). Approximately 5 people participated in the public meeting and the public comment period ended at midnight on December 11, 2018.

Illinois EPA issued a public notice for the Draft Stage 3 TMDL public meeting on the Agency's Public Notices website at: <https://www2.illinois.gov/epa/public-notices/Pages/general-notices.aspx> and by placing a display-ad in the Daily Southtown Newspaper (the local newspaper in the Village of Park Forest, IL). In addition, a direct mailing was sent to several stakeholders/Permittees in the watershed. The notice gave the date, time, location, and purpose of the meeting. The notice also provided references on how to obtain additional information about this specific watershed, the TMDL program, and other related information. The draft Stage 3 TMDL Report was available for review at the Park Forest Village Hall in the Village of Park Forest, IL, during regular business hours, and on the Agency's web page at: <https://www2.illinois.gov/epa/topics/water-quality/watershed-management/tmdls/Pages/reports.aspx>.

Questions & Comments

1. The proposed TMDL for zinc for Deer Creek segment HDBC is based on an outdated interim (monitoring Only) limit of 0.079 mg/l. This proposed limit will be dropped from the NPDES permit IL0024473 Aqua Illinois- University Park WWTP on the next permit renewal upon one year of discharge data in compliance with the limits. This is based on identifying the zinc and nickel discharger and reducing the discharge to acceptable levels. Attached is the spreadsheet with monthly levels below the interim limit of 0.079 mg/l for zinc and 0.0013 mg/l for nickel. Aqua Illinois requests the proposed TMDL zinc limit be eliminated.

Response:

TMDLs projects are developed utilizing existing effluent limits, water quality standards, and available monitoring data. However, TMDLs are an iterative process and are intended to be revisited if new water quality data has been approved or based on new information in the watershed. The zinc wasteload allocation (WLA) assigned for Aqua Illinois-University Park WWTP (NPDES Permit No. IL0024473) is consistent with the current NPDES Permit of 0.079 mg/L a monthly average zinc concentration limit. The Permit Section will address the wastelaod allocation during the next NPDES Permit renewal process.

2. A reduced limit for fecal coliform bacteria is also proposed for Deer Creek. Deer Creek is not a wadable stream and is not easily accessed from the steep stream banks. Utilizing more stringent than whole body contact limits for fecal coliform bacteria is not justified for a stream that is not utilized for recreation including wading or swimming, therefore reducing the limit for fecal coliform bacteria is unjustified.

Response:

According to Illinois stream classification, Deer Creek is subject to the General Use water quality standards and the fecal coliform limit outlined in Illinois Administrative Code. Title 35. Subtitle C. Part 302.209 (b) is applicable for TMDL development.

The general use fecal coliform standard reads as follows: "During the months May through October, based on a minimum of five samples taken over not more than a 30 day period, fecal coliform shall not exceed a geometric mean of 200 per 100 ml, nor shall more than 10% of the samples during any 30 day period exceed 400 per 100 ml in protected waters."

The Permit Section will address the fecal coliform wasteload allocation during the next NPDES Permit renewal process.

3. It is critical to restoring Thorn Creek that appropriate load reduction strategy (LRS) targets be chosen for phosphorus, sediment and other pollutants and that the total maximum daily loads be properly calculated, that load allocation and waste load allocations be reasonable and that an effective implementation plan be developed.

Response:

Illinois EPA started developing Load Reduction Strategy (LRS) during the 2012 TMDL development cycle for parameters that do not have water quality standards.

In addition, as part of the Illinois Vision (July 2015) - the Long-Term Vision for Assessment, Restoration, and Protection under the CWA Section 303(d) Program (Vision), and TMDL Development – Alternative Approaches, Illinois EPA started developing Load Reduction Strategy as presented below:

Load Reduction Strategy (LRS) - The Agency is planning to use LRSs as an alternative for TMDL development where possible. The Agency started developing LRSs in 2012 for those pollutants that are listed on the Illinois Integrated Water Quality Report-303(d) list that do not have numeric water quality standards. LRSs are not a substitute for TMDL development but are used as planning tools until a TMDL is developed. As with a TMDL, this involves determining the loading capacity and load reduction necessary by implementing best management practices in order for the water body to meet “Full Use Support” for its designated uses.

Please refer to Illinois 2016 Integrated Water Quality Report, Appendix – F, for the Illinois-Vision:

<https://www2.illinois.gov/epa/Documents/iepa/water-quality/watershed-management/tmdls/2016/303-d-list/appendix-f.pdf>.

As outlined in Section 1.2 of the TMDL Report, the LRS load capacity (LC) is not divided into WLA, LA, or MOS components, rather it is represented by one number as a target concentration for load reduction within the watershed, and only LRS has been developed for total suspended solids (TSS), and sedimentation/siltation in this watershed (please refer to Appendix-G).

The total phosphorus LRS target has been withdrawn, as Illinois EPA is working with stakeholders to address nutrient issues in Illinois through the Illinois Nutrient Loss Reduction Strategy (NLRS) Program.

Please refer to the link below for Illinois NLRS:

<https://www2.illinois.gov/sites/agr/Resources/NutrientLoss/Pages/default.aspx>.

4. Further, particularly here where the some of LRS targets are based on uncertain science and data, the final TMDL implementation plan as presented for approval to U.S. EPA should explicitly call for revisiting the water quality targets and recalculating the load and waste load allocations in five years. This milestone should be added to Section 3.15.3 Success Criteria.

Response:

The LRS developed for the watershed was intended to help stakeholders develop watershed-based plans with goals of bringing waterbodies to attainment of “Full Use Support” for their designated uses by implementing Best Management Practices (BMPs). In addition, adaptive management strategies have been added in the TMDL implementation plan to evaluate the milestones and make adjustments/revisions as necessary (please refer to Section 3.15.4 in the TMDL Report).

5. Unless we are missing appendices, it is not clear from the TMDL document how the 0.226 mg/L LRS phosphorus target was derived by IEPA. What method was used?

Response:

The LRS target is based on data from all stream segments within the HUC-10 basins of the watershed, as well as stream segments or lakes which closely border the watershed in neighboring HUC-10 basins, in order to best represent the land use, hydrologic, and geologic conditions unique to the watershed. Load reduction targets were calculated by the Agency using data from stream segments whose most current assessment shows “full support” for their designated uses.

Please refer to Response #3, the total phosphorus LRS has been withdrawn. The Agency is working with stakeholders to address nutrient issues in Illinois through the Illinois Nutrient Loss Reduction Strategy (NLRs) Program.

6. It is stated that that waste load allocation (WLA) and load allocations (LA) are not being considered because LAs are “voluntary” (2-31) and non-point controls are “entirely voluntary.” (3-2) However, as is explained at the beginning of the report (1-5), a TMDL is supposed to include a WLA and a LA. Moreover, while non-point source pollution is not regulated under the Clean Water Act, that is no reason why such controls could not be imposed under state or local law as has been done in many areas. See, *Pronsolino v. Natri*, 291 F.3d 1123 (9th Cir. 2002). The final TMDL should include a realistic appraisal of what could be done to better control non-point pollution, including through use of mandatory programs (such as the MS4 program), and should include a realistic allocation of reductions between point and non-point sources of phosphorus pollution. The TMDL further states that phosphorus limits for point sources will be worked out by IEPA during the NPDES process. (3-31). This further precludes creation of an appropriate WLA and combined with the conclusion that non-point controls will be “entirely voluntary” implies that point sources will be responsible for all the reductions.

Response:

Illinois EPA views a TMDL as a tool to develop water quality-based control actions that can be incorporated into an overall watershed management approach. The TMDL establishes the link between water quality standards,

assessment, and water quality-based solutions. For the TMDL to be successful, NPDES Permittees (Point Sources) in the watershed must work with Illinois EPA's Permit Section to address applicable Wasteload Allocation (WLA) during the next cycle of the NPDES permit renewal process, while the Load Allocation (LA) – nonpoint sources pollution is addressed through voluntary and incentive-based approaches, such as participation in the Agency's Section 319 funding program for developing watershed-based plans.

The voluntary management measures recommended in the TMDL Report can be successfully implemented through the leadership of local stakeholders within the watershed. In order to assist local stakeholders in implementing these recommendations, Illinois EPA strongly encourages the formation of watershed workgroups to expedite implementation through voluntary and incentive-based approaches. These groups can direct planning efforts for implementing best management practices (BMPs) that are both practical and feasible for the watershed. Please refer to the TMDL Implementation Plan outlined in Section 3 of the report.

The Illinois Nutrient Loss Reduction Strategy (NLRS) Program is working with policy work group that include representatives from local, state and federal agencies, the agricultural industry, and nonprofit organizations as well as scientists, academics, wastewater treatment professionals, and MS4 Communities to address nutrient issues in Illinois.

As to the case referenced above (*Pronsolino v. Nastri*, 291 F.3d 1123 (9th Cir. 2002), Illinois EPA has been developing LRS to address nonpoint source pollutants that do not have numeric water quality standards by implementing best management practices.

Please also refer to Response # 3.

7. Assuming a criteria as loose as 0.226 mg/L is tolerable, end-of-the-pipe limits below that level should be imposed on the four major point sources as limits below 0.2 mg/L can be met and have been imposed as to other dischargers. See e.g. *Upper Blackstone Sanitary v. EPA*, 690 F.3d 9,18 (1st Cir. 2012); U.S. EPA, Montana Variance Approval letter, Oct.31,2017.

See: <https://deq.mt.gov/Portals/112/Water/WQPB/Standards/NutrientWorkGroup/PDFs/Montana%20Nutrients%20Variance%20Final%20Letter%2010%2031%2017.pdf>.

Lower limits than that will be necessary if it is insisted that the non-point share will only be approached with purely voluntary programs as the points sources must then be called upon to make up reductions that non-point sources are not being required to address. Further, if, as we fear, phosphorus limits tighter than 0.226 mg/L prove to be needed, further wastewater treatment and additional point and non-point controls will be necessary in the future. That the IEPA will reconsider the 1) LRS targets, 2) the WLA-LA allocation, 3) the need for new or enhanced non-point controls and 4) reduced point source limits should be made an explicit requirement of the implementation plan.

Response:

At this time, in the absence of total phosphorus (TP) water quality standards, Illinois EPA has been including a 1.0 mg/L TP monthly average as an interim effluent limit in NPDES permits for major domestic wastewater dischargers (DAF \geq 1.0 MGD) during the NPDES permit renewal cycle or plant upgrades. Special Conditions in the NPDES permit also require facilities to develop a range of measures for reducing phosphorus discharges (Phosphorus Optimization Plan), including possible source reduction measures, operational improvements, and to conduct a phosphorus removal feasibility study on how to reduce phosphorus levels in their discharge for consistently meeting a potential effluent limit of 0.5 mg/L or 0.1 mg/L.

Major municipal dischargers are also receiving special conditions requiring an effluent limit of 0.5 mg/L Total Phosphorus 12-month rolling geometric mean by 2025, 2030 or 2035 depending on if the discharger will remove phosphorus via chemical phosphorus removal, biological phosphorus removal or biological nutrient removal.

Additionally, major municipal dischargers are receiving a special condition stating that a 12-month rolling geometric mean limit of 0.5 mg/L for phosphorus will take effect in 2025, 2030, or 2035 depending how the discharger decides how to remove phosphorus via chemical phosphorus removal, biological phosphorus removal, or biological nutrient removal respectively.

The nonpoint source contribution may be addressed by implementing BMPs as discussed in Response #6.

In addition, Illinois EPA is also working with stakeholders to address nutrient issues in Illinois through the Illinois Nutrient Loss Reduction Strategy (NLRs) Program. The total phosphorus LRS has been withdrawn, please refer to Response #3.

The Illinois NLRs - Nutrient Science Advisory Committee (NSAC) has completed a nutrient criteria study for Illinois streams, and Illinois EPA will review the recommendations of its Science Panel. Based on this information, in early 2021, Illinois EPA will work with Region 5 to assess the utility of NSAC recommendation for numeric nutrient criteria to protect aquatic life and recreation uses throughout Illinois.

8. In Section 1.5.2.6 Total Phosphorus LRSs for Streams, it is reported that the Innophos facility discharges phosphorus at an average monthly concentration of 60.6 mg/L with discharges as high as 116 mg/L. This is an extremely high level of phosphorus discharge. Certainly, reducing this discharge should be an immediate priority for TMDL implementation and not put off as part of a generalized LRS. Likewise, priority should be placed on reducing any phosphorus discharges above the LRS target of 0.226 mg/L from the other point sources in the watershed.

Response:

The NPDES Permit No.IL0035220 for Innophos, Inc., was issued on 10/08/2015, and the facility's operation results in an average discharge of 0.27 MGD of non-contact cooling water and stormwater runoff from outfall 001, and uncontaminated intermittent discharge of stormwater runoff from outfall 004. A total phosphorus monitoring is included in the NPDES Permit for this facility. Coverage under the Industrial Stormwater General Permit (ILR007669) was issued in March 2020.

9. ECHO also reports that the Innophos facility has exceeded its Total Suspended Solids limit ten times in the last twelve quarters. Resolving compliance problems at facilities that are not meeting their current permit limits should be a first step in meeting the TMDL.

Response

On September 26, 2019, USEPA issued an Administrative Order of Consent ("Order" of "Consent") to Innophos, Inc., (NPDES Permit (IL0035220) to address the total suspended solids (TSS) effluent limit non-compliance issues and to bring the facility to comply with its NPDES Permit TSS effluent limits. The BOW- Compliance Assurance Section has followed up with the subject facility on the Order, and at this time the Innophos, Inc. facility is meeting its NPDES Permit effluent limits.

10. We are pleased that the Army Corps is scheduled to remove the Sauk Trail Lake dam on Thorn Creek in 2021-2022. We recommend that continuous monitoring of dissolved oxygen levels in the dam pool reach be conducted prior to and after the dam is removed in order to document the impact of dam removal on oxygen levels in the creek.

Response:

Thank you for the recommendation.

11. Facilities such as the Park Forest Excess Flow Facility and Homewood Excess Flow Treatment Plant are a source of nutrients and oxygen demanding materials that may cause violations of the DO standard in the river when discharging at times outside of the critical condition model considered in the TMDL. Reductions in these discharges should be considered through the implementation of end of pipe controls and green infrastructure installation in order to address the release of oxygen-demanding materials to the waterways during high flows.

Response:

Additional discussion has been added to Section 3.6.1 of the TMDL report to limit the potential contributions from intermittent discharges as follows:

"In addition, intermittent discharges such as those from the Park Forest Excess Flow Facility (IL0047562) are a potential source of nutrients and oxygen

demanding materials during periods of high flow that do not coincide with the critical condition model considered in the TMDL. Load reductions for intermittent discharges should be considered through the implementation of end of pipe controls and green infrastructure installation in order to address the release of oxygen-demanding materials to the waterways during high flows.”

- 12 In Section 1.5.1.4 Headwater Conditions, it is stated that data from July 6, 2005 was used in the modeling. Where DO and fecal coliform water quality standards met in these reaches during that period?

Response:

Headwater dissolved oxygen concentrations fell below the water quality standard on July 6, 2005. The data is presented on QUAL2K model calibration plots in Appendix B. Fecal coliform data and associated impairments are addressed using Load Duration Curve in other sections of the report. There is little relationship between DO concentrations and fecal coliform loads so fecal coliform is not an input into the QUAL2K modeling performed for DO impaired streams, which is the subject of the Headwater Conditions discussion in Section 1.5.1.4.

13. It is stated in Section 1.5.1.7 that estimates were made when there was not facility data available for model inputs. Does Table 1-6 represent the reported point source information only? What are the estimated values for the data missing from the table? Where can they be found? Was a phosphorus input estimated for each point source? What are those values and where can they be found?

Response:

This table has been revised and footnoted accordingly. Constituent-specific model inputs are set to zero for facilities without existing data or reasonable potential to discharge a given constituent. All QUAL2K model inputs, including additional inputs associated with point sources, are provided in Appendix C.

- 14 Regarding Section 1.5.2.2 Fecal Coliform TMDLs for Streams, did IEPA or CDM Smith review the discharge monitoring reports for the facilities that discharge in the watershed? Were any problems identified where the facilities were not meeting their standards? For example, ECHO indicates that Thorn Creek Basin Sanitary District STP violated its fecal coliform limit in the first quarter of 2018. Resolving any problems in compliance at facilities that are not meeting their current permit limits should be a first step in meeting the TMDL.

Response:

Existing discharge loads from facilities are considered in the model calibration process during TMDL development and are used as inputs to reflect existing conditions. However, WLAs for facilities are set based on permitted design flows (Design Average Flow\Design Maximum Flow) rather than measured data from Discharge Monitoring Reports (DMRs) to account for the plants design capacity. The Agency’s Bureau of Water-Compliance Assurance Section has been following

up with NPDES permittees to address non-compliance issues reported on discharge monitoring reports (DMRs). At this time, the Thorn Creek Basin Sanitary District- STP is in compliance with its fecal coliform NPDES Permit effluent limits.

- 15 How soon will the 200 cfu/100 ml monthly geometric mean water quality standard for fecal coliform be incorporated into the facilities listed in Table 2-4? Couldn't the IEPA immediately impose a limit and monitoring requirement for this standard through a minor permit modification?

How does IEPA plan to incorporate the WLAs for fecal coliform into the MS4 permits for the facilities listed in Tables 2-5 through 2-12? How soon can this be done?

Response:

The fecal coliform Wasteload Allocation (WLA) for Individual NPDES Permits will be included in the reissued permit during the next cycle of NPDES permit renewal process.

The MS4 general permit expires in February 2021. The existing MS4 general permit requires dischargers to modify their Stormwater Pollution Prevention Plan (SWPPP) if TMDL waste load allocations are not met. The permit also requires a monitoring program to determine whether the storm water controls are adequate to meet the WLA.

16. Thorn Creek Basin Sanitary District STP has a chloride monitoring requirement in its current NPDES permit. Based on that data, how often is the facility currently discharging chloride in excess of the calculated WLA-DMF of 167,949 lbs/day?

Response:

The Thorn Creek Basin Sanitary District NPDES permit (IL0027723) expired on 9/30/2015, and the permit is under review for reissuance. The draft NPDES permit includes an effluent limit based on the chloride WQS 500 mg/L.

According to the Discharge Monitoring Reports submitted by Thorn Creek Basin Sanitary District for reporting period (05/31/2015 to 06/30/2020), the highest chloride concentration reported was 380 mg/L in February 2019, and this translates to a Chloride WLA of 127, 560 lbs/day. The chloride effluent concentration reported is lower than 500 mg/L Water Quality Standards, that has been used in developing the Chloride TMDL WLA for the subject facility.

Discharge monitoring report is publicly available on USEPA's Enforcement and Compliance History Online (ECHO) webservice, that offers a discharge loading tool useful in determining existing loads from all NPDES permitted facilities based on available DMR data. Available DMR data do not show any sample concentrations that would equate to a load in excess of the WLA-DMF for chloride. ECHO is available at: <https://echo.epa.gov>.

17. If Illinois adopts a more science-based chloride standard, how and when will this be integrated into the TMDL and any implementation strategies?

Response:

TMDLs are developed based on current water quality standards and available monitoring data. Implementation plans are recommended to address high level of chloride in the watershed by implementing best management practices. However, a TMDL is an iterative process and is intended to be revisited as new or revised water quality standard becomes available.

18. Has IEPA evaluated the ammonia reductions described as needed in Section 2.3.5.6 Load Allocations and TMDL Summary to reflect the known need to change Illinois' water quality standards for ammonia to better protect freshwater mussels? Would these load reductions serve that purpose too? Shouldn't the point sources in the watershed be required to contribute to this reduction too rather than only be set at their most stringent current permit levels as has been done in Table 2-29?

Response:

TMDLs are developed based on current water quality standards. In this case, Illinois EPA has not yet proposed the 2013 National Criteria Document for ammonia to the Illinois Pollution Control Board for adoption of the water quality standards.

TMDLs are developed based on current water quality standards and available monitoring data. Implementation plans are recommended to address high level of chloride in the watershed by implementing best management practices. However, a TMDL is an iterative process and is intended to be revisited as new or revised water quality standard becomes available. This TMDL report may be reopened to develop a revised ammonia WLA when new ammonia water quality standard becomes available.

19. We note that having a local coalition of stakeholders is important to implementing the provisions of the TMDL and other projects that have been identified to improve the health of the Thorn Creek Watershed. From 2003 to 2005 a watershed-based plan was developed by the Northeastern Illinois Planning Commission with local stakeholders. That plan was updated by the Chicago Metropolitan Agency for Planning in December 2014.

See: <https://www2.illinois.gov/epa/Documents/iepa/water-quality/watershed-management/watershed-based-planning/2016/thornwbp.pdf>.

Response:

References to the watershed-based plan and addendum were added to Section 3 of the TMDL report.

20. Chloride is listed as a pollutant of concern. Road salt application was identified as a potential contributor to the impairment. IDOT requests to be included in the waste load allocations for chloride. Please inform Felecia Hurley, Felecia.hurley@illinois.gov, of any needed data in order for this to be accomplished.

Response:

A chloride WLA has been assigned to all discharges that have the potential to discharge chloride to impaired waterbody segments. The NPDES Permit for Illinois DOT's - MS4 General Permit No. ILR400493 has been assigned a WLA (refer to Table 2-23). Once, USEPA approves the TMDL report, Illinois EPA will notify IDOT and all other NPDES Permittees\stakeholders the approval of the TMDL report by regular mail and/or electronic mail (email).

21. The Draft TMDL Report indicates that impairments based on narrative water quality standards are assessed through the development of LRSs, and then goes on to develop an LRS for total phosphorus, allegedly based on the narrative standard.

However, that approach is not authorized by applicable Illinois regulations or the state's methodology for listing impaired waters. The narrative standard for "offensive conditions" is found at 35 Ill. Adm. Code 302.203, and prohibits "sludge or bottom deposits, floating debris, visible oil, odor, plant or algal growth, color or turbidity of other than natural origin" in all general use waters. The Illinois Integrated Water Quality Report and Section 303(d) List, 2016 indicates that since 1997, exclusively narrative standards such as the one for offensive conditions apply only to the protection of aesthetic quality in Illinois waters. The same language is noted in the 2018 Draft Integrated Report.

None of the Thorn Creek segments, however, is or has been listed as impaired for aesthetic quality. Indeed, in the 2008, 2010, and 2012 Integrated Reports, none of the Thorn Creek segments were evaluated for aesthetic quality. In the 2014, 2016, and 2018 Integrated Reports, Thorn Creek segments HBD-04 and HBD-05 were assessed as fully supporting aesthetic quality, while the remaining segments were not evaluated.

Although the 2008 listing methodology indicated that total phosphorus could be listed as a cause of aquatic life impairment in streams, that approach is contrary to Illinois regulations and the more recent listing methodologies. The nontoxic parameters currently used for evaluation of aquatic life uses in streams are water temperature, pH, and dissolved oxygen, but not total phosphorus. In fact, Illinois EPA has separately determined that any dissolved oxygen impairments in Thorn Creek are not related to excess algal growth that might require reductions in total phosphorus:

The dissolved oxygen (DO) cause for impairment in the above waters was investigated for a link to excess algae or aquatic plant cause of impairment. Continuous monitoring data for Thorn Creek at several locations does not indicate that algae or plant growth in excess is present. The DO values that resulted in this cause being listed were at times of day that do not relate to algal or plant respiration.

Because there is no valid impairment listing for total phosphorus based on the narrative standards, the LRS allocation for total phosphorus should be withdrawn.

In addition, it is not clear that Illinois EPA has the authority to adopt LRS targets or allocations in the Draft TMDL Report. Nothing in federal or state regulations authorizes the development of LRSs either within or outside the TMDL process. Further, the Draft TMDL Report indicates that the LRSs are not intended to be translated into permit limits. If the LRSs are intended only as supplemental information, they should not be included in a TMDL, which is intended to have binding effect on NPDES permittees and other dischargers. The inclusion of LRSs in a binding TMDL could result in regulatory confusion, and components of the LRSs could be used for purposes that were neither intended nor authorized by law. If needed at all, LRSs should be removed from the Draft TMDL Report and addressed through some other mechanism.

Finally, there is no valid basis for the LRS target of 0.226 mg/L. The Draft Report simply indicates that:

As no numeric water quality standard exists for total phosphorus in streams in Illinois, a numeric target (0.226 mg/L) was developed by Illinois EPA for this watershed.

There is nothing in the Draft TMDL Report to demonstrate why that target is appropriate for all segments of Thorn Creek, what designated use that target is necessary to support, or how that target was derived.

For the reasons discussed above, the LRS for total phosphorus should be withdrawn and removed from the Draft TMDL Report.

Response:

Illinois EPA acknowledges that some past-identified causes (Nutrients, Total Suspended Solids, and Sedimentation\Siltation) that remain associated with Illinois 303(d)-listed water bodies are not directly related to Illinois water-quality standards. In the 2008 and 2012 Integrated Reports, Illinois EPA provided to USEPA its basis for removing waters or potential causes based on guidelines that were not directly related to Illinois water-quality standards. In late 2019 and early 2020, USEPA and Illinois EPA agreed to resolve pending decisions on these causes. The final resolution remains pending.

Illinois EPA has been developing Load Reduction Strategy (LRS) since 2012 for parameters that do not have water quality standards (please refer to Response #3 above). However, the phosphorus LRS has been withdrawn, as Illinois EPA is working with stakeholders to address nutrient issues through the Illinois Nutrient Loss Reduction Strategy (NLRS) Program.

The Illinois NLRS - Nutrient Science Advisory Committee (NSAC) has completed a nutrient criteria study for Illinois streams, and Illinois EPA will review the recommendations of its Science Panel. Based on this information, in early 2021, Illinois EPA will work with Region 5 to assess the utility of NSAC recommendation for numeric nutrient criteria to protect aquatic life and recreation uses throughout Illinois.

22. A TMDL establishes binding conditions that will determine the effluent limitations included in National Pollutant Discharge Elimination System (NPDES) permits issued to regulated parties who discharge into the affected waters. As a result, other states such as Ohio have determined that a TMDL must be promulgated through the rulemaking process before it can become effective. Because TMDLs developed by Illinois EPA have the same binding effect as in other states, they should be promulgated pursuant to the Illinois Administrative Procedures Act, 5 ILCS 100/, and the Illinois Pollution Control Board procedural rules.

Response:

Section 303(d) of the federal Clean Water Act (CWA) requires states to identify waters that do not meet applicable water quality standards or do not fully support their designated uses. The CWA also requires that a TMDL must be developed for each pollutant of an impaired waterbody. In order to meet this requirement, Illinois EPA develops TMDL(s) for a single waterbody segment or for waterbody segments or for a watershed, rather than for the whole state.

The Illinois EPA has a three-stage approach to TMDL development. The stages are as follows:

Stage 1 – Watershed Characterization, Data Analysis, Methodology Selection

Stage 2 – Data Collection (if additional data is necessary)

Stage 3 – Model Calibration, TMDL Scenarios, Implementation Plan

Illinois EPA has been working with NPDES Permittees, watershed workgroups, other stakeholders such as SWCD\NRCS including farmers\landowners, and non-governmental organization in several watersheds during the TMDL development process and for their input in the TMDL Implementation plan.

As part of the Stage 1 TMDL development process, the Agency issues public notice for 30 days and conducts a public meeting in the watershed to engage and inform stakeholders in the watershed. Following the public meeting, the public notice remains open for another 30 days for review and comment. All comments received during Stage 1, are addressed and incorporated into the Final Stage 1 Report. This process is also repeated during the Stage 3 TMDL development process. At this, time, the Agency develops a Responsiveness Summary and addresses all comments received during the public comment period. The Responsiveness Summary is incorporated into the TMDL report and is submitted to USEPA- Region 5 for approval.

Once the TMDL is approved by USEPA, the NPDES Permittees\Stakeholders in the watershed, public meeting participants, and other non-governmental organizations are notified by regular mail or electronic mail (email) to this effect.

The wasteload allocation (WLA) assigned to NPDES Permits will be addressed during the next NPDES Permit renewal process, while the load allocation (LA) can be addressed through Watershed Based Plans (WBP) or alternative best management practices (BMPs).

23. Section 1.2 TMDL Goals and Objectives for Thorn Creek Watershed – As stated on page 1-4, the dam for Sauk Trail Lake is scheduled to be removed in less than four years. It is unclear why TMDLs were calculated for the lake. Dam removals typically improve water quality downstream of the dam – why did the TMDLs for Thorn Creek not consider the additional assimilative capacity that may be provided by the dam removal project?

Response:

TMDLs quantify assimilative capacity for a water body under current conditions, not potential future conditions. It would not be possible to attempt to project water quality impacts due to a potential future physical alteration of the stream. However, the TMDL may be revised or updated in the future if new data becomes available.

24. 1.3.1 Existing Water Quality Data – As stated on page 1-6, Appendix A was intended to include a summary of all relevant data for the TMDL and load reduction strategies (LRSs). Given the importance of ammonia to the Thorn Creek TMDL, Appendix A should summarize the 21 parameters listed in Table 1-2 versus repeating Table 1-3.

Response:

Appendix B has been updated to include available data for all parameters listed in Table 1-2.

25. 1.5.1.4 Headwater Conditions – Headwater water quality conditions were set based on data from July 6, 2005 which is more than 13 years old (page 1-14). No information was provided as to whether this is representative of current conditions. At a minimum, information on how this compares to the validation period of July 10, 2007 should be provided.

Response:

As stated in the TMDL report, this sampling date represents the most recent headwater water quality data available for the critical conditions and time period of concern. The TMDL calculations make use of the best data available.

26. 1.5.2.2 Fecal Coliform TMDLs for Streams – The fecal coliform standard consists of two parts: (1) a geometric mean of 200 colony forming units (cfu)/100 ml, and (2) a statistical threshold value (STV) of 400 cfu/100 ml not to be exceeded in more than 10% of five samples taken over a 30-day period during the recreation season. Applying the 200 cfu/100 ml as a daily maximum (page 1-20) is inappropriate and overly conservative. USEPA's 2012 recreational criteria recommend use of the STV as an instantaneous maximum for beach notification purposes (as opposed to compliance with the water quality standard since the STV can be exceeded at times). Illinois EPA should apply this same principle for the TMDL.

Captions for Figures 1-6 through 1-13 should reflect that the flow duration curve (FDC) represents only flows from May through October.

The statement on page 1-25 asserts that the primary sources of fecal coliform loads occur during higher flow conditions. However, the FDCs clearly show that exceedances occur under all flow conditions.

The FDCs include data from multiple stations. Data from the stations should be plotted with different symbols so that any upstream to downstream trends can be ascertained. This comment applies to all FDCs (not just fecal coliform).

Response:

Applying the geometric mean portion of the standard as a daily maximum is a conservative approach commonly used for TMDL calculations due to data limitations to allow for assessment of daily fecal coliform loads that represent the potential to exceed the in-stream standards. This approach is used largely as a result of uncertainty associated with the need to account for seasonality and long-term variability while utilizing often limited available datasets. However, a waterbody's compliance with water quality standards for fecal is assessed prior to inclusion on the 303(d) list of impaired waters using the 10% of five samples collected over a 30-day period, as denoted by the language in the water quality standard.

Captions for Figures 1-6 through 1-13 have been updated to include “(May through October)” for clarification.

Regarding plotting the data from different stations with different symbols, the focus of the TMDL and the subsequent analysis is on impairments of designated stream segments; thus, data is grouped by stream segment rather than specific sampling locations for the development of the load duration curve. Additional assessment of station-level data may be useful in developing implementation measures, and station identifier information is retained and presented for all applicable water quality data in Appendix B.

27. 1.5.2.3 Chloride TMDLs for Streams – The modeling files did not include a chloride FDC for HBD-06. This information needs to be provided.

The statement on page 1-27 about typical sources of chlorides and winter months with less extreme high flow events is questionable. There was a chloride exceedance for HBD-04 in June 2006 and the data reflect high flows in the winter.

Response:

The chloride Flow Duration Curve (FDC) data sheet for HBD-06 is included in Appendix D. The statement in Section 1 regarding flow conditions under which exceedances of the chloride water quality standard references typical sources of chloride and the general tendency of less extreme flows occurring during winter months. Variations from these conditions are possible.

28. 1.5.2.4 Zinc TMDLs for Streams – The statement that primary sources of zinc loads are not runoff related (page 1-28) are not substantiated. Sources of zinc cited in Section 2.2 include sediment-bound zinc in runoff.

Response:

The statement is supported by the data shown in Figure 1-16. The Section references the primary sources of zinc; it is not intended to cover all sources. Section 1.5.2.4 has been revised to address the comment.

29. 1.5.2.6 Total Phosphorus LRSs for Streams – The TMDL should include justification for the 0.226 mg/ L total phosphorus target and why it is applicable to all stream segments.

The draft permit issued to the Thorn Creek Basin Sanitary District on November 17, 2015 indicates that total phosphorus LRSs are not needed for HBD-06, HBD-02, and HBD-04. The permit writer stated "The dissolved oxygen (DO) cause for impairment in the above waters was investigated for a link to excess algae or aquatic plant cause of impairment. Continuous monitoring data for Thorn Creek at several locations does not indicate that algae or plant growth in excess is present. The DO values that resulted in this cause being listed were at times of day that do not relate to algal or plant respiration."

Response:

The phosphorus LRS has been withdrawn, as Illinois EPA is working with stakeholders to address nutrient issues through the Illinois Nutrient Loss Reduction Strategy (NLRS) Program.

The sensitivity analysis in the revised model indicated that phosphorus loads appear to have minimal impact on DO concentrations in this system.

30. 1.5.2.7 TSS and Sedimentation/Siltation LRSs for Streams – The TMDL should include justification for the 72.7 mg/L for TSS and 61.6 mg/L for NVSS targets.

Response:

The LRS target is based on data from all stream segments within the HUC-10 basins of the watershed, as well as stream segments or lakes which closely border the watershed in neighboring HUC-10 basins, in order to best represent the land use, hydrologic, and geologic conditions unique to the watershed. Load reduction targets were calculated by the Agency using data from stream segments whose most current assessment shows “full support” for their designated uses.

Also, please refer to response #3.

31. 1.5.3.4 BATHTUB Confirmatory Analysis – Information on the selected kinetic parameters should be provided in the TMDL document. These parameters were adjusted iteratively to achieve an "excellent match". It is therefore unclear as to how this model has "predictive value."

Response:

Text in section 1.5.3.4 has been adjusted to clarify the extent of the confirmatory analyses. BATHTUB model inputs are provided in Appendix E.

32. 2.2 Pollutant Sources and Linkages – There is no discussion of illicit discharges to municipal separate storm sewer systems (MS4s) under the sources of fecal coliform (page 2-3).

Chloride can build up in soils adjacent to roadways which could be a source of chloride in non-winter months.

The statement on page 2-5 that low dissolved oxygen levels are driven by a combination of low reaeration and high sediment oxygen demand are unsubstantiated given the issues with the QUAL2k model.

Response:

Section 2.3.1.4 has been revised to add statements regarding sources of fecal coliform in MS4s as follows:

“It should be noted that allocations based on proportional area may not accurately reflect the distribution of various sources of pollutant loads (runoff, possible illicit discharges, etc.) and may need to be adjusted upon further investigation of loading from each MS4 discharge.”

Section 2.2 has been revised to add statements regarding sources of chloride as follows:

“Land use in the Thorn Creek watershed is approximately 58% urban overall, with denser urban areas towards the downstream end of the watershed. Nonpoint chloride sources may therefore originate from road de-icing

activities using chloride salts. These salts can accumulate in soils adjacent to roadways and then become a source of chloride in non-winter months.”

The TMDL Consultant revised the QUAL2K model in response to the provided comments. Section 2.3.5.6 was revised to reflect updated modeling results:

”The analyses indicate that, given the best available data and constructed model, low DO levels in this watershed are driven primarily by a combination of diffuse loads of oxidizing material (CBOD and ammonia-N), high SOD, and relatively low reaeration...”

33. 2.3.1.4 Waste Load Allocation (fecal coliform) – It is inappropriate to assign individual waste load allocations (WLAs) to the MS4s in the tables. WLAs should be assigned to the aggregate MS4s discharging to each segment. No information was provided on whether the MS4 areas in the watersheds are accurate. Further, the relative contribution of the fecal coliform from each MS4 may have nothing to do with relative area in the watershed. If this table remains in the TMDL, a footnote should be provided that the WLAs are not the allowable WLA for each individual MS4.

Response:

Section 2.3.1.4 has been revised to clarify that distributions of loads for MS4s may not be directly proportional to land area and be revised based on future data availability as follows:

“It should be noted that allocations based on proportional area may not accurately reflect the distribution of various sources of pollutant loads (runoff, possible elicit discharges, etc.) and may need to be adjusted upon further investigation of loading from each MS4 discharge.”

34. 2.3.1.6 Load Allocation and TMDL Summary (fecal coliform) – The fecal coliform TMDLs are largely unattainable and do not account for the variability in concentration that is reflected in the water quality standard. A dynamic model should be used to establish the TMDLs. At a minimum, a 400 cfu/100mL target should be used because of the permitted point sources in the watershed, including the two excess flow facilities (which are disinfected).

Response:

The fecal coliform TMDL calculations were performed following a conservative approach commonly used during the TMDL process largely as a result of uncertainty associated with the need to account for seasonality and long-term variability while utilizing often limited available datasets. The approach allows for assessment of daily fecal coliform loads that represent the potential to exceed the in-stream standards when data collection inconsistently meets the assessment criteria denoted by the standard. NPDES permit limits account for variability and

duration prescribed assessment criteria in existing water quality standards accordingly.

35. Why was the permitted design maximum flow (DMF) not used for the Park Forest Excess Flow Facility? (page 2-14)

Response:

The Park Forest NPDES Permit No (IL0047562) was reissued 9/12/2019. The treatment facility includes primary settling and chlorine disinfection. However, the limiting flow at the excess flow facility is the capacity of the Thorn Creek interceptor sewer, not the treatment facility. The design flow capacity of the Thorn Creek interceptor sewer is 2.9 MGD.

36. 2.3.2.4 Waste Load Allocation (chloride) – The TMDL states that HBD-06 (Thorn Creek) is no longer impaired for chloride and recommended for delisting and therefore a TMDL was not developed (page 2-2). If the segment that TCSD discharges into is no longer impaired for chloride, how can the exceedances in HBD-04 be attributed to the TCSD? (page 2-18)

Table 2-24 shows that no reductions are needed for the chloride inputs to HBD-04. Why is a TMDL even required?

Response:

TMDLs are developed based on existing data which indicates that impairment is not currently observable for segment HBD-06. However, chloride loads entering Thorn Creek in this segment are contributing to downstream impairments and are accounted for in the TMDL development for the nearest downstream segment that remains impaired.

Section 2.3.2.6 states: Although individual samples collected in this segment have exceeded the instream water quality standard on several occasions, exceedances are relatively infrequent (approximately 2.6% of all samples) and do not result in a calculated percent reduction (based on the 90th percentile of recorded concentrations in each flow category) needed from any of the flow categories.

37. 2.3.5.6 Load Allocations and TMDL Summary (dissolved oxygen) – The QUAL2k model does not appear to be calibrated to anything other than dissolved oxygen. Therefore, there are numerous combinations of total ammonia, total phosphorus, carbonaceous biochemical oxygen demand and sediment oxygen demand that could all achieve the dissolved oxygen targets. Tables 2-31 through 2-36 are therefore questionable. Also, the calibration was conducted for extreme flows – it is unclear why WLAs would be provided for the MS4s.

Response:

The TMDL consultant has revised the QUAL2K model and related report text in response to the comments provided comments. As discussed in the revised section 1.5.1.8, the updated model included calibrations of each applicable parameter:

“The calibration process focused on those water quality constituents relevant to dissolved oxygen simulations for which measured data were available, including water temperature, CBOD, nitrate, ammonia, total phosphorus, and DO. The model was considered calibrated when relative consistency between modeled vs. measured profiles were achieved for all parameters.”

WLAs included in the revised models consist of point source discharges only. Tables 2-31 to 2-36 have also been updated to reflect the revised model. The revised model inputs and outputs are provided in Appendix C.

38. Model Segmentation – The QUAL2k model does not include the Sauk Trail Lake impoundment and dam even though it physically connects segments HBD-03 and HBD-05 of Thorn Creek. The Lake has a surface area of 28.8 acres, the volume of the lake is about 120 acre-feet, the maximum depth is 6.4 feet, and the average depth is 4.0 feet. The residence time of the water in the lake should therefore be included the QUAL2k model to accurately simulate water quality in the downstream segments of Thorn Creek. There is no segment for Sauk Trail Lake.

Response:

The TMDL consultant has revised the QUAL2K model to include the Sauk Trail Lake impoundment and dam as discussed in the revised section 1.5.1.2 regarding stream segmentation and section 1.5.1.3 regarding flow and hydraulic characterization of the QUAL2K model. The revised model inputs and outputs are provided in Appendix C.

39. Reach Characterization – Each model segment in the QUAL2k model has been assigned a high ammonia sediment flux value ranging from 250 to 1,000 milligrams per square meter per day of nitrogen (mgN/m²/day). These ammonia fluxes will result in elevated levels of ammonia in the QUAL2k model. Information was not provided as to how the model predictions compare with measured values in the creek.

Response:

The TMDL consultant has revised the QUAL2K model inputs in response to the provided comments. Prescribed ammonia flux values in the revised model range from 0-100 mgN/m²/d. Comparisons of modeled to observed data are included in Appendix C.

40. Headwater Inputs – The headwater inputs for Thorn Creek and its tributaries have very high values of ammonia and nitrate specified. The headwaters of Thorn Creek and its

tributaries do not include wastewater treatment plant inputs or other potential sources of ammonia, and hence the use of these values is not justified. The dissolved oxygen inputs for the headwaters of Thorn Creek and North Creek seem unrepresentatively low for shallow creeks.

Response:

The TMDL consultant has revised the QUAL2K model inputs in response to the comments. Headwater inputs are derived from available data collected on July 6, 2005 for DO and all other available parameters. Headwater ammonia and nitrate inputs range from 1-5 mg/L in the revised model.

41. Point Sources Inputs – The flow values for the two major publicly-owned treatment works (POTWs) reported in the Table 1-6 of the TMDL report and the QUAL2k model inputs do not match. This discrepancy between the model and TMDL report should be corrected.

Response:

The TMDL consultant has revised the QUAL2K model inputs in response to the comments. Flow values for point sources in the revised model are now consistent with Table 1-6 after accounting for the appropriate unit conversions from MGD to m³/s.

42. Diffuse Flow Inputs – The QUAL2k model includes the diffuse flow inputs for the flow that directly drains into mainstems of Thorn Creek and its major tributaries. The water quality concentration for the diffuse flow were varied for calibration since there is no available data. The use of high values of ammonia and nitrate is not justified since there are no major wastewater plants in the area draining directly to the mainstems of Thorn Creek and its tributaries.

Response:

The diffuse flows and loads have been revised in the revised QUAL2K model. The diffuse inflow loads were reduced in the revised model to more accurately reflect expected load contributions from, for example, agricultural runoff, lawn fertilizer, septic systems, etc. Diffuse loads of ammonia and nitrate are less than or equal to 3.5 mg/L in the revised model.

43. Rates – There were certain issues in the kinetic rates used for the QUAL2k model:
- Organic nitrogen hydrolysis is set to 4 per day which is at least an order of magnitude higher than the literature reported values of 0.001 to 0.4 per day.
 - Settling velocity of organic nitrogen is set to zero.
 - Subsistence quotas for nitrogen (q_0Np) and phosphorus (q_0Pp) are set to zero for phytoplankton. This results in no nutrient limitation for phytoplankton. Hence the QUAL2k model is missing the important process of nutrient limitation for phytoplankton which impacts dissolved oxygen predictions.

Response:

The TMDL consultant has revised the QUAL2K model inputs in response to the comments above. Kinetic rates in the revised model are consistent with ranges found in the available literature. The inputs consist of default values, values derived from literature, and values derived from site specific information or calibration analyses.

44. Model Calibration – Final calibration profiles are not included in Appendix B of the report. The plots provided here are generated with the modeling files supplied by Illinois EPA. Given the comments described above, calibration plots should be provided for various state variables as opposed to providing only the comparison to dissolved oxygen (which should be the final step in calibration).

Response:

Model Calibration plots for applicable parameters are now included in Appendix C.

45. Sensitivity Analyses – An initial sensitivity analysis run was performed by removing the flow from the Thorn Creek Sanitary District (TCSD). Results showed that dissolved oxygen drops in absence of flow from the TCSD, even in the upstream segments of TCSD. This is because the inputs for the diffuse flow are tied to the point source discharges.

A second sensitivity run was conducted by zeroing out the TCSD discharge but forcing the diffuse flows to remain the same as in the model calibration. Results showed that the upstream decline in dissolved oxygen from the reduced diffuse flows is addressed and that dissolved oxygen declines downstream of the plant without the TCSD flow. A third sensitivity run was conducted to evaluate the impact of increasing (doubling) the TCSD discharge. Dissolved oxygen levels improve.

Response:

Thank you, the comment has been noted.
